- The Forensic accountant collects the documentary, material, oral and digital evidence. He studies, examines, and evaluates the total evidence. He finds the missing links, the incompatible data, the wrong evaluations, the inflated/deflated bills and the manipulated invoices, the non-existing (fictitious) beneficiaries. He prepares a list of all the fraudulent events. He rearranges the list to make it a connected whole. Based on the findings he writes the Forensic Accountancy report.
- During the investigation, Forensic Accountant also finds some contradictory evidence to his main thesis. He evaluates the evidence and finds the reason for the existence of such evidence. He discusses the contradictory evidence in his report
- The Forensic Accountant is asked to investigate some specific aspects. He finds evidence or some and not others. He prepares the report in two parts; one of those he has been able to find evidence and the other for those where he could not collect evidence for a definite positive/negative report. He mentions the reasons for the failure.

3. Losses

The Forensic Accountant identifies and estimates losses. He indicates the avenues where the money has gone/secreted and how it can be recovered. He identifies:

- Suspected losses
- Recovered amounts
- Recovery from insurance company
- Losses to be written-off
- Net corporate losses

The supporting evidence, point wise, should form part of the report. The conclusions/recommendations should be clear – free from any ambiguity or of double interpretations.

9.7.4 Police cases

Police investigate the criminal cases. There are numerous police investigating agencies Including, local Police/CID/CBI. The RBI has also provided investigation guidelines to banks.

9.8 FORENSIC ACCOUNTANT

Forensic Accountant is an investigator of accountancy crimes and an appraiser of findings of opposing Forensic Accountants. He locates evidence. He prepares a comprehensive report. He is often required to present his findings in the court or departmental proceedings. He often faces cross-examination, from the opposing side.

Forensic Accountants are a class of specialists, trained to dive deep into the accounting record oceans. Curiosity; scepticism; persistence; creativity; and attention to details are their hallmarks. Further, knowledge of the business in hand and materials involved therein and sound professional judgment are indispensable. They are familiar with the legal requirements and procedures involved in Forensic Accountancy. Above all, they have the uncanny insight to discriminate substance over form (sifting grain from chaff).

Some Forensic Accountants go in for Alternative (out of court) Dispute Resolution (ADR) work. Thus, they handle mediations and arbitrations to resolve the business dispute and minimise expense, time loss and business disruptions.

Forensic Accountants analyse, interpret and present complex financial and business account records and statements in an intelligible, concise, precise, well-illustrated (with photographs, sketches, charts and graphics) reports which speak for themselves. They explain the findings, if necessary, to all, including the professionals of the criminal justice system.

Forensic Accountants take into consideration all alternatives, dive deep into the details, thrash out the evidence with colleagues and visualize the connected whole, to present a complete and correct picture.

Forensic Accountants have to be a perfect communicator (listen, learn, assimilate and convey). They deliver their findings/views effectively in a precise, concise and comprehensive manner orally while giving evidence in courts or writing, in the form of reports.

Forensic Accountants handle many issues relating to accounts disputes, including insurance/securities frauds, bribery cases, money laundering. They estimate and locate proceeds of crime, thefts. They appraise material disputes, professional negligence, assess economic losses due to cheating, embezzlements, breach of contract, diversion of resources, They handle valuations, trace missing assets, recover embezzled/stolen money/assets. They identify accounting lapses/lacunae.

Forensic Accountants and Forensic Accountancy have emerged, comparatively, recently. They have acquired tremendous importance is a short time. The practitioners are academically qualified, professionally certified and legally identified as competent Forensic Accountants, based on their academic qualifications/training/Certification/professional experience/performance. They also present/defend the evidence they have located/collected/presented in financial fraud cases, which they investigated.

The Forensic Accountants offers many advantages over the departmental auditors including:

1. They are independent investigators. Hence, the investigations carry greater credibility.

2. They are professional investigators, specially qualified and experienced to investigate the issue(s). Hence they give correct findings.
3. As organised professionals, they have the required staff, expertise and the essential equipment to handle the work efficiently.
4. They have the required experts (Document Experts, Forensic Experts, Engineers and others) at their beck and call to get the needed help.
5. Above all, they have the expertise in accountancy to handle the investigations professionally and efficiently.

A bird's eye view of the nature of the Forensic Accountant's work is in the text box above.

ANNEXURE 1

FINANCIAL FRAUDS

(Genesis & Prevention)

MEN
(Staff, service provider, Vendor, customer, fraudster)
MATERIALS:
(Documents, goods/machinery instruments gadget, goods etc.)
SITUATIONS/OPPORTUNITY
(Loopholes in Transactions, Rules and regulations, policies, inefficient control systems/Post-fraud handling)

Fig. 9.1

Genesis of Frauds

Financial frauds are the result of inter-play of the trilogy of frauds:

1. **Men (**s): negligent management; corrupt partners, crooked staff; dishonest service providers/vendors; careless/dishonest customer and professional fraudsters.
2. **Materials:** Documents, Electronic gadgets and modes), and a host of materials, mercantile goods, machinery, property, and miscellany of assets.
3. **Situations/Opportunities**. There are too many situations where the fraudster gets opportunities to commit financial frauds, including:

1. Blind trust.
2. Lack of checks and balances.
3. No oversight.
4. No accountability.
5. Duties not properly specified.
6. No rotation of duties.
7. No proper tranfer policy. Staffers allowed to take roots at one seat/one place.
8. Lax rules.
9. No proper audit.
10. No inventory.
11. Delayd and inefficient investigations.
12. No deterrence.
13. Corrupt mangment: joins hand with the fraudster.
14. Company engagd in shady transactions.

The situations where the fraudster can make hay is available in most of the work environments. Computers and cyberspace have added a vast new arena to the depredations of the fraudster. Financial Forensics has spread and spreading all around. The role of Forensic Accountancy has gone up many folds and is likely to expand further in the coming times.

I) Men

Men (and women) are the most important component of the trilogy. They are the actors in the drama of the perpetration/perpetuation of financial frauds. Human beings are selfish, and most of them are dishonest. However, social environment, education, deterrents, preventive action, and controls keep them at bay. An old USA estimate indicated that:

- 25% persons are always dishonest
- 50% persons are fence sitter, they commit fraud when they get **'safe'** opportunities
- 25% persons are generally honest under normal circumstances

Then who commit frauds? Not all! The fraudsters have some special characteristic features and pliable disposition that make them con artist. They possess conglomeration of a somewhat excessive dose of dishonesty; some compulsion(s); some defrauding ability, skill and above all they possess a will to commit frauds.

They are on the lookout for suitable opportunities to defraud. In earthly terms the persons involved in financial frauds are:

- Dishonest staffer
- Rogue customer
- Service providers
- The professional
- Vendors
- Money launderers
- Drug traffickers
- Terrorists

Fig. 9.2

Fraud's Quintessential Quintet

1. The Staff

All financial frauds are the result of the failure of the staff, supervisors and management included. For example, in banking frauds in India, the bankers are involved, directly or indirectly, in about 64% cases (a current report of RBI). Most of the times it is their wilful act, sometimes it is their miscalculation about the risk factor and infrequently it is the disregard for the rules and regulations, the system and the policies of the bank. Over-trust, incompetency, negligence, and ignorance of the banker help in other cases.

Financial Frauds are
Failures of the management

2. The portrait of a fraudster

The fraudster has a distinct personality. He is identified in most of the cases without difficulty. The main characteristics of his personality are:

a) He is efficient

He finishes his work well before time. Consequently, he has plenty of time to develop public relations with colleagues and customers.

b) He is obliging

He obliges everybody. He goes out of the way to help his superiors. He helps his colleagues who are bogged down with backlogs and find themselves hard put. He is helpful to his subordinates. He tolerates their inefficiencies, provides a helping hand and even takes over their work with a

smiling face. He obliges even customers. He provides them with information, helps them with the procedures and puts in a word to his colleagues for quick disposal of their cases.

c) He is a "know-all"

He knows everything: rules, procedures, persons, the services provided by the organisation and the conditions thereof, relative merits and demerits of various transactions. In addition, he knows their loopholes, difficulties and trouble spots of the working of the organisation. Thus, he is a guide to his superiors, to his colleagues, to his subordinates and to the customers. He is always busy dispensing information, putting in a word here, a word there and giving a helping hand to all who need.

d) He is "Indispensable"

The knowledge, the efficiency, the hard work, the obliging nature of the fraudster makes him indispensable. He does not go on leave. He sticks to the same post and branch indefinitely. His transfer from the place is unthinkable. If the head-office transfers him, the whole branch exerts all the influence to retain him in the branch as he has made himself indispensable to all. Thus, he continues in the same position for years together.

3. The rogue client/customer

The general fall in the moral values is almost universal. It is bringing in the rogue customer/ partner/client increasingly. He may be an individual, a group, a company, a corporation, an NGO, a Trust or the like. The usual *modus operandi* includes using fake or altered documents, impersonation, loans on fake documents, kite flying, spurious hypothecation goods, removal of pledged goods, non-payment of the instalments, credit card manipulations, Now it is the computer, the internet or other electronic entities that are deployed to steal the password, the electronic identity, the data, the software and the account numbers. The new technology (digital accountancy, telemarketing and cashless transactions) are adding to the woes of the common person.

4. Service Providers

Service providers are the persons who programme, maintain and service the equipment (computers, internet, software and other electronic gadgets) of various organisations. Their depredations, whenever they occur, are often very costly. They steal the passwords and tamper with security installations and misuse them to defraud the organisations.

> *Stanley Mark Refkin was a* ***computer programmer****, employed by many a bank. One morning he walked into the wire fund transfer room of Western Union Bank, in Los Angeles. He had earlier seen the working of the transfer of money to all parts of the world in that room. He had done his homework: where to transfer the money and what to do with the money. He came there, officially, to check the transfer system. He had been coming to do so earlier also. On the day of the fraud, he posed as a trouble-shooter and wanted to correct the fault in the transfer system. Nobody suspected his* bona fide*. He befriended a young operator and learnt the process and password of the transfer of money. He went out and from a public telephone, phoned the bank and with little effort he got 10.2 million dollars transferred to an account of a diamond dealer in Switzerland. He flew to the country and returned with the diamonds***! (CH)**

5. The Professional

He is the big game master. His depredations cause heavy losses. Forgery of hard or electronic documents is his common mode. He may manage to take big loans on fake documents; he may use stolen or fake credit cards on a massive scale, fake ATM Cards, EFT or NEFT technology

to transfer money from bank coffers to his account. He may be a Ponzi schemes master. He often steals and usurps the identity of the victim and defrauds him.

> *Mr.Charlie Koissi*[7] *was an honest person. He was working as Research Assistant in Pasture Institute in Paris. He lost his French national Identity card in 2005. He had forgotten about the incident. However, one day, while going abroad, in 2007, he was arrested at the airport for financial frauds in Germany. He protested that he had never been to Germany; but to no avail. He was sent to jail. He was released only after his Institute gave the certificate that he was on duty at the material time/period.*
>
> *After two months, he was again arrested. He had to produce the duty certificate again for release.*
>
> *It was clear to him that somebody was misusing his identity. He sought help from his friends and engaged a detective. A lot of evidence was unearthed but the police did not take any action. However, they believe (March, 2014) that they are closing on the identity thief.* (CH)

6. Vendors

They are the persons who transact business with the organisation, trusts and individuals. A dishonest vendor may introduce a 'Trojan Horse' and get secret information like passwords, command software and other secret data and misuse them to the detriment of the victim. Vendors include:

- money launderer
- drug traffickers
- terrorists

II) Materials

Frauds are perpetrated through materials. The important fraud vehicles used in classical frauds include:

1. Documents

Business transactions and documents are inseparable, though the nature of documents is undergoing a sea change. The paper document is giving way to an electronic document, to paperless society. However, the paper document still rules the roost; volume-wise. The manipulation of bank documents offers the easiest, the least dangerous and the quickest means to riches. It has attracted many an evil genius and has created a flourishing "trade" of manipulated documents. They create problems for all those concerned with the criminal and civil justice system.

A fraudster commits frauds, via documents in business transactions. Major depredations include:

1. Submitting spurious documents.
2. Using an altered document.
3. Printing counterfeit currency notes, stock and share documents.
4. Credit Cards Frauds.
5. ATM frauds.

7. Reader's Digest (Indian Edition), September, 2014, p 127.

6. Tampering with electronic documents, messages and diverting the contents from the right addressee to someone else.
7. Misappropriation of deposit(s); transferring money from the account of a customer to his account or the account of his accomplice.
8. Depositing the fresh deposit money of the customer to his/his accomplice account.
9. Pledging spurious/inferior/short measure of the pledged goods.
10. Pledging the same goods to more than one person/organisation.

The list goes on.

2. Computers and Internet

Computers and the internet are new genies of the fraud master.

III) Situations

In accountancy, there are many fraud-prone opportunities and situations. Their elimination promotes the prevention of frauds. The following are some such situations:

1. The lax environment (non-observation of rules, the wilful breaking of rules/policies, bypassing control systems.
2. Negligence, incompetence, fraudulent intent.
3. Failure to create and observe healthy transactional policies.
4. Lack of periodic auditing and balancing of accounts.
5. Lack of ill-defined duties of staff.
6. No accountability.
7. Over-trust of individuals.
8. Non-mobility of staff.

Alert management keeps strict vigilance on these (and other) situations and plugs any loopholes.

PREVENTION OF FINANCIAL FRAUDS[8]

Anti-financial frauds mantra:
"Eternal Vigilance"

Financial frauds have acquired frightening dimensions and unfortunately, they are still expanding exponentially. There is an urgent need to prevent them and to deter their perpetrators. The classical methods for fraud prevention also hold good for accountancy frauds (box below). In addition:

1. Hold periodic audit at irregular intervals.
2. Devise a dynamic rotation of staff and transfer policy. No staffer should take roots at one place/post.
3. Involve multiple handlers for important transactions.
4. Know the weak links and provide for their safety.

8. For details see: Sharma BR. 2016, *Bank Frauds*, publisher LexisNexis.

5. Know your staff, customer, partner, associates, important subordinates, service providers. Collect personality profiles of important/doubtful personalities involved in the organisation, covertly, from a Forensic psychologist. He may indicate dubious characters.
6. Keep oversight not only on staff but also on customers, partners, service providers, associates and other involved persons in the business. It helps.
7. Keep a strict check on materials: their arrival, storage, movement, sale, transfer.

Forensics Financial Fraud Antidote

1. Management must realise that they are solely responsible for fraud control. They cannot pass on the buck to others.
2. Use Forensics to recruit honest persons only.
3. Induct periodic honesty angle checks as part of the service rules.
4. Effective oversight promotes efficiency and reduces financial frauds.
5. Real-time monitoring of transactions, regular auditing and balancing of accounts are the key to minimise frauds.
6. A blend of detection and prevention measures, ingrained in an organization's culture, is most effective in preventing financial frauds.
7. Transparency minimizes frauds effectively.
8. Blind over-trust is anti-business practice. It promotes frauds.
9. Identify fraud-prone areas and install anti-fraud system
10. Install whistle blowers
11. **Segregate duties so that more than 2/3 persons are involved in a single transaction.**
12. **Assign responsibility. Induct accountability.**
13. The fraudster must believe exemplary deterrence is round the corner

In short:

Institute reasonable oversight, establish checks and balances, segregate responsibilities, eliminate management overrides, no over-trust, implement proper policy for recruitment/rotation of duties/transfers and ensure exemplary deterrence. And you are there.

A man's writing seems to be part of his flesh and bones; he cannot discard it at Will.

Fig. 10.1

10.1 IMPORTANCE

Documents play an important role in human life. We daily write and sign a number of documents. It may be a personal letter, a receipt, a cheque, or an order affecting the lives of many individuals. If we stop writing or accepting documents[2], the working of modern society may be adversely affected.

The criminal has not been slow to realise the importance of documents. He has been exploiting the potentialities of their falsification. Thousands of forgeries and frauds are perpetrated every year with new modes and methods. Documents form major part of the physical evidence handled by an average investigating officer. Yet, it is estimated that only 50% of the questioned documents cases are reported to the police.

The falsification of financial documents is a "big business" in almost every country and it is on the increase everywhere. It is estimated that thousands of crores of rupees are lost in financial frauds every year.

The art or craft of forgery is not difficult. A little patience, good penmanship, sufficient practice, intelligence and courage to face the consequences are the only requirements. On the other hand, the detection of forgery is comparatively far more difficult. It may be possible to detect a fraudulent document, but the identification of its author is difficult. For example, initials are easily imitated with little chance of detection of the forgery. Erasures, small additions or alterations, likewise, seldom permit the identification of the culprit. Signatures of illiterate or semi-literate persons are easy to imitate. If the forger has written after practice, there is little chance of his identification as author.

Scientific detection of forgery is possible in a large number of cases. However, the courts are wary of accepting the findings of experts as final and sufficient. Most of them want corroboratory evidence in all cases.

A false document is the creation of an educated person. He keeps up with the latest advances and uses them to perfect his art. Consequently, the detection of falsification of documents is difficult and slow.

A businessperson had obtained an advance for the agreed sale of a property from another businessman. The prices shot up. The seller wanted neither to sell the land at the agreed price

2. Paperless society is heading toward the situation.

nor to return the money. He used the most modern way to forge signatures of the purchaser on 30 receipts of money of total face value Rs 40.5 Lakhs!

Modus operandi? *Simple!*

He picked up genuine signatures of the victim from a court file on a digital camera and transferred the same to a computer. The signatures from the computer were printed on the 30 receipts in blue ink. What perfect duplicates! Even the dot and the small spur were clear. However, the perfection of the signatures was the undoing of the culprit's ingenuity and the effort.

1. *There was not a kink different in the 30 signatures.*
2. *Corresponding loops corresponded in dimensions, positions.*
3. *Intra-distances among the various formations were the same.*
4. *Intra-angulations were alike, though the forger had varied the positions of the signature vis-a-vis the typed text on the receipts.*
5. *The blue ink of the forged signatures corresponded to the ink of his computer.*
6. *The thirty signatures superimposed on one another, almost perfectly.*
7. *The model from which the forged signatures were copied could be located. Not only it could be superimposed on the disputed signatures, but the original was of a later date than any of the dates, the various forged receipts carried. (CH)*

The forgery of a document does not come to notice immediately. Often, the falsification is suspected/detected after years when there is no witness to the act and sometimes scientific evidence is also insufficient (faded, mutilated or destroyed) to provide positive proof. The criminal, consequently, escapes punishment.

10.2 NATURE

Section 29 of the Indian Penal Code **(IPC)** defines the term **"document"** comprehensively:

"Document" *The word "document" denotes any matter expressed or described upon any substance by means of letters, figures, or marks, or by more than one of those means, intended to be used, or which may be used, as evidence of that matter.*

Explanation 1

It is immaterial by what means or upon what substance the letters, figures or marks are formed, or whether the evidence is intended for, or may be used in, a Court of Justice, or not.

Illustrations

1. *A writing expressing the terms of a contract, which may be used as evidence of the contract, is a document.*
2. *A cheque upon a banker is a document.*
3. *A power-of-attorney is a document.*
4. *A map or plan which is intended to be used or which may be used as evidence, is a document.*
5. *A writing containing directions or instructions is a document.*

Explanation 2

Whatever is expressed by means of letters, figures or marks as explained by mercantile or other usage, shall be deemed to be expressed by such letters, figures or marks within the meaning of this section, although the same may not be actually expressed.

Illustrations

A writes his name on the back of a bill of exchange payable to his order. The meaning of the endorsement, as explained by mercantile usage, is that the bill is to be paid to the holder. The endorsement is a document, and must be construed in the same manner as if the words "pay to the holder" or words to that effect had been written over the signature.

[s 29 A] "Electronic record"[3]

Electronic record" means data, record or data generated, image or sound stored, received or sent in an electronic form or micro film or computer generated micro fiche.

A document is an object/material, having a symbol or writing on it, which conveys some meaning to one or more persons. The object may be a stone, a wall, a wooden piece, a glass, a metal sheet, and a skin, a piece of cloth, a parchment or a paper. It includes a map, a plan, graph or a drawing, a sketch and a photograph.

Electronic gadgets have not been included in the definition of documents. They should be included. For example, the following gadgets qualify for the inclusion in the definition:

1. Computers
2. Mobile phones
3. A disc[4], tape, sound track or other device in which sounds or other data (not being visual images) are embodied so as to be capable with or without the aid of some other equipment, of being reproduced there from; and
4. Any film, negative, tape or other devices in which one or more visual images are embodied so as to be capable, with or without the aid of some other equipment, of being reproduced there from; "film" includes a microfilm.

In a case of wrongful confinement by the police, the "victim" scratched his signatures on one wall of the cell where he was detained illegally. When he came out, he filed a suit against wrongful confinement. The police denied the charge. His signatures on the wall proved his confinement. (CH)

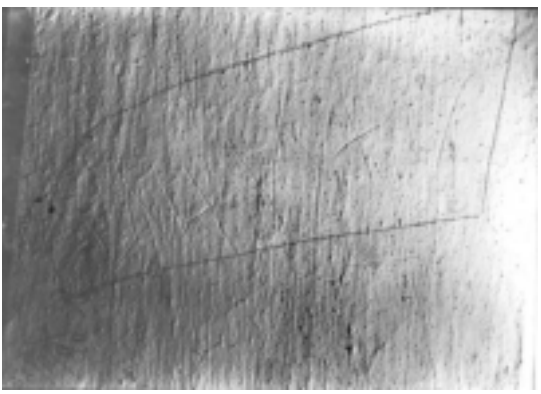

Fig. 10.2
Writings on the wall

In a case of theft, the costly cloth was shipped through railway. It was packed in gunny bags. The culprits (members of the railway staff), on the way, changed the address on the packets. The change in address was detected before the delivery. The culprits responsible for the act were identified through the writing on the bags. (CH)

3. *"Electronic record" means data, record or data generated, image or sound stored, received or sent in an electronic form or micro film or computer generated micro fiche' (vide* Clause (t) of sub-section (1) of section 2 of the Information Technology Act, 2000*).* The words "electronic record" shall have the meaning assigned to them as in clause (t) of sub-section (1) of section 2 of the Information Technology Act, 2000.
4. The Supreme Court has ruled that a compact disc (CD) is a document under section 3 of the Indian Evidence Act, 1872. The Court also held that a CD has to be exhibited/played by the trial court to enable the public prosecutor to admit or deny its genuineness under section 294 of the Code of Criminal Procedure (CrPC).

10.2.1 Letters

A questioned document may be pseudonymous or anonymous communication. It may be a threatening or a suicide letter. It sometimes may contain secret or code writing.

> *In a case of suicide, a letter purported to be written by the victim, contained material that indicated that her in-laws were torturing her. A case was instituted against the husband and the mother-in-law. The husband vehemently opposed the accusation. He was sure that his (late) wife had no cause to write the letter and probably the letter in question was spurious.*
>
> *The husband sent the letter, along with some other letters written by the victim, to the author to check the authenticity of the letter. It was found that his (late) wife (the victim) did not write the letter. However, the handwriting on the letter had close similarities to the handwriting of the deceased. Probably her brother or sister had written the letter. On checking, the handwriting of her younger sister was found to correspond to the handwriting on the disputed letter. (CH)*

10.2.2 Financial Documents

A questioned document may be a money receipt, a money order form, a cheque, a ProNote, a currency note, a payment order, an account book, a bill or a tender.

Fig. 10.3

Fig. 10.4
Forged currency note (top) was compared with a genuine note of the 'same' series (x). The forgery was disclosed by the absence of security thread, water mark (imprint was made in wax!) and defective national emblem

10.2.3 Orders

A questioned document may be an order relating to an appointment, transfer, training, promotion, demotion, increment, allowances or leave. It may be a permit or licence for

purchase, sale or possession of some articles. It may be a passport for travels abroad, or it may be a certificate, a degree or a diploma.

10.2.4 Records

Falsified Records become questioned documents. It may be an office, production, sale or purchase record. It may relate to consumption, stores, confidential inquiry or some report.

10.2.5 Tickets

All sorts of tickets are forged: bus tickets, railway tickets, lottery tickets, the excise stamps, and horse race betting tickets are some of them.

Fig. 10.5
All the three tickets printed with the same block but forged ticket was numbered with different numbering machine. The shape and spacing differences are clearly brought out by the transparent graph plate

In a state lottery, four tickets bearing the winning number were presented to the authorities. All the tickets were printed in the same press except for the serial numbers. Four different numbering machines were used to print the numbers. Three of the four tickets, from the study of the size, structure and spacing of numbers, were forged.

Blank printed tickets, without numbers, had been stolen from the press. (CH)

In a State Transport undertaking unauthorised bus tickets of various denominations were printed on a mass scale and used on various routes by a gang of the transport staff. Comparison with the genuine tickets revealed the forgery. The tickets were also linked with blocks recovered from the suspects. (CH)

A few years ago, some employees of the railway staff ganged up and started selling used tickets by punching new dates on the old tickets collected from the passengers after they had completed their journeys (mostly Amritsar-Delhi tickets). Punches recovered from the accused were identified to have been used to re-date the old tickets. (CH)

Fig. 10.6
A mutilated college fee receipt (left side photo), recovered from the rotten clothes found alongwith a skeleton, established the identity of the victim when compared with the carbon copy (right side photo) found in a college receipt book.
comparison was done with a graph plate

10.2.6 Examination Papers

Degrees and diplomas are of great value to secure employment, promotion and confirmation. The answer books are, therefore, sometimes replaced. Complete paper or some questions are done by some person other than the real examinee and are passed on to the examiner. Sometimes the real examinee is impersonated, and a substitute appears for the examination.

10.2.7 Wills

A Will is a document a person executes to allocate his wealth and property to persons of his choice. The disinherited relatives often question the validity of the Wills. Some Wills are fraudulently prepared. If the deceased is literate, signatures are obtained by deceit or threat on a blank paper. If he is "**sign-only**" person, she/he is made to sign blank paper on some pretext or threat. The paper is later converted into a Will. Such Wills are prepared usually after death.

In many cases, a Will is prepared, and the signatures are forged thereon. If the person is illiterate, his thumb-impression is impressed on the Will even before/after his death or at the time of death.

Once, a multi-millionaire couple lived in a farmhouse. They had no issues. They adopted unofficially their nephew who was also to inherit their property in due course. However, he was in hurry. He killed both, his uncle and aunt. He expected to get their property. He was tried for murder, but he was acquitted.

The deceased had left a Will. It was a typed document. There were no signatures at the end. Nevertheless, throughout the text wherever the testator had used "I" he had written his name with his own hand in brackets. The Will was accepted as genuine by the court.

According to the Will, the property of the husband, in the event of his death, would pass over to the wife (and subsequently after her death, it was to pass to her heir(s). It was proved that the wife died after the death of her husband. The property was transferred to wife's father.

The nephew contested the case at all stages without success. (CH)

In another case, a moneyed man, though of low intellect, was pampered by a "friend" for a few days and a Will was got thumb-printed from the person, which was witnessed by some of the associates of the fraudster "friend".

Soon after the man was found missing. Murder was suspected. The "friend" produced the Will to claim the property. He became the prime suspect. The relatives suspected foul play. Detailed and lengthy interrogation of the fraudster led to the discovery of a partially burnt buried body. The body as such could not be identified, but remains of the thumb gave identifiable prints. The thumbprint on the "Will" was compared with them. RH thumbprint (from the semi-burnt body) tallied with the one on the will. The body was, thus, identified. The fraudster/murderer did not get the benefit. He was convicted of murder. (CH)

10.2.8 Historical Documents

Curio/antique collectors and museum curators are always anxious to get letters, autographs and other documents of historical importance to add to their collection. They pay fantastic prices for important documents (and other objects). The forgers often exploit the weakness of the persons. They forge all type of sellable objects including documents like letters, orders, autographs, diaries, and other documents, purported to have been signed or written by great historical personalities. They often scramble/get handsome "rewards".

The British Archives purchased Mussolini's Diaries. Mussolini was the Italian dictator and contemporary co-war lord of Hitler. The British Archives paid part of the fantastic price and got the diaries. They engaged an historian to check the correctness of the events mentioned in the diaries.

The historian reported that the facts mentioned in the diaries were correct but there was nothing in the diaries, which was not already known.

A suspicion of their authenticity arose. A document expert was employed to check the diaries. The expert found that the paper of the diaries was not manufactured before 1957, as the bleach used for the paper (which gave fluorescence under ultra-violet rays) was not known before 1957. The diaries were, therefore, counterfeit as the dictator had died in the early forties. (CH)

10.2.9 Posters

Some people publish objectionable posters and distribute them. The posters may tend to increase communal hatred, illegally propagate against the government policy, or vilify an individual. Such posters do not carry the name of the printer, the publisher, or the author.

10.2.10 Books

Books containing pornography violate the law. Book piracy violates copyrights. They are questioned documents.

It is possible to identify the printing press where they were printed.

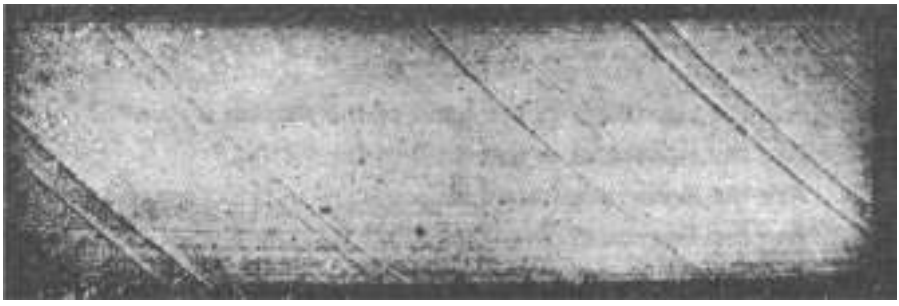

Fig. 10.7
Ghost press is indicated and suspected source identified from guillotine marks on the edge, formed during the trimming of a book

10.2.11 Burnt or Damaged Documents

Burnt documents are found in cases of arson, in accidental fires or in cases where the culprit fears incrimination on the discovery of some offending documents. He destroys them by fire. The criminal often destroys Destruction of financial documents, records, notebooks, diaries or some other types of documents, which may be harmful to his interest.

10.2.12 Electronic Documents

All electronic records are electronic documents. The electronic record has been defined in section 29 A of the IPC as mentioned/discussed above. Fraudulent manipulation of an electronic document is common, and it is increasing.

10.3 DOCUMENT PROBLEMS

Questioned document problems are varied in nature. The important ones include:

1. Identification of handwriting
2. Evaluations of typescript/typewriter/computer printing
3. Examination of writing materials like pen, paper, ink, pencil
4. Matching of seals and stamp
5. Restoration of contents of burnt documents
6. Revealing secret writing
7. Ascertaining the original contents of altered documents
8. Establishing a sequence of strokes in crossed strokes writings
9. Inter-linking/delinking counterfoils and foils *inter se*
10. Fixing common origin of torn paper/letters/other documents
11. Restoration of erased, indented, obliterated, faded writings

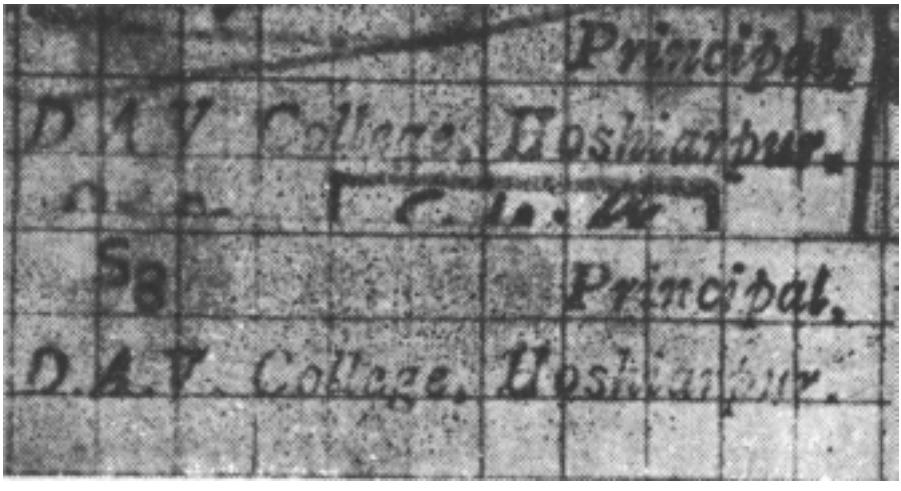

Fig. 10.8
Spurious seal impression matched with the impression from the seal recovered from the suspect

Some tough documents problems, which defy proper solutions, are:

1. Identification of persons who traced and inked traced signatures.
2. Identification of the fraudster who altered/modified a digit or two in the writing
3. Determination of the age of a document, without taggant[5]
4. Identification of a typist from typescript
5. Scored and obliterated writings

10.3.1 Handwriting

Identification of handwriting is the most important branch of document Forensics. It is usefully divided into the following categories:

10.3.1.1 Signatures

1. Are the signatures genuine or forged?
2. Are the signatures in the hand of the suspect?
3. Are the signatures in the hand of the victim?
4. Are the signatures traced signatures?
5. Are the signatures in disguised hand?
6. Are the signatures on the given document transplanted?
7. Are the signatures computer printed?

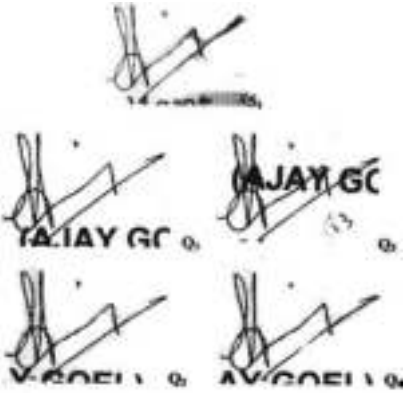

Fig. 10.9
The forger copied the signatures Q_1 to Q_4 from the genuine signatures S1 with a scanner – computer. There are not even the slightest variations, in any aspects – impossible for any human hand to achieve

In an office, there were two peons of the same name. One of the peons did not receive his pay for one month. He reported the fact to the higher authorities. It was suspected that the other peon might have drawn the pay of the complainant.

5. An additive to security ink containing radioactive material. The radioactivity is time-dependent.

The author examined the case. He found that the signature on the revenue stamp was of the complainant. Closer examination revealed transplantation of the revenue stamp.

Previous payment record was checked. It was possible to establish the place from where the signed stamp had been removed. A new stamp bearing the name of the complainant (not written by the complainant) had been pasted at the place. The handwriting on the stamp led to the culprit. (CH)

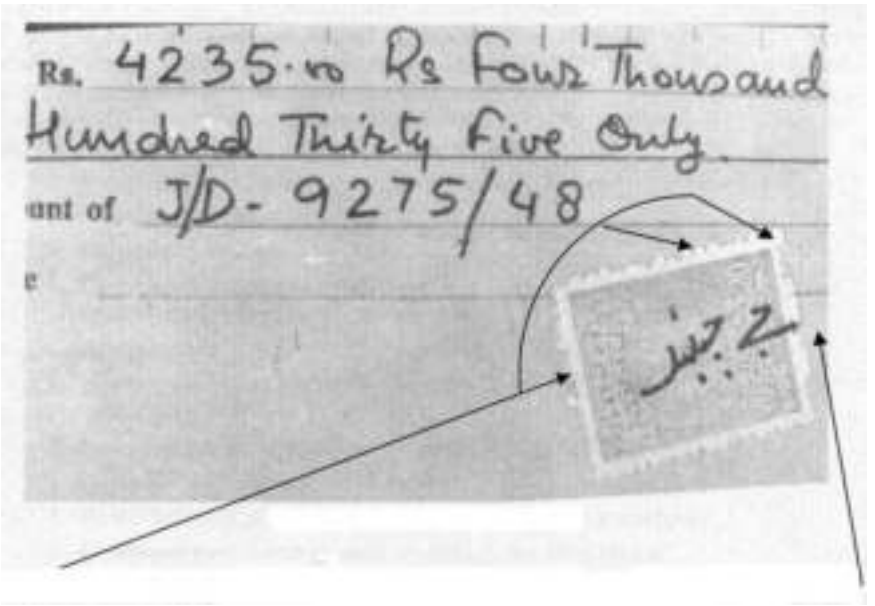

Fig. 10.10
Arrow Head Indicate the Residual Paper from the Previous Document

The document written and signed by one person is called a holograph. The questions asked about the holograph are:

1. Is the document a holograph?
2. Is it written by the suspect or by the victim?

10.3.1.2 Anonymous Letters

The questions asked about the anonymous or pseudonymous letters are:

1. Where has the letter come from?
2. What is the educational calibre of the writer?
3. What is the occupation of the writer?
4. Did one person write the given bunch of letters?
5. Is the suspect the author of the letter(s)?

10.3.1.3 Alterations

1. Were the changes in the document made at the time of writing? Or, were they made later?
2. Are the changes in the hand of the original writer?
3. Are the changes in the hand of the suspect or the victim?

10.3.1.4 Figures and Marks

Figures, hand printing, block lettering; marks may be the questioned writing in some cases. The author of the same may have to be identified.

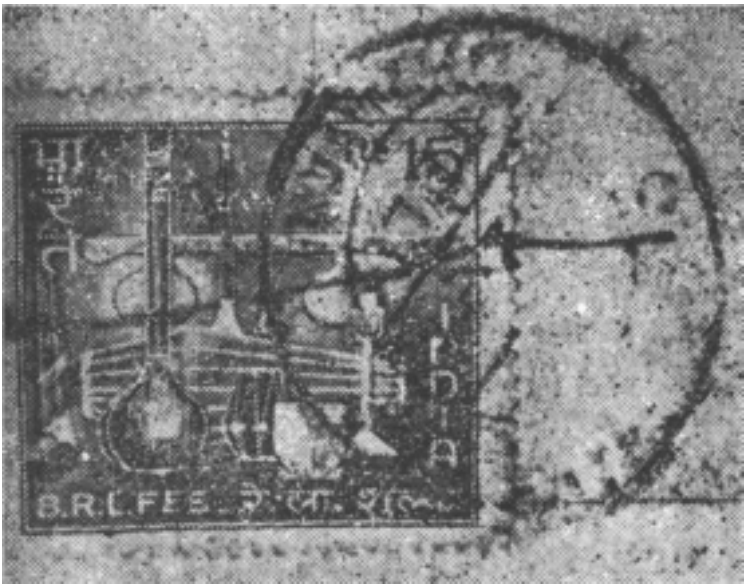

Fig. 10.11
A ticket reused by a postal clerk. the discontinuity of the inner and outer cancellation circles of the stamp is apparent. in addition, dates were also different

10.3.2 Typescript

The typewriters are becoming a vanishing entity. However, they are not completely gone. Computers are replacing them. The problems relating to typewriter/typescript are also the problems of computer/computer prints. They are:

1. Was the disputed document typed on the suspected machine (typewriter/computer)?
2. What is the make and model of the machine?
3. Was the document typed on one or more than one machines?
4. Are there any additions, alterations or substitutions to the original text? If so, were they made on the same machine?
5. Is there any erasure in the typescript? If so, what was the original text?
6. Is the document a true carbon copy of the original document or *vice versa?*
7. What is the age of the given documents?
8. Can the typist be identified?

Fig. 10.12
Manufacturers' variations in letter designs permit easy eliminations

10.3.3 Writing Materials

The preparation of documents requires paper, ink, pen, pencil, blotting paper, carbon paper, and erasers. Sometimes these materials become disputed materials and need evaluations. The raised problems about them are:

10.3.3.1 Paper

The following questions are asked about the paper:

1. Are the leaves of the multi-leaf document alike?
2. What is the age of the paper(s) of the document?
3. Has the surface of the paper suffered alteration?
4. Does the piece of paper form part of another piece of paper?
5. Is the paper similar to the given sample?
6. Does the paper contain any secret or indented writing?

In an appeal against the death sentence, the accused submitted that the paper, on which the sale of potassium cyanide was shown in the sale book in the name of the accused, was transplanted. It was not part of the sale book originally.

The author examined the paper of the leaf and compared it with other leaves of the sale book. The evaluation showed distinct dissimilarities in shade, fluorescence, screen (wire net) print and water marks. It showed a clear case of substitution. The court acquitted the accused. (CH)

Fig. 10.13
The interpolation of a leaf was indicated by the difference in tear patterns of interpolated leaf (central) and of the proceeding and succeeding leaves

In another case, the authenticity of a particular entry in a register was questioned. There were brownish stains on all the sheets of the register on both sides except on the sheet containing a questioned entry, in corresponding position. Evidently, the sheet was planted at the site. (CH)

10.3.3.2 Inks

The evaluation of inks on questioned documents solves many problems:

1. Is the whole document written in the same ink?
2. What is the age of writing?
3. Has the ink come from the given inkpot?
4. Can the faded ink be restored?
5. Can the erased writing be restored/photographed/read?
6. Are the additions, alterations, substitutions and/or cancellations with the same ink with which the main document is written?
7. Can the obliterated writings be made legible?

10.3.3.3 Pen

The following questions are asked about the pen:

1. Is the whole document written with one pen?
2. Are the additions, alterations or substitutions with the same or different pens?
3. Is the questioned writing written with the given pen?
4. Can the seized pen be linked with the given writing?

In a training institution, an instructor started receiving obscene letters. The suspected source was checked, and pen, paper and ink were recovered. The recovered articles along with the handwriting established the authorship of the anonymous letters. The culprit, a trainee, when confronted with the evidence, admitted the writing and left the training institution. (CH)

10.3.3.4 Pencil

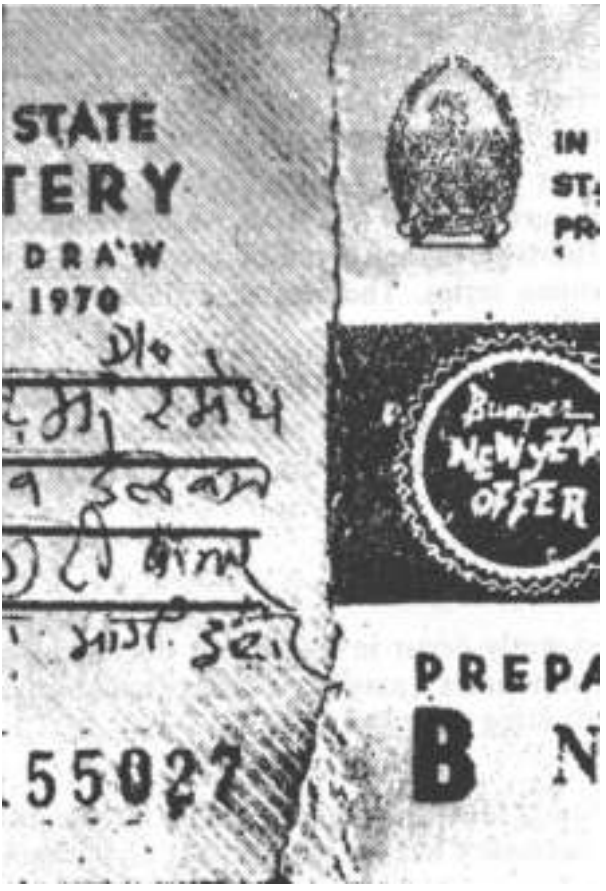
In some cases, it is necessary to find out if the questioned writing is with the pencil recovered from a suspect or not. Likewise, additions, alterations, and substitutions may be made with the same pencil as used to write the original text or with a different pencil. It is useful to establish the fact.

10.3.3.5 Erasers

A criminal may use erasers to remove unwanted writing from a document. Some particles of the eraser are left in the paper. They may permit the identification of the eraser used.

10.3.4 Seals/Stamps/Torn Paper

The comparison of seals, stamps, punches, torn paper pieces, carbon copies, printing blocks, perforations, stubs, watermarks, punched numbers, embossed marks and trademarks is sometimes required. It involves techniques and principles that are used in the examination of tool marks and matching of broken and severed parts of various articles. They have been, therefore, discussed in the chapter on tool marks.



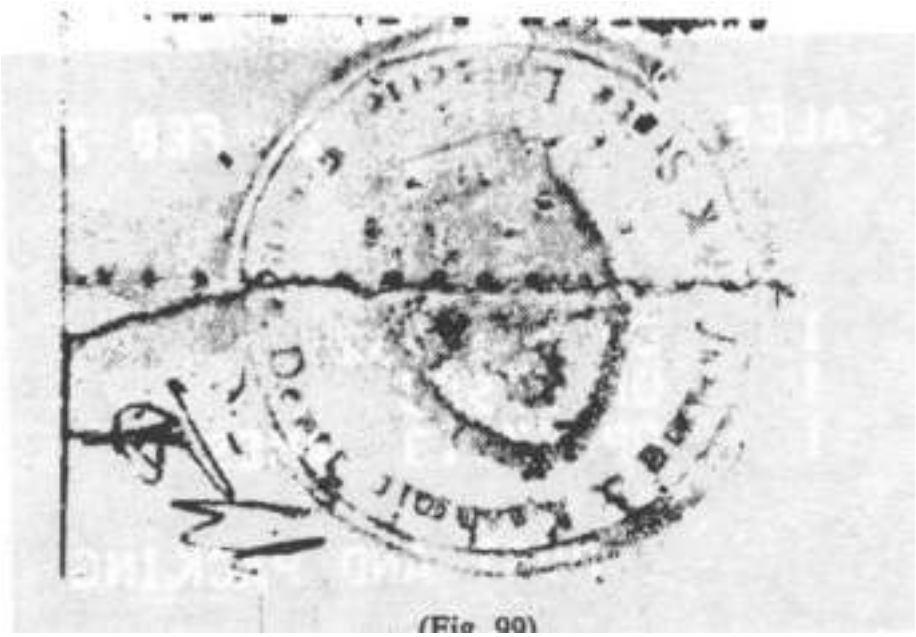


Fig. 10.14
Mechanical fit of the winning lottery ticket and its counterfoil indicated the genuineness of the ticket. the other ticket bearing the same number (forged) did not fit with the counterfoil. the two photos show the two sides of the same ticket and its counterfoil

10.3.5 Burnt Documents

Burnt documents require restoration of the writing. If currency notes are involved, it may be necessary to estimate the amount. If currency notes are of one denomination only, it is easy to estimate the amount.

In a fire in an office, the fire allegedly burned currency notes worth thousands of rupees. When the ashes were examined it was found that only a few hundreds of rupees could be accounted for from the charred remains of one-rupee packets. The correct estimate of the total loss could not be given. (CH)

10.3.6 Secret Writings

Smugglers, spies, and criminals often communicate with one another in secret writing. It is desirable to find out the secret message and to know the code and method of communication.

10.3.7 Miscellaneous

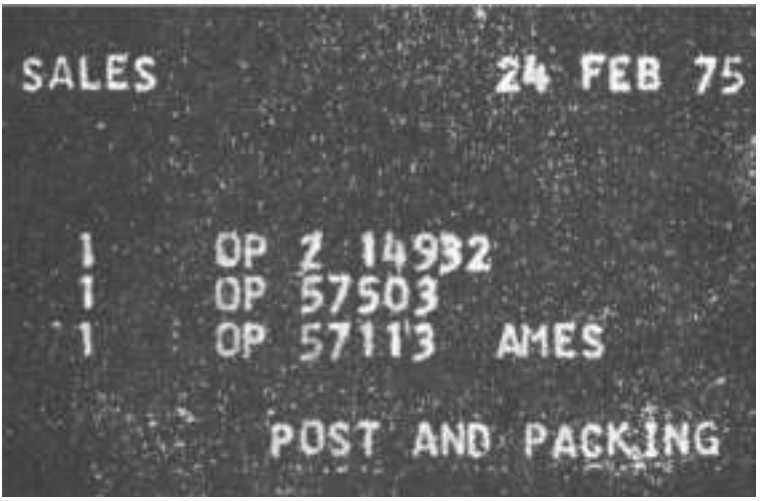

Fig. 10.15
Clandestine sale discovered from the discarded carbon paper recovered from a dust bin in a police raid on the premises of a firm. Transmitted light photography gave out the writing clearly

10.3.7.1 Erasures

Erasures are, sometimes, found in fraudulent documents. It is necessary to find out the original text. Sometimes it may be necessary to identify the erasing material — the eraser or the eradicating chemical.

10.3.7.2 Indented Writing

Indented writing sometimes gives useful information about the questioned documents. It is necessary to find out the text of indented writing. ESDA is the apparatus which is used to reveal the indentedwritings.

> *The source of a series of anonymous letters could not be traced for some time. After a long wait a letter was received on which some indented writing was detected. The evaluation of the same gave a name and a platoon number. When the local training institution was checked, the person with the name and platoon number could be located. Further investigation led to the writer of the anonymous letters. He was a roommate of the person whose name was discovered in the letter in indented writing. (CH)*

10.3.7.3 Sequence of Stroke

The determination of the sequence of strokes is an important task to fix the responsibility of the writer where additions have been made allegedly after the execution of the document.

> *In a government office certain important documents were lost. It was essential to fix the responsibility for the loss. The documents were allegedly handed over by one person to another under signatures. When the peon-book was closely examined, it was found that in the sentence relating to the handing over of the document, one of the lines of a letter had crossed one of the letters in the signature. The crossed line was found over the signature through ESDA. The person handing over the document was held responsible for the loss (theft) of documents and the act of forgery. (CH)*

10.3.7.4 Gum, Adhesive and Sealing Wax

The examination of gum, adhesive and sealing wax is required when it is suspected that a letter/packet were opened by an unauthorised person or not. It is often possible to detect the opening through examination of the new adhesives.

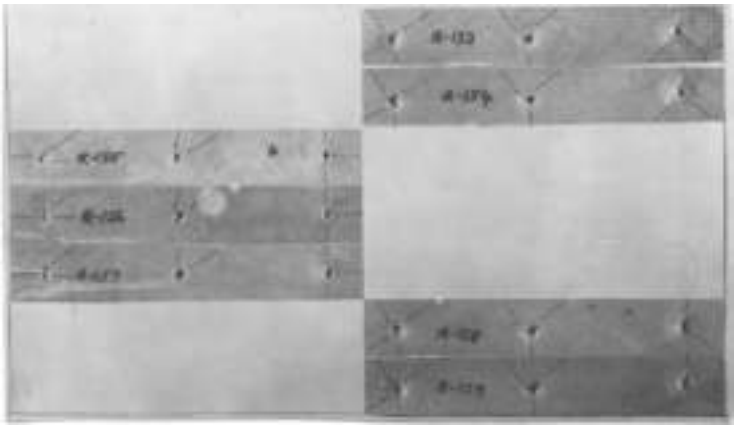

Fig. 10.16
Stich-holes identify the inserted page (3) in between 1 and 2

10.4 LOCATION

Location of questioned documents is not difficult in most of the cases. The document is produced by the culprit or by the affected party. At times, however, where documents are to be collected from a huge record of years in big firms and government offices, the work becomes stupendous. In such cases, help from Forensic accountant to understand the working of the establishment concerned facilitate the location is necessary.

10.4.1 The Victim

Anonymous letters, forged cheques, money orders, receipts, currency notes, permits, ration cards, passports, orders, identity cards, letters of recommendation and the like are with the victim.

10.4.2 The Culprit

The forged wills, account books, permits, ration cards, passports, currency notes, order books, identity cards, historical documents, authority letters and the like are with the culprit.

10.4.3 The Office

Genuine or forged authority letters, records, examination papers, account books, attendance registers, sale and purchase deeds and the like are in the affected office.

10.4.4 The Lockers

It is customary and becoming increasingly so, among the educated and the rich, to keep important documents in bank lockers. It is a safe haven for the corrupt, the fraudster and

the politician/bureaucrats. They hide the documents relating to illegally amassed property and wealth in banks. The bank lockers are becoming an increasingly important source of documents in criminal cases against the corrupt, the fraudster, the smuggler, the money launderer, the drug syndicates, the smuggler and the like.

10.4.5 Other Sources

Questioned posters are found in the affected area. Interception of the post provide secret and spy letters. The mobile and the internet are changing the scenario.

10.4.6 Fireplaces

Burnt documents are found at the seat of the fire. It may be a fireplace, a stove or an open place.

10.4.7 Dustbins

Incriminating documents are torn and thrown away in the open or in dustbins. They sometimes provide important evidence.

Bits of torn documents are collected from wastepaper baskets, dustbins or debris heaps. They are sometimes scattered inside, outside or around the house.

10.4.8 Admitted Writings

*A*dmitted writings are those writings, which a person has written in the ordinary course of work when the suspect/person is not aware that the writing could be used for comparison purposes with a questioned document in some court case. The handwriting is natural/normal. Such writings permit detection of forgery/disguise in specimens.

Admitted writings are essential to evaluate most of the document problems involving handwriting. No effort, therefore, is spared to collect adequate/right admitted writings.

The main sources[6] of admitted writings are:

1. Office where the person is employed. Applications for appointment, leave or loan, acquaintance rolls, pay, fingerprint records, office noting, orders and acknowledgements are important admitted documents.
2. Offices of the utility services: municipal authorities water supply, electricity supply and. Cancelled cheques and specimen signatures are with the banks. Postal records are available with the post offices, income tax returns are found in the income tax office.
3. Alma maters: school, college, university, training institutions
4. Correspondence with friends, relatives, businessmen, associates, insurances, and finance companies, lawyers and the like. *Vakalatnama* is an important source of authentic signatures.
5. Financial transactions, sale deeds, contracts, mortgage papers, lease deeds, sale slips, stock certificates, are good sources of admitted writings.
6. Signatures and other writings, in court case(s)
7. Diaries
8. Notebooks

6. See Appendix B.

In a case of forged Will, standard signatures of the alleged testator were not available. He had contested a property dispute case, some years ago. The record of the case was summoned and the signatures thereon compared with disputed signatures. (CH)

10.5 COLLECTION

10.5.1 Admitted Writings[7]

Contemporary admitted writings are always collected, whenever possible. While collecting admitted writings, one should keep the following points in mind:

10.5.1.1 Admitted documents are authentic

The authenticity of the admitted signatures/writings is paramount. There are proxy signatures sometimes. If such signatures are submitted for comparison, the results will be wrong. Only the proved genuine admitted signatures/writings are accepted as authentic. They are proved genuine by independent evidence/genuinely admitted by the concerned person. Writing/signatures, on official documents, are mostly genuine.

10.5.1.2 Admitted writings are contemporaneous

The admitted writings/signatures 2 should belong to the same period during which the questioned document was executed. Some writings should belong to the periods immediately before and some immediately after the execution of the questioned document, whenever possible.

The handwriting of adolescents, school/college students is in the formative stage. It Undergoes drastic changes later. It is not a suitable standard for comparison with set handwriting of later life and *vice versa*.

Old age/illness/accidents affect the writing abilities of a person. Writings of such persons are not good standards for evaluating writing/signature written as adult and *vice versa*.

Illness and old age sometimes deteriorate the handwriting drastically and quickly.

Standard writings, in such cases, should be as from as close a period to the alleged period of the questioned writings as possible.

10.5.1.3 Admitted writings are "Like"

The "like" documents provide the best standards for comparison. If questioned writing is in capital letters in an anonymous letter, the admitted writings should be in capital letters. Similarly, bills, cheques or forms signed in the normal course, corresponding to the questioned documents, are collected as standards. If the questioned writings are entries or initials in a register, there must be some genuine similar entries in the same or similar registers. They are the standards of choice for comparison.

In a bank fraud, a banker put his initials in token of having received a bearer cheque for depositing the proceeds in the bank account of the customer. Instead, he cashed the cheque at the payee bank. When the customer found that the proceeds have not been entered in his account, he showed the receipt, with his initial to the banker. He denied his initials on the deposit receipt or the receipt of the cheque. Over 900 standard initials were sifted to find "perfect" match to the disputed initials. The initials were collected from:

1. *Attendance registers.*
2. *Rotation of duty order registers.*
3. *Maintenance account books.*

7. See Appendix B: Sources of Admitted writings. Also see: B R Sharma, *Handwriting Forensics*, Publisher: LexisNexis (2017 Edn).

Over 100 initials were located and demonstrated to correspond to that of the suspect, which indicated that he could be the probable writer of the initials. (CH)

If similar admitted documents are not available, admitted writings, which contain all or most of the words, letters, digits, figures and their combinations are collected.

Some persons sign different types of documents differently. For example, they sign letters to their friends/relatives by writing their first word of the name, write their initials and surnames in official correspondence. They usually put abbreviated initials in token of having seen or taken possession of correspondence and put stylish signatures on bank documents or money documents. The corresponding type of signatures is collected as standards for comparison with the questioned signatures. Otherwise, the comparison is often difficult in some cases.

As only the likes can be compared, admitted writings in the same script, the same letter form (small or capital), the same style (letter-printing or cursive writing and the writing written with the same or similar materials (pen, ink and paper) are collected.

10.5.1.4 Standards text writings

Sometimes the standard signatures for comparison with the questioned signatures are not available. In such cases, the normal text writing is used for comparison. It may or may not provide conclusive results. Nevertheless, the standard text is examined and compared with the questioned signatures.

A person pens his signatures more frequently than any other single word or a combination of words. Consequently, he goes on simplifying or modifying the letters and their combinations in the signatures to save time. When the signatures are compared with the letters and words of the text, they look different, suggesting different authorship. It may not be so. Positive identification of signatures is possible in some cases. An adequate amount of written text is used for comparison.

10.5.2 Request Specimens[8]

The following principles are sacred for the collection of request specimens:

1. An expert may fail to identify a questioned writing because of insufficient standards for comparison. A large number of standards have never been a handicap.
2. Only the 'likes can be compared'. Script or symbols must be same. Further, signature is best compared with signatures (same model!); text writings are best compared with similar text and so on.
3. Whenever possible actual text is dictated. If for secrecy/obscenity the same text is not used, a text is thoughtfully prepared. It contains the maximum number of words and important word combinations of the questioned text.
4. Dictation is given at three different speeds, on separate sheets.
   - **At slow speed**: With slow speed the suspect can have time to embellish his writings, if he so desires.
   - **At a fast speed:** The fast speed is important because the culprit shall not be able to effectively hide his handwriting characteristics.
   - **At normal speed:** Normal speed brings out his usual way of writing.
5. If the questioned items are signatures, about 30 signatures are obtained on each of the three different sheets.

8. For comprehensive integrative approach, please see: B R Sharma, *Handwriting Forensics,* chapter 7, Publisher: LexisNexis (2017 Edn).

6. If the material is a long text, selected paragraphs are dictated to get specimen writings on three sheets of paper written at different speeds.
7. The writing speed is controlled through dictation speed covertly.
8. Each sheet is removed immediately after completion.
9. The suspect is told about the style he is to write in, *viz.* cursive, pen-printing, block-lettering or a mixture of all these.
10. He is not shown the original questioned writing,
11. He is not given the text (even typed copy) to copy.
12. The space for writing is important. The specimen writings are obtained on the similar blank format, whenever possible; for example, a blank cheque for cheque, a lined similar blank paper for writing in a lined paper and so on. If printed blank forms are not available, electrostatic copies of the forms provided.
13. Two more sets of similar specimens are obtained on two different dates with intervals of a few days, each time.
14. The spellings and punctuations are those of the subject. They are given the spellings or corrected. They are also minor identifying features of the culprit.
15. It is effective to frame a paragraph describing an event or telling a story, unrelated to the crime in hand. All the essential letters, digits and their combinations in the paragraph are inducted in the text. The subject often gets engrossed in the description and, therefore, forgets to disguise his habitual handwriting.
16. Readymade paragraphs or forms for all situations are not quite effective.
17. No prior notice for taking specimens is given to the subject, if possible.
18. If the questioned writing is block lettering/hand printing, more specimen writings are obtained.
19. Specimens are obtained in the presence of a magistrate[9]. He certifies each sheet to that effect.
20. On each specimen sheet the case information data (FIR No. with date and the name of the police station), the suspect's name, age, health is written.
21. The factors, which are likely to affect the handwriting, such as intoxication, injury or weakness are mentioned.
22. The subject (writer) signs each sheet with date.
23. The investigating officer also signs each sheet with date.

10.5.3 Typescript Specimens[10]

In the collection of typescripts, all the points mentioned above, with needed modifications, are kept in mind. In addition, the following points are noteworthy:

1. If the typefaces are dirty, five sheets of specimens should be obtained before cleaning and five sheets after cleaning the dirty faces.
2. If the ribbon is worn out, five sheets of specimens each, with the worn-out ribbon and with a new ribbon is obtained.

9. Section 311 A of Cr P C (2005 Amendment of the Act) confers powers on the magistrate to order a person to give specimen signature or handwriting. For full text of the section see enacted law (Cr PC)
10. Typewriters/typescripts are a vanishing creed. However, they may come up in some court cases.

3. If the platen of the typewriter is uneven, it does not give even typescript. Two sets of specimens are prepared. Five sheets of specimens are obtained as such. Five sheets are obtained after padding the platen with a few sheets of paper.
4. Questioned typescript is used as specimen text, from the suspected typewriters.
5. If the typed questioned is old, standard admitted typescript of that period and of dates immediately before and after the date on which the questioned document was typed is collected.
6. If the dating of the typescript is required, properly dated typed documents is obtained for an extended period covering the alleged period of the questioned writing. They are available in the office where the typewriter was used.
7. The pressure with which the letters are typed is practically the same with experienced typists, but it varies tremendously with novices. The clarity of formation of letters and spacing vary to a certain extent if the questioned and specimen texts are typed with appreciable pressure difference. Therefore, specimens, typed with different pressures, are obtained. An idea of pressure is obtained from the indentations the typefaces cause on the paper, observed on the backside of the paper.
8. If typed carbon copies are the questioned documents, some carbon copies should be prepared as specimens.
9. The number, make and model of the typewriter, the name of the typist, are put on each typed specimen sheet.
10. The typist puts his name and signature (with date) on each sheet.

Note: *It is preferable/desirable to send the suspected typewriter(s) to the laboratory instead of sending typed specimens.*

10.5.4 Burnt Documents

Burnt documents are found in cases of wilful destruction of documents, arson and accidental fires. They may be partially burnt, carbonised or ash.

Burnt documents are extremely fragile. If mishandled they change into small bits, they are useless for evaluation purposes. Whenever possible, an expert from a forensic science laboratory is called to collect/strengthen/preserve the burnt documents.

Burnt documents are collected in a cardboard box of convenient size. Cotton wool padding is placed at the bottom and the document is gently brought into the box. Additional cotton padding is gently placed at the top.

Sometimes the burnt document is strengthened before collection by spraying dilute solution of polyvinyl acetate.

In collecting burnt documents, one should:

1. Handle the burnt documents to the minimum extent.
2. Collect charred documents or their ashes from different places in separate boxes.
3. Keep away the burnt documents from strong wind.
4. Not straighten the folds.
5. Keep them away from a fan in motion.

Fig. 10.17
Apparently completely burnt record of a firm salvaged to get some useful data

10.5.5 Fragile Documents

Old documents or those exposed to sun, heat, smoke, fumes or action of chemicals become fragile. They need careful handling. In short, they are handled only after strengthening and lamination. Polyvinyl acetate solution spray is used to strengthen them.

The fragile document should not be folded.

10.5.6 Damaged or Torn Documents

A suspect may tear the incriminating documents in small bits, throw them in water closets or chew and eat them if he fears raid and search. If these damaged documents are recovered before complete destruction, it is possible to reconstruct or restore them and find out the contents. The IO takes care to:

1. Dry it at room temperature before packing if the collected document is wet.
2. Collect the pieces of documents from different places in separate containers.

10.5.7 Preservation of Documents

The trials relating to document cases, sometimes take years to complete. The documents, therefore, need careful handling and preservation. One should:

1. **Lamination;** all the important documents are laminated such that only the edges of the plastic sheet are fused.
2. **Photocopies**[11]**;** only photocopies of the documents, in place of the original, are used in day-to-day working.
3. **Minimum Handling;** the documents are handled to the minimum extent. They are not carried in a pocket to avoid damage.

11. An attested (certified) photocopy of a document is a legal substitute for the original for most purposes.

4. **Exposure;** the documents are not exposed to strong light, heat or moisture. Sometimes document have to be preserved in humid climate for a long-time. They are placed in a closed container with some desiccants and anti-mould agent.
5. **Identification Marks;** no identification marks are to be put on a questioned document until it has been processed for evidence. A photocopy is used for identity/ processing after its certification to be being a true copy of the original. However, if an identification mark is to be placed, it must be placed at an inconspicuous place so that the questioned writing or other evidence is not disturbed. When secret writing or erasure is suspected even this is not be done.
6. **Alterations;** the questioned document is not to be cut, trimmed, torn, pinned, punched, tagged or joined by adhesive tape. Even stapling is avoided. When two or more documents are to be kept together, use painted paper clips. Or, put the documents together in an envelope.
7. **Torn Documents;** pieces of torn documents are placed in between two polythene sheets. The writing on both sides can be studied without handling them. An adhesive tape keeps the plastic sheets together.
8. **No New Folds;** unnecessary folding/unfolding is not done, nor new folds are introduced.
9. **Chemical Treatment;** Only an experienced Forensic expert can give chemical treatment to a document on orders of the judge. Chemical treatment brings in irreversible changes. They are undesirable/unacceptable/objectionable.

10.5.8 Legal Possession

Questioned document, like other evidentiary clues, are seized observing all legal formalities: properly recorded in the case diary and recovery witnessed by independent witnesses whenever possible.

10.5.9 Reference Marks

The documents are marked for reference purposes. It is better to have a uniform marking system. The most convenient system to mark the documents is:

1. questioned documents as Q_1 Q_2 Q_3.....Q_n,
2. the specimen document as section $_1$, section $_2$, section $_3$ … S_n and,
3. the admitted documents as A_1 A_2 A_3 … A_n.

The questioned, specimen and admitted documents are kept, at least, in three separate envelopes unless they are all in one register or file. The IO may mark the specimens/ admitted documents. It is desirable that the questioned documents are marked after the expert has examined the document for extraneous evidence including latent fingerprints/ secret writings,

Only the relevant papers, not the whole files, are sent to the examiner. The irrelevant papers (from the point of view of examination) may get lost.

10.5.10 Unusual Circumstances

If there are allegedly unusual circumstances (writing under intoxication, writing while ill, writings of old persons, writing in moving vehicle,) in the execution of the questioned, specimen or admitted documents, the unusual circumstances are mentioned in the forwarding letter.

10.5.11 Transport

The documents are sent to the examiner through a special messenger. In important cases, the investigating officer himself takes the documents to the examiner. If documents are sent through post, railway or motor transport, they should be insured against loss and theft.

10.5.12 Movement of documents

The transfer of possession from one person to another is properly documented in a chain of custody log, attached to the case file. The receiver of the document signs the receipt with date. If they are lost, stolen or mutilated, the responsibility for the negligence/trickery could be fixed.

10.6 EVALUATION

Identification of handwriting of a person is highly specialised. It needs a lot of experience, study, and patience. Never submit the documents to unqualified, self-styled or known dishonest experts.

The identifications are based upon certain principles and detailed evaluation of both class and individual handwriting characteristics.

Handwriting identification and evaluations of other document problems are a time consuming and tricky task. Never push the expert to hurry up as it can lead to erroneous results and hence miscarriages of justice. Likewise, the expert should never hurry to avoid later worry. He should not propel any opinion until he has given three sittings after intervals of days and discussed the process/observations/findings with some other expert (colleague/subordinates/superiors) also.

10.6.1 Preliminary Examination[12]

The preliminary examination of a disputed document case is done to find out if the document case is fit for detailed examination or not. The expert appraises whether the disputed document is:

1. Normal.
2. Free from alterations.
3. Free from trimming.
4. Free from obliteration.
5. Free from the infirmities of:
    - Old age
    - Intoxication
    - Disease

The preliminary examination of the standards helps to find out if the standards are:

1. Authentic, proved to be from the alleged source or accepted by the purported person?
2. Adequate (sufficient)
3. Contemporaneous
4. Disguised or otherwise

12. B R Sharma, *Handwriting Forensics*, chapter 10, Publisher: LexisNexis (2017 Edn).

The preliminary examination, thus, determines the adequacy, authenticity and integrity of all the documents being examined. It is followed by detailed examination and evaluation.

10.6.2 Basic Equipment

The examination of the document, in its totality, needs a long array of equipment. However, for most of the situations (especially for handwriting evaluations) the following pieces of equipment are adequate:

1. A good quality magnifying lens with inbuilt illumination arrangement.
2. A **D**igital **S**ingle **L**ens **R**eflex (DSLR) camera with changeable lenses are meeting most of the challenging situation adequately.
3. A good source of light, with variable intensity and manoeuvrability to throw the light at various angles, is an indispensable necessity.
4. An ultraviolet lamp.
5. A poly lite if possible.
6. An X-ray film examination light box for examination of documents in transmitted light.
7. A stereomicroscope.
8. A transparent graph plate.

10.6.3 Principles[13]

Principles are generic law that has many applications in a field and serves as a foundation for a system. They are based on observation and rational truths. They make it easy to understand the concerned phenomena. Handwriting forensics has many principles including the following:

10.6.3.1 Individuality

The handwriting of a person has a personality of its own which is different from that of any other individual, even from his or her father, mother, sister or brother; son or daughter; teacher or friend. The important principle is:

The handwriting of every individual is unique.

No two persons can write exactly alike.

Writing is a conscious act but repetition, with the passage of time, makes it a subconscious act. The output, to start with, is the sum total of schooling, training, writing experience, environments and occupation in addition to mental, physical and emotional make-up of the person. Later, it is influenced by changes in life. No two persons can have the same mental or physical makeup or same life experiences. Therefore, their writings will always vary.

13. See Appendix A: Brewster on Principles of Handwriting Forensics. Also *see*: B R Sharma, *Handwriting Forensics,* chapter 4, Publisher: LexisNexis (2017 Edn).

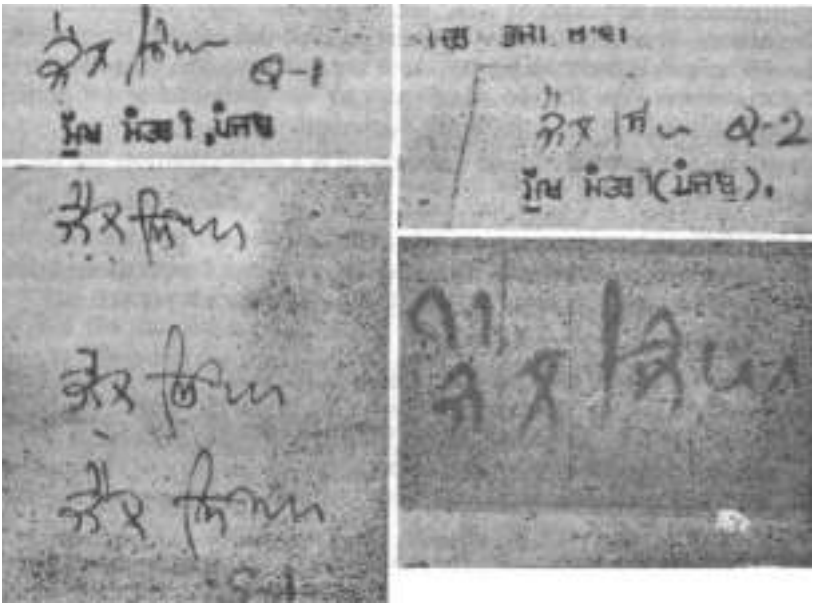

Fig. 10.18
Forged signatures of a Chief Minister, later President, were identified in respect of the forger by synthesizing the 'signatures' of the Chief Minister from the general writing of the culprit. He disguised his handwriting characteristics in request specimens.
S-1 are genuine signature of the Chief Minister

10.6.3.2 Natural Variations[14]

Natural variations in handwriting are subjective. They vary in nature and number with different individuals but the range of variation for an individual is more or less constant, within a range. Natural variations are because our brain does not work like a computer. It gets distracted easily both by the external and internal distractions. Likewise, our fingers, hands and arms are not printing machines to recreate the same writing time and again. Further, the handwriting of a person shows some variations due to:

1. Fatigue
2. Illness
3. Age
4. Writing materials
5. Writing position
6. Physical disturbance (such as movement in a train)
7. Writing with the dormant hand (other than the one normally used)
8. Emotional disturbance
9. Lack of concentration during the writing process
10. Influence of drinks, drugs or both.

14. For a detailed explanation *see*: B R Sharma, *Handwriting Forensics,* Appendix to chapter 4, Publisher: LexisNexis (2017 Edn).

These variations affect the pictorial effect, line quality, size and slant. They do not change the fundamental characteristics. However, with limited writing it may not be possible to identify the writer due to these changes, in some cases.

In guided handwritings, where the hand of the writer is held by someone else, there is little which is identifiable. Guided signatures are the result of the working of two minds. The result cannot be attributed entirely to any of the two writers. The author believes that no expert opinion is possible in such cases.

10.6.3.3 Fundamental Divergences

The identification of common source of two handwritings can be established only if in addition to similarities observed, there are no fundamental divergences.

General similarities are found in persons having been to the same school or their being members of the same family. For example, parents and siblings, brothers, sisters, sons or daughters, may show general similarities. When the writings are examined closely, basic differences are found which permit individualisation of the handwritings.

10.6.3.4 Handwriting Features

The handwriting of an individual is identified by a careful study of handwriting features. They are:

1. General qualities
2. Writing habits
3. Individual characteristics

10.6.4 General Qualities

The following general qualities are noted and compared:

10.6.4.1 Pictorial Effect

The pictorial effect of writing shows the skill of the writer. The handwriting may be clumsy, artistic, forceful, hesitating, laboured, or nervous. A clumsy handwriting indicates little writing experience. The illiterate or the semi-literate writes clumsily. Artistic handwriting indicates artistic bent of mind. Forceful writing is found in persons who write with abandon. Old feeble ill, or illiterate/semi-literate persons show labour (effort, deliberation) in their writing. Most of the forgers show hesitations it is often seen in simulated or traced forgeries. The writings of nervous persons are inconsistent and irregular.

The pictorial effect is the general appearance of the writing. A forger, if he is to succeed, must imitate and create a similar pictorial effect. One, therefore, must not go by super similarities in pictorial effect. "Appearances are deceptive" is literally true in some forged signatures.

10.6.4.2 Rhythm

Educated persons with ample writing experience show rhythm in the handwritings of only. Rhythm is indicated by the flow of the writing, correct line quality and proportionate formation of letters and figures. It is the product of a lot of writing and reading experience and cannot be imitated easily.

10.6.4.3 Style

Style primarily depends upon the initial training, but it is modified according to individual whims/idiosyncrasies and adoption of certain forms that appeal to the particular writer. The writing style may have round, angular or a mixture of the two formations. It may be artistic or simple.

10.6.4.4 Movement

The writing process involves movements of the fingers, hand and arm. The writer may have used the movements of fingers, hand, wrist, forearm, the whole arm or a combination of some of these.

The writing by movement of fingers alone is slow. The size of letters is small. Rhythm is usually absent. School children or illiterate persons generally write with finger movement mostly.

In writing with a hand movement, the wrist acts as a fulcrum. The result is a slow and laboured writing. The pictorial effect is usually poor.

The use of forearm and hand movements for writing is common with most of the writers who write with speed. The writing is smooth and symmetrical.

The whole arm movement writing is produced when the arm does not rest on a support. The writing is usually large and sometimes may be clumsy. The writing on a wall or on a blackboard involves whole arm movement.

Most of the experienced writers combine finger, hand and forearm movements.

Fig. 10.19

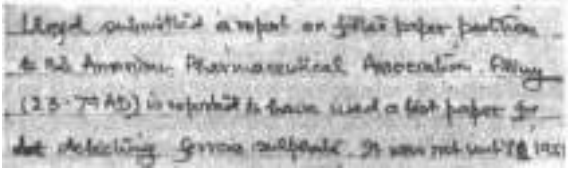

Fig. 10.20

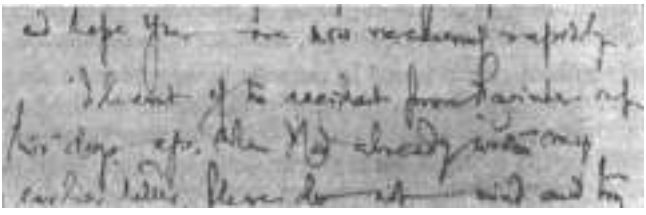

Fig. 10.21

Fig. 10.22
Writers acquire different writing movement habits. Finger Movement (Fig. 10.19) Gives disjointed small-sized writing, hand movement (Fig. 10.20) slightly larger. Forearm movement (Fig. 10.21) gives long and broad writing, whereas whole arm movement (Fig. 10.22) is adopted only when one is writing on the wall or board. Most people combine finger and hand movement with some arm movement

10.6.4.5 Pen Position

The pen is held at an angle to the writing surface, varying from 15° to 90°. Usually it is held at about 60°. The angle of the pen with reference to the base line also varies and is useful in the identification of handwriting. Again, the nib of a pen is held at an angle. Consequently, the nib wears in a characteristic fashion. If the pressure is on the left-hand side, the left part wears more than the right part and *vice versa.* A few individuals may put equal pressure on both the parts of a split nib pen (the pen is now a vanishing creed).

10.6.4.6 Line Quality

The lines written by an experienced writer are smooth and uniform. The starting, finishing and embellishment strokes are natural and smooth. Connecting strokes are uniform and continuous except where the writer habitually lifts the pen to complete or modify the letters.

The line quality, in simulated and traced forgeries, is often poor. There are frequent pen pauses, pen-lifts, kinks and hesitation marks. The lines look laboured and drawn especially at starting and finishing points, connecting and embellishment strokes and on curvatures of certain letters.

The line quality is also poor if the writer is:

1. Weak and feeble
2. Illiterate or semi-literate
3. Unfamiliar with the script
4. Writing with dormant hand
5. Writing in a moving vehicle or in an unnatural position
6. Using a defective pen, paper, ink or writing paper support

Fig. 10.23

Fig. 10.24
In handwriting evaluation the line quality is important. If the questioned writing exists on a stamp (Fig. 10.23), the background shade of the stamp is eliminated by filter photography

10.6.4.7 Skill

The skill acquired by a person depends upon his initial training, writing experience and his physical, emotional and intellectual health/personality. In addition, artistic bent of mind in some persons play the dominant role. It is the sum total of the total writing experience. Once a person acquired graphic maturity, the acquired skill remains with him for a long time. It is inimitable. Because of this, a person with inferior skill cannot simulate the writing of a person with superior skill.

10.6.4.8 Tremors

Tremors are natural in the handwriting of some persons who are old, sick, drunk, or illiterate. These tremors have a pattern of their own. In simulated tremors, the forger is likely to place them at wrong places and the number, shape and size of the tremors are different. The fraudulent nature of the writing can, therefore, be established.

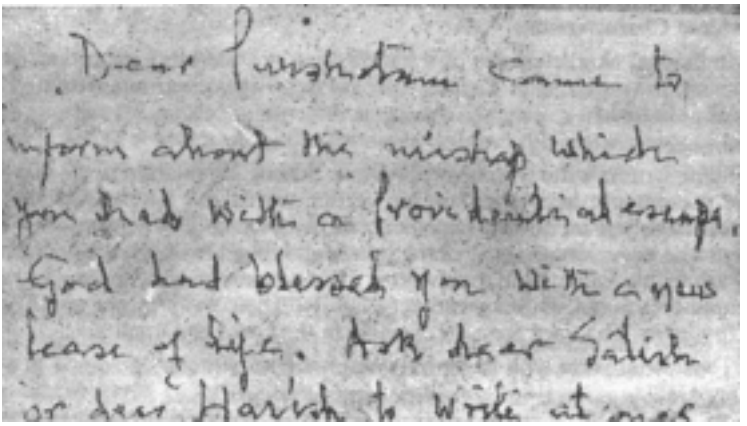

Fig. 10.25
Natural tremors are due to old age, certain diseases, influence of drugs and liquor. Natural tremors cannot be imitated

10.6.5 Writing Habits

Writing habits are formed in the long process of learning and using a language. The following points are noteworthy:

10.6.5.1 Headings

Some writers give headings to their writings not only at the top but to the paragraphs also. The way of introducing and concluding a subject also have personal characteristics.

10.6.5.2 Pet Words and Phrases

Certain words, phrases and sentences are favourite with writers. Their presence, frequency, use or misuse is useful identification clues. They are of some importance in the psycholinguistic analysis.

10.6.5.3 Paragraphing

The habit of paragraphing one's ideas depends upon education and use of the language of the writer. The correct or incorrect use of paragraphs, their frequency and their average sizes are important.

10.6.5.4 Spacing

Spacing of the words in a line, of lines in a paragraph and of paragraphs in a text is valuable points to be studied. Spaces left as margins on the left and the right-hand sides are characteristic of an individual.

10.6.5.5 Alignment

Alignments of writing lines with respect to an imaginary baseline and with other lines, of signatures with the base line and of various lines in an address are distinctive features of a writer. Alignment of letters in signatures, *inter se*, is highly characteristic habit.

10.6.5.6 Punctuation

The shape of punctuation marks, their position and frequency, the choice of a particular punctuation sign, under-scoring and bracketing are important characteristics of the writing habits of a writer.

10.6.5.7 Figures and Abbreviations

The arrangement of figures, use and frequency of abbreviations and the choice of certain letter formations are all products of habits of an individual.

10.6.6 Individual Characteristics

Individual characteristics of handwriting are the most important factors to determine the authorship. They usually survive disguise and simulation in most of the forgeries. They are carefully studied.

10.6.6.1 Pen Pressure

Some writers write with heavy pressure causing indentation in the writing line. Some persons put heavy pressure on certain words and letters only where they sub-consciously want to lay emphasis. Normally a moderate pressure is used to achieve the necessary shading of the letters and to get proper pictorial effect. The lines are slightly indented in such writings. The pressure may be uniform, graduated or impulsive. Some Writers write very lightly. Their writings are usually smooth and rhythmic. The lines are also of uniform thickness and quality.

Those who write with heavy pressure are slow writers.

Illiterate persons ordinarily write with heavy pressure.

10.6.6.2 Shading

Shading in writing may be continuous, graduated or impulsive. Shading varies with different individuals in its occurrence, form, frequency and intensity. Even if a hard nib is used, it is possible to study the shading pattern microscopically.

Shading pattern of an individual is characteristic. It is not easy to imitate it. The forger imitates shading through retouching. A simple microscope reveals the retouching. The natural shading pattern of the forger also appears at different places and proclaims the forgery. Modern writing instrument have decreased the utility of shading as they create limited shade patterns.

10.6.6.3 Pen Pause

Experienced and well-trained writers do not ordinarily pause in writing the letters of a word. Pen pause is natural in the writing of illiterate persons who find it difficult to execute the writing. The pen pause from the forger's pen is different from the pause of an illiterate person though the reasons for the pause are the same.

The pen pauses in a forgery are in the starting stroke, ending stroke, embellishments, at difficult formation and in connectives. The pen pause in genuine writing will be either throughout the writing or only at difficult formation but not in the starting strokes.

The pen pauses deposit extra ink. Sometimes the pen slips leaving some blank or light shade ink gap. Pen slips are identified by this gap. The pen may slip forward or backwards. Pen pauses are easily detected with a magnifier or a stereomicroscope.

10.6.6.4 Pen-lifts

Certain writers lift their pen for certain letter formations in genuine writings. For example, they lift pen to put a dot, to cross a "t", to correct shading by retouching, to complete an incomplete letter or to modify a certain letter in a particular way. In forged writing the forger lifts pen mostly to correct formations, connectives, the pen-lift patterns of the two, genuine and the fake writers, vary consistently. The consistent variations indicate forgery.

If the writer is in the habit of making pen-lifts, the number and positions of the lifts are carefully noted. The number and positions vary in the forged signatures. The positions of pen-lifts in forged writings are sometimes at very unlikely places such as in the starting or the ending strokes or in the embellishments, or at the top or base of a long letter where normally nobody lifts a pen. The pen-lifts in genuine writings are quite conspicuous, while in forgery they are often covered by retouching to give the impression that the writing is continuous.

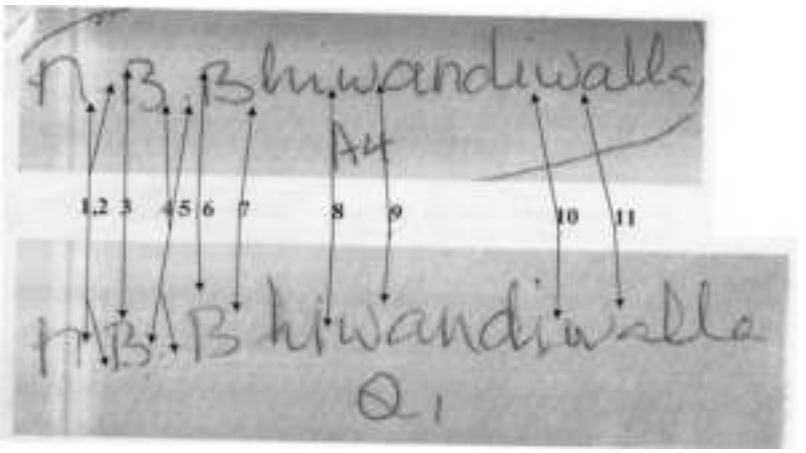

Fig. 10.26
Correspondence in pen-lifts, both in number and positions

10.6.6.5 Starting and Ending Strokes

Experienced writers start writing with a flourish of the pen in the air. When the pen touches the paper, the flourish continues and gives a fine starting line. The fine and tapering stroke is absent in forgeries. Instead, the initial stroke is as thick as the rest of the writing because it is drawn rather than written. Sometimes the starting point is even thicker.

Likewise, the ending stroke of a fluent writer tapers to a fine tip. In most of the forgeries the end points are blunt. The blunt ends are particularly conspicuous in the strokes that end horizontally or downwards.

10.6.6.6 Hesitations

The starting and ending strokes in a forgery show hesitations through tremors or lack of firmness. When a forger starts a forgery, he is not certain whether he will be able to do the job

efficiently or not. Hence, the hesitation is observed in the starting strokes. When he reaches the ending stroke, he is worried whether he has been able to forge the signature well or not. In contrast, in genuine signatures, these strokes are done rather more freely than the rest of the writing. Therefore, hesitation in these strokes indicates forgery.

Hesitations found in vertical lines, in curvatures, loops, ovals and bulbs also indicate forgery.

10.6.6.7 Retouching

Genuine retouching in writing is done to complete, clarify or to produce a pictorial effect in some letters. There is no effort to hide it. Fraudulent retouching in writings, on the other hand, is intended to imitate the shading pattern of the genuine writer or to hide pen-lifts or pen pauses. The two types of retouching are, therefore, easily distinguished. Fraudulent retouching is good evidence of forgery.

10.6.6.8 Embellishments

Certain writers improve the pictorial effect of their writings, particularly signatures, by embellishments (also known as rubrics) through extra non-functional strokes. They are flourishes of the pen. These embellishments are peculiar to a writer.

The embellishment strokes are observed in the starting or in the ending of letters or with the underscoring line after the signatures.

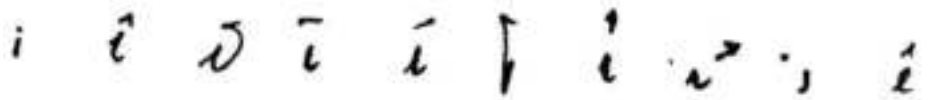
10.6.6.9 Abbreviations

Experienced writers consciously or unconsciously start simplifying letters and words which they frequently write. Sometimes the simplification is so peculiar that it is a highly characteristic feature of the handwriting.

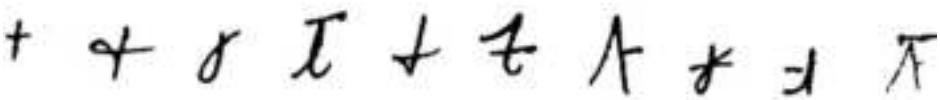
Simplification of signatures is a continuous process. It is possible sometimes to estimate roughly from the simplified pattern the period of the signatures, provided admitted signatures are available in sufficient numbers for an extended period, covering the questioned period.

10.6.6.10 Placing

The positioning of dots, crossing strokes and placing of punctuation marks are highly characteristic of an individual. The placing habit is observed in a sufficiently large amount of writing. In one or two freak instances, the placing patterns differ even in genuine writings.



Variations in (i) dottings



Variations in (t) crossings

Fig. 10.27
Dot and cross bar patterns

10.6.6.11 Slope

Most of the forgers try to change the slant of their genuine writing when they try to disguise their handwriting or imitate the handwriting of their victims. He may succeed in the effort, if the questioned writing consists of a few words only. But in extended writing the forger reverts to the habitual slant. He is seldom able to change the degree of slant substantially. Besides he fails to create consistent slants in different letters. Consequently, the varying slants in the writing offers an inconsistent pictorial effect. There is a mixture of various slopes in different letters or in the same letter at different places.

Slants of the staffs of the tall letters ("f", "g", "h", "j", "k", "p", "q", "t", "y") are studied/measured.

10.6.6.12 Size

The relative sizes of letters and words become almost fixed with the passage of time with a writer. The length, breadth and size of the curves of various letters and words are personal characteristic features. Even if a disguise is tried, the ratios of the length and breadth of letters and words remain constant. The comparison of the ratios is useful to detect forgery.

10.6.6.13 Connective Strokes

Like pen-lift, joining of letters *inter se* is high characteristic habit. Length, shape, and positions of joining sites characterise the writer.

The signatures in free hand forgeries are ordinarily larger than the genuine signatures.

10.6.7 Language

Document experts use certain terms to describe formations of letters and parts thereof. It is useful to know these terms. There is nothing technical or difficult about them. They are convenient to clarify handwriting evidence.

1. **Angular hand**. When the formations of letters are angular, having arms of an angle or a semblance thereof (as against round curves in round hand), the handwriting is said to be angular.
2. **Arc.** A curved line in a letter (*e.g.,* round bottom of "l") is an arc.
3. **Beard**. Beard is the starting embellishment stroke.
4. **Body**. The main portion of a letter, word or a text is its body. In a letter it is the letter without the initial and ending strokes.
5. **Buckle**. A small loop or oval made in a letter *(e.g.,* middle loop of "k") is called buckle.
6. **Bulbs**. A small circular enclosure like one at the end of letter "b" is called bulb.
7. **Connective Stroke**. The line joining two letters is called the connective stroke.
8. **Feathering**. Spreading of the ink on the paper is called feathering.
9. **Foot**. The portion of a letter resting on the base line is called foot of the letter.
10. **Graduated or explosive shading**. When the shading in a letter increases or decreases gradually it is called graduated shading. If it is irregular, it is called "explosive shading'.
11. **Hiatus**. When ink is missing from a portion of a continuous line, it is called hiatus. It is either due to pen lift, ink failure or due to the pen jump.
12. **Hook**. Hook is a hook-like formation at the beginning/ending of a letter.

13. **Loop**. The closed oblong curve in a letter, such as upper parts of "l" or of "h" is called loop.
14. **Oval and "'Eye"**. Closed oval-shaped formation is called an oval. The inside of oval/loop is called 'eye'.
15. **Retracing**. When a stroke is superimposed on a previous stroke by bringing back the pen over the line, the process is called retracing.
16. **Round hand**. When various letters are written without bringing in sharp angles, the handwriting is said to be round.
17. **Shoulder**. The upper portion of a curved letter *(e.g.,* curved portion of letter 'm') is called its shoulder.
18. **Spur**. An ending stroke is called a spur.
19. **Staff.** Staff is a long vertical stroke in a letter.
20. **Wedge**. A wedge like formation in a letter *(e.g.,* crossing stroke of "t") is called wedge.

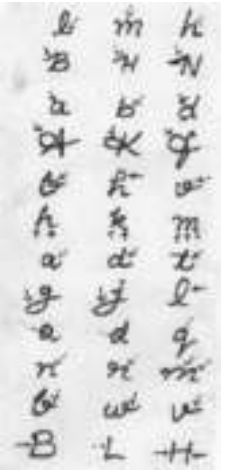


Fig. 10.28
Letter peculiarities: shapes and their nomenclature

10.7 SPECIFIC PROBLEMS

10.7.1 Simulated Forgeries

Simulated forgeries, also known as copy/free-hand/imitation forgeries are those in which the forger tries to imitate the handwriting of another person—the victim. They are practised to forge mainly the signatures of the victim. The success of the forger depends primarily on his education, artistic skill, patience and practice. It also depends partly upon the victim. If the victim is illiterate or semi-literate, his writings are easy to forge. If the design of the writing (even of an educated person) is simple, the writing is more readily forged than when the design of the model signature is complex. If the penmanship of the victim is of higher skill, it is more difficult to forge his writing.

The amount of questioned writing is an important factor in simulated forgeries. It is comparatively easy to forge initials of a person; it is also easy to add one or two small words or digits to a text. Short signatures are easily imitated while long signatures are difficult to forge. It is almost impossible to forge a long text and it is not usually attempted. Hitler's diaries were created but his handwriting was not imitated.

In free hand forgeries, the forger suppresses his own handwriting characteristics, learnt and practiced for decades and adopts the handwriting characteristics of another person who has also writing experience of decades. Both have acquired graphic maturity which becomes part of human nature. It is an extremely difficult task to unlearn his writing experience/mode of decades and learn mode of writing of an accomplished writer in a short period without much experience/practice. He succeeds only to a limited extent. Usually he is able to produce only the caricature of the signature. It is often enough to deceive the layman including the victim. The expert, however, is able to detect the forgery in most of the cases.

A simulated forgery is copying an available model or from the mental picture of the model signature. The forgery from the mental picture is poorer and hence it is easier to detect.

A perfect forgery is impossible. It is a myth

A forgery can never be perfect. The feeling of guilt, the fear of failure and the possibility of punishment is always lurking in the mind of the culprit. It creates mental and physical tension. Therefore, even when the culprit has perfected the art of copying and amount of writing he is copying is small or the writing being copied is of higher skill, some lacunae remain in the forgery. They pop out before the eyes of the expert with/without instruments of an expert. He is able to identify the simulation forgeries in most of the cases. However, generally, it is not possible to identify the forger from the simulated signature, because the signature, writing most of the time is a hotchpotch mixture on distorted handwriting characteristics of the victim and the forger.

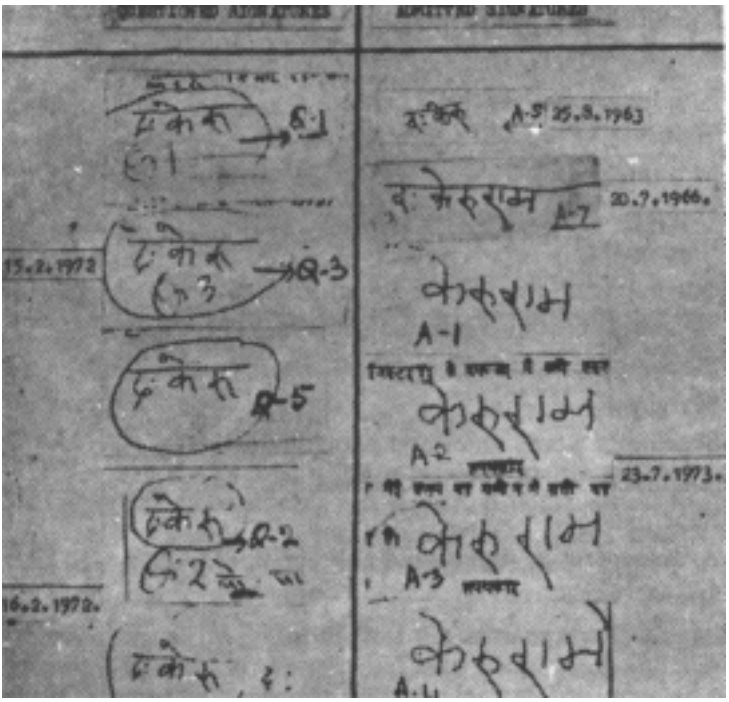

Fig. 10.29

Simulated forgery fails to click. Forgery of signatures involves a double process for success. The forger must discard all his own writing habits of two decades or more and at the same time assume the unfamiliar habits of over two decades of another writer, the victim. The perfection is not possible. Forgery can generally be detected because of differences in habitual skill, formational style, size, proportions, emphasis, etc. Simplifications, speed of writing, firmness of writing strokes, pattern of shading, degree of skill, fundamental muscular movement and co-ordination, rhythm, continuity, pen position and freedom in writing, which affect line quality, alignment, placings, pictorial effect etc. They are very well demonstrated in the above questioned and admitted signatures. The culprit has failed to copy the handwriting of the victim convincingly

10.7.2 Simulated Forgery Indicators

The following features of the document indicate simulated forgery:

1. Same model for all the disputed signatures
2. Drawing-like unnatural appearance: no rhythm, no speed, no abandon
3. Thick/abrupt start/end points.
4. Defective line quality with kinks, bends, pauses, hiatus, defective curves/loops/crests/troughs.
5. Careful retouching
6. Corresponding pictorial effect but not quite alike
7. Inconsistent sizes, shapes slants and curvatures of various letters and formations.
8. Selection of the wrong model for forgery.

The principles and the identification features of a forgery of handwriting have already been discussed above. They are summarised here.

The principles are:

1. Every handwriting has individuality. No two persons can write alike exactly alike.
2. There are always natural variations in the writings of a person.
3. Inconspicuous features have greater identification value and hence greater importance than gross features.
4. Two writings, written by the same person, do not have fundamental divergences.
5. The forger, for disguise, introduces variations in slant but he cannot sustain them in any extended writings.
6. It is not possible to identify the forger in all forgeries.

General qualities of handwriting are:

1. Pictorial effect
2. Rhythm
3. Style
4. Movement
5. Pen position
6. Line quality
7. Skill

The writing habits of a writer are found from:

1. Headings, introductions and conclusions
2. Paragraphs, their frequency and size
3. Margins
4. Spacing in words, lines and paragraphs
5. Alignment in lines, words, letters,
6. Punctuations
7. Arrangement of figures and abbreviations
8. Speed

The individual characteristics are studied from:

1. Pen pressure
2. Shading
3. Pen pauses
4. Pen-lifts
5. Starting and ending strokes
6. Hesitations
7. Retouching
8. Embellishments
9. Abbreviations
10. Placing
11. Slope
12. Size
13. Intra and inter letter size proportions.
14. Emphasis, marginalization, simplification

10.7.3 Genuine Signatures[15]

The hallmarks of genuine signatures are:

1. They are written with speed/abandon. The writer may
   - Miss certain formation.
   - Introduce new forms.
   - Make conspicuous corrections, if any.
   - Write start/end strokes with a flourish.
2. The writings of an experienced writer, in good health have rhythm. It is absent in the writings of semi-illiterate/old/ill/feeble persons. Rhythm may/may not be absent in writing of person under the influence of liquor or drugs.

   In a case a person was so addicted to drinking that he could write properly only when he had consumed liquor; otherwise his hand would quiver. (CH)
3. The lines curves, ovals, bulbs, are smooth.
4. There may be subconscious emphasis on certain formations.
5. The writer is not a stickler to one model.
6. The release of pressure is graduated.
7. There are abundant natural variations but within a range.
8. The slant, alignment and letter proportions are consistent.
9. The marginalisation's and simplifications of certain formations are consistent.
10. The patterns of pen-lifts, crossings, embellishments, are consistent
11. The dimensions of the various writing units correspond *inter se*.

15. For a detailed discussion *see* BR Sharma, *Handwriting Forensics*, 2017 Edn, Publisher: LexisNexis, chapter 14.

10.7.4 Traced Forgeries

From an expert's point of view, a traced forgery is the crudest forgery. However, a good traced forgery can easily mislead a nonprofessional. There are quite a few cases, in which neither the victim nor the IO suspected tracing. The expert revealed the forgery.

The forger needs a model for a traced forgery. Once he has selected the model, he employs any of the following techniques:

10.7.4.1 Carbon Copy Tracing

A carbon paper is placed over the document on which the signatures are to be duplicated, the model signatures are placed over the carbon paper. A dry pen, stylus or any other pointed device is moved along the outline of the signatures with some pressure. A carbon copy of the signatures is obtained on the document. The carbon outline thus obtained is inked to complete the forgery.

Fig. 10.30
Forgery by tracing, using a carbon paper is more frequent than the other tracing techniques. It is the easiest to detect. Carbon outline and carbon particles at places can be easily seen through a magnifier or a microscope

10.7.4.2 Indent Tracing

In this technique, the model signature is placed over the document to be forged. A dry ball pen or similar device is moved over the signatures with pressure. An indented outline of the signature is obtained on the document being forged. It is inked and the forgery is complete.

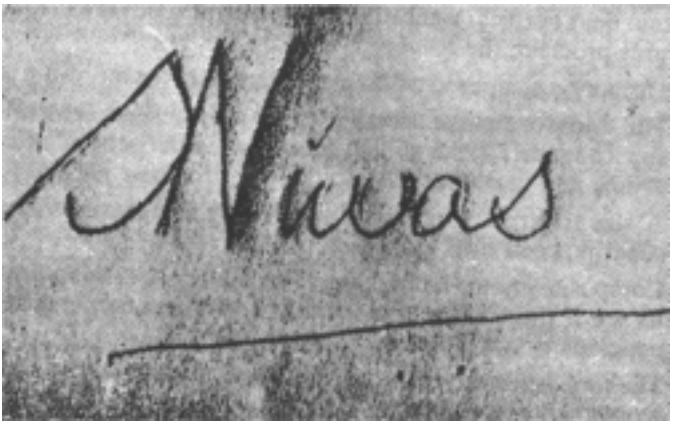

Fig. 10.31
Inking of an indented outline of signatures is another technique for traced forgery. It is also comparatively easily identified. Uncovered indentations at places and canal like depression under the inked portions reveal the indentations

10.7.4.3 Tracing Paper

The model signature is first traced on to a tracing paper. The tracing paper is then placed over the document being forged. A hard-pointed pencil is used to retrace the outline of the signature onto the document being forged. An indented impression obtained is inked and the forgery is complete, as above.

10.7.4.4 Transmitted Image

If the document to be forged is placed over the model signature, on a glass-topped table and strongly illuminated from below, a shadow outline of the signature appears on the document. The outline is inked.

A windowpane can replace a glass-topped table if necessary.

The dimensions of the signatures can be varied by projecting the model signature on to the document being forged through a photographic enlarger. The image formed on the document is inked as in transmitted shadow.

10.7.5 Identification of Traced Forgeries

Traced forgeries are identified easily from the following special features:

10.7.5.1 Model

The culprit may have used a wrong model. It may be an old or a recent model. It does not belong to the alleged period of disputed signatures.

10.7.5.2 Trace Residues

If any of the first three methods were used to trace the signatures, the traces of carbon deposits or indentation outline inside or outside the ink line, detected under a stereomicroscope, indicate traced forgery.

10.7.5.3 Duplication

The traced signatures are replicas of the model signature chosen. If the questioned signatures have identical dimensions with another signature, it is replica of the latter signature. It is, therefore, a forgery as no person can write anything twice exactly alike.

In the evaluations of initials/small-sized signatures of one has to be careful. The writing habits of a person are so fixed that deceptive near perfect duplication may be achieved.

One of the following methods is used for dimensional comparison of a traced forgery with the suspected model:

- The two documents are adjusted in transmitted light until the signatures/writings are one over the other. If they superimpose, it is forgery.
- A size-to-size transparency of the questioned signatures is prepared and placed over the suspected model. If the transparency superimposes, it is a forgery.
- A composite photograph of the forged and model signature is prepared. If the various projections (nooks and corners) correspond, it is forgery.
- The forged signatures and the model are placed one above the other and covered by a glass/transparent plastic graph sheet. Positional correspondence of the various writing units/features indicates forgery.

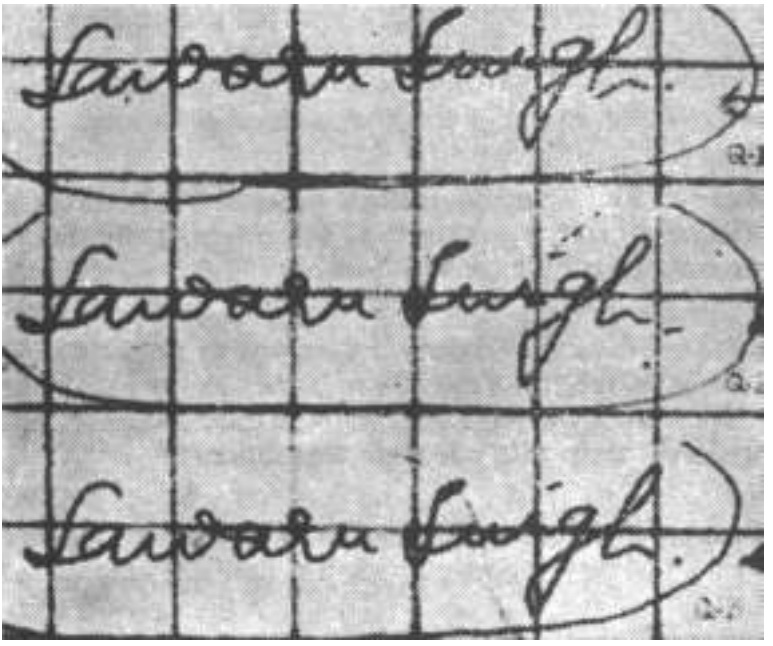

Fig. 10.32
'No person signs twice exactly alike' is well-established principle to establish traced forgery. Graphic comparison of the three questioned signature show 'almost' exact identity of the dimensions, which is possible only in traced forgery

In traced forgeries handwriting characteristics: movement, line quality, crossing and dotting, pen-lifts, shading, retouching and punctuations are not normal and, therefore, they are not used for the identification of the forgery.

The factum that the given signatures are a traced forgery is established in most of the cases. However, it is not possible to identify the forger through handwriting evaluation. The recovery of tracing paper, the model or the carbon paper carrying the model are likely to prove useful to link the culprit with the crime. The beneficiary of the forgery is the prime suspect!

10.7.6 Computer based Forgery

Computer has come up as a top gadget to produce "**perfect**" forgeries. The images of the model signature are picked up through:

10.7.6.1 Scanning

A scanner (of a computer) is an instrument of choice to copy the signatures of a person. A scanner picks up the digital images of the targeted signatures and stores them in a computer. The image is printed on the document being forged in any colour/size. The process gives high quality imitation.

10.7.6.2 Digital Photography

Digital photograph provides a "perfect" duplication of any signature/writings. The picked-up signature are printed on any document, any number of times, in any size/colour through a computer.

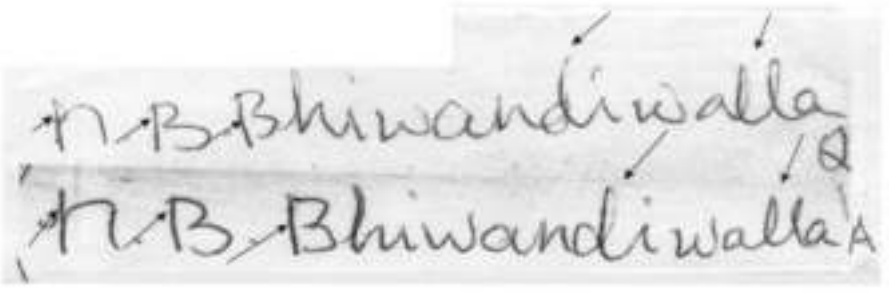

Fig. 10.33(a)

Fig. 10.33(b)

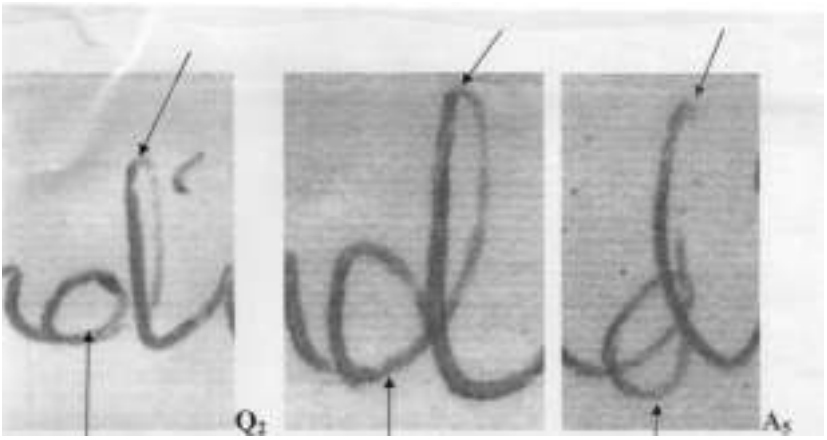

Fig. 10.33(c)

Fig. 10.33(d)
Digital photography in action; top: comparison photograph; (b), (c) and (d) are corresponding segments

10.7.7 Disguised Handwriting[16]

A dishonest person may sign or write a document with the prior intention to deny it later. He writes or signs in disguised hand in such cases.

Disguise is a special kind of forgery where the forger and the 'victim' of forgery are one and the same person. Here the disguiser modifies his usual handwriting characteristics to prevent his identification from the disguised handwriting.

10.7.7.1 Characteristics

A forger makes one or more the following changes to disguise his handwriting:

1. He varies the slant of the writing. Often it is inconsistent.
2. He changes the size of the letters, words, figures and punctuation marks. He is unable to maintain consistency in sizes also.
3. He adopts alternative forms of letters, the other ones than the ones he commonly uses. Frequently he is inconsistent and uses both forms.
4. He simplifies letters and words.

16. For details, see: BR Sharma, *Handwriting Forensics*, chapter 16, Publishers: LexisNexis (2017 Edn).

5. He increases legibility/illegibility of his writing by changing the speed.
6. He uses capitals and small letters indiscriminately. He also changes the shape of the capitals.
7. He adopts pen printing and block lettering.
8. He avoids paragraphing, punctuation and correct spellings.
9. He introduces tremor in his writing.
10. He writes in circles, curves or upside down or *vice versa.*
11. He writes with a dormant hand. The pictorial effect is drastically changed.
12. He introduces/eliminates rubrics (flourishes) and embellishments in the capitals.
13. He changes the pictorial effect of signatures.
14. He uses different embellishments.
15. He uses slow speed in writing. It lacks rhythm.
16. He uses abnormal spacing.
17. He adopts grotesque designs for letters and other formations.

Disguise may be successful when the questioned writing is small in a document. For example, it may be possible to hide one's handwriting characteristics in one or two letters (like initials/ small signatures). However, it is not possible to maintain disguise in a long text. One's personal characteristics, acquire over a decade, pop up there now and then. This is because:

1. It is not possible to writing habit/skill forms, acquired in a lifetime. Decades of writing experience! Engrave them in his brain/mind.
2. The forger does not know the nature of the main identifying features. He makes changes in apparent pictorial effect or in capital letters, but basic inconspicuous individual characteristics remain.
3. The belief of the forger that change from small to block lettering and *vice versa*/ adopting pen-printing/using the second (dormant) hand instead of the usual hand in the execution of the fraudulent document, will hide his personal writing characteristics has no basis. The changes change only the pictorial effect. The form adopted by him bears the imprint of his personality and gives him up if suitable standards for comparison are made available.

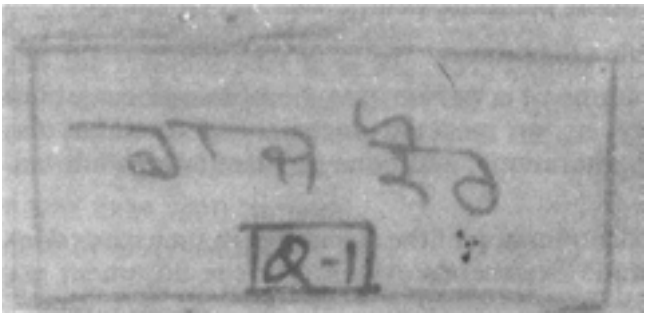

Fig. 10.34

Fig. 10.35
Better skill in signature Q1 vis-a-vis the admitted signatures A1 and A2 proclaims Q1 as forgery, beyond doubt

10.7.7.2 Identification of Disguise/Disguiser

Disguise is easily identified if the disguised text is considerable and normal admitted writing is available in sufficient quantities.

Disguise and Disguiser are identified from the following:

- The changes in letter or other formations indicate disguise.
- The inconsistencies in slant size, forms,, are the hallmark of disguise. He is aware of them. He keeps them out of his consideration for the identification/non-identification of the author of the disguised writing.
- Inductions, eliminations or changes in abbreviations, simplifications embellishments or underscoring strokes indicate disguise.
- The handwriting of the unchanged words permits the identification of the writer.
- There is evidence of conflict between the new style (in disguise writing) and his normal writing style in the same disputed text in patches (left undisguised text inadvertently). The culprit tries to hide his normal characteristics, while habits and set mind pop them up to the forefront. The conflict is evident from the haphazard pictorial effect of writing, the presence of different slants in the same writing (even in the same letter written at different places), and different designs adopted for the same letter in the same or similar words.
- The culprit is conscious of the disguise. The writing, therefore, is slow, drawn, irregular and inconsistent. There are frequent hesitations, pen-lifts, pen pauses and patching. Patches of undisguised text are left in the document.
- The disguise is usually limited to capital letters, slant and pictorial effect. The remaining identification features remain intact. They permit the recognition of the disguise.

10.7.8 Forgery over Genuine Signatures

The genuine signatures of a person may be obtained on a blank paper in good faith or by trickery, or, an innocent document of no value may be changed by trimming, erasures, alterations, additions or substitutions into an important document.

Fig. 10.36

Fig. 10.37

Fig. 10.38

An interesting case. Fig 10.36 is the photograph of a receipt presented by the culprit of having delivered goods. The piece of paper of this receipt was cut from an ordinary letter given to the culprit in routine. The carbon copy of the letter could be located and the relevant part is in Fig. 10.37. Fig. 10.38 is the superimposed photograph of the original Fig. 10.36 and its carbon copy Fig. 10.37. It left no doubt that the receipt was spurious

Handwriting identification of the signatures in such cases does not prove useful to establish the fraud. Extraneous evidence on the document may, however, lead to useful results:

1. The dimensions of the paper may prove to be different than the normal size.
2. The edges are found trimmed.
3. The paper surface carries erasures.

A matriculation certificate had altered name, role number and marks. Only a few digits relating to the original roll number could be figured out. Further check with the official records led to the original owner of the certificate. (CH)

4. The writing is in two different hands. If it is typewritten, it may have been typed on two different machines. Even if the typing has been done on the same, re-insertion can be detected.
5. Two pens may have been used.
6. The writings may be crowded at relevant places.

   In a receipt, the amount and the reasons for payment were subsequently written in the margin. The added text was in continuation of the first line. The margin space was un-used in other lines. (CH)
7. Crossed strokes provide a clue to the sequence of writing.
8. Seals and stamps may be forged.
9. The feathering of ink across a fold on the document indicates fraudulent additions.
10. The date on which the fraudulent document is executed should be checked to ascertain whether the victim was at the alleged station or whether he was capable of executing the document.
11. Signs of tagging, pinning, clipping, stapling, reverse printing on another form (paper) due to long contact and staining may lead to its genuine source.

Fig. 10.39
Modern con-art. Digital camera-computer mode! Exact duplication? Perhaps!

10.7.9 Transplanted Signatures

Money receipts were being signed in colonial days mostly on a revenue stamp pasted on the document. In fact, no payment over a certain amount was considered valid without a revenue stamp. The stamp carries major portion (body) of the signatures while the starting and ending letters or strokes may be on the main document. The forger sometimes lifts the signed revenue stamp and uses it to forge a document. The extraneous evidence rather than handwriting identification helps to establish the forgery.

1. The stamp carries additional adhesive and fibres from the surface from which it has been lifted.
2. The stamp is soiled, especially by additional (and different) gum.
3. The edges are frayed.
4. The beginning and the ending of the signatures are in different pen and ink.
5. The whole signature is sometimes re-inked. Ink used is often different.
6. The Ink, especially at the edges of the stamps, feathers due to fresh application of adhesive.
7. The stamp edges may carry abrupt endings of the writing strokes.
8. The revenue stamp on the fraudulent document may belong to a period different than that of the receipt.

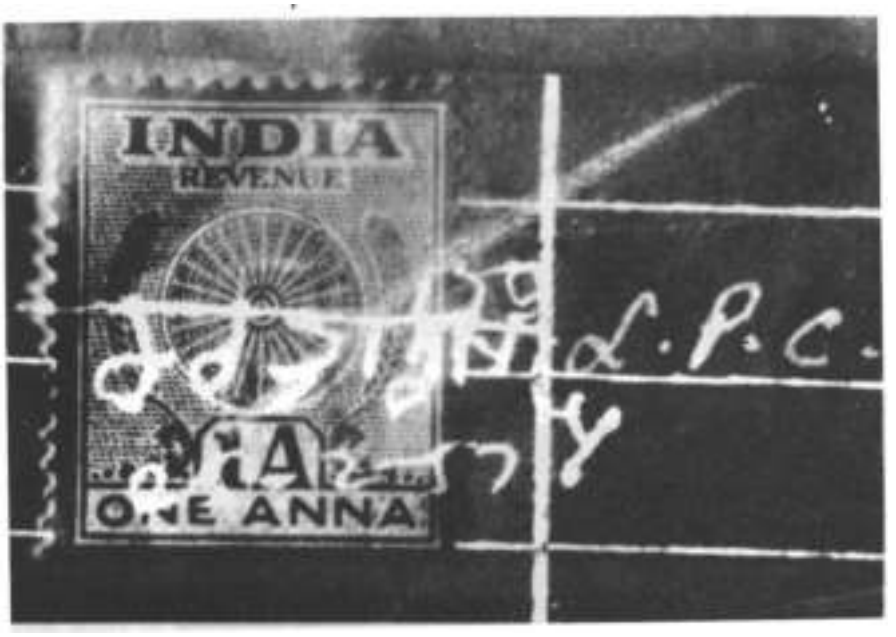

Fig. 10.40
Transplantation of signature on stamp is common but crude type of forgery. Here a used stamp bearing the signature had been lifted from a place and pasted. The leftover letters have been completed. The forgery of this type is easily detected if scrutinized properly

10.7.10 Genuine Writing Denied

A person may find it convenient to deny his genuine signature/writings on a document to avoid responsibility the document assigns. Ordinarily, it is not difficult to identify the genuine signatures if suitable standards for comparison are available.

Genuine signatures or writings have the following peculiarities in addition to those already mentioned:

1. The line quality of the signature/writing will be smooth, forceful and rhythmic. It will not look like a "drawing".
2. Genuine signature/writings will always have natural variations.
3. There is usual illegibility, pen failure, pen-lifts and the like.

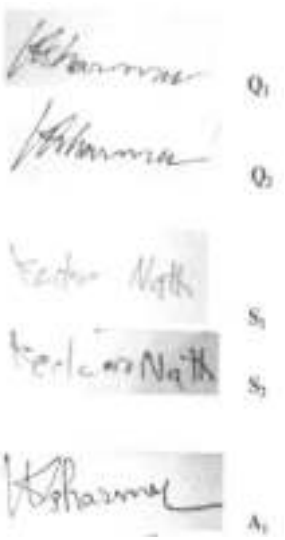

Fig. 10.41
A bank Loanee denied his signatures (Q1, Q2 and others). Distinguished his signatures (S1, S2 and others). Signatures ultimately identified from his signatures (A1) on a bail bond, signed before a prison officer.

10.7.11 Hand-Printing and Block-Lettering

The identification the authors of block letters and letter print writings offers no particular difficulty if sufficient amount of corresponding hand printed and block letter writing is available.

The specimen material should contain the same letters, words and figures written with similar writing instrument on similar writing surface.

10.7.12 Additions and Substitutions

The identification of the authorship of an addition, substitution or alteration in a document involving changes or modifications in a few letters, digits or a few words only is often not possible, though the fact that the document has been altered can be established in most of the case. The changes are identified from inks, spacing, differences in pens and erasures.

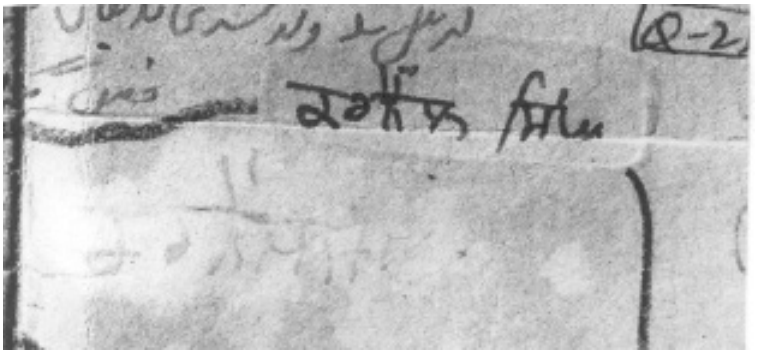

Fig. 10.42
Substituted signatures

If the changes contain extensive undisturbed (feathering, prior writing,) writing, it may be possible to identify the writer. The authorship of changes is identified from the handwriting characteristics.

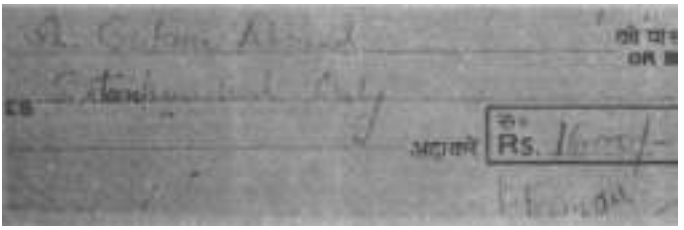

Fig. 10.43

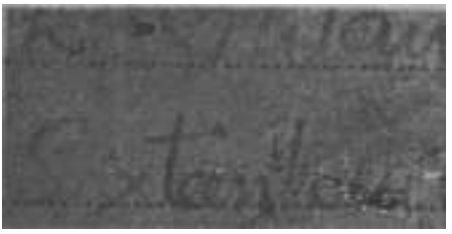

Fig. 10.44

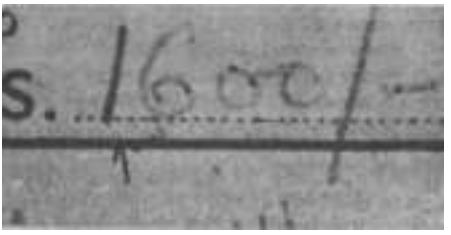

Fig. 10.45
Cheque raising is of frequent occurrence. In the present case 'six' hundred has been changed to 'sixteen' hundred. The original writing (top) does not look so suspicious but filter photography (middle) and ultraviolet rays (bottom) make the forgery so evident!

10.7.13 Anonymous Letters

An anonymous letter maybe for blackmail. If it is so, it must touch the victim at a sore point such as his sexual misbehaviour or dishonest dealings, the exposure of which is likely to cause him great distress. It also gives detailed instructions to the victim for handing over the price-money for non-disclosure. The blackmailer usually assures the victim that there would be no further demands.

An anonymous letter may carry a threat. Political, religious and industrial leaders and men in high positions often receive such letters. The letters focus attention on some of their unjust and undesirable acts.

An anonymous letter may contain hints to the identity of the person. These hints may be intended to implicate some persons who happen to be the enemies of the writer.

A writer may address an anonymous letter to himself, to attract the attention of the family or of the authorities. If it is a threat letter to a businessperson, his/her accounts are checked. The person may be trying to stage a burglary or fire to avoid legal payment or to collect insurance money.

An anonymous letter may be a recommendation letter. The writer is often a member of the family of the recommended person if he himself is not the writer. The inefficiency and negligence of others, in contrast to his good work, is sometimes discussed.

An anonymous letter may be for revenge. It contains disclosures about the character and illegal acts of a person. The allegations may be correct; or, they may be just the work of imagination.

An anonymous letter may be found at the scene of occurrence. It may be written by the culprit or the victim. It gives information about the crime, the culprit or the victim.

> *A few years ago, a letter was discovered in the underwear of a deceased person. It disclosed that he was expecting death at the hands of his wife and her new lover. The letter when discovered was partially washed and the writing had faded. The authorship, however, could be traced to the deceased through his authentic writing. (CH)*

An anonymous letter may contain abuses or indecent language. The writer thus gives vent to his pent-up feelings.

An anonymous letter may be a practical joke. Or, it may be the work of an unbalanced mind of a maniac.

Most of the anonymous letters are ignored.

10.7.13.1 Contents

The anonymous letters should get evaluated from a forensic psychologist. He can provide a lot of information about the writer:

1. The education level of the writer
2. The social status of the person
3. The sex, age and mental poise of the writer
4. The purpose and provocations for writing the letter
5. The nationality and occupation of the writer

In recent times, the building of writer's profile has come up in a big way. Police in USA have regular staff, psycholinguistics experts for profiling such writers. A psycho-logistic expert can provide a fairly useful and accurate portrait of the culprit in some cases.

10.7.13.2 Authorship

The writer of an anonymous letter is identified from the possible suspects through the study of:

1. Handwriting
2. Writing materials
3. Language
4. Fingerprints; the document may carry fingerprints of the writer.
5. Tracing materials; if some persons are suspected to write anonymous letters, they are identified through marked stationery and postal stamps. The source from where the suspect purchases these items are found and the items are secretly marked. When a fresh anonymous letter is received, the secret marks indicate the source of origin.

It is not, ordinarily, possible to disguise the handwriting characteristics in an anonymous letter because of its extended length, even though hand printing or block lettering. However, in cases of anonymous letters to political, religious and social leaders, it is often difficult to locate the possible suspects.

10.8 TYPE MATERIAL[17]

10.8.1 Identification

Identification of typescript with reference to a typewriter is comparatively an easy task. The degree of certainty in identifications is of the same order as in the case of fingerprints, tool-marks, or identification of fired cartridges and bullets in respect of a firearm.

Osborne[18] the great authority on questioned documents had rightly observed:

> *If a specimen of typewriting shows clear impressions and includes numerous characteristics and if suitable standards are available, it is possible to show with the highest degree of certainty that a document was or was not written on a particular typewriter.*
>
> 'Entirely new machines show slight but persistent divergences which can be seen upon close examination.
>
> Hilton[19], another great authority on questioned documents has observed:
>
> *Every typewriter is individual, as tolerances allowed in typewriters give variations, sufficient for individuality. The variations are increased by wear and tear.*

10.8.2 Principles

As in fingerprints, firearms and tool marks, no two typewriters give identical typescript, even when they are manufactured in the same factory, one after the other and are new. The manufacturing process of typewriter requires virtually hundreds of parts and hundreds of operations by hundreds of men scattered all over the world. It is impossible theoretically (also observed practically) to have two typewriters made exactly alike. Every machine has an individuality.

Even if a person (the best of mechanics) tries to make two machines exactly alike, he will not succeed. It has been tried and ended in failure.

The wear and tear, due to extensive use and abuse increases the variations in the typewriters:

1. The typefaces chip.
2. They get filled up and affect the clarity.
3. The bars, carrying fonts bend/twist and change the alignment of the letters and digits.

17. Typewriters are on the way out. However, typescript as questioned material is likely to continue for many years.
18. Albert S. Osborn, *Questioned Documents*, chapter XXXII, Second Edn, Reprint by Universal Publishers.
19. Ordway Hilton, *Scientific Examination of Questioned Documents*, 1982, Amazon.

4. There is gradual wear of the typefaces and other parts. The wear is useful in dating the typescript on a document.

Some variations in typescript of the same typewriter, at the same time and by the same typist do occur due to:

1. Difference in pressure with which the keys are pressed
2. Defective ribbon
3. Defective platen
4. Dirty type faces
5. Difference in typing rhythm due to different moods

Unless the typewriter is mishandled or misused, the typescript typed today is identifiable even after a long interval. The following typescript characteristics help to identify the typewriter:

Sizes of the letters; they vary from 6 to 16 letters per inch, though commonest size are 10 and 12 letters per inch, known as "pica" and the "elite" designs respectively. There are usually six single-spaced lines in an inch. These sizes are also expressed in metric system in some countries.

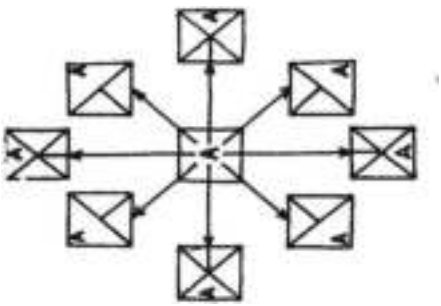
In addition, proportional spacing typewriters, in which different type letters occupy space according to their (letters') sizes are also in use.

The advent of computers, however, has made a typewriter an out-dated and an inefficient device, on its way out, but they are still extensively used in India. It will take some time before they become obsolete.

Design of the letters; the digits and punctuation signs vary with different makes and models. The notable differences are in letterforms, intra-proportions of the letters/digit, sizes, shapes, positions of punctuation marks, dots, bars, serifs, sizes and curvatures of the ovals of the letters and digits,

Imperfections in typescript; they are mainly due to alignment defects. They are individualistic in nature. Font Letters are seldom typed in the centre of the rectangles as intended. They are often off the feet, and twisted sideways, upward or downward. They contribute heavily towards alignment defects. They are also due to the faulty typing by the typist, but they are easily eliminated either by examining the typescript typed by different persons or by examining an extended text. The typing defects are not duplicated.

A letter can assume one of the major nine positions, or, any of the intermediate positions.



ALIGNMENT-DEFECTS

Fig. 10.46

A chart to indicate the alignment defects in typescript. The manufacturer of a typewriter wants the letter to be in the centre of the given space but due to imperfections in the manufacture, in the fitting, and due to use (wear and tear) it is seldom in the centre. It acquires any of the remaining eight positions (or intermediate positions). Other letters, digits and figures behave likewise. Thus the variations in typewriters due to alignment alone are infinite and no two typewriters, even fresh from the factory are exactly alike

Typeface defects; they are breaking, chipping, denting and twisting (introduced either at the manufacturing stage, during transit or due to use). They are very useful to individualise the typewriter.

> *In an important case, the machine was found damaged and no words could be typed. Impressions of the individual letters and digits, however, could be obtained. The questioned typescript was identified from the defects in the typefaces alone. (CH)*

Space variations; they are due to slippage, improper working of the ribbon gadget or irregular margin due to defect in the margin stop of a machine. They help to individualise a machine.

Temporary defects; they are defective ribbon, clogged typefaces and rusty and dirty bars. They introduce certain identifying features. They are useful only rarely, until the machine is not cleaned and serviced.

The advent of **Projectina Comparator** has facilitated the comparison of typescript. The comparator permits side-by-side comparison, superimposition or by placing the questioned and standard typescript one below the other. The computer also allows side-by-side comparison or comparison by superimposition.

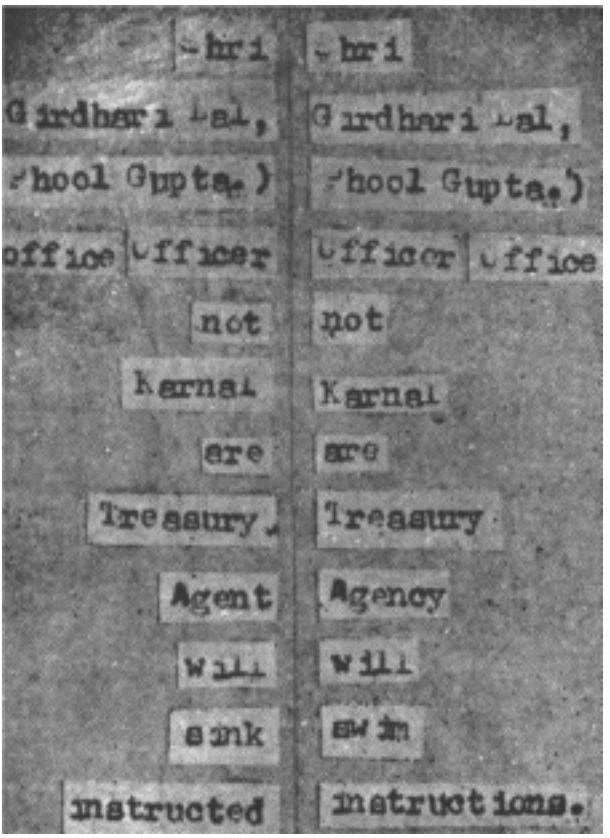


Fig. 10.47
A comparison chart of typescript of questioned and specimen texts, pasted side by side. They reveal a wealth of individual characteristics – wear and tear in letters (fonts) and alignment defects. The individuality of the typewriter is established like that of a fingerprint

10.8.3 Age of Typescript

The age of the typescript is determined from the progressive increase in the defects, consequent upon its continued use. If dated typescripts for an extended period, before and after, including the period in question are available, it is possible to ascertain the age of the document. The dated typescript of a typewriter is found in the office where the typewriter was used. The age of the questioned document is found from the dated documents, which have a similar set of defects, distinct from less or more defects, corresponding to earlier or later periods.

Sometimes a forged document is allegedly on a date on which the alleged typewriter in question was not even in existence. It is easy to detect such frauds. For example, typewriters in Indian languages except for Hindi typewriters were not in existence before 1950. If a document is allegedly typed before 1950 in an Indian language (except Hindi) it will evidently be a forgery, Hindi typewriter came into existence in 1910.

10.8.4 Typist

Identification of a typist is only a possibility with varying degree of probability. No prudent examiner can say that a particular typist typed the typescript. The following observations indicate the typist:

1. Peculiar alignment due to the characteristic shifting of the key
2. Punctuation, arrangement of paragraphs, margins, headings, use of capitals, choice of optional symbols, use of abbreviations, length of lines and method of writing figures, amounts and fractions.
3. Spellings and phraseology
4. The technique of correction, cancellation, interpolations and overwriting

Identification of the typist is based upon examination of extensive typed texts before the typing is linked/attributed to a particular typist.

10.8.5 Alterations

It is comparatively easy to detect alterations in typescript:

1. If the typewriter used for additions is different, the difference in typefaces permits identification.
2. If the same typewriter is used to induct addition, the alignment of fresh lines/text is different; because it is impossible to reinsert the paper, once taken out, in the same position on a typewriter. Misalignment, however minute, is detected and demonstrated by microscopic examination and magnified photographs.
3. If the additions are with changed ribbon (has been changed in between), the difference in the tint due to change in ribbon is noticeable and indicates the additions.
4. Spacing of words and lines also helps.

10.8.6 Suspected Additions: Check Points

Checkpoints for suspected additions to a document are:

1. Two forms of the same letter(s), in the text, indicate additions.
2. Alignments (both vertical and horizontal) of the added text/words differ.
3. Alignments of margins, of the added text, differ from that of the original text.

4. Use of different ribbon, for the questioned text (apparent from ink shades of the texts), indicates additions.
5. Different typing force (pressure), indicated by the extent of indentations, proclaims addition.
6. Varying ink deposits in questioned typescript points to fraudulent additions.
7. Different spacing pattern in the disputed text points to addition.
8. Paper sheets from different stock in multi-leaf document.
9. Writing sequence inconsistency in questioned text vis-à-vis original text indicates additions.

10.8.7 Make and Model

It is possible to know the make and model of a typewriter from its typed text. Some laboratories/institutes/departments keep extensive specimens of the typescripts from typewriters of different makes and models in their data bank. The data is used to fix the identity of the typewriter used (by comparing the data from the disputed text. However, in recent times many manufacturers of typewriters purchase font from the same manufacturer of fonts. The fonts, therefore, may not provide the necessary discrimination for the make and model. Further, the use of computers has made the data bank redundant.

10.8.8 Other Writing Machines

The discussions relating to typescript are equally applicable to similarly written materials by proportional spacing typewriters, electric or electronic typewriter cheque writers, adding machines and the like except that the modern electronic typewriter allows easy changes in the fonts and spaces.

10.9 COMPUTERS PRINTERS[20]

Fig. 10.48
A Multifunctional all-in-one computer printer

Computer-printer duo has emerged as the ideal writing machine for writing all sorts of documents in all fields. They are so convenient, fast, versatile and utilitarian that they are becoming indispensable. A significant advantage of the computer-printer is that the computer retains a copy of the document, which has been prepared on it and printed with it. If the person

20. For detailed discussion see chapter 19 of author's book: *Handwriting Forensics*, Publisher: LexisNexis, 2017 Edn.

who has prepared it denies its authorship or its existence, his denial is refuted by producing (with all the legal formalities) a copy from the computer printer. If the person has deleted the text of the document, the computer retains the image even after erasing. A computer expert can regenerate it.

The depredations of the fraudster misusing the computer-printer duo have brought in the Forensics expert to identify con artwork and to link them *inter se.*

10.9.1 Identification of printers

Computer printers and their identification vis-à-vis printed output have acquired tremendous importance in Document Forensics. The IO, the counsels and the courts have to deal with them increasingly. It is, therefore, necessary to be familiar with the computer-printer duo. The Forensics expert has to deal with them increasingly. He has to keep up with all the technologies concerned with the duo.

Researches for individualisation of the printer have gained momentum, as there is a growing need for the same. The problem is being tackled by studying the noise of the printer, manufacturing defects (accidentals) and the wear and tear of the various parts of the printer. In addition, the printer identifications include the following explorations.

10.9.2 Intrinsic Signature

Intrinsic signatures are the unique features of a printer of a particular make or model, which are transferred to the printed documents. They are printed with laser or jet printers.

The identification of the printers is based on banding signals to discriminate the machine.

10.9.2.1 Inconspicuous Tiny Yellow Dots Patterns

Most of the laser printers print yellow dot patterns. The process is called steganography. The pattern indicates the make and model of the printer and metadata[21] about the printing. The absence of these yellow patterns generally indicates that the document has not been printed with a laser printer.

Induction of yellow dot patterns is a highly desirable step, forensically, to identify a printer positively and irrefutably. The metadata thereon is also useful to fix the history of the document. The induction, therefore, should be enforced through legislation, if necessary. All printers should print the identifying information mentioned above, on all their printouts to help Forensic investigation when required.

10.9.2.2 Hue Histogram

HSV (**H**ue **S**aturation **V**alue) colour space, based on hue histogram, for identification of printing process (ink jet, laser jet or photocopying) is likely to gain grounds in colour printing. The features selected for discrimination are:

- Hue contrast
- Periodicity, and
- Overspray

21. Meta data is data that provides information.

10.9.2.3 Colour Discrimination

A novel new technique is currently being explored. It is to capture the text images at high resolution with a high-power camera, usually of a single character. The image is transferred to computer. Unique colour count, texture feature uniformity and intensity variations features are used for comparison and discrimination with similarly generated data from the suspected printer.

The methodology is applicable to link the printouts from inkjet and laser printers with the originating machine. Identification and linking fake documents to scanners, colour LaserJet printers or colour inkjet printers is possible in most cases.

10.9.2.4 Other Techniques

A lot of research is going on to find ways and means to link the printer and the printed material via the study of the Gray level features for discriminating ink jet print from laser jet print, The methods are based on high resolution scanned images, e.g., 3200 dot per inch.

Research on evaluation of other gray level features like perimeter-based edge roughness of the text for print technique classification system, is going on.

10.10 INKS

Inks are complex mixtures of solvents, dyes, pigments, particulate matter (carbon in India ink) solubilisers, stabilisers, fluorescent materials, resins, lubricants, surfactants, made into a liquid for manual writing and into a paste for printing purposes, to produce images, texts and designs. The nature/quality/quantity of the ink ingredients determine the characteristic of its output (writing) along with other factors; for example, the format.

Computer printers and photocopying machines also use powder inks.

The examination of ink is one of the most difficult and yet important tasks in the examination of documents. The variety of inks is very large. The amount of ink available for examination is extremely small. An ounce (28.35 g) of dry ink gives six miles un-blotted ink line. The examiner has to content him with about one millimetre of the ink line, which may be blotted. The analysis of ink is, therefore, undertaken, only when it is vital.

10.10.1 Nature

The following types of inks are common:

10.10.1.1 India Ink

It is carbon suspension in water. The ink is made stable by the addition of glue. The colour is improved sometimes by the addition of Prussian blue. The ink was commonly used in India in schools with reed pens and by the petition writers in writing important documents. The use of ink has decreased tremendously in the recent past. The ink has become obsolete, for all practical purposes.

The ink is highly stable and is not affected by chemical reagents. It is neutral and does not damage the paper. It does not penetrate into the paper. It can be removed by scraping or by wetting and blotting.

The black colour may have different shades: black, brownish or yellowish black. They permit differentiation and identification of the inks.

10.10.1.2 Iron Gal-Tannate Ink

A mixture of tannic acid and gallic acid extracted from wood when mixed with ferrous (iron) salts, gives a colourless liquid which on drying and ageing gives black colour. The ink as such is not suitable. It is mixed with dyestuff to give proper shade. Some acid and phenol are added to give stability. The common blue-black ink belongs to this class. It is permanent ink. It changes colour in course of time from blue-black to black (due to change of iron from ferrous to ferric state). Its stains on the clothes are not washed off easily. It was being used for writing important documents throughout the world. Its use is also decreasing. It may also vanish from the scene in the coming years.

10.10.1.3 Dyestuff Inks

The most popular inks these days are dyestuff inks manufactured from a number of dyes, particularly from nigrosine dyes. They are available in all colours and shades. They are washable and are not permanent inks. They fade with time. The fading period depends upon the individual dye.

10.10.1.4 Ball Pen Inks

Ball pens have become very popular because of their convenience in use. Ball pen inks are dyestuffs suspended in a suitable vehicle. Vegetable oils were used as vehicle for the dyes formerly. Glycols are replacing vegetable oils as vehicle in the inks.

Ball pen, using ordinary pen ink, has also come up. It uses a sapphire tip (ball) contained in a platinum housing.

A suspension of carbon (graphite) in a fluid gives liquid lead pencils. They are like ball pens.

10.10.1.5 Logwood Inks

Logwood extract with potassium dichromate gives permanent ink. It is not used in our country to any appreciable extent.

10.10.1.6 Alkaline Inks

Alkaline inks are manufactured from dyestuffs and copper or vanadium complexes. They are quick drying and are permanent inks.

10.10.1.7 Special Inks

1. **Printer's ink***:* It contains carbon, adhesive and drying oil.
2. **Cancellation ink:** It is used in post offices. It is similar to printer's ink.
3. **Stamp-pad ink:** It contains dyestuffs, glucose and glycerol or glycol.
4. **Typewriter ink**. It contains dyestuff and oil (castor oil). It may contain carbon for permanency.

10.10.1.8 Carbon Nano-tube Ink

A new carbon ink has come up recently. It is a suspension of carbon nanotubes in a polymer. These inks are used in inkjet printers**.**

10.10.2 Pencils

The following are the various types of pencils or pencil like entities:

1. **Lead pencils*;*** normally contain graphite, clay and glue. The extruded 'lead' is glued in wood.
2. **Copy Pencils*;*** *i*n addition to graphite and clay, copying pencils contain dyestuffs. They are called copying pencils because a copy from a dense copy pencil writing can be prepared. They are also known as indelible pencils because it is not easy to remove copying pencil writing—the dye spreads all over the surface.

   The compositions of lead and copying pencils vary, which permit discriminations.
3. **Coloured pencils*;*** *c*oloured pencils are crayons. They contain dyestuffs dissolved in waxes.
4. **Coloured chalks**; coloured chalks are sticks of calcium sulphate mixed with dyestuff.

10.10.3 Examination

Examination of inks is carried out to find out suspected additions, obliterations, erasures, the age of the writing, or to restore faded writings. The examination involves:

10.10.3.1 Visual Examination

The colour and shade variations are carefully noted with angle-poise table lamp and spotlight. The observations are made with light falling at various angles and in transmitted light. The examination reveals apparent, variations, discrepancies and erasures.

10.10.3.2 Magnifiers

Magnifiers facilitate the examination of inks. The stereomicroscope is especially useful. Some manufacturers provide arrangements for transmitted light and a tilting stage. The two accessories are invaluable in the examination of questioned documents.

10.10.3.3 Filters

Filters of different colours are helpful in the detection of differences in ink shades and evaluation of faded writings or writings obscured by obliteration or by highly coloured surfaces. A modern computer has excellent provisions to study the inks under varying magnifications, contrast, brightness and colour shades provided the original writing is properly transferred to the computer digitally.

10.10.3.4 Invisible Rays

Soft X-rays, ultraviolet rays and infrared rays are useful to study the variations in inks. A Video Spectral Comparator (VSC) is useful to carry out these studies. A poly-light instrument permits evaluation of ink under radiations of varying wavelength including ultraviolet and infrared rays.

Fig. 10.49
Infrared photography reveals the place of posting of an anonymous or pseudonymous letters. In the present case figure (above) is an infrared photograph of the postal stamp 'park street' Both in english and Hindi is revealed clearly

10.10.3.5 Spectrographic Analysis

If metals are suspected in an ink, spectrography, especially with laser microprobe, of a small amount of ink writing, proves useful to give their nature and quantity.

10.10.3.6 Chemical Tests

The inks may be acidic, alkaline or neutral. They may be attacked or may resist the attack of oxidising or reducing agents. The action and time of reaction is noted. The chemicals used for the tests are: chlorine or bromine water and stannous chloride, potassium permanganate and sodium hydroxide solutions. They differentiate the inks. Many other chemical reagents have been used in the past and are being used by some experts, but they are useless in the context of modern development of other refined methods.

10.10.3.7 Chromatographic Analysis

Thin Layer Chromatography (TLC), is the most important and technique useful in distinguishing different types of inks via the dyestuffs added to them. The technique separates the dyestuff constituents into the band. The separated picture is called a chromatogram. It has proved handy, as it is quick, cost and time effective, sensitive and specific for most of the inks. There is no streaking. In short, TLC is the most frequently used technique to differentiate and identify inks.

10.10.3.8 Electrophoresis

The inks are subjected to electrical field. The dyestuff constituents separate out in bands due to differences in their nobilities. The results are similar to those obtained in TLC but the process is cumbersome and time consuming. It is not used frequently.

10.10.3.9 Spectrophotometry

The dyestuffs can also be identified by spectrophotometry and their chemical nature determined after separation through chromatography.

10.10.3.10 Video Spectral Comparator (VSC)

Video Spectral Comparator is an instrument of choice, which helps in the identification, and comparison of inks. The writing understudy is exposed to various wavelength of the spectrum (usually UV visible and infrared rays). The effect of these rays on the inks is displayed on a monitor (TV screen). The system has also proved useful for faded or obliterated writings.

10.10.4 Age of Ink

The determination of the age of ink is not an easy task. The following observations are helpful:

10.10.4.1 Colour Changes

Only the blue-black ink changes its colour from blue-black to black. The change is gradual and is affected by factors like quality of paper, storage conditions, exposure to sunlight, air, humidity, exposure to ageing agents,

10.10.4.2 Smudging[22]

Fresh ink writing is easily smudged, while old ink writings do not smudge.

The smudging is due to wiping/rubbing or dissolution of ink dyestuff in solvent (water). The dyestuff becomes insoluble or fades away with time. Or, it is masked by the iron tannate formed. Therefore, the time taken for the solution of the ink in a solvent and smudging are important indicators of the age of ink.

10.10.4.3 Diffusion Pictures

Inks often contain sulphate or chloride ions from the acids added to them. They diffuse into the paper with the passage of time. If the paper is treated with lead acetate or silver nitrate, sulphate or chloride ions precipitate as lead sulphate and silver chloride to give diffusion pictures. The age of the writing is directly related to the extent of diffusion, indicated by the diffusion pictures. However, diffusion is affected by many undeterminable factors, which make estimation of age a mere guess work because the analyst does not know the upkeep of the document.

10.10.4.4 Ink Age Markers

In view of the importance of determining the age of documents manufacturers of ink in certain countries adds age markers – chemicals – to the ink. The added chemical changes progressively with the passage of time. The extent of change indicates the period and hence the age of the document.

Ink age markers are usually radioactive substances.

Ink age markers have not been used in India, so far.

22. Make or become blurred/smeared.

10.10.4.5 Faded Writings

The restoration of faded writings is possible where the ink used contains iron or other metal. The iron-tannin ink is the commonest ink amenable to restoration. The writing is restored by:

1. **Exposure to ultraviolet rays**; it reveals the writing in many cases, the faded writings is exposed to moist hydrogen sulphide/ammonium sulphide. Writing appears in black colour.
2. **Contrast photography**; it reveals the writing. It may need the use of filters *(e.g.*, yellow filter)
3. **IR Photography**; it reveals writing in ink or pencil containing carbon may;
4. **Electrostatic Detection Apparatus (ESDA);** the image developed may reveal writing in some cases.
5. **Iodine fuming**; it may help in some cases. The image developed is photographed.

Dyestuff inks, ordinarily, do not leave residues. Therefore, they are not amenable to the restoration of the writing.

Computers by using magnification, colour contrast and colour changes,, has proved useful in many cases to figure out the faded writings.

10.11 PAPER

10.11.1 Nature

Paper essentially consists of cellulose obtained from wood, straw or rags. The material is beaten to small shreds, decolourised and their suspension in water is passed over a continuous moving wire gauze screen. Water is sieved through the screen and the shreds get interlocked with one another due to constant shaking of the carrier screen. By the time the paper material reaches the end of the screen, it is drained off most of its water content and acquires sufficient strength for further processing. A watermark is given to the paper at this stage where the impression in relief is pressed on to the paper with a dandy roll bearing the mark creating die.

The paper thus obtained, is like a blotting paper, unfit for writing purposes. Therefore, to make it fit for writing, the paper is sized with a loading material, like kaolin (china clay)/ calcium or barium sulphate, added to the suspension of the shreds. The surface of the paper is still rough. It is, therefore, glazed with a mixture of rosin and alum. Starch, gelatin, latex, wax and plastic resins are also used. Finally, the paper is passed through hot rollers. They dry the paper, smoothen its surface and give gloss to the surface. The process is called calendaring.

Research in the paper industry has brought certain improvements. For example, wet strength of the paper is increased by wax or resin treatment. Paper has been prepared from synthetic fibres like nylon (for enhanced strength) and special surface treatment has given NCR (no carbon-paper required) paper. This paper does not require ribbon or carbon paper to prepare typescript documents. Security paper carries special surface treatment. High denomination bank notes carry a security thread, firmly interlocked in the fibres of the paper and watermarks.

10.11.2 Examination

The examination and comparison of paper involve the appraisal of the following entities:

1. Dimensions: length, breadth and thickness
2. Weight per unit area

3. Colour
4. Fluorescence
5. Loading and sizing materials: checked chemically/spectrographically
6. The nature of the fibre: studied by chemical/microscopic/staining techniques.
7. Water marks: studied and compare using UV rays/transmitted light.
8. Wire-gauze marks.
9. Opacity, stains and erasures
10. Ruled lines on the paper
11. Artificial ageing
12. Ash

The detailed discussion of the methods is beyond the scope of the present work.

10.12 ERASURES

Disputed documents often carry erasures. They are used to remove some unwanted date/word/figure/letter/digit.

10.12.1 Techniques

The erasing techniques used are:

10.12.1.1 Mechanical erasures

The area bearing unwanted writing is scraped/rubbed to remove the writing. The tools used for erasures are usually razor/penknife/sharp blade/eraser or even a fine sand paper.

The process disturbs the surface. The extent of damage to the paper surface depends upon the nature of the ink, writing surface, the technique employed for the removal of the writing and the skill of the con artist.

10.12.1.2 Solvent action

Certain inks are readily soluble in solvents like water, alcohol, acetone, petrol, chlorohydrocarbons and tetrahydrofuran. The sites are swabbed repeatedly with a tested suitable solvent. The solvent dissolves the ink and the swab removes it.

10.12.1.3 Chemical action

Oxidizing and reducing agents like potassium permanganate solution, chlorine or bromine water and sulphurous acid decolourise the writings. They are extensively used.

10.12.1.4 Detergent action

Certain inks especially carbon inks are easily removed by detergents. They detach the inks from the surface and the swab remove it.

10.12.1.5 Trimming

Certain unwanted entries are trimmed off. It is possible only if the unwanted writing is on one side or on a corner of the document. Sometimes trimming has been done even in the middle of the paper.

In an interesting case a person died, leaving his considerable immovable property to his two daughters. His brothers thought that family property should not go to the daughters. They forged a Will from father side, in which he gave all the property to these brothers. The signatures of the testator were available in some other document. They trimmed off the blank part of the document and pieced the signature bearing part to the last page of the typed Will with the help of a tape after cutting off the blank portion of the last leaf. The process was clumsy. The following glaring acts of omission and commission declared the forgery:

1. *The length of the pieced paper was less vis-à-vis the other two leaves of the Will.*
2. *In the process of piecing the ink of the signature got smudged. They re-inked the signature with a different pen and ink. The re-inking process was easily visible.*
3. *The handiwork was highly unsatisfactory. They forged another signature of the simulated testator which again was done so carelessly that it itself proclaimed forgery! No expert evidence was needed to proclaim forgery.*

The forgers, however, have taken care to use the same paper for three-leaf document, except the signature bearing piece. (CH)

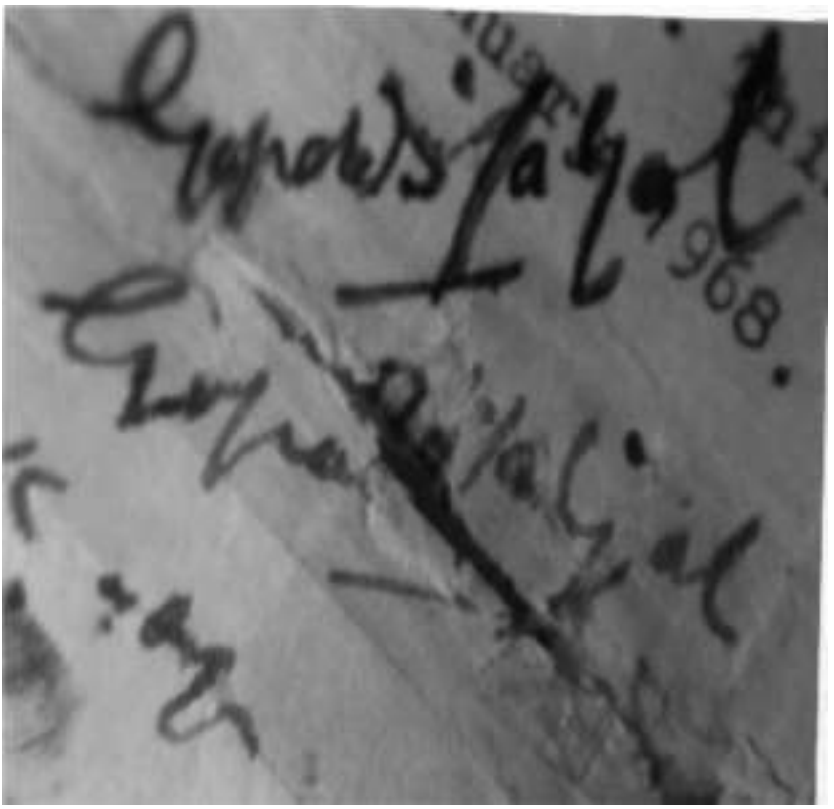

Fig. 10.50

A crudely forged will, in which the testator's signature bearing paper piece was taped to the last trimmed page of the text. In the patching process the signatures were disturbed. Another signature was forged. the second signature had to be inked, as initially ball pen was used which was not prelevant on the alleged date of will. The stereomicroscope revealed the patch work as well as the over-inked signatures

10.12.2 Detection

Both physical and chemical methods are used to detect erasures and to read or restore the original writing. The usual drill is to check:

10.12.2.1 Dimensions

Length, breadth and thickness of the given document are checked on all sides. The document is further checked for repairs.

10.12.2.2 Lighting

The expert examines the document for erasures with ordinary light at various angles. Grazing light and transmitted light are particularly useful. They reveal mechanical erasures in most of the cases.

Angle-poise lamp and spotlight lamp are useful for the examination.

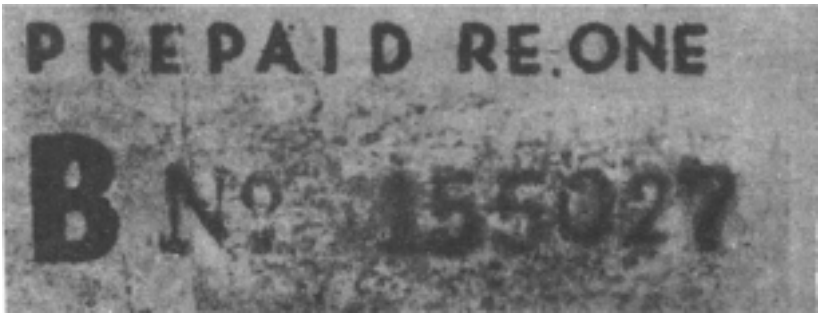

Fig. 10.51
Tampering of the lottery ticket is revealed by the disturbed fibres

A VSC or a poly lite system of light provides not only visible light but also ultraviolet and infrared radiation also. They are being used increasingly for the evaluation of documents. UV rays reveal chemical erasures.

10.12.2.3 Stereoscopy

Stereomicroscope is an indispensable instrument in the examination of questioned documents. A document expert usually uses a zoom type of stereomicroscope with a tilting stage and arrangement for oblique/transmitted lighting. It helps to:

1. Detect erasures
2. Ink hade difference
3. Additions
4. Alteration of digits/figures/words
5. Detect line quality defects in simulated/traced forgeries
6. It permits discrimination of electronically transferred or handwritten signature
7. It is the first instrument used for the preliminary examination of documents.

8. Find out the erased original writing.
9. Find out the text from the reverse writing impression on the reverse page of the document especially if the document was written with a dirty paper support. The writing on the surface is inverted It is read with the help of a mirror/photograph.
10. Figure out indented writings on the document.

10.12.2.4 Ultraviolet (UV) Rays

UV rays' source is a constant companion of Document Examiner. They give different fluorescence with different materials Thus; they permit detection of physical/chemical/solvent erasures through the difference in fluorescence at the erased and un-erased surfaces. Fluorescence may also reveal the original text especially in chemical erasures. Ultraviolet rays also detect additions/obliterations/alterations,

10.12.2.5 Photography

Photography using oblique/transmitted lights frequently reveals the sites of erasures and sometimes the original writings. Photography with ultraviolet rays often reveals the original text especially in chemical erasures. Photography with infrared rays is useful in those documents in which infrared opaque inks have been used. Some permanent inks are opaque to infrared rays. The rays reveal the site of erasure and allow evaluation of the original writing.

10.12.2.6 Solvents

Erased writings, written with indelible pencil, are often restored by alcohol vapours which intensify the colour of the ink. The document is placed in a closed chamber containing alcohol in a dish. The alcohol vapours are allowed to develop the writing.

10.12.2.7 Chemical Action

Hydrogen sulphide, ammonium sulphide, and hydrogen sulphocyanide on coming in contact with a moist iron salt of the ink gives black or red colour. The erased writings, which were written with inks containing iron are often restored by the action of these reagents.

Tannic acid and other organic reagents which give coloured compounds with iron are also used to restore the faded writing.

10.13 SECRET WRITINGS

Criminals, (whether inside or outside the jail), criminal gangs, political offenders members of secret societies/subversive groups and international spies frequently interact with their partners, relatives, sympathizers, or friends on illegal matters through secret writings.

The detection techniques of secret writing vary with the methods and material used for the writings.

They can be very simple or highly complex. Some examples are:

10.13.1 Invisible Inks

Invisible inks are also known as sympathetic inks. The nature of the inks varies tremendously. The criminals who have limited resources at their disposal, especially inside a jail, have used simple substances like water, body secretions (saliva, urine, and perspiration), tea, milk, sugar,

fruit juice, soap, toothpaste, medicine, perfume and the like. On the other hand, the invisible inks may be highly complex chemicals. The writings are often decipherable with ultraviolet rays, infrared rays, soft X-rays. Colour reactions with specific reagents are also used. The ink may be heat or light sensitive, or, it may have a radioactive substance and its presence in specific words forms the text of secret writing. The rest of the writing, thus, forms cover for the message.

Invisible writings on documents are processed in a laboratory. Most of the secret writings allow identification and evaluation of the writings because the surface of the paper carrying the writing is disturbed at the place of writing and the extraneous matter is deposited therein. The disturbed surface and the extraneous matter make it possible to find out the writing. The following process is adopted:

1. The document is examined with ordinary light falling at various angles. Grazing light and transmitted light are often useful.
2. The above observations are repeated using a stereomicroscope. Sometimes, in addition to the detection of the presence of the secret writing, the contents (message) is deciphered.
3. A large number of "inks" fluoresce in ultraviolet rays. The secret message may thus be revealed. The differential absorption and reflection of ultraviolet rays may also help to decipher the secret message.
4. If the secret ink contains some heavy metal, opaque to infrared rays, the writing, is revealed in an infrared photograph.
5. X-rays opaque metal salts become visible with soft X-rays either in a radiograph or on an X-ray screen.
6. If radio-active substances have been used to tag certain words in a text, they are located Geiger counter.
7. Iodine fuming reveals secret writing in many cases. It also does not disturb or spoil the document extensively. Differential absorption of iodine fumes at the place of writing reveals the text.
8. Writing with a silver nitrate solution becomes evident when exposed to strong light.
9. Writings with body fluids or fruit juices become evident when the document is heated. Heat also affects certain salts and organic compounds. The document is heated with an electric iron or in an electric oven.
10. Coloured powders and solutions are employed only when other methods fail because coloured powders and solutions disfigure the document and may spoil other writings. They are used only when the document is not important, and it is not to be sent to its destination. However, the document is photocopied before it is treated with coloured powder/solutions.
11. Chemical methods depend upon the correct identification of the sympathetic ink. Reagents are then employed which give coloured compounds with the inks.

The chemical reagent is used only after testing that it will be useful and would not damage the document.

10.13.2 Miniature Writings

The secret message may be in a microphotograph. Even a photograph of the size and shape of an inconspicuous dot may carry all the necessary information of a secret message. They are evaluated through a microscope or enlarged photographs.

10.13.3 Latent Photographs

A secret message may be conveyed through an exposed but undeveloped film/bromide paper. The recipient develops and fixes it to read the message. If it falls into wrong hands, the message is destroyed as soon as it is exposed to light.

If a police officer comes across a packet containing some material wrapped in black, red or brown paper, he should open the same in a dark room only. If a piece of sensitive photographic film or paper is found, it should be developed immediately.

If it is essential to send the message to its destination, a similar latent is prepared and sent.

10.13.4 Codes and Ciphers

To convey secret messages, codes and ciphers are extensively used. The secret services, military, police and other administrative departments are frequent users.

Governments employ highly complex codes and ciphers while most of the criminals use simple codes. Computers have made use of highly intricate/complex codes/ciphers easy. If sufficient coded material is available, it is usually possible to decode the same by the code experts.

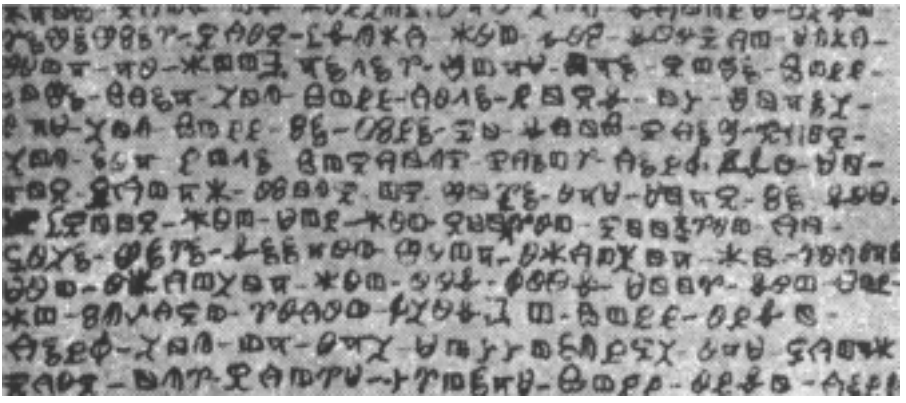

Fig. 10.52
Photograph of a letter in code. The cyphers were simple and the contents could be evaluated

10.14 BURNT DOCUMENTS

Processing of burnt documents involves the following techniques:

1. **Visual examination,** it may reveal some writing. It is photographed.
2. If the original writing was in carbon/other infrared opaque ink and the document is not fully burnt, an infrared photograph may reveal the writing.
3. A charred document, placed in contact with a photographic film/plate, affects the emulsion differentially, to reveal the writing in some cases.
4. Sometimes, silver nitrate solution helps to read the charred writing. The document is placed over a glass plate in a photographic enamelled tray. A second glass plate

is placed over it in such a way that it does not touch the document. Silver nitrate solution is poured in the tray to cover the charred document. The writing appears grey against black background.

10.15 AGE OF DOCUMENTS

10.15.1 Age Indicators

Age of a document sometimes assumes importance. It is indicated by the following observations:

1. The age of paper can be a rough index of the age of the document. The document cannot be older than the paper itself. Some paper manufacturers keep a record of the watermarks and put some signs, which indicate the year of manufacture. The reference to the manufacturer, therefore, can get the age of the paper.

   The watermarks, the composition of the fibre, sizing and loading materials used are useful indicators.

   The British archives purchased Mussolini's diaries they were referred to historians. They opined that the facts given in the diaries were correct. But there was nothing in the diaries which was not already known about Mussolini. It created a suspicion that the diaries might be forgeries. They were sent to a document expert. He found that the paper on which the diaries were written contained optical brightener, which was unknown in Mussolini's days. He, therefore, opined that the diaries were fake. (CH)

   The condition of the paper gives its approximate age.
2. The age of ink gives the age of the writing/document.
3. The use of a particular pen points to the age of the document in some rare cases. For example, in India, ball pens were not used before 1950. Therefore, a document, written with a ball pen, prior to 1950, is unlikely to be a genuine document.
4. The revenue stamps carry distinct marks indicative of the period of their printing. A revenue stamp can, therefore, indicate the age of the document. The security press at Nasik can give the age of the document.
5. An office changes its seals from time to time, as they become defective with the passage of time or become out-dated. The comparison of the questioned seal impression with the standard impressions of seals and stamps with dates (available on office files) may give idea about the age of the document bearing a seal mark.
6. The contents of a document may contain references to events, which happened after the alleged date of the writing of the document. Such a document is evidently a forgery.
7. The alleged writer or signatories of a document may not be in existence or present at the alleged station on the material date.
8. The age of a typewritten document may be indicated by the age of the typescript.

10.15.2 Artificial Aging

The document is sometimes artificially aged. The following techniques are employed:

1. The document is placed in a chimney. The smoke of the hearth 'ages' the document.
2. The document is soiled with dust or dirt.
3. Heating or exposing the document to sun or ultraviolet rays 'ages' the document.

4. Iodine fuming or treatment with other chemicals *(e.g.,* sulphur dioxide, permanganate solution) 'ages' the document.
5. An old paper, from some old books, is used to forge the document. The ink on the document indicates the forgery.

It is possible to detect the artificial ageing of a document in a laboratory, in most of the cases.

10.16 OBLITERATIONS

Obliteration is covering the unwanted/offensive writing with a thick dark ink/paint/fluid, to prevent deciphering the contents of the writing. Some con artists obscure the writing after scoring it extensively so that the resuscitation of the writing may not be possible. The following techniques are used to read the obliterated writings:

1. Examination under strong light at various angles particularly with transmitted light frequently reveals the obliterated writings when the ink used for obliteration is not too dark or too thick.
2. If infrared rays can pass through the obscuring ink but do not pass through the ink in which the document is written, an infrared photograph reveals the writing.
3. Solvents like acetone or tetrahydrofuran may remove the obliterating ink.
4. Ink eradicators remove the obscuring ink.
5. High contrast films on contact printing may prove useful and reveal the writings.
6. Colour filters reveal the writing if the shades of the obscuring and the original inks are different.

If the text has been obliterated soon after the writing using the same pen and ink, it is often difficult to read the original text.

Scoring and abrading the writing surface, prior to obliteration, make the task more difficult.

In a recent case, a letter suspected to carry an important address was received. The original address was badly scored and erased. It was then covered with the same type of ink. The obliteration was completed by pasting a piece of paper over the address with a strong adhesive.

Thorough processing gave only partial success. (CH)

Fig. 10.53

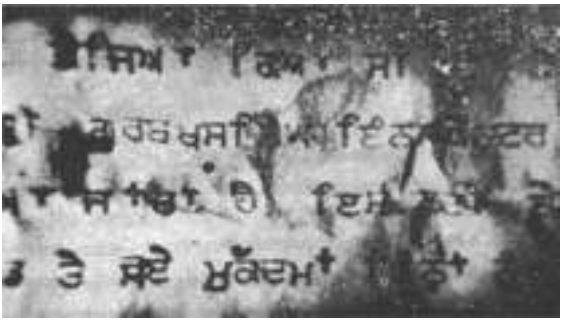

Fig. 10.54
Infrared rays also reveal obliterated writings. Fig. 10.53 is a photograph with ordinary light. Fig. 10.54 is a photograph with infrared rays

10.17 SEQUENCE OF STROKES

The study of sequence of strokes helps to find out if some fraudulent additions have been made to the existing text.

The crossed strokes of the alleged original and additional writing are studied to find out the order of the strokes. It is a difficult study. Inexperienced persons make mistake frequently.

The following points usually help to determine the sequence:

1. The ink from a line of new writing spread over the previously written line where the new line crosses the older line in some cases in some cases. If ink has spread, the order of strokes is established. A stereomicroscope is useful to study the spreading.
2. The pen some time creates a furrow in its written line. If it the upper line it will show continuity of the furrow. If it is the line from the prior writings, it shows discontinuity of the furrow at the crossing point.
3. A pen may deposit ink on side(s) of writing line. If the deposit line is continuous, it is written later. If its continuity is broken at the crossing point, the line was written first.
4. The fibre along the writing lines is conspicuously disturbed if the pen nibs are defective. The disturbance of the fibre may indicate the sequence of strokes.
5. An Electrostatic Detection Apparatus (ESDA), usually utilised to decipher indented writing, also helps to decide which stroke was written first. The image obtained indicatescontinuity/discontinuity of the intersecting lines.
6. The Scanning Electron Microscope (SEM), also helps to find the sequence of stroke. The instrument is costly and not available with most of the laboratories in India.

The sequence of strokes in pencil lines is indicated by the continuity/discontinuity of furrow in the writing lines.

The novice is trapped in ink shade deceptive illusion. Ordinarily, the line in darker shade appears to be on top even when it is the lower line, written first. Only an experienced examiner can establish the correct sequence of strokes.

10.18 INDENTED WRITINGS

10.18.1 Indented Writing

Indented writing is the impression from the writing instrument (pen/pencil,) on a sheet(s) of paper underneath the paper being written upon. Such indented writings are often found on letters, pads, notebooks in educational institution, record registers in offices,

Indentations of the original text on the erased writing are sometimes met with. They are also useful to reconstruct the original writings.

In criminal situations, indented writings appear on disputed documents, anonymous or pseudonymous letters, threat letters, ransom notes, Sometimes, they assume great importance.

10.18.2 Processing Indented Writings

The following techniques are used to detect/read indented writings:

1. Ordinary light (from an angle-poise/spotlight lamp) is allowed to fall at grazing angles, less than 30°. The light intensity is gradually decreased. The observations are repeated with a stereomicroscope. The examinations reveal the indented writings frequently.
2. When the indented writing is fumed with iodine, the quantity of iodine deposited is less at the place of the indented writing than at the rest of the paper surface. The contrast allows the evaluation of the text.
3. A solution containing iodine, potassium iodide and glycerine in water is spread over the surface bearing the indented writing. It frequently reveals the writing.
4. A photograph taken on a contrast film using grazing light often reveals the writing.
5. ESDA (Electrostatic Detection Apparatus) is an important machine. It reveals the indented writing in most of the cases. In some cases where other methods, have failed, it has succeeded.

   The apparatus and its functioning are simple. The document is sandwiched between a thin transparent plastic film and a porous copper plate. High voltage is applied to the system and toner is cascaded over the film. The toner gets concentrated on the indented line of the writing and makes it readable.
6. Scanning Electron Microscope (SEM) gives 3-dimensional images. It has therefore, the potential to reveal indented writings.

Fingerprint powders/coloured solutions may reveal the indented writings, but they spoil the documents. They are not used to reveal the indented writings usually.

Fig. 10.55
Indented writing revealed by powdering an innocent looking paper

10.19 CLOSED ENVELOPES

The following process helps to know whether a packet (letter) has been opened or not:

1. The packet is examined under strong light, especially with transmitted light, using a magnifying glass. Additional gum, tearing and accumulation of paper fibres at certain places indicate opening of the packet.

Examination with a stereomicroscope improves observation power.

2. Ultraviolet rays differentiate the additional gum put on the packet.
3. If a seal impression *(e.g.,* postal cancellation stamp) or some writings (even lines across the flap) have originally crossed the opened flap; in reclosing, some misalignment is bound to occur.
4. Chromatography (TLC) differentiates old and new gums or adhesives.
5. If a sealed packet is opened and resealed, the new wax used for resealing and the defects in the new seal mark would indicate opening of the packet.

10.20 WRITING INSTRUMENT

Positive identification of the writing instrument (pen)y is rather difficult. Only in rare cases, where the pen has conspicuous defect it may be possible Elimination of certain writing instrument is possible in more cases. However, individualisation of the pen is rather elusive.

10.21 PRESENTATION[23]

10.21.1 The Expert

The expert is the chief performer in the presentation of evidence. The prosecution and the defence counsels are helpers. They extract the total evidence through examination in chief, cross-examination and re-examination. The court appraises the evidence and the performance of the expert.

Basic traits of an honest and efficient expert are*:*

10.21.1.1 No Bias

The expert is not biased in favour of the prosecution or defence. He assists the court to find the truth. He presents the data he has generated, the conclusions he has drawn from the material submitted to him. He submits his findings to the court, in precise/concise/intelligible/simple language.

10.21.1.2 No Dogmatism

He is not dogmatic.

10.21.1.3 Man of Science

The expert is a man of science and does not go beyond the data he has generated. He demonstrates his evidence with adequate photographs/illustrations/d data.

10.21.1.4 Cogent reasons

He gives cogent reasons for his opinion/report. He does not go by moral conviction or hunch.

10.21.1.5 Assistance

He discusses the case with his assistants, colleagues or superiors and removes lacunae or deficiencies if any

23. For a detailed discussion, *see*: chapter 3 of this book and chapters 21–22 of BR Sharma, *Handwriting Forensics*, 2017 Edn, Publisher: LexisNexis.

10.21.1.6 Qualifications

The expert is a properly qualified person:

1. He has a degree in science.
2. He has training in the expertise.
3. He was attached with some reputed document examiner for an adequate period.
4. He is engaged in research.
5. He has ample casework experience.
6. He has liaison with professional bodies.
7. He participates in meetings/seminars/conferences on expertise.
8. He has published research papers and books.

10.21.1.7 Court Appearance

Most of the lawyers feel shy of expert evidence. They leave the matter of presentation to the expert. The expert, therefore, has to be careful in presenting the evidence. He should:

1. Qualify himself as an expert.
2. Identify the documents which he examined.
3. Certify the correctness of the report, the photographs and other graphics.
4. Submit two column charts. They are effective. If the demonstration relates to letters, digits or their short combinations, they are placed in horizontal rows as a number of letters or digits from different documents are shown.

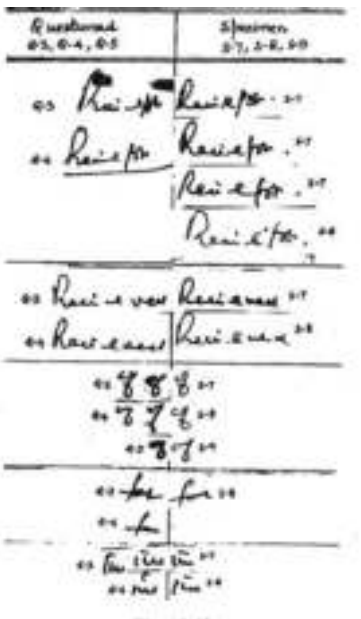

Fig. 10.56
Comparison chart of questioned and specimen writings reveals common authorship of the two documents

If it relates to long signatures or words, they are placed in vertical columns.

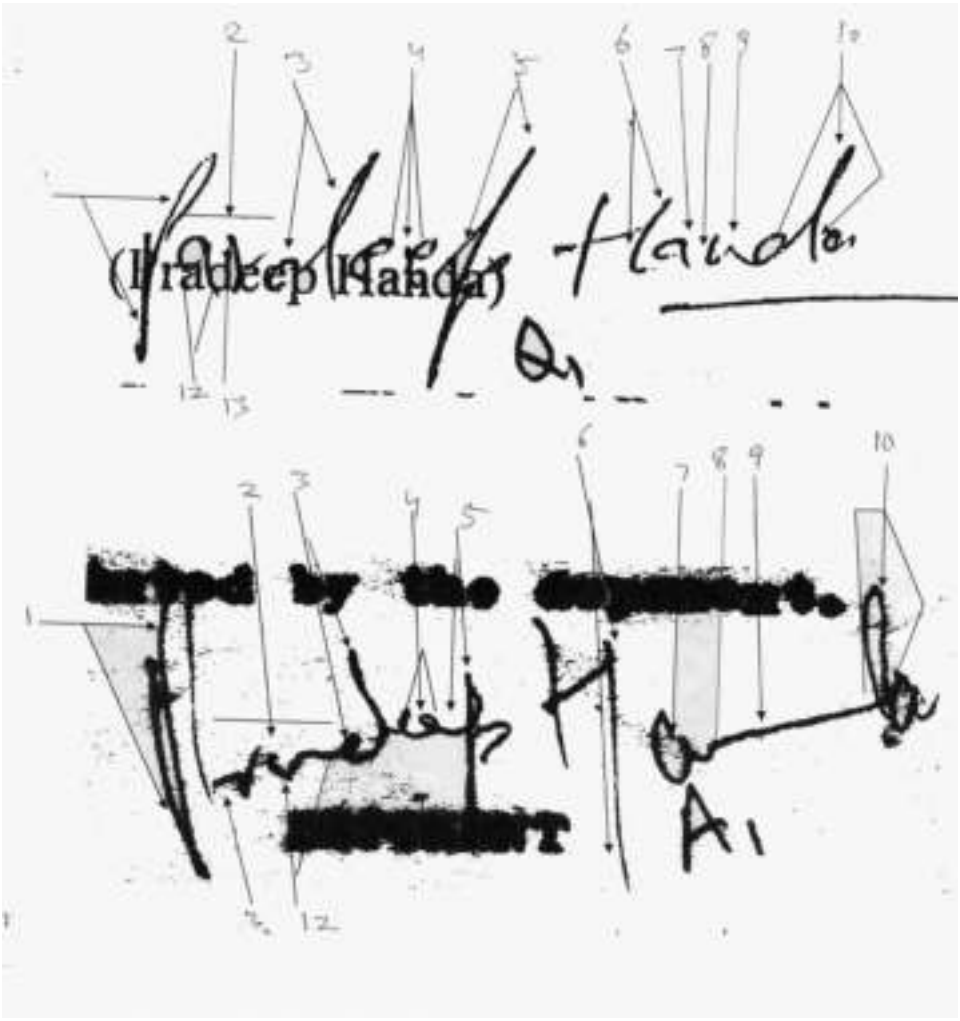

Fig. 10.57
A faithful, clear and convincing computer-generated illustration

5. The following points are kept in view:
   - The charts carry information relating to the documents from which the letters, words or digits are selected.
   - Avoid congestion on the chart.
   - Arrange letters, words, digits and figures functionally in the charts. However, as far as possible, make the chart pleasing to the eye.
   - Give explanatory notes/remarks on the chart so that the non-professionals understand/assimilate the evidence without much assistance.

- Keep magnification of photographs in the illustrative charts relating to handwritings about 2 to 5 X (times). Higher magnifications are required to show erasures, alterations, pen pauses or traces in traced forgeries.
- Number the photographic charts.
- The charts bear the signatures of the expert.
- Make the photographic charts of the size 30 x 20 cm. When larger charts are required, they are folded. Thus, the effective dimension is doubled/tripled, without increasing the external size of the chart.

The bare reports and opinions of experts are not valued. The opinions, therefore, is supported by cogent reasons/illustrations.

The presentation is quoted in layman's language, no verbosity. Technical terms, if used, are explained.

10.21.2 The evidence

The expert examines the documents in his laboratory before coming for evidence. He marks the documents for identification purposes. When the documents are produced in the court, he identifies them from those identification marks.

After the examination of the document in the laboratory, the expert sends a report of his findings to the concerned person/authority. The report is usually brief. It contains all the relevant information: date and mode of receipt, the number and nature of the documents received and examined and date and mode of dispatch,

The expert prepares a number of photographs. They are for records, illustrations, to decipher or to differentiate the writings. Some photographs are taken with infrared or ultraviolet rays or with filters in some cases. They all bear his identification marks.

Fig. 10.59
Photographic exhibits should speak for themselves

Comparison of photographic charts are prepared carefully. Two column charts are effective. If the demonstration relates to letters, digits or their short combinations, they are put in horizontal rows as a number of letters or digits from different documents are shown. If it relates to long signatures or words, they are placed in vertical columns. The following points are kept in view:

1. The charts carry information relating to the documents from which the letters, words or digits are selected.
2. Congestion on the chart is avoided.
3. Letters, words, digits and figures are arranged functionally in the charts. However, as far as possible, the chart is made pleasing to the eye.
4. The charts bear explanatory remarks and notes so that layman can understand the evidence without much assistance.
5. The photographs in the illustrative charts relating to handwritings have magnification of about 2 to 5 times. Higher magnifications are required to show erasures, alterations, pen pauses or traces in traced forgeries.
6. The photographic charts bear serial numbers, given by the expert. When they are produced in the court, they bear the court exhibit numbers.
7. The charts bear the signatures of the expert.
8. The convenient size for photographic charts is 30 x 20 centimetres. When larger charts are required, they are folded. Thus, the folded charts double/triple the effective dimension without increasing the external size of the chart.

The courts form their own opinions. A demonstration through photographs is, therefore, of great value. Mere verbal description of the findings will not carry conviction, especially if an unscrupulous person is appearing as an 'opposing expert' and misguides the court through a barrage of words.

The bare reports and opinions of experts are not valued. The opinions, therefore, is supported by cogent reasons, preferably accompanied by illustrations/photographs/charts. The efficient expert does so.

The evidence is understood by a layman only if it is presented in a proper sequence. The photographs of the size of documents are produced in important cases, followed by the illustrative charts. Each chart is presented when the evidence relating to the chart is submitted.

An experienced expert does not use technical words in his presentation. If some uncommon term is unavoidable, he explains the same. The language of the expert should not cause confusion; instead, it should simplify the technical aspects of evidence.

10.21.3 Presenting Counsel

The responsibility of proper presentation of expert evidence is mostly upon the presenting counsel. A conscientious attorney takes the following steps:

10.21.3.1 Prior Consultation

Technical evidence needs careful study and understanding. The counsel, therefore, has a conference with the expert to understand the evidence.

10.21.3.2 Examination-in-Chief

The counsel presents the evidence of the expert in the form of answers to questions. Narrative form is inferior to the question and answer form. The court loses interest in a long narrative, the questioning keeps up the interest. The presenting counsel, therefore, should:

- Establish the *bona fide* of the expert.
- Establish the *corpus delicti* by exhibiting the documents.
- Exhibit the report after getting the main statement recorded, along with graphics, data and reasons.
- Anticipate defence questions against the expert evidence and ask those questions himself to blunt the heroics of the defence counsel.
- Listen carefully to the cross-examination, take notes and prepare for re-examination.
- Ensure that the evidence produced is legal/relevant.
- Ensure that the standards produced are genuine/accepted by the accused/proved to be his.

10.21.3.3 Re-examination

The presenting counsel listens to the cross-examination carefully. He takes notes and re-examines the expert on points needing clarifications or amplifications.

10.21.4 Defence counsel

The defence plays a dramatic part in the presentation of evidence. He cross-examines the expert.

The Cross-Examination of an expert witness is not an easy and off-hand task. It needs a proper understanding of the evidence and a thorough preparation of the case. Nevertheless, it is not an impossible task as considered by some counsels. If they study the evidence and consult an expert and literature on the subject, the cross-examination can be carried out effectively.

10.21.4.1 Aim

The cross-examination of an expert witness must have a proper aim. It may be

1. To discredit the witness
2. To question his findings
4. To elicit information to support defence version of the case.

10.21.5 Cross-Examination[24]

The cross-examination of an expert witness is not an easy and off-hand task. It needs proper understanding of the evidence and a thorough preparation of the case. Nevertheless, it is not an impossible task as considered by most counsels. If they study the evidence and consult an expert and literature on the subject, the cross-examination can be carried out effectively.

24. See chapters 21–22 of BR Sharma, *Handwriting Forensics,* 2017 Edn, Publisher: LexisNexis.

The defence counsel should fix the aim of cross-examination. The main aims are to:

- Discredit the expert. It is futile to try to discredit an honest, well-qualified and experienced expert.
- Question the report/findings/inadequacy of data,
- Elicit information to support defence version of the case.

10.21.6 Judge

The judge is the ultimate authority to evaluate and utilise the expert evidence. He is to see that justice is done in every case. The expert, the prosecution and the defence counsels are just to assist him. He has to evaluate the evidence and form his own opinion. The judge, therefore, must understand the evidence and utilise it in the dissemination of justice.

The prosecution counsel may not present the evidence properly. The defence counsel tries to elicit information that is helpful to his client. Thus, only the judge is interested in real justice. He should, therefore, ascertain the facts, assimilate them and utilise them in the dissemination of justice.

The scientific methods in the detection of the crime are daily improving and are becoming accurate, sensitive, rapid and specific. However, at no stage they are unintelligible. They should be utilised.

In brief, the judge sees that:

1. The expert is honest, properly educated, trained and is engaged in professional work. The court should not permit an impostor to impose upon the court and perjure.
2. The expert evidence produced is relevant, intelligible, properly demonstrated and explained.
3. The expert does not use meaningless jargons, technical terminology or verbosity to hide the weak points in his evidence or to mislead the court to non-issues.
4. The expert has not side-tracked the relevant questions put to him by the counsel or the court.
5. The expert, the prosecution and the defence have done their duties properly, if they have not, the court should intervene at the appropriate time.
6. The expert is not forced to answer questions in "yes" or "no" answers. The scientific evidence often needs elaboration. "Yes" or "No" answers, at times, cannot do justice to the truth.
7. The counsels do not waste time in asking hypothetical questions.
8. The points left ambiguous or incomplete, either by the prosecution or by the defence, are clarified through court questions.
9. The inconclusive reports are probed to ascertain their probative values and they are given due weight accordingly. Some reports are inconclusive only technically. They must be given due weight.
10. The data conform to the standards laid down by the concerned professional body.
11. The expert has explained the apparent contradictions satisfactorily.

10.22 ADDITIONAL READINGS

1. B R Sharma, *Handwriting Forensics,* LexisNexis, 2017 Edn.
2. Huber RA and Headtrick, AM, *Handwriting Identification: Facts and Fundamentals*, CRC Press, New York.
3. Morris, R, *Forensic Handwriting Identification,* Academic Press, New York.
4. Ellen, D, *Scientific Examination of Documents,* CRC Press, New York.

APPENDIX A

10.23 BREWSTER ON HANDWRITING PRINCIPLES[25]

1. No two persons can write precisely alike.
2. Natural variations are within a range.
3. Different writing habits do not exist in the same person at the same time.
4. To change one's writing style is exceedingly difficult.
5. No one is capable of writing better or more fluently than his manual capacity or dexterity will allow.
6. It is exceedingly rare for a person to write his signature twice exactly alike.
7. Speed or pace of writing of the same person at different times is fairly constant.
8. Forger nearly always attempts to make his product as much as he can, alike the genuine.
9. Retouching is done carefully by the forger and carelessly by the genuine writer.
10. No genuine writer makes an outline of his signature by stylus or pencil and then inks it.
11. Anonymous letters are disguised by writing slowly. Disguised signatures are written quickly.
12. Hesitation, labour and care generally indicate forgery and their absence generally genuineness.
13. Two handwritings are identified as the work of the same writer if they contain both in number and degree a sufficient quantity of individualising features which cannot be due to coincidence (and *vice versa*).

10.25 SUPREME COURT CASE LAW

(21St Century)

10.25.1 Evidence Admissible[27]

Author's Summary

It is a case of forgery of railway receipt by an employee of the railways; by which consignment was diverted from its destination and contents usurped.

Document expert identified the handwriting of the forger. The three courts, including the SC accepted the expert opinion, which was supported by other evidence. The culprit was convicted.

Highlights italicised

27. *Alamgir v State (NCT, Delhi)*, AIR 2003 SC 282 : 2002 AIR SCW 4749 : 2003 Cr LJ 456 (SC).

Relevant Extracts (Verbatim)

In the first place, it may be noted that the appellant was at the material time a Guard in the employment of the Railway Administration with his headquarters at Agra and he had nothing to do with the train by which Wagon No. SEKG 40765 was dispatched from Munda to Bikaner, nor with the train, which carried that wagon from Agra to Ludhiana. He was not a Guard on either of these two trains. There was also no evidence to connect the appellant with the theft of the blank Railway Receipt at Banmore Station. It is indeed difficult to see how the appellant, who was a small employee in the Railway Administration, could have possibly come into possession of the blank Railway Receipt from Banmore Station which was not within his jurisdiction at any time. It is true that B. Lal, the Handwriting Expert, deposed that the handwriting on the forged Railway Receipt Ex. PW-10/A was that of the same person who wrote the specimen handwritings, Ex. PW-27/37/to 27/57, that is the appellant, but we think it would be extremely hazardous to condemn the appellant merely on the strength of opinion evidence of a Handwriting Expert. It is now well-settled that Expert opinion must always be received with great caution and perhaps none so with more caution than the opinion of a Handwriting Expert. There is a profusion of precedential authority which holds that it is unsafe to base a conviction solely on Expert opinion without substantial corroboration. This rule has been universally acted upon and it has almost become a rule of law. It was held by this Court in *Ram Chandra v State of Uttar Pradesh*, AIR 1957 SC 381 : 1957 Cr LJ 559, that it is unsafe to treat Expert Handwriting opinion as sufficient basis for conviction, but it may be relied upon when supported by other items of internal and external evidence. This Court again pointed out in *Ishwari Prasad Misra v Mohammad Isa*, AIR 1963 SC 1728 : (1963) 2 SCR 722 : 1963 BLJR 226, that Expert evidence of handwriting can never be conclusive because it is, after all, opinion evidence, and this view was reiterated in *Shashi Kumar Banerjee v Subodh Kumar Banerjee*, AIR 1964 SC 529, where it was pointed out by this Court that Expert evidence as to handwriting being opinion evidence can rarely, if ever, take the place of substantive evidence and before acting on such evidence, it would be desirable to consider whether it is corroborated either by clear direct evidence or by circumstantial evidence. This Court had again occasion to consider the evidentiary value of Expert opinion in regard to handwriting in *Fakhruddin v State of Madhya Pradesh,* AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197, and it uttered a note of caution pointing out that it would be risky to found a conviction solely on the evidence of a handwriting expert and before acting upon such evidence, the Court must always try to see whether it is corroborated by other evidence direct or circumstantial. It is interesting to note that the same view is also echoed in the Judgments of English and American Courts, Vide *Gurney v Langlands*, 1822 (5) B and Ald 330, and Matter of Alfred Foster's Will (34 Mich 21). The Supreme Court of Michigan pointed out in the last mentioned case.

Everyone knows how very unsafe it is to rely upon any one's opinion considering the niceties of penmanship – Opinions are necessarily received, and may be valuable, but at best this kind of evidence is a necessary evil.

We need not subscribe to the extreme view expressed by the Supreme Court of Michigan, but there can be no doubt that this type of evidence, being opinion evidence is by its very nature, weak and infirm and cannot of itself form the basis for a conviction. We must, therefore, try to see whether, in the present case, there is, apart from the evidence of the Handwriting Expert, B Lal, any other evidence connecting the appellant with the offence.

In our view, however, reliance in Magan (supra) is rather misplaced in the contextual facts since no conviction is based on the opinion of the Handwriting Expert but admittedly it can be relied upon when supported by other items of internal and external evidence. The Handwriting Expert's opinion simply corroborates the circumstantial evidence and as such we are unable to record our concurrence with the submissions of Mr. Singh on this score.

Significantly, this Court in Murarilal v State of Madhya Pradesh, AIR 1980 SC 531 : (1980) 1 SCC 704 : 1980 Cr LJ 396, in no uncertain terms observed that the hazard in acceptance of opinion of an Expert is not because it is unreliable evidence, but because human judgment is fallible. Needless to record that the signs of identification of handwriting have attained more or less a state of perfection and the risk of an incorrect opinion is practically non-existent. This Court went on further to record that doubting the opinion of a Handwriting Expert ought to be a far cry and insistence upon further corroboration as an invariable rule does not seem to be a justifiable conclusion.

In continuation of the above-noted principle, this Court went on to further examine as regards judicial precedence and in that vein stated in para 7 of the report as below:

> *"7. Apart from principle, let us examine if precedents justify in the variable insistence on corroboration. We have referred to* Phipson on Evidence, Cross on Evidence, Roscoe on Criminal Evidence, Archibald on Criminal Pleadings, Evidence and Practice and Halsbury's Laws of England *but we were unable to find a single sentence hinting at such a rule. We may now refer to some of the decisions of this Court. In Ram Chandra v State of Uttar Pradesh, AIR 1957 SC 381 : 1957 Cr LJ 559, Jagannadhadas, J, observed: "It may be that normally it is not safe to treat Expert evidence as to handwriting as sufficient basis for conviction". "May" and "normally" make our point about the absence of an inflexible rule. In Ishwari Prasad Misra v Mohammad Isa, AIR 1963 SC 1728 : 1963 BLJR 226 : (1963) 2 SCR 722, Gajendragadkar, J, observed;*
>
> *"Evidence given by Experts can never be conclusive, because after all it is opinion-evidence", a statement which carries us nowhere on the question now, under consideration. Nor, can the statement be disputed because it is not so provided by the Evidence Act and, on the contrary, section 46 expressly makes opinion-evidence challengeable by facts, otherwise irrelevant. And as Lord President Cooper observed in* Davis *v* Edinburgh Magistrate, *AIR 1953 SC 34: "The parties have invoked the decision of a judicial tribunal and not an oracular pronouncement by an Expert."*

As regards the decision of *Magan* (supra) this Court in para (10) stated as below:

> "10. Finally, we come to *Magan Bihari Lal v State of Punjab*, AIR 1977 SC 1091 : 1977 Cr LJ 711 : (1977) 2 SCC 210, upon which Sri R.C. Kohli, learned counsel, placed great reliance. It was said by this Court:
>
> *… but we think it would be extremely hazardous to condemn the appellant merely on the strength of opinion evidence of a Handwriting Expert. It is now well-settled that Expert opinion must always be received with great caution and perhaps none so with more caution than the opinion of a Handwriting Expert. There is a profusion of precedential authority which holds that it is unsafe to base a conviction solely on Expert opinion without substantial corroboration. This rule has been universally acted upon and it has almost become a rule of law. I*
>
> It was held by this Court in *Ram Chandra v State of Uttar Pradesh*, AIR 1957 SC 381 : 1957 Cr LJ 559, that it is unsafe to treat Expert Handwriting opinion as sufficient basis for conviction, but it may be relied upon when supported by other items of internal and external evidence. This Court again pointed out in *Ishwari Prasad Misra v Mohammad Isa*, AIR 1963 SC 1728 : (1963) 2 SCR 722 : 1963 BLJR 226, that Expert evidence of handwriting can never be conclusive because it is, after all, opinion-evidence, and this view was reiterated in *Shashi Kumar Banerjee v Subodh Kumar Banerjee*, AIR 1964 SC 529, where it was pointed out by this Court that Expert evidence as to handwriting being opinion-evidence can rarely, if ever, take the place of substantive evidence and before acting on such evidence, it would be desirable to consider whether it is

> corroborated either by clear direct evidence or by circumstantial evidence. This Court had again occasion to consider the evidentiary value of Expert opinion in regard to handwriting in *Fakhruddin v State of Madhya Pradesh,* AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197, and it uttered a note of caution pointing out that it would be risky to found a conviction solely on the evidence of a Handwriting Expert and before acting upon such evidence, the Court must always try to see whether it is corroborated by other evidence, direct or circumstantial. The above extracted passage, undoubtedly, contains some sweeping general observations. But we do not think that the observations were meant to be observations of general application or as laying down any legal principle. It was plainly intended to be a rule of caution and not a rule of law as is clear from the statement "it has *almost* become a rule of law". "Almost", we presume, means, "not quite". It was said by the Court there was a "profusion of precedential authority" which insisted upon corroboration and reference was made to *Ram Chandra v State of Uttar Pardesh* ; *Isdhwari Prasad v Mohammad Isa* ; *Shashi Kumar v Subodh Kumar* and *Fakhruddin v State of Madhya Pradesh*. We have already discussed these cases and observed that none of them supports the proposition that corroboration must invariably be sought before opinion-evidence can be accepted. There appears to be some mistake in the last sentence of the above extracted passage because we are unable to find in *Fakhruddin v State of Madhya Pradesh*, any statement such as the one attributed. In fact, in that case, the learned judges acted upon the sole testimony of the Expert after satisfying themselves about the correctness of the opinion by comparing the writings themselves. We do think that the observations in *Magan Bihari Lal v State of Punjab*, must be understood as referring to the facts of the particular case."

In *Murarilal* (supra) this Court stated that there is no rule of law, nor any rule of prudence which has crystallised into a rule of law that opinion evidence of a Handwriting Expert must never be acted upon, unless substantially corroborated.

We feel it expedient to record our concurrence therewith, though, however, we hasten to add that since human judgment cannot be said to be totally infallible, due caution shall have to be exercised and the approach ought to be that of care and caution and it is only upon probe and examination the acceptability or creditworthy of the same depends. The learned Sessions Judge, as also the High Court, did place upon consideration of all relevant facts and material on record, reliance on the opinion of the Handwriting Expert and we do not see any reason to [28]record a contra finding.

10.25.2 Specimens under section 73, I EA[29]/311 A Cr PC[30]

Author's Summary

It is a simple case of interpreting the power of the court under section 73 of the IEA. The SC ruled that the court has no powers to order any person to give specimen writing in cases under investigation. However, during trials if the court needs specimens for its own scrutiny, they have the powers to order**.** Addition of Section 311 A in Cr P C has given powers to order specimens during investigation.

Highlights italicised

28. *Murarilal v State of Madhya Pradesh*, AIR 1980 SC 531 : (1980) 1 SCC 704 : 1980 Cr LJ 396.
29. *State of Haryana v Jagbir Singh*, AIR 2003 SC 4377 : 2003 AIR SCW 5180 : 2003 Cr LJ 5054 (SC).
30. Section 311 A Cr PC was introduced as Amendment No.25 of 2005 with effect from 23.06.2006. It reads: "Power of Magistrate to order person to give specimen signatures or handwriting.-If a Magistrate of the first class is satisfied that, for the purposes of any investigation or proceeding under this Code, it is expedient to direct any person…"

Relevant Extracts (Verbatim)

We shall examine the circumstances highlighted. So far as ransom notes are concerned, prosecution sought to rely upon the report given by the handwriting expert. It appears that the accused was taken before Addl. Chief Judicial Magistrate, Bhiwani. According to him, on 10 September 1991 the accused was brought before him in custody for giving his specimen signature under section 73 of the Evidence Act. It was noticed by this Court in *State of Uttar Pradesh v Ram Babu Misra*, AIR 1980 SC 791 that the Chief Judicial Magistrate has no power to direct the accused to give his specimen signature for comparison during investigation. Section 73 of the Evidence Act reads as follows:

> ***73. Comparison of signature, writing or seal with others admitted or proved.*** In order to ascertain whether a signature, writing or seal is that of the person by whom it purports to have been written or made, any signature, writing, or seal admitted or proved to the satisfaction of the Court to have been written or made by that person may be compared with the one which is to be proved, although that signature, writing, or seal has not been produced or proved for any other purpose.

The Court may direct any person present in Court to write any words or figures for the purpose of enabling the Court to compare the words or figures so written with any words or figures alleged to have been written by such person.

This section also applies, with any necessary modifications, to finger-impressions.

The second paragraph of section 73 enables the Court to direct any person present in the Court to give specimen writings "for the purpose of enabling the Court to compare" such writings with writings alleged to have been written by such person.

The clear implication of the words for the purpose of enabling the Court to compare is that there is some proceeding before the Court in which or as a consequence of which it might be necessary for the Court to compare such writings. The direction is to be given for the purpose of enabling the Court to compare and not for the purpose of enabling the investigating or other agency "to compare". If the case is still under investigation there is no present proceeding before the Court in which or as a consequence of which it might be necessary to compare the writings. The language of section 73 does not permit a Court to give a direction to the accused to give specimen writings for anticipated necessity for comparison in a proceeding which may later be instituted in the Court.

10.25.3 Admissibility of Reports *(section 293 Cr PC)*[31]

Author's Summary

In this case, the report of a handwriting expert was accepted by the appellate court under section 293 of Cr P C. The expert was not examined. The defense stressed that the report of the expert, as such, is no evidence. The SC agreed with the defense as the document expert is not one of the specified experts in section 293 of Cr PC and order to call the expert to prove his report, with opportunity to defence for cross-examination.

Relevant Extracts (Verbatim)

Reports of Document Expert not covered under section 293 Cr PC.

Mr. Singh, learned Counsel for the petitioner submitted that the petitioner has been found guilty solely on the basis of the report of the Government Examiner of Questioned Documents, Exhibit 29, but the expert who submitted the said report was not examined and his report was proved by the Investigating Officer which is not permissible. By referring to sub-section (4) of section 293, Cr PC, he submitted that report of those government scientific experts mentioned therein can be admitted into evidence without they being examined, but in the instant case the hand writing expert was the Deputy Government Examiner and the said expert is not one of the experts mentioned in sub-section (4) of section 293, Cr PC Mr. Pradhan, learned Additional Public Prosecutor, on the other hand, submitted that the conviction of the petitioner is not based solely on the report of the hand writing expert. There is also other evidence on record which justifies his conviction.

I have perused the impugned judgment and on its close scrutiny it appears that the learned sessions Judge has not discussed the evidence on record at all. In para 7 of the judgment he has referred to the arguments of the Public Prosecutor who seems to have submitted before him that for different offences committed by the petitioner, there is evidence of certain PWs and separate documentary evidence.

It may be stated that as an appellate Court, the learned Sessions Judge is required to assess and consider the evidence on record independently. As a court of appeal, he has to remember and keep in view that the presumption of innocence of the accused continues and therefore, he is to satisfy himself that the judgment of the trial Judge is correct. It is the bounden duty of the appellate Court, which may be the final Court of fact, to go through the evidence for himself, to assess it in proper perspective and to come to an independent finding. On careful examination of the impugned judgment, I have no hesitation to hold that the learned Sessions Judge has failed to discharge his duty as an appellate Court. As indicated above, he has simply summarised the submissions made before him by the learned Public Prosecutor and has not cared to examine and scrutinise the evidence for himself. For the reasons aforesaid, the impugned judgment is vulnerable and, therefore, the appeal needs rehearing by him.

There appears to be a force in the submission of the learned counsel for the petitioner with regard to the report submitted by the Deputy Government Examiner and Assistant Government Examiner of Questioned Documents. Section 293, Cr PC dispenses with the proof of certain documents unless the court itself thinks it necessary to be proved. Sub-section (4) thereof provides that the said section applies to those Government Scientific experts mentioned therein. So far as handwriting expert is concerned, the Director of the Finger Print Bureau has been mentioned as the expert. It means that if the report is submitted by the Director of Finger Print Bureau, the same may be admitted into evidence without he being formally examined. But in the present case, Exhibit 29 was not made by the Director of Finger Print Bureau. Therefore, it is necessary that handwriting expert who prepared Exhibit 29 should be examined to prove the contents thereof, in the interest of justice. The learned Sessions Judge is directed to summon the expert and examine him as a witness. For this, prosecution will take necessary steps. After he is examined, the learned Sessions Judge will give adequate opportunity to the defence to cross-examine the witness. The evidence of the said witness will form part of the record and be available to be considered along with other evidence already on record.

From a perusal of the above it would be clear that section 293, Code of Criminal Procedure applies only to certain experts like Chemical examiner or Assistant Chemical Examiner to the

Government. Chief Inspector of Explosives, Director of the Finger Print Bureau, Director, Deputy Director or Assistant Director of a Central Forensic Science laboratory or a State Forensic Science Laboratory and the Serologist to the Government, besides Director of Haffkeine Institute, Bombay.

The report of the handwriting expert, even if it has been given by the expert working in the Forensic Science laboratory, would not be per se admissible under section 293, Code of Criminal Procedure unless the maker of the said report is summoned and examined as a witness and the other side is given opportunity to cross examine the witness. In my opinion, there was absolutely no occasion for the learned Sessions Judge to have observed that the report of the handwriting expert was admissible under section 293, Code of Criminal Procedure and could be allowed to be tendered into evidence without summoning the author of the report.

In *State of Maharashtra v Damu Gopinath Shinde,* 2000 AIR SCW 1617 : 2000 Cr LJ 2301 : AIR 2000 SC 1691 (1700) opinion of the Assistant State Examiner of documents was produced in evidence as Ex. 64. Under these circumstances, it was held by their Lordships of the Supreme Court that from that description alone, it could not be gathered whether his office would fall within the purview of section 293 Code of Criminal Procedure and hence without examining the expert as a witness in the court, no reliance could be placed on Ex. 64.

In view of the above, in my opinion, even if the prosecution was allowed to produce the report of the handwriting expert by way of additional evidence, the learned Sessions Judge, had gone wrong in allowing the prosecution to tender the said report of the handwriting expert in evidence, without examining the expert and allowing opportunity to the accused to cross-examine him. As referred to above, this was contrary to law, inasmuch as such a report would not be covered under section 293, Code of Criminal Procedure.

For the reasons recorded above, while upholding the order of the learned Sessions Judge, allowing the prosecution to produce the report of the handwriting expert by way of additional evidence, the present petition is partly allowed and the order dated 23 September 2000, passed by the learned Sessions Judge, is modified and

it is directed that for proving the report of the handwriting expert, the prosecution would be given opportunity to examine the expert, who had given the said report and the accused would have the right to cross-examine the said witness.

10.25.4 Forgery: (addition)[32]

Author's Summary

In this case, a borrower took a loan of Rs 25000/- from a moneylender and wrote a promissory note. The money lender added digit "1" to the figure to increase the amount to Rs 125000/= in the promissory note. The victim admitted his signatures etc. on the document but not the amount. An expert found the forged addition of digit "1". The trial court accepted the expert's report and rejected lender's claim. The case, ultimately, came up in SC. It agreed with the trial Court and did not accept the lender's claim.

Highlight italicised

32. *Tatipamula Naga Raju v Pattem Padmavathi,* AIR 2011 SC 1499 : (2011) 4 SCC 726 : 2011 AIR SCW 2168.

Relevant Extracts (Verbatim)

2. The suit had been filed by the plaintiff (the respondent herein) for recovery of Rs 1,90,000 from the defendant, who is the appellant herein, with interest and the claim was based on a promissory note, which was alleged to have been executed by the defendant for Rs 1,25,000. The trial court dismissed the suit in the circumstances stated hereinbelow.

3. The case of the plaintiff was that a sum of Rs 1,25,000 had been borrowed by the defendant and the defendant had, therefore, executed a promissory note for Rs 1,25,000 on 18 September 2001. In spite of demand, as the amount was not repaid, the plaintiff was constrained to file Original Suit No. 933 of 2003 for recovery of the said amount along with interest thereon.

9. Being aggrieved by the order passed in the appeal, the defendant filed Second Appeal No. 587 of 2008 in the High Court of Andhra Pradesh and the said appeal was dismissed by the High Court because no substantial question of law was involved in the appeal.

10. We have heard the learned counsel and have considered the judgments of all the courts. the evidence of the mediators, in whose presence the dues of the defendant had been settled and Nanaji, son of the plaintiff was paid Rs 90,000 in full settlement of Rs 1,25,000 borrowed by the defendant from Nanaji. The defendant had admitted the earlier transactions, which he had with the son of the plaintiff.

In our opinion, the evidence of the mediators and the handwriting expert was duly considered and appreciated by the trial court and the trial court had come to a right conclusion. There was absolutely no reason for the lower appellate court to arrive at a different conclusion than the one arrived at by the trial court. We are, therefore, of the opinion that the findings arrived at by the trial court are absolutely correct and no justifiable reasons have been given by the lower appellate court for arriving at a different conclusion.

11. *In our opinion, simply because the defendant had fairly admitted his signature, the court should not have come to the conclusion that the amount was payable by the defendant especially when there was an expert evidence that figure "1" was added so as to make the figure 1,25,000 from figure 25,000*

and when the mediators had deposed to the effect that there were transactions between the defendant and the son of the plaintiff and in pursuance of the said transaction, promissory notes were executed by the defendant and one of the promissory notes was not returned to the defendant. The explanation given by the defendant, which was supported by ample evidence, ought to have been considered by the lower appellate court and the lower appellate court should not have been guided by a mere fact that the defendant had admitted execution of the promissory note. In our opinion, in such a set of circumstance, the defendant ought not to have been saddled with a liability to pay the amount in pursuance of the tampered promissory note for which no consideration had ever passed from the plaintiff to the defendant.

12. As the High Court did not find any substantial question of law, it did not entertain the second appeal.

13. ***For the aforestated reasons, we are in agreement with the conclusion arrived at by the trial court and, therefore, we set aside the order passed by the High Court as well as the order passed by the lower appellate court and restore the order passed by the trial court whereby the suit had been dismissed.***

10.25.5 *Prima Facie* Case from Handwriting[33]

Author's Summary

It is case in which arbitration between two real brothers was to resolved. However, one brother forged a document 'Retirement Deed' which is purported to dispense with the Arbitration. However, an expert found the document forged It caused confusion among the lower judiciary. It appointed one SC judge as the arbitrator to decide all issues relating to the dispute.

Highlight italicised

Relevant Extracts (Verbatim)

The dispute in this case is between brothers. The appellant, Sunder Kukreja filed a petition under section 20 of the Arbitration Act, 1940 praying for the appointment of an arbitrator. The parties are real brothers and were carrying on business with each other in the name and style of D.R. Kukreja and Company. Their mutual rights and obligations were governed by partnership deeds, the last of which was executed on 10 July 1984.

In terms of clause 11 of the said deed, disputes arising between the parties had to be resolved by way of arbitration before a sole arbitrator to be nominated by the parties. Clause 11 reads as follows:

> "11. In the event of any dispute or disputes arising between the parties in the running of the partnership business or any matter relating to partnership, it shall be referred to a sole arbitrator, agreed to in writing by the parties and the award given by the sole arbitrator shall be binding on all the parties. In case the parties cannot agree to a sole arbitrator, the matter will be decided in accordance with the Arbitration Act, 1940."

> *6. It was contended by the respondents true that the partnership was dissolved by the parties with mutual consent in terms of the retirement deed dated 16 August 1990 alleged to have been executed by the appellant. However, the appellant denied executing any such retirement deed.*

Subsequently, the petition under section 20 of the Arbitration Act was filed by the appellants seeking a direction for filing the arbitration agreement dated 10 July 1984 in the court and for reference of the dispute between the parties to arbitration in terms of clause 11 thereof.

It was alleged in the petition under section 20 that disputes relating to payment of profits earned by the partnership firm and the interest on the said amount had arisen between the parties which called for adjudication by the arbitrator under clause 11. The petitioner further alleged that the respondent had been mismanaging the affairs of the partnership by employing undesirable elements and other dubious means, thereby disentitling himself to remain in control of the partnership.

The said petition under section 20 was opposed by the respondent herein who filed a written statement contending that the petitioner has misrepresented the true facts and that there was no subsisting arbitration agreement between the parties in the light of the retirement deed dated 16 August 1990 allegedly executed by the petitioners by which the partnership between the parties stood dissolved and all claims stood completely satisfied. It was also alleged that the petitioners had not come to the court with clean hands and had

33. *Surender Kukreja v Mohan Lal Kukreja,* AIR 2009 SC 2108 : (2009) 4 SCC 585 : 2009 AIR SCW 2691 : (2009) 4 Scale 529.

deliberately omitted to mention the fact of their retirement from the business under the retirement deed.

> *The genuineness of the retirement deed was, however, challenged by the appellants herein (the petitioners in the petition under section 20) who asserted that no retirement deed had been executed by them. According to the petitioners, the alleged retirement deed was a forged and fabricated document which was never executed by the petitioners, and which was prepared to somehow usurp the share belonging to the other partners in the firm without settling the accounts.*
>
> *By an order dated 1 May 1996, the learned Single Judge hearing the arbitration petition referred the disputed deed of retirement for examination and opinion to the Central Forensic Science Laboratory (CFSL). The document in question was accordingly examined by CFSL which reported that the alleged signatures of the petitioners on the alleged retirement deed were not genuine. The learned Single Judge held that the plea that there was no dispute because of the alleged retirement deed and receipts can be easily gone into by the arbitrator, and in view of the report of the forensic expert, between the parties it cannot be prima facie said that the dispute does not whilst. The report of the forensic expert creates a substantial doubt in the stand taken by the respondent of the alleged retirement of the appellant from the partnership.*

In appeal, however, the Division Bench of the High Court was of the view that in case there is a dispute as to the very existence of an arbitration clause by reason of supersession of the agreement in which the same is contained by another subsequent agreement arrived at between the parties the said dispute cannot be referred to arbitration. The Division Bench hence set aside the judgment of the learned Single Judge and remanded the matter to the learned Single Judge for a fresh consideration of the question whether the alleged retirement deed was never executed between the parties.

In our opinion the learned Division Bench was not correct in holding that the dispute should not have been referred to the arbitrator in view of the alleged retirement deed dated 16 August 1990. The very genuineness of the said retirement deed was challenged and in fact the forensic expert, gave a report that it was not genuine. The learned Single Judge has recorded prima facie satisfaction that the dispute had not become dead. Hence, in view of the decision of this court in Shree Ram Mills Ltd v Utility Premises Pvt Ltd, JT 2007 (4) SC 501 it would have been appropriate to have left the question regarding the genuineness of the alleged retirement deed to be decided by the arbitrator.

In view of the above discussion, *we set aside the decision of the Division Bench and we appoint Mr. Justice DP Wadhwa, retired Judge of the Supreme Court as the sole arbitrator to decide the dispute between the parties, including the dispute whether the alleged retirement deed was genuine or not. Hon'ble Mr. Justice DP Wadhwa can fix his own terms of emoluments and other requirements*.

10.25.6 Wrong Report Discarded: Ocular Evidence Accepted[34]

Author's Summary

It is a simple case of signature denial. It was proved false as the postman who delivered the receipt said that he saw the person signing. The liar but an expert who denied that were the signature were not his (Incompatible Standards?). The court accepted the ocular version.

Relevant Extracts (Verbatim)

The respondent allegedly gave a hand loan or Rs 1,20,000 to the appellant on 4 October 2000. In discharge of the said debt the appellant is said to have issued two cheques for Rs 60,000

34. *P Venugopal v Madan P Sarathi,* AIR 2009 SC 568 : (2009) 1 SCC 492 : (2009) 1 SCC (Cri) 554.

each on 26 April 2001 and 5 April 2001. The said cheques were presented before the bank on 10 July 2001 and were returned dishonoured on the ground that sufficient fund therefor was not available.

Upon service of notice upon the respondent, a criminal complaint was filed. By an order dated 20 November 2002, cognizance of the offence under section 138 of the Negotiable Instruments Act, 1881, was taken by the learned Magistrate.

Before the learned trial judge, the parties examined themselves. One of the contentions, raised by the appellant was that there did not exist any relationship of creditor and debtor between the parties. It was furthermore urged that notice in terms of the proviso appended to section 138 of the Negotiable Instruments Act, was not served upon the appellant.

Learned Additional Metropolitan Magistrate upon considering the materials brought on record by the parties, including the report of a handwriting expert, opined that the signatures appearing on Exhibit P-II (Postal Acknowledgment) was not that of the appellant.

The signature of the appellant on the said postal acknowledgement was compared with his signatures on the cheques. The respondent, however, examined the postal peon BA Subramanium as PW-2. He stated that he knew the appellant very well. The learned Metropolitan Magistrate did not place any reliance upon the said report of the handwriting expert and held that the notice was in fact served upon the appellant. It was also not disputed that the address of the appellant slated by the complainant was the correct address.

10.25.7 Expert Evaluation Indispensable[35] (Time Gap in Disputed and Standard Writings)

Author's Summary

It is a case of disputed Will of lady Uma. She Willed her property to a Mission Gaydia). Her real sister disputed that the Will is forged. The case went to High Court. It gave the property to the sister after comparing the signature and finding other lacunae.

Mission went to SC. It decided that the court should have taken the fact of registration of the Will/Codicil and sent the case to an expert as requested by the mission.

Relevant Extracts (Verbatim)

Brief facts of the case are that one Narendra Nath Bose, resident of Allahabad and working as Lecturer, Government Girls' Inter College, Gonda (U.P.) was having his family consisting of his wife Radha Rani Bose and three daughters, (i) Asha Bose, (ii) Uma Bose, and (iii) Shobha Bose (respondent herein). All the three sisters (daughters of deceased Narendra Nath) decided not to marry. Kum. Asha Bose died on 9 June 1990.

Kum. Uma Bose was serving as a Lecturer in Government Girls College, Gonda, UP and was a disciple of "Gaudia Mission" (hereinafter referred to as "the Mission") a Society, registered under the Societies' Registration Act, 1860 (appellant herein). She was closely associated with the activities of the Mission and also got printed various religious books and literature for the Mission by spending considerable amount. It is the case of the appellant that after her retirement from the College, she was living in Vrindaban and not with her sister Kum. Shobha

35. *Gaudiya Mission v Shobha Bose,* AIR 2008 SC 1012 : 2008 AIR SCW 564 : (2008) 1 SCALE 390.

Bose-respondent at Allahabad. She continued to take interest in the activities of the Mission. Because of her attachment and dedication towards work of the Mission, she executed a Will on 28 December 1994 bequeathing her properties in favour of the Mission. The Will was duly registered. On 9 September 1996, said Kum. Uma Bose executed a Codicil in favour of the appellant Mission in relation to certain further sums and movable properties which had come to her share and also her share in immovable properties at Vrindaban. The Codicil was also registered on 19 September 1996. On 18 November 1996, Kum. Uma Bose died in Vrindaban.

According to the appellant Mission, Kum. Shobha Bose-respondent No. 1 herein-real sister of late Uma Bose, never kept any relation with her and never looked after her and continued to stay at Allahabad only. It is the case of the appellant that in 1997, respondent No. 1 Kum. Shobha Bose applied for a Letter of Administration to the estate of deceased Kum. Uma Bose concealing real facts, of Will and Codicil in favour of appellant-Mission. The Letter of Administration was granted to her on 26 September 1997 but on application at the instance of the appellant Mission, the certificate was cancelled. The appellant-Mission applied for Probate for the Will executed by deceased Kum. Uma Bose by filing Probate Case No. 174 of 1997 before the Division Bench of Allahabad High Court. The application was, however, withdrawn by the appellant with the liberty to file fresh proceedings. Respondent No. 1-Kum. Shobha Bose filed Testamentary Suit for the estate of deceased Kum. Uma Bose. The appellant-Mission filed its objections to the said suit and claimed that it was the appellant who was entitled to the property of deceased Uma Bose and Kum. Shobha Bose had no right, title or interest in the estate of late Kum. Uma Bose. Issues were framed by the court and witnesses were examined. Respondent No. 1-Kum. Shobha Bose produced a sale deed said to have been executed by Kum. Uma Bose long back and contended that signature on the sale deed and that in the Will did not tally. The appellant-Mission applied to the High Court that the signatures be examined by handwriting expert. But the prayer was not granted by the court.

The matter was then heard by a Single Judge of the High Court and by judgment and order dated 28 March 2006, the learned Judge himself compared the handwriting of deceased Kum. Uma Bose in sale deed and in the Will and held that the Will was surrounded by suspicious circumstances. He also observed that the deceased was not living in Vrindaban and was not being looked after by the Mission as claimed by the Mission. He held that Kum. Shobha Bose was the real sister of deceased Kum. Uma Bose. In that capacity, she was entitled to a Letter of Administration of the estate and credits of late Kum. Uma Bose. The court consequently ordered payment of amount received from the Bank by the deceased to Kum. Shobha Bose holding that she was entitled to the said amount. She was also held to be the owner of the house. The learned Judge also imposed cost of Rs 25,000 on the Mission-appellant herein.

Being aggrieved by the order passed by the trial court (Single Judge), Special Appeal was filed by the appellant herein before the Division Bench of the High Court which, as stated above, was dismissed *in limine* by the Division Bench holding that the view taken by the Single Judge was correct and appeal did not require admission. Hence, the present appeal has been preferred by the appellant-Mission.

The counsel made serious grievance against the order passed by the learned Single Judge and confirmed by the Division Bench on the ground that they had committed a grave error in comparing signatures and hand-writings of deceased Kum. Uma Bose on sale deed and in the Will and in coming to the conclusion that the signatures and the hand-writings differed and they were not of one and the same person.

The counsel urged that this court has held in several cases that no comparison of hand-writing should be made by a court as it is the function of an expert. It is dangerous, hazardous and risky to

record a finding on comparison of hand-writings on different documents and it should be avoided. In the instant case, though the said objection was taken before the trial court by the appellant and an application was also made to send the hand-writings to experts, the prayer was rejected and the court proceeded to undertake the exercise which was not warranted. But, even otherwise, the appellant contended that the court was in error in comparing handwritings of Kum. Uma Bose in the Will on the one hand and in the sale deed on the other hand. So far as sale deed is concerned, it was said to have been executed in 1987 whereas Will was executed in 1994. There was thus substantial time lag between the sale deed and the Will and the said important and vital fact had not been considered properly by the learned Single Judge.

Bare reading of the aforesaid provision leaves no room for doubt that it is a regular appeal and all questions *i.e.,* questions of fact and of law are open to urge before the appellate court. In the circumstances, it was expected of the Division Bench to consider all submissions and contentions of the parties.

We are also of the view that the argument of the learned counsel for the appellants that the Will as well as Codicil were executed in 1994 and 1996 and both were duly registered, was one of the relevant factors which ought to have been kept in mind by the Division Bench. Again, even if it is held that a court of law has power, authority and jurisdiction to compare hand-writings under section 73 of the Evidence Act, the point raised as to whether on the facts and in the circumstances of the case and in the light of an application made by the appellant-Mission that they may be sent to hand-writing expert, the court should have undertaken the exercise of comparison of handwritings was a relevant issue. This is coupled with the fact that the sale deed said to have been executed by deceased Kum. Uma Bose was of 1987 and Will and Codicil were of 1994 and 1996 respectively.

10.25.8 Expert Evidence not Essential[36]

Author's Summary

It is a simple case of fraud where the marks of various relevant papers have been changed. However, the fraudster made such blunder that the forger was easily identified.

The case did not involve Handwriting or other Forensics.

Highlight italicised

Relevant Extracts (Verbatim)

Prosecution version as unfolded during trial is essentially as follows:

A-1 is the son of A-2, who was running a nursing home at Ernakulam during the relevant period and A-4 was an Assistant Registrar, Examination Wing, Kerala University. A-1 was a Pre-degree student during the academic years 1978–79 and 1979–80 in the Mar Ivanios College, Thiruvananthapuram, affiliated to the Kerala University. He appeared for the first year Pre-degree examination in April, 1979 and for second year Pre-degree examination in April/May 1980. After the second year examination, A-1 got following marks as indicated in the mark list issued by the Mar Ivanios College:

English	204/300
Hindi	109/150
Physics	127/150

36. *AS Krishnan v State of Kerala,* AIR 2004 SC 3229 : (2004) 11 SCC 576 : 2004 Cr LJ 2833 (SC).

Chemistry	131/150
Biology	129/150
Grand total	700/900

Total for the optional subjects, *viz.,* Physics, Chemistry and Biology was 387 out of 450. The above mark list issued by the Kerala University to A-1, through Mar Ivanios College, Thiruvananthapuram was received by both the appellants with their acknowledgment in the mark lists kept in the college. As both appellants were aware that the marks secured by the A-1 were insufficient to get an admission in any medical college for the First Year MBBS Course in Kerala on merit, they entered into a criminal conspiracy along with A-3 and A-4 and some day between 30 June 1980 and 10 October 1980 for forging a mark list showing higher marks and pursuant to such conspiracy A4 in the case procured a blank mark list of Pre-degree examination and by fraudulent means and without the knowledge and authority of the Controller of Examinations (PW-1) got the impression of the facsimile signature of PW-1 and the University emblem seal affixed on the blank mark list form. A-4 wrote in his own handwriting falsely and fraudulently the following marks in the forms to have been secured by A-1 in the Pre-degree final year examination:

English	:	204/300
Hindi	:	109/150
Physics	:	142/150
Chemistry	:	140/150
Biology	:	138/150
Grand total	:	733/900

In addition total of 420 marks out of 450 marks was shown for the optional subjects, *viz.,* Physics, Chemistry and Biology. A-4 forged the initials of the concerned section assistants, who actually prepared the true mark list issued through Mar Ivanios College and received by A-1 and A-2. A-4 also attested a true copy of the mark list (Ext. P-27). He forged with his designation and seal and entrusted both the forged mark list and its true copy attested by him (Ext. P-27) to A-1 and A-2. Ext. D-4 is the forged mark list. A-1 and A-2 thereafter prepared an application form for admission to a Medical College during the year 1980–81 with their signatures by incorporating the marks found in Ext. D-4, the forged mark list fully knowing the forged nature of Ext. D-4 and forwarded such application together with the attested true copy Ext. P-27 of Ext. D-4 to the Medical College, Thiruvananthapuram with the fraudulent intention to make the concerned authorities to believe that the marks shown in the application are the real marks obtained by A-1 and thereby cheated the Selection Committee and obtained admission for the First Year M.B.B.S. course on merit basis. Appellants with the intention of causing disappearance of the evidence of the commission of the crime destroyed the true genuine mark list/the true copy of which is marked as Ext. D-8 in this case received by them from Mar Ivanios College and thus the appellants and the other acquitted accused committed the alleged offences. A-3 was an associate of A-2.

6. Certain factual aspects need to be noted in the present case. Though, criticism was levelled against the analysis made by the High Court to find out how on the basis thereof it was held that the document was forged one, we find no substance therein. It was clearly conceded before the High Court that D-4 was a forged document. What was urged before the High Court was that even if it is forged, the appellants had not used it deliberately or intentionally as a forged document. A comparison of the mark sheet filed by A-1 with the marks register shows great variance.

The High Court has noticed that the appellants had asked for revaluation of the first year pre-degree answer sheets as they were not satisfied with the marks shown in the mark list and claiming that A-1 should have obtained more marks. Evidence was let in by the prosecution to indicate that in Part II Examination, optional subjects are there and the subjects are Physics, Chemistry and Biology and the maximum one can get in one of the above optional subjects is 150 marks and 45 marks were required to be obtained to pass. Part I consists of English and language other than English. As noticed by the High Court, Part II (optional subjects) each subject consists of Paper I, Paper II and practical. The examination for Paper I is conducted in the first year, where A-1 appeared in 1979. Paper II is written in the second year of the course and A-1 undisputedly appeared in the year 1980. The total marks of 150 are split as follows:

Paper I (1st year) 40 marks
Paper II (2nd year) 60 marks
Practical 50 marks

It has not been disputed by the appellants that the marks obtained by A-1 in the first year for Paper I were known. What they had done was to ask for revaluation. A-1 had obtained 24, 33 and 35 marks in Physics, Chemistry and Biology (as evidenced by Ext. P-2). *There is no provision for seeking revaluation for practical examination and it is only restricted to theory papers. Unless one knows the marks secured in a particular examination, the question of seeking revaluation does not arise. Though a claim was made that the result of re-valuation was not known so far as 1st year is concerned, the evidence on record clearly proves to the contrary. In the communication relating to results of revaluation it had been clearly indicated that there was no change in the marks. Obviously, the marks are shown in excess of the actual in Exh. D-4 can be related to Paper II. The excess marks are 33, i.e., 15, 9 and 9 in Physics, Chemistry and Biology respectively. As per Exh. D-4 the marks indicated are 142, 140 and 138 for the aforesaid three subjects. The High Court has taken pains to analyse that for the second year in respect of Paper II the maximum marks are 60 in the aforesaid three subjects. If by way of illustration, Physics marks are taken, originally before revaluation the mark secured by A-1 was 55 and if excess 15 marks are added to it, as the allegedly forged document shows the total comes to 70 marks. If the total marks for a paper are 60, there cannot be even a shadow of doubt that A-1 could not have secured 70 marks. Similar is the case of Biology, where the marks would be 61 against total maximum marks of 60, of course in Chemistry 59 marks are shown as against maximum 60 marks. If a student gets cent per cent marks in paper II in each subject the total would come to 180, whereas on the basis of D-4 it comes to 190. This impossible difference would have attracted notice of A-1 and A-2. They are not illiterate persons. As claimed by learned counsel for the appellants, A-1 was a brilliant student and A-2 was a reputed doctor and that they would miss this simple aspect in mark list is not only possible, to believe, but also would be against normal human experience. The High Court also on the basis of evidence tendered by PW-60, came to conclude that in the first year for Paper I the total marks secured by A-1 was 92 and practical marks were 138. Even if it is conceded for the sake of arguments, as submitted by learned counsel for the appellant, that A-1 secured cent per cent marks in Paper II the total marks would have come to 92+138+180 which would make a total of 410, and not 420 as Ext. D-4 shows.*

Another interesting feature has been noticed by the High Court to show how it would have been impossible for A-1 and A-2 to overlook something tainted appearing to even naked eyes. Exh. D-4 is dated 30 June 1980. It was not disputed before the High Court that the results were published for the first year degree course on 30 June 1988. If the results were published on 30 June 1980, Exh. D-4 which is purported to have been drawn up after revaluation could not have indicated a date seal of 30 June 1980. These factors clearly go to show that A-1 and A-2 had sufficient knowledge

that there was a forgery and they had used the document knowing it to be forged. The pretended ignorance stood belied and self-condemned on the indisputable materials on record. The plea of innocence as presently advanced has no substance.

10.25.9 Strictures on Prior Reports[37]

Author's Summary

It is a straightforward case of forgery. A bank employee got a cheque book issued in the name of a customer and withdrew through cheques over a lakh of rupees. The customer reported the fraud. The bank management found the culprit, proved his depredation through a handwriting expert and dismissed him after holding an inquiry.

In defense, the forger said that the report of the expert cannot be used as his expertise is tainted due to stricture. The SC held that prior strictures do not prevent acceptance of reliable evidence.

Highlight italicised

Relevant Extracts (Verbatim)

Order of dismissal from service having been restored by Division Bench of Delhi High Court setting aside judgment of the learned Single Judge, this appeal has been filed.

Factual background filtering out unnecessary details is as follows:

> Appellant (hereinafter referred to as "the employee") joined services of the Lakshmi Commercial Bank in 1976 as a Clerk. The said bank was merged with Canara Bank (hereinafter referred to as 'the employer') in October 1985. As a consequence, services of the employee stood transferred to the employer-Bank. He was posted as a Clerk in Deen Dayal Upadhyay Marg, New Delhi Branch and was deputed to work at AIWC extension of the said branch.

One customer of the Bank *i.e.,* SV Deshpande, advocate lodged a complaint with the police stating that there has been unauthorised withdrawal of Rs 1.07 lakhs from his account in the Bank. An internal investigation was also undertaken by the employer in respect of the complaint. Report of the preliminary investigation was submitted and the employee was served with charge-sheet along with imputations of misconduct to the effect that the employee was responsible for the unauthorised withdrawal from the customer's account.

Enquiry Officer was appointed to hold the enquiry and along with other witnesses the evidence of Handwriting Expert Mr. VK Sakhuja was tendered. The proceedings in the enquiry were concluded on 29 April 1993. Both the parties were asked to submit their written submissions. At this stage the employee filed an application for further cross-examination of a Handwriting Expert. Said prayer was rejected on 10 May 1993. The Enquiry Officer submitted his report and the employee was also furnished with a copy to make his submissions as regards the findings. The written submissions were submitted on 24 June 1995. Findings of the Enquiry Officer were recorded. Thereafter order of dismissal was passed.

The Disciplinary Authority concurred with findings of the Enquiry Officer after taking into account the submissions made by the employee. The charge sheet contained the following allegations:

37. *Lalit Popli v Canara Bank,* AIR 2003 SC 1796 : (2003) 3 SCC 583 : 2003 AIR SCW 1238.

On the 11th of May, 1992, a charge-sheet was issued to the petitioner in the following terms:—

Whereas, there are *prima facie* grounds for believing that you have committed gross misconduct, the particulars whereof are given below, this charge-sheet has been drawn up against you and you are required to submit me within 15 days of receipt of this charge-sheet a statement in writing setting forth your defence, if any and showing cause as to why suitable action should not be taken against you.

CHARGE

You have been working at Canara Bank, DDU Marg, New Delhi Branch since 7 March 1986.

One Mr. SV Deshpande, Advocate, Supreme Court of India is maintaining his SB A/c. No. 4272 with AIWC Extn. Counter of DDU Marg, New Delhi Branch. On 23 December 1991 a cheque book authorized to be issued in S.B. A/c. No. 4272 to one Sri Mohinder Kumar on the strength of a purported letter in violation of the laid down procedure of the bank. Thereafter, a total of Rs 1,07,000 was withdrawn from his account by utilizing five cheques out of the abovesaid cheque book, details which are given below:

Date	Cheque No.	Amount
26-12-91	460827	Rs 15,000
28-12-91	460823	Rs 15,000
31-12-91	460821	Rs 15,000
31-12-91	460822	Rs 14,000
31-12-91	460826	Rs 50,000

The accountholder has complained/disputed above said withdrawals as well as the issuance of the cheque book No. 460821 to 460830. The purported letter on the basis of which the abovesaid cheque book had been issued had also not been found on records. The handwriting expert has confirmed that the signatures appearing on the abovesaid cheque are not that of Mr. SV Deshpande, the accountholder and they are forged.

The cheque No. 460826 for Rs 50,000 was posted by you in the relative ledger on 31 December 1991 though there was a fictitious endorsement on the reverse of the cheque to give creditability to the transaction.

Handwriting expert has opined after examining your handwriting with that of the disputed instruments in question that the signatures of the account-holder appearing on the above said five cheques and the endorsement on the back of the cheque No. 46026 for Rs 50,000 is in your handwriting.

From the above, it is evident that you by misusing your official position, in collusion with someone else, got the above said cheque book issued in S.B. A/c. No. 4272, utilised the cheque leaves in question by forging the signature of the accountholder and got the same presented to encash the cheques fraudulently.

By your above said fraudulent acts you have caused damage to the property of the bank thereby committed a gross misconduct within the meaning of Chapter XI, regulation 3, clause (j) of Canara Bank Service Code.

Your above said acts are also prejudicial to the interests of the bank thereby you have committed a gross misconduct within the Meaning of Chapter XI, regulation 3, clause (j) of Canara Bank Service Code.

Your abovesaid acts are also prejudicial to the interests of the bank thereby you have committed a gross misconduct within the meaning of the Chapter XI, regulation 3, clause (m) of Canara Bank Service Code.

An appeal was preferred by the employee before the prescribed appellate authority who rejected the appeal. The employee challenged the findings culminating in his order of dismissal by filing a writ petition before the High Court.

> *The main plea which was advanced before the learned Single Judge was that the Enquiry Officer should not have rested his decision on the opinion of the Handwriting Expert. The entire case rested on suspicion and there was no material to connect him with the alleged misconduct. Learned Single Judge referring to the evidence recorded during the enquiry proceedings came to hold that the conclusions arrived at by the Enquiry Officer were erroneous and no credence should have been attached to the evidence of VK Sakhuja and his evidence is no evidence at all. It was also held that the charges framed by the Bank do not have sustainability in law. These observations came to be made by a learned Single Judge because of some adverse remarks made against VK Sakhuja in three cases. The conclusions of learned Single Judge in para 17 so far as relevant read as follows:*
>
> *The fact that the courts had made very strong stricture against the Handwriting Expert is not disputed. In my view, Mr. Sakhuja is not a person who is competent to speak about the handwriting or fingerprints. His evidence is no evidence at all. Consequently, the charge issued by the bank is not sustainable in law. The findings by the Inquiry Officer against the petitioner are not based on any evidence and, thus, the order passed by the disciplinary authority cannot be sustained, in law there is, no evidence against the petitioner. Thus, the order of the disciplinary authority is wholly illegal, and it cannot be sustained.*

In appeal, the Division Bench observed that the High Court in exercise of the power under Article 226 of the Constitution of India, 1950 (in short 'the Constitution') does not act as an appellate authority and, therefore, the learned Single Judge was not justified in interfering with the conclusions arrived at by the disciplinary authority. This judgment of the High Court is under challenge.

Learned counsel appearing for the appellant-employee submitted that there has been a denial of fair play. There is no material to connect the appellant with alleged forgery, which was the foundation for the disciplinary action. Report of the Handwriting Expert about whose credibility serious remarks were made has no evidentiary value, and he is not a competent witness and his report which forms the foundation for disciplinary action has to be ignored and if that is kept out of consideration, there is no other material on which the allegations of misconduct could be substantiated. It is pointed out that when investigation was done initially, a report was submitted by the Forensic Science Laboratory which did not find any material against the employee and others. The employee was also denied an adequate opportunity to submit his reply as regards the enquiry report. The charges related to two transactions. One was posting of the cheque and the other related to forgery. Report of the Handwriting Expert is full of inconsistencies and the conclusion about similarity in handwriting in the disputed document and the admitted signatures has been drawn erroneously. To prove his innocence the employee had requested the authorities to hand over the enquiry to the Central Bureau of Investigation. This request was made as the employee was convinced that the authorities were bent upon removing him from service for union activities. Further, request was made for being represented by an advocate which was turned down. The employee had requested for supply of certain documents which were not accepted to causing thereby prejudice.

Learned counsel for the respondents on the other hand submitted that the Division Bench rightly considered the scope and ambit of judicial review in the matter of disciplinary proceedings. The stand that the Handwriting Expert's report cannot be accepted without further corroboration is not the correct proposition in law. Denial of the representation by an advocate was also justified because the presenting officer was not an advocate or a person with a law background. The only area of dispute related to acceptability of the Handwriting Expert's report. The employee who claimed to be

a trade union activist is well-versed with various aspects relating to service jurisprudence, has cross-examined at length and quite effectively the management witnesses. Therefore, there is no substance in the plea that there was prejudice by refusal of permission to be represented by an advocate. It was further submitted that no argument was advanced before the High Court (either before learned Single Judge or the Division Bench) regarding prejudice. It is also pointed out that the employee himself held accepted that he committed careless mistakes but took the plea that there was no criminal intent. The authorities have analysed the job requirements of the post which the employee held and discussed at great length as to how the requisite care and caution were not exercised. A bare look at the endorsement on the back side of the cheque would have aroused suspicion. The plea that many transactions took place that day is clearly without substance because an employee of the bank is required to be vigilant and any abnormality should have been noticed. The customer was an advocate and he could not have misspelled the word 'signature' as appears on the reverse side of the cheque in question in the endorsement. There was an unusual endorsement and withdrawal of Rs 50,000 by a bearer cheque. The unusual features should have aroused suspicion. That being so, the authorities were justified in drawing adverse remarks. The report of the Handwriting Expert is clear and cogent and has clearly spelt out the areas of similarities in the disputed document and the admitted writings to highlight as to how employee was the author of forgery.

> ***To start with the approach of the learned Single Judge as regards evidence of VK Sakhuja is clearly erroneous. Even if there were adverse remarks (which we find related to 1958–59) that did not affect the credibility of his evidence to treat it as totally irrelevant and to be no evidence in the eye of law. What was required was a careful analysis of evidence, if it was brought to the notice of the authorities that his evidence has been doubted in the past. Nothing could be shown to us as to how the report in this particular case suffers from any infirmity. There is no finding recorded by learned Single Judge to that effect. On that score alone the Division Bench was justified in upsetting the learned Single Judge's decision.***

Sections 45 and 73 of the Indian Evidence Act, 1872 (in short 'The Evidence Act') deal with opinion of experts and comparison of signature, writing or seal with others admitted or proved. Section 45 itself provides that the opinions are relevant facts. It is a general rule that the opinion of witnesses possessing peculiar skill is admissible. There was no challenge to the expertise of VK Sakhuja. He deposed to have testified in about ten thousand cases relating to disputed documents. Though the employee highlighted certain adverse remarks, it cannot be lost sight that they were about four decades back. But we need not go into that aspect in detail as no infirmity in the report acted upon by the authority in the present case was noticed or could be pointed out.

It is to be noted that under sections 45 and 47 of the Evidence Act, the court has to take a view on the opinion of others, whereas under section 73 of the said Act, the court by its own comparison of writings can form its opinion. Evidence of the identity of handwriting is dealt with in three sections of the Evidence Act. They are sections 45, 47 and 73. Both under sections 45 and 47 the evidence is an opinion. In the former case it is by a scientific comparison and in the latter on the basis of familiarity resulting from frequent observations and experiences. In both the cases, the court is required to satisfy itself by such means as are open to conclude that the opinion may be acted upon. Irrespective of an opinion of the Handwriting Expert, the court can compare the admitted writing with disputed writing and come to its own independent conclusion. Such exercise of comparison is permissible under section 73 of the Evidence Act. Ordinarily, sections 45 and 73 are complementary to each other. Evidence of Handwriting Expert need not be invariably corroborated. It is for the court to decide whether to accept such an uncorroborated evidence or not. It is clear that even when experts' evidence is not there, court has power to compare the writings and decide the matter. [See *Murarilal v State of Madhya Pradesh,* AIR 1980 SC 531 : (1980) 1 SCC 704 : 1980 Cr LJ 396 : (1980) 2 SCR 249.]

In the instant case, the Enquiry Officer and the Disciplinary Authority took pains to carefully consider the Handwriting Expert's report and also looked at the documents to arrive at their own conclusions.

Great emphasis was laid on the Forensic Science Laboratory's report to say that the Handwriting Expert's report is not worthy of acceptance. We have looked at the report of the Forensic Science Laboratory. It only says that no definite opinion can be formed. That itself is an indication that a clean chit was not given as claimed by the employee.

It is fairly well-settled that the approach and objective in criminal proceedings and the disciplinary proceedings are altogether distinct and different. In the disciplinary proceedings the preliminary question is whether the employee is guilty of such conduct as would merit action against him whereas in criminal proceedings the question is whether the offences registered against him are established and if established what sentence should be imposed upon him. The standard of proof, the mode of enquiry and the rules governing the enquiry and trial are conceptually different.

See *State of Rajasthan v BK Meena,* AIR 1997 SC 13 : (1996) 6 SCC 417 : 1996 AIR SCW 4160 : 1996 (3) SCJ 582. In case of disciplinary enquiry, the technical rules of evidence have no application. The doctrine of "proof beyond doubt" has no application. The preponderance of probabilities and some material or record are necessary to arrive at the conclusion whether or not the delinquent has committed misconduct.

While exercising jurisdiction under Article 226 of the Constitution the High Court does not act as an appellate authority. Its jurisdiction is circumscribed by limits of judicial review to correct errors of law or procedural errors leading to manifest injustice or violation of principles of natural justice. Judicial review is not akin to adjudication of the case on merits as an Appellate Authority.

In *BC Chaturvedi v UOI,* AIR 1996 SC 484 : (1995) 6 SCC 749 : 1995 AIR SCW 4374 : JT 1995 (8) SC 65, the scope of judicial review was indicated by stating that review by the court is of decision-making process and where the findings of the disciplinary authority are based on some evidence, the court or the Tribunal cannot re-appreciate the evidence and substitute its own finding.

As observed in *RS Saini v State of Punjab,* AIR 1999 SC 3579 : (1999) 8 SCC 90 : 1999 AIR SCW 3587 : (1999) 5 Scale 427 in paras 16 and 17 the scope of interference is rather limited and has to be exercised within the circumscribed limits. It was noted as follows:

> Before adverting to the first contention of the appellant regarding want of material to establish the charge, and of non-application of mind, we will have to bear in mind the rule that the court while exercising writ jurisdiction will not reverse a finding of the enduring authority on the ground that the evidence adduced before it is insufficient. If there is some evidence to reasonably support the conclusion of the inquiring authority, it is not the function of the court to review the evidence and to arrive at its own independent finding. The inquiring authority is the sole judge of the fact so long as there is some legal evidence to substantiate the finding and the adequacy or reliability of the evidence is not a matter which can be permitted to be canvassed before the court in writ proceedings.

A narration of the charges and the reasons of the inquiring authority for accepting the charges, as seen from the records, shows that the inquiring has based its conclusions on materials available on record after considering the defence put forth by the appellant and these decisions, in our opinion, have taken in a reasonable manner and objectively. The conclusion arrived at by the inquiring authority cannot be termed as either being perverse or not based on any material nor is it a case where there has been any non-application of mind on the part of the inquiring authority. Likewise the High Court has looked into the material based on which

the enquiry officer has come to the conclusion, within the limited scope available to it under Article 226 of the Constitution and we do not find any fault with the finding of the High Court in this regard."

As noted above, the employee accepted that there was some lapse on his part, but he pleaded lack of criminal intent. A bank employee deals with public money. The nature of his work demands vigilance with the inbuilt requirement to act carefully. Any carelessness invites action.

As has been rightly submitted by learned counsel for the respondents-Bank, even to the naked eye the mistake in spelling of "signature" are visible and should not have escaped the eyes of a bank employee who is supposed to be trained and equipped to notice the similarities highlighted by the Handwriting expert in the disputed document and the admitted signatures of the employee to show how the similarly is visible and even any layman can notice the similarity. These were a factual conclusion.

Considering the limited scope of judicial review, the Division Bench was right in upholding the order of dismissal by setting aside the learned Single Judge's order by which interference was made with it. We find no reason to differ from the conclusion of the Division Bench. The appeal is without merit and is dismissed accordingly.

10.26 ADDITIONAL CASE LAW

10.26.1 Expert Evidence not Essential[38]

1. Marmik's statement that the appellant had written the endorsement on the postal receipt has been accepted by the High Court. It is not necessary to examine a handwriting expert in every case of disputed writing. The investigating officer stated that he did not send the specimen writing of the appellant for comparison with the endorsement on the postal receipt as he could not secure admitted writings of the appellant though he tried his best to obtain his admitted handwritings. He was not further questioned to explain why he considered it necessary to have admitted writings of the appellant in order to obtain the opinion of the handwriting expert about the disputed writing when specimen writings of the appellant were available. The explanation of the investigating officer seems to have been on account of practice. It appears from his statement that he sent certain questioned documents along with the admitted handwritings and specimen handwritings, signatures and initials of accused Nos. 1 and 2 to the government examiner of questioned documents. The practice may be sound or not but the *bona fides* of the conduct of the investigating officer cannot be questioned. The High Court, however, further considered that the material provided by the writing on the acknowledgement receipt was very scanty and the investigating officer might have felt that the subsequent handwriting would be feigned or disguised and that any comparison with the same would be deceptive. Such considerations might have been in the mind of the investigating officer but he had not stated them to be his reasons for not obtaining the opinion of the handwriting expert. The High Court cannot be said to have been in error in taking these further reasons into consideration and holding that no adverse inference can be drawn against the prosecution from the fact that the opinion of the handwriting expert has not been obtained with respect to the endorsement on the acknowledgement receipt.[1]

38. *Srichand K Khetwani v State of Maharashtra*, AIR 1967 SC 450 : (1967) 1 SCWR 896 : 1967 Cr LJ 414 (SC).

10.26.2 Court as Expert[39]

This statement is not factually correct also as the trial court had itself compared these writings and signatures with certain other writings which had been proved to be of the respondent. A court is competent to compare the disputed writing of a person with others which are admitted or proved to be his writing. It may not be safe for a court to record a finding about a person's writing in a certain document merely on the basis of the comparison, but a court can itself compare the writings in order to appreciate properly the other evidence produced before it in that regard. The opinion of a handwriting expert is also relevant in view of section 45 of the Evidence Act, but that too is not conclusive. It has also been held that the sole evidence of a handwriting expert is not normally sufficient for recording a definite finding about the writing being of a certain person's or not. It follows that it is not essential that the handwriting expert must be examined in a case to prove or disprove the disputed writing. It was, therefore, not right for the learned judge to consider it unsafe to rely upon the evidence of the complainant in a case like this, *i.e.*, in a case in which no handwriting expert had been examined in support of his statement.[40]

10.26.3 Expert Evidence Essential[41]

1. A comparison of the signature of the first defendant in Ex-A-1 with those found in Exs. B-4 to B-10 brings out the clear differences between the two. While the admitted signatures are in a free and flowing hand, the disputed one appears to be a laboured and constrained one. D.W. 2 says that in his signature ordinarily there will be spacing between the first two letters and the third letter and that the final two letters are written one over the other.

In the admitted signature, the first two letters are written over one another and there is spacing between the 2nd letter and the 3rd letter whereas it is not so in the case of the disputed signature. In this case, we have not had the advantage of a handwriting expert scrutinizing the signatures and giving his opinion on the genuineness or otherwise of the disputed signature. This is certainly one of those cases where expert evidence would have been of great use.

But for one reason or other that was not done in the court below. The learned counsel for the appellant suggests that the document may now be sent to an expert but we think the request is rather too late for the suit is of the year 1950 and six years have passed by. The appellant also filed an application for admission of other documents containing the first defendant's signatures for comparison. It is alleged in the affidavit filed in support of the petition that said documents were sent to the High Court in Appeal No. 812 of 1948, and, after the appeal was disposed of, they had been returned to the District Court, Anantapur and they were still there.

But that appeal was disposed of in February, 1951, whereas the suit out of which this appeal arises, was dismissed on 25 February 1952 and the plaintiff had every opportunity to file the documents in the District Court if he had intended to use them for the purpose of

39. *State of Gujarat v Vinaya Chandra Chhota Lal Pathi*, AIR 1967 SC 778 : (1967) 1 SCWR 391 : 1967 Cr LJ 668 (SC). **Also see**: *Basawarajaswami (Re)*, AIR 1967 Mys 210 : (1967) 1 Mys LJ 548 : 1967 Cr LJ 1536 (Mys); *Ranjit Sinha v State of Bihar*, (1963) 2 Cr LJ 36 (Pat).
40. *State of Gujarat v Vinaya Chandra Chhota Lal Pathi,* AIR 1967 SC 778 : (1967) 1 SCWR 391 : 1967 Cr LJ 668 (SC). Also see *Re Basawarajaswami*, AIR 1967 Mys 210 : (1967) 1 Mys LJ 548 : 1967 Cr LJ 1536 (Mys); *Ranjit Sinha v State of Bihar,* (1963) 2 Cr LJ 36 (Pat).
41. *Koppala Venkataswami v Satrasala Lakshminarayana Chetti*, AIR 1959 AP 204 : ILR 1957 AP 399 : 1959 Cr LJ 428 (AP).

comparison. There are no grounds for admitting the fresh document sought to be filed in this case.

No doubt, a comparison of the signatures without the help of an expert may not afford a conclusive test in the case of expert forgeries. But, in this case, the disputed signature appears to belong to a class different from the group of admitted signatures. It is not as if the admitted signatures were scribbled on some unimportant papers but they were all affixed to promissory notes wherein the first defendant was undertaking a liability.[42]

10.26.4 Court no Expert[43]

In view of the respective contentions of the parties the only question that falls for determination in this appeal is whether the learned Magistrate was justified in acquitting the respondents of the charge under section 63 of the Copyright Act, for absence of any expert opinion to prove that the offending books of the respondents were reproduction of the book printed and published by the *de facto* complainant. It appears from the impugned judgment that in insisting upon an expert opinion in deciding such a case the learned Magistrate relied upon a Division Bench judgment of this court in the case of *Sita Nath Basak v Mohini Mohan Singh*, AIR 1924 Cal 595. It is interesting to find that the case arose out of the copyright, which is the subject-matter of this appeal. It was held therein that the court should be reluctant to sit as an expert to decide the question of infringement of copyright and the proper course, in ordinary circumstances was to get the opinion of experts. On a careful perusal of the judgment in that case I find that the above view was expressed primarily on the ground that the court would have to take great pains and would have to waste its valuable time to ascertain how far the piracy extended and it was desirable therefore to seek opinion of expert to compare the works and to ascertain the details to avoid excessive expenditure of time and labour. The court also pointed out that such a course was also necessary as the court might not be conversant with the alphabets of the book.

In view of the above judgment, this court, in ordinary circumstances would have referred to the matter to the learned Magistrate to get the evidence of experts to ascertain whether the offence under the Copyright Act, was committed or not for the learned Magistrate was not justified in recording an order of acquittal for absence of any expert opinion. When the books were before him the court could have on its own motion, examined such experts for ends of justice. But then considering the fact that the offences were allegedly committed in the year 1972 and the case was instituted in 1973, such a direction would cause further delay. That apart considering the contents of the book I do not think it necessary to get the evidence of experts particularly when this court is acquainted with the alphabets. As pointed out in the judgment of *Sita Nath Basak* (supra) in ordinary circumstances expert opinion is necessary particularly when the contents of the book are such that the court, being not an expert cannot decide whether there is piracy or not. Considering all these facts and aspects; I proceed to decide whether the books printed and published by the respondents can be said to have infringed the copyright of the book owned by the *de facto* complainant. Before doing so it will be necessary to state the nature and contents of the books.[44]

10.26.5 Evidence Admissible[45]

In our view, the legal position enunciated in *Fakhruddin's* case[46] cannot be said to be inconsistent with the ratio of any one of the earlier decisions to which reference has been made therein. Now it is no doubt true that the opinion of a handwriting expert given in evidence is no less fallible than any other expert opinion adduced in evidence with the result that such evidence has to be received with great caution. But this opinion evidence, which is relevant, may be worthy of acceptance if there is internal or external evidence relating to the document in question supporting the view expressed by the expert. If after comparison of the disputed and the admitted writings by the court itself, when the presiding officer is familiar with that language it is considered safe to accept the opinion of the expert then the conclusion so arrived at cannot be assailed on special leave on the mere ground that comparison of handwriting is generally considered as hazardous and inconclusive and that the opinion of the handwriting expert has to be received with considerable caution. The question in each case falls for determination on the appreciation of evidence and unless some serious infirmity or grave failure of justice is shown this court would normally refrain from reappraising the matter on appeal by special leave. The trial court in this case agreeing with the principle of law enunciated by this court compared the relevant documents and arrived at the conclusion that they have all been written in one hand. The learned second temporary Session Judge on appeal after referring to the comparison of the disputed and specimen writings by the trial magistrate himself compared those writings with the help of the expert's opinion and his report and came to a definite conclusion "that the disputed handwritings tally with the specimen handwriting". In the High Court also the learned single judge, after referring to the decision in *Fakhruddin* case (supra), observed as follows:

> *I have myself made a comparison of the specimen writing of the applicant with the writing contained in the two letters. I have not the least doubt that the writing in the post-card and the writing in the admitted writing of the applicant are the same. Thus, I have no reason to differ from the finding recorded by the courts below.*

No serious attempt was made on behalf of the appellant to find fault with the approach of the three courts below. There is, therefore, no ground made out for interference by this court with the appellant's conviction. Unfortunately, the record is not before us otherwise we would have also tried to examine for ourselves the disputed and the specimen handwritings. However, in view of the concurrent decisions of the three courts below we did not consider it necessary to adjourn the hearing of this case to have the documents before us for our examination.[47]

10.26.6 Court No Expert[48]

Mr. Kohli said that these cases establish that the evidence of the handwriting expert is worthless and the court cannot compare the writing for itself and the only possible evidence should have been of one who either saw Fakhruddin write or was familiar with the writing. We had sent for

48. *Fakhruddin v State of Madhya Pradesh,* AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197.

the writings which are disputed and the writings with which they were compared with a view to observe for ourselves the similarities and differences between the two and to verify whether the conclusions of the handwriting expert were proper or not. Mr. Kohli contended that this was not open to us. We do not agree.

Evidence of the identity of handwriting receives treatment in three sections of the Indian Evidence Act. They are sections 45, 47 and 73. Handwriting may be proved on the admission of the writer or by the evidence of some witnesses in whose presence he wrote. This is direct evidence and if it is available the evidence of any other kind is rendered unnecessary. The Evidence Act also makes relevant the opinion of a handwriting expert (section 45) or of one who is said to have familiarity with particular writing. Thus, besides direct evidence which is of course the best method of proof, the law makes relevant two other modes. A writing may be proved to be in the handwriting of a particular individual by the evidence of a person familiar with the handwriting of that individual or by the testimony of an expert competent to do the comparison of handwritings on a scientific basis. A third method (section 73) is comparison by the court with writing made in the presence of the court or admitted or proved to be the writing of the person.

Both under section 45 and section 47 the evidence is an opinion, in the former by a scientific comparison and in the latter on the basis of familiarity resulting from frequent observations and experience. In either case the court must satisfy itself by such means as are open that the opinion may be acted upon. One such means open to the court is to apply its own observation to the admitted or proved writings and to compare them with the disputed one, not to become an handwriting expert but to verify the premises of the expert in the one case and to appraise the value of the opinion in the other case. This comparison depends on an analysis of the characteristics in the admitted or proved writings and the finding of the same characteristics in large measure in the disputed writing. In this way the opinion of the deponent, whether expert or other, is subjected to scrutiny. Where an expert's opinion is given, the court must see for itself and with the assistance of the expert come to its own conclusion whether it can safely be held that the two writings are by the same person. This is not to say that the court must play the role of an expert but to say that the court may accept the fact proved only when it has satisfied itself on its own observation that it is safe to accept the opinion whether of the expert or other witnesses.

Therefore, to satisfy ourselves whether the testimony of the handwriting expert is acceptable or not, we, sent for the record and compared the disputed writings with some comparable material. There were two such writings which were claimed as standard. One was a register maintained at the office of the Association in which there was a signature in three places in Hindi which purported to be that of Fakhruddin (Ex. P-56). The other was a writing which Fakhruddin made to the dictation of the police officer in jail (Ex. P-61). These were of course not admitted by Fakhruddin and the question had to be first decided which of the two or both could be said to be approved standard material. Mr. Kohli urged that Ex. P-56 could not be so treated as there was no proof that the signatures were made by Fakhruddin. In this submission Mr. Kohli is right. The evidence of Tahir Ali, P.W. 14 which has been relied upon is not definite on this point. He does not say that the signatures were of Fakhruddin who was the accused in the case. He only says that the person whose signatures were made in the register, signed it and this leaves the matter at large. There is, however, proof that the other writing was made by Fakhruddin, the appellant. The sub-inspector, P.W. 33 took the precaution of having two witnesses P.W. Nos. 16 and 27. Of these P.W. 16 did not identify the appellant as the writer but the other P.W. 27 did. Exhibit P-61, therefore, furnishes the necessary comparative material.

Mr. Kohli said that the expert took both Exs. P-56 and P-61 into account to reach his conclusion that the disputed writing was that of the appellant and he might have been persuaded to this view on the strength of Ex. P-56. This is not a correct reading of the evidence. The expert said that Exs. P-56 and P-61 and the disputed writings were all by the same person as they possessed the same individual characteristics. In other words, he proved that all these writings agreed in characteristic features. He proved that Exs. P-56 and P-61 were by the same writer but as we need not go to Ex. P-56 we may leave it out altogether and the conclusion of the expert that Ex. P-61 and the disputed material were written by the same person thus remains unimpaired.

We sent for these writings and compared them to satisfy ourselves about the accuracy of the expert's observations. Exhibit P-61 and the disputed writings on the applications are so clearly written by the same person that one hardly needs expert guidance. Numerous idiosyncrasies in one are faithfully reproduced in the other and leave no manner of doubt as to the authorship of the applications. They were written by the appellant. As the applications are ostensibly by different persons the conclusion is inescapable that Fakhruddin was making applications in diverse names and collecting iron sheets in this manner. Once the offence of forgery is established the proof of the other offence is clear. Fakhruddin's conviction for the offences other than conspiracy was, therefore, soundly grounded.[49]

10.26.7 Court's Scrutiny supports Expert Evidence[50]

So far as the appellant Ram Chandra is concerned the circumstantial evidence against him in respect of both the offences is clear. On the finding that the various ransom letters are in his handwriting and on the finding that a very large number of the noted currency notes which formed the ransom money was traced to his possession, there can be no doubt as to his conviction under section 386, Penal Code. It may be that normally it is not safe to treat expert evidence as to handwriting as sufficient basis for conviction. But in this case the authorship of the letters has been held by the courts below to be that of appellant Ram Chandra, on various items of external and internal evidence already noticed above in addition to the opinion of the expert. As regards the charge against him under section 364, Penal Code, for kidnapping, though there is no direct evidence, the various ransom letters categorically state that the missing boy is in the custody or control of the writer. Therefore, it is asserted therein that on payment of the ransom money, the boy will be restored at a particular time and place. We find it hard to believe that this can be mere pretence in order to strike terror in the mind of the father of the boy and to obtain money. It is to be noticed that the ransom letters started from the day next after the disappearance of the boy and they continued pouring in, right up to 4th July, a period of over three weeks. It appears to us to be extremely improbable that a person can keep up the pretence for so long if he had not the absolute confidence that there was no chance of the boy returning until the time which he had to take for bringing about payment of the ransom. The tone of these letters justifies one of two inferences, *viz*., either the boy has been already murdered as the confession suggests, or the boy, having been kidnapped is kept in effective custody so as not to be able to escape. We have, for reasons already given, felt it unsafe to convict the appellant Ram Chandra of the offence of murder. But there is absolutely no reason why his very admissions in the various letters of which he has been found to be the author, should not be treated as clear evidence against him that he has obtained the custody of the boy by kidnapping. It is true that the boy has not, in fact, been restored as promised in the various letters. But this by itself is no indication that the boy had not been kidnapped by persons of whom the writer of these letters is one. It may be recalled that though the boy was not restored

49. *Fakhruddin v State of Madhya Pradesh,* AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197.
50. *Ram Chandra v State of Uttar Pradesh*, AIR 1957 SC 381 : 1957 Cr LJ 559.
Also see: *Maliah v State of Mysore*, 1956 Cr LJ 253 (Mys).

on the 5th July, as promised, there was a further letter from the same writer dated the 5th July promising to restore the boy later on. This promise may not have fructified since before it has received the appellants were arrested. We are of the opinion that the circumstances lead to the conclusion that the appellant, Ram Chandra is guilty of the offence under sections 364 and 386 of the Indian Penal Code. It may also be mentioned that though we have considered it unsafe to act upon the confession as basis for the conviction in respect of murder, there is no reason why the confession insofar as it relates to the two offences of kidnapping and extortion should not be taken into consideration as against this accused to lend assurance to the conclusion we have reached against him insofar as these offences are concerned based on circumstantial evidence.

10.26.8 Evidence Reliable[51]

Shri Gopaiji Misra, Assistant Director-cum-Assistant Chemical Examiner, Forensic Science Laboratory, Chandigarh, P.W. 10, examined this Haryana Lottery Ticket in dispute Exhibit P-1 bearing No. B. 0623368 and also its number marked Q/l under stereo microscope in oblique reflected and transmitted light. On thorough examination he observed as follows:

1. First two digits from left to right, *i.e.*, 0 and 6 have not been tampered with except inking around these two digits.
2. From third to last digit (from left to right), *i.e.,* 2, 3, 3, 6, 8 are on small square pieces of papers bearing digits 2, 3, 3, 6 and 8 have been pasted separately.
3. The gaps between these square pieces of papers are clear at the places (a) in the horizontal part below the digits from 2 to 8, (b) in the vertical upper part between the digits 6 and 2, (c) in the vertical upper part between the digits 2 and 3, (d) in the upper vertical part between the digits 6 and 8, (c) in the middle and lower part of the right side of the digit 8.
4. The overlapping of these small pieces of papers is clear at places (a) in the lower vertical part between the digits 2 and 3, (b) in the lower vertical part between the digits 6 and 8.
5. The digits making the number of the ticket are not in proper alignment.

He gave the opinion that the digits from third to last (2, 3, 3, 6 and 8) have been transplanted in the gap made by cutting the original digits on the ticket and that the two digits 0 and 6 are original digits as no patch work could be observed. The inking around all the digits had been done to hide the tampering. He prepared the photographs Exhibits P.H., P.H./l and P.H./2 of the full ticket and the number bearing portion in reflected and transmitted ordinary light. His report is Exhibit P.G., which is signed by him. This witness was cross-examined by the counsel for the accused but nothing could be elicited from him to shake his testimony. He is M.Sc. and Ph.D. in Chemistry and has undergone practical training in Forensic Science Laboratory, Calcutta and Chandigarh and has done original research work, he is a Government servant and is a disinterested person. There is nothing on the file to shake his testimony and see no reason to disbelieve his evidence. From the positive statement of this witness, it is established beyond any reasonable doubt that the digits 2, 3, 3, 6 and 8 of the number of this winning ticket Ex. P-1, in dispute have been replaced by cutting the original digits on the ticket and the number of the ticket and also the digits of this number have been inked with a view to hide the tampering of the number of the digits.[52]

51. *Jai Singh v State*, Criminal Appeal No, 1178 of 1972 (P&H HC).
52. *Jai Singh* v *State*, Criminal Appeal No. 1178 of 1972 (P&H HC).

10.26.9 Court not super Expert[53]

But to prove the charge in the present case, the aforesaid conclusion is not of any material consequence, though the learned trial Judge has totally been swayed away because of the aforesaid conclusion reached by him earlier. The sole question for consideration is as to who had filled in the application forms for withdrawal (Exts. 10 and 11) and signed the same. Was it the accused, or the depositor (P.W. 1), or anybody else? If the conclusion from the evidence is that it was the accused who had filled in the forms as well as signed the same, then the accused must be held to be liable for the offence alleged against him. The accused has admitted that he has entered in Exts. 10 and 11 the pass order and further he has made the corresponding entries in the list of the transaction is Exts. 23 and 24, as well as the logbook under Exts. 25 and 26, and so also the cash books (Exts. 27 and 28). In all these documents corresponding entries as to the withdrawals contained in Exts. 10 and 11 have been made by the accused. P.W. 3 in his evidence states that Exts. 10 and 11 did not pass through him and on account of pressure of work sometimes, the postmaster himself was also doing the job of P.W. 3. Even the learned trial Judge himself has believed this part of the evidence of P.W. 3 and has come to the conclusion that due to heavy pressure of work in the seat of the counter clerk (P.W. 3), the accused as postmaster might have personally dealt with the withdrawal applications (Exts. 10 and 11). In the aforesaid context, one will have to examine the evidence of the Handwriting Expert (P.W. 9), who has categorically opined that it is the accused who has filled in the forms in Exts. 10 and 11 and also made the signatures purporting to be those of the depositor, Artratran Behera. After comparing the admitted writings of the accused with the disputed ones, the Handwriting Expert has categorically opined that the writings marked as Q-3, Q-15 and Q-21 are in the handwriting of the accused. Q-3 is the portion contained in red-mark which has been filled up by writing, Q-15 is the filling up of the form on the backside which is nomenclatured as "warrant of payment". Q-21 is the blank portion contained in the same form which has been filled up indicating receipt of payment. The Expert has further opined that Q-9 which is the purported signature of the depositor on the application for withdrawal and Q-27 which is the purported signature of the said depositor in token of receipt of payment on Ext. 10 are not the signatures of the depositor (P.W. 1) and that he has opined by comparing the same with the admitted writings of the depositor in Exts. 3 to 9. Similarly, the Expert has also opined in respect of the writings on Ext. 11. The learned trial judge has lightly brushed aside the aforesaid evidence of the Expert on the ground that there is no corroboration to the said evidence and in my opinion, he has committed gross error in rejecting the evidence of the Expert. Apart from the evidence of the expert (P.W. 9), P.Ws. 3 and 7 who are the co-employees of the post-office also state that the writings on Exts. 10 and 11 were those of the accused.

In the case of *Murarilal v State of Madhya Pradesh*, AIR 1980 SC 531 : (1980) 1 SCC 704 : 1980 Cr LJ 396, it has been held:

> *We are firmly of the opinion that there is no rule of law, nor any rule of prudence which has crystallised into a rule of law, that opinion evidence of a handwriting expert must never be acted upon, unless substantially corroborated. But, having due regard to the imperfect nature of the science of identification of handwriting, the approach, as we indicated earlier, should be one of caution. Reasons for the opinion must be carefully probed and examined. All other relevant evidence must be considered. In appropriate cases, corroboration may be sought. In cases where the reasons for the opinion are convincing and there is no reliable evidence throwing a doubt, the uncorroborated testimony of an handwriting expert may be accepted. There cannot be any inflexible rule on a matter which, in the ultimate analysis, is no more than a question of testimonial weight …*

53. *State of Orissa v Sapneswar Thappa*, 1987 Cr LJ 612.

Applying the aforesaid test in the present case to the evidence of P.W. 9, I do not find any reliable evidence which throws a doubt on the expert's evidence. If the reasons for the opinion of the Expert are probed, nothing has been elicited in the cross-examination of P.W. 9 to throw any doubt on his testimony. That apart, I find sufficient corroboration in the present case from the evidence of P.Ws. 3 and 7 and again from the statement of the accused himself. This being the evidence, I hold that the prosecution has been able to satisfactorily prove that it is the accused who has filled up the withdrawal application (Exts. 10 and 11) in the name of P.W. 1 and has also forged his signatures thereon. Thus, the charges under sections 467 and 471 of the IPC have been fully established against the accused.[54]

10.26.10 Forgery/Tear identified Fraud[55]

It was the case of the respondent that Voucher Ex. P.W. 14/1 was a forged document and had been surreptitiously replaced for the genuine voucher in his return of expenses. The trial court has carefully examined this aspect of the controversy and has dealt with it adequately. The voucher was examined in the Central Forensic Science Laboratory, Chandigarh, and has given adequate reasons for the opinion that there was sufficient evidence to conclude that the voucher Ex. P.W. 14/1, its perforated part left in the cash memo book and the counterfoil did not originate from the cash book Ex. P.W. 14/2 from which, it was stated by Dina Nath P.W. 14, to have originated. The witness categorically stated that the voucher Ex. P.W. 14/1 had been substituted later on. The trial court rightly came to the conclusion that this was really so, and that the statement of Dina Nath about the printing of the offending poster Ex. P.W. 14/4 at the instance of the respondent is unbelievable.[2]

10.26.11 Appraisal[56]

1. The main criticism of the learned counsel for the appellant against the testimony of Mr. N Das Gupta is, that his opinion has been contradicted by the expert examined by the defence and that where the charge against the accused is one of forging a writing, as a rule it is imprudent to convict him solely on the basis of the expert testimony.

I have no quarrel with this proposition. It is merely a rule of caution and not an absolute rule of law. There is nothing in law to prevent the court from recording a conviction on expert evidence alone. The reason is that the identification of handwriting is an imperfect science. Experts often give dogmatic opinions unsupported by reasons. The value of the expert evidence, however, varies with the circumstances of each case and the reasons given by him in support of his opinion. Its value is to be judged with the same yardstick with which the evidence of any other witness is appraised. It is to be seen how far it fits in with the surrounding circumstances and the natural probabilities of the case. If in a given case the evidence of the expert is materially corroborated and confirmed by the other evidence, there is nothing in law to debar the court from recording a conviction of the accused on the basis of such expert testimony.

In the instant case, the evidence of Mr. N Das Gupta finds material corroboration from the circumstantial evidence brought on the record.

After going through the evidence of the experts, I am clearly of the view that the evidence of Mr. AS Kapur, A. 37/D.W. 17, is not reliable while that of Mr. N. Das Gupta, P.W. 120, is creditworthy. *Firstly*, Mr. Kapur did not examine all the original writings which are in question. He only saw photographs of some of them, supplied to him by the accused. Even the exa-

56. *Manmohan Singh Johal v State of Punjab*, 1969 Cr LJ 932 : AIR 1969 Punj 225 : ILR (1969) 2 Punj 173.

mination of these originals made by him in court was only for about one hour. Furthermore, the surrounding circumstances and the other overwhelming evidence brought on record by the prosecution clothe the opinion of Mr. N Dass Gupta with a high degree of probability. Particularly, the set habit of the writer, as revealed by the specimen as well as the questioned entries in the passports in committing the same spelling mistakes such as writing the word "Belgium" as "Belguim", goes to show that at least those entries on the passports were written by Mr. Johal.[57]

10.26.12 Corroboration of Handwriting Expert[58]

The next category of evidence in this case consists of the evidence of the expert, Mr. Gregory (P.W. 286), with regard to the disputed documents. It has been contended that the opinion of the handwriting expert is a very unsafe basis for conviction. A number of authorities have been cited for this well-established proposition. I may mention, in particular, the following:

> *Ishwari Prasad Misra v Mohammad Isa*, AIR 1963 SC 1728 : (1963) 2 SCR 722 : 1963 BLJR 226 ; *Ram Chandra v State of Uttar Pradesh*, AIR 1957 SC 381 : 1957 Cr LJ 559 ; *Kameshwar Nath v State,* 1957 All WR (HC) 842 : 1957 Cr LJ 276 (All) ; *Sudhindra Nath Dutt v The King,* AIR 1952 Cal 422 ; *Ambal Bagyam v Ramayya Padayachi,* AIR 1955 Mad 88 : 1954 Mad WN 757(2).

In *Ishwari Prasad Misra v Mohammad Isa*, AIR 1963 SC 1728 : (1963) 2 SCR 722 : 1963 BLJR 226, Gajendragadkar, J, (as he then was) observed: "Evidence given by experts of handwriting can never be conclusive, because it is after all opinion evidence". It appears necessary for me to point out that opinion evidence cannot, as a general rule, be considered infallible.

In *Ram Chandra's* case[59], their lordships of the Supreme Court did not lay down a general rule of prudence with regard to expert evidence in stronger terms than these, "it may be that normally it is not safe to treat expert evidence as to handwriting as sufficient basis for conviction". And, after making this observation, their lordships accepted the expert evidence as it was corroborated by other evidence including the internal evidence furnished by the writing on the document itself.

Even in *Kameshwar Nath's* case,[60] in which Asthana, J. of this court, cited a passage from Sircar's Law of Evidence pointing out the deceptibility of the evidence of handwriting experts, on which strong reliance is placed by the appellants. It was pointed out, relying on *Kalicharan Mukherji v King Empero*[61] that there might be such characteristic peculiarities, of a writer as to lead to an irresistible conclusion about his identity from a writing. Mr. PC Chaturvedi drew my attention to an unreported decision of this court in *Kameshwar v State,* (Criminal Appeal Nos*,* 1672 : 1675) and 2132 of 1958, dated 10 February 1960 (All), in which the accused is apparently the same individual as Kameshwar Nath of the 1957 case. In this case, where facts were certainly very exceptional and remarkable there was found to be what was described as a 'twin-like resemblance" between the disputed writings alleged to be of the accused and the indisputably proved writings of another individual who had nothing to do with the disputed writings so that the expert and also other witness, who were very familiar with the writing

57. *Manmohan Singh Johal v State of Punjab*, AIR 1969 P&H 225 : 1969 Cr LJ 932 : (1969) ILR 2 P&H 173.
58. *Devi Prasad v State of Uttar Pradesh*, AIR 1967 All 64 : 1967 Cr LJ 134 (All). Also see *Ravjappa v Nilakanta*, AIR 1962 Mys 53 : ILR 1960 Mys 1206 : (1962) 1 Cr LJ 441 (Mys); *State of Madhya Pradesh v Dhannelal*, 1961 (2) Cr LJ 233 (MP); *Amir Chand v Lok Nath*, AIR 1951 P&H 90(1) : AIR 1952 J&K 26 : 1952 Cr LJ 1230 (Nag) ; *Sripada Sinai Duclo v State of Goa, Daman and Deo*, 1976 Cr LJ 145.
59. AIR 1957 SC 381 : 1957 Cr LJ 559.

61. 6 All LJ 184.

of the accused, were completely misled and were compelled to admit their mistakes when it was pointed out. This case illustrates the danger inherent in evidence relating to the identity of an accused person from similarities in writings only. I am, however, unable to hold that the evidence as to the identity of an accused person, from close resemblance between his admitted handwriting and the disputed handwriting, is even less reliable than evidence as to the identity based upon personal impressions of previously unknown individuals, alleged to have been seen in all kinds of lights in dacoity cases, which courts in this country do accept and act upon. The authorities cited before me only indicate the need for care and caution in judging and utilising the testimony of handwriting experts. Apart from the liability to err to which opinion evidence and evidence as to identity in general are specially exposed, the technical terminology of the handwriting expert (his "jargon" as the anti-experts would like to call it) enables the expert to conceal errors and even dishonesty to a degree which an untrained witness cannot attain.

No useful purpose will be served by discussing the fallibility and deceptibility of expert opinion evidence and of evidence relating to identity or the abstract general principles about such evidence which are well-established. An appellate court has to examine whether the trial court has correctly understood the general principles and then rightly applied them in assessing the worth of the particular opinion evidence upon the data in a given case. Reliable criteria have been scientifically formulated for judging the worth of the evidence of handwriting experts. The trial court has rightly relied upon *Jitendranath Gupta v Emperor,* AIR 1937 Cal 99 : 38 Cr LJ 818 (SB) and has pointed out that the evidence of an expert has to be tested with care and caution and has set out the considerations which the learned judge has applied in judging the worth of the expert's evidence in this case.

A great deal of emphasis was placed upon the brevity of the reasons given by the expert, Mr. Gregory, in his reports on the disputed documents. Quotations from a work of Mr. Osborn, the well-known authority on handwriting, were made to demonstrate the weight to be attached to the reasons given for an opinion by an expert. There is no doubt that the worth of an opinion can be tested by the reasons given in support of that opinion and not by the bare conclusions of the expert. Nevertheless, the trial Court was, in my opinion, quite justified in pointing out that the opinion can be stated by the expert both by means of a report and by means of the statement in the witness box which must be there in addition. Moreover, as the unsoundness of the expert's opinion about some writing can be demonstrated by means of his cross-examination, the brevity of his reports is not sufficient to destroy the value of his evidence. Even if the reports given by the expert are very brief in this case, in view of the great number of documents alleged to bear the writings of the accused persons, the expert has supplemented his reasons by his statement in court, and he has been subjected to quite stringent and searching and expert cross-examination. It may be observed that the appellants did not produce an expert in reply to the evidence of the expert produced by the prosecution. In my opinion, the brevity of the initial statements made by the expert in the form of his reports upon the disputed handwritings of the accused is not sufficient to justify the elimination of the expert's testimony as worthless in this case.

It was argued that Mr. Gregory (P.W. 286) was not really a handwriting expert at all inasmuch as he did not hold any qualification, such as a degree or a diploma possessed by a qualified medical or legal practitioner. This objection overlooks what was pointed out by Dr. WR Harrison, Director, Home Office Forensic Science Laboratory of Britain, in a recent book entitled *Suspect Documents:*

> *The demand for specialists in the examination of documents is so small that comparatively few qualified men are ever likely to be wholly engaged in this work. No university college of*

> *any standing either in Great Britain or America offers a course of study leading to a degree and if such a course were contemplated, it would be a difficult matter to provide either teachers or anything like full employment for any substantial number of students when qualified.*

Mr. Gregory has deposed that he is a handwriting expert, with a standing of 32 years at the time when he gave evidence in 1961, and that he had given evidence in more than 2,500 cases all over India. He also stated that he held certificates of competency from leading handwriting experts, including one from Dr. Locard, Ex-Director of the French Police Laboratory and that, in 1948 he went to England to study the latest developments in his subject at the laboratory of the world famous Scotland Yard. He also stated that he had been an expert placed on the approved list of the Oudh Chief Court and also a consulting expert of the Criminal Investigation Department of Uttar Pradesh. He has also written a book on the subject. The above-mentioned credentials and qualifications of Mr. Gregory were, at any rate, not questioned in the course of his cross-examination. However, it is not the apparent qualifications of a handwriting expert which ought to determine the value of the evidence given by him, but the soundness of the reasons advanced by him in support of the particular opinion expressed by him. These reasons are always open to scrutiny by a court of law, and their soundness can be tested by examining the disputed and the admitted writings in the light of the reasons given. The object of expert evidence is to assist the court in forming its own opinions.

Even if an expert's opinion was not reliable in any particular case a court is not-absolved from the duty of forming its own opinion about the disputed handwriting (also *see* AIR 1937 Cal 99). There are certain well-known criteria, such as the examination and comparison of individual characteristics and idiosyncrasies, which have to be employed by experts as well as by courts in arriving at their conclusions.

Mr. C.S. Saran, appearing for some of the appellants, argued that it is very hazardous for a court to act as an expert and to form its own opinions from the individual characteristics, spacing, size, thickness and slant of letters, or the pen pressure at various points, pen-lifts, pauses, and the pictorial effect of the whole writing. The task of arriving at a sound opinion is always fraught with difficulties. A court cannot, for that reason, either abandon its duty of forming its own opinions or reject the opinions of a qualified expert merely because his evidence belongs to the variety known as "opinion evidence". In the absence of better evidence, opinion evidence has to be utilised by courts of law in forming their own opinions. The only effective safeguard against erroneous conclusions is for courts to use their own powers of observation well and to study and use the recognised tests in a manner which satisfied the conscience of the court. I have noted the commendable care and attention with which the trial court has used the opinions of Mr. Gregory (P.W. 286). It arrived at its own conclusions after testing the opinions of the expert by close examination of the documents about which the opinions were given. I have also tested the reliability of the opinions of Mr. Gregory by closely examining the disputed and admitted writings once again for the purposes of forming my own opinions with the help of the expert evidence. Far from finding this method objectionable, I am not able to find any other more satisfactory way of testing the reliability of expert evidence in a case.

In *Ram Chandra's* case[62] their lordships of the Supreme Court examined the contents of a document and relied upon internal evidence in addition to other external and corroborative evidence before accepting the expert evidence about the writing before their lordships. A comparison of disputed and admitted writings, which are pieces of evidence on record, is also a method of examining the internal evidence of a document and of judging whether it

62. AIR 1957 SC 381 : 1957 Cr LJ 559.

finds support from other evidence on record which is external *qua* the document containing the disputed writing. Another method of testing whether the opinion of an expert should be accepted or not, suggested by what was laid down in *Ram Chandra's* case, is to look for other kinds of circumstantial or direct corroborative evidence on record. It is certainly hazardous to rely upon expert evidence solely without any corroboration from other kinds of evidence in the case. But it is seldom that a prosecution case hinges purely on expert opinion evidence. Usually, there is also other evidence as there is in this case.

My attention has been drawn by Mr. Hamid Husain, appearing for the State, to two cases in which their lordships of the Privy Council examined the disputed and the accepted writings in order to arrive at their own conclusions (See *Manindra Chandra Lala v Mahaluxmi Bank Ltd,* ILR (1945) Kar PC 225 : 49 Cal WN 481 : AIR 1945 PC 105 (107) ; and *G. Madhavayya v G. Achamma,* (1949) 2 Mad LJ 716 : AIR 1949 PC 325 (329). Indeed, section 73 of the Indian Evidence Act, empowers courts of law to compare admitted and disputed writings for the purposes of forming their own opinions. The rule of caution is not to base a conclusion entirely upon the court's own comparison because the court's function is distinct from and above the role of an expert witness giving evidence on handwriting which is tested by cross-examination: (See *Bhagwan Din v Gouri Shankar,* AIR 1957 All 119 and *Fazaluddin Mandal v Panchanan Das,* AIR 1957 Cal 924). The court is, however, bound to form its own opinions with the aid of all the permissible methods, and to arrive at a conclusion where a conclusion can safely be arrived at. Such a conclusion can safely be arrived at where the conclusions, of a court, after comparing the admitted and disputed writings, coincide with the opinions of the expert and are further corroborated by other pieces of evidence. In other words, the method contemplated by section 73 of the Evidence Act, can and ought to be employed by courts in order to test and find corroboration or contradiction of the opinion of the expert. The court does not in such a case function as a handwriting expert itself, but it acts as the authority charged with the duty of arriving at a conclusion with the aid of all the data upon the record by all legally permissible means at its commands (See *Bisseswar Poddar v Nabadwip Chandra Poddar,* AIR 1961 Cal 300 : 64 Cal WN 1067 : 1960 Cal LJ 190). With great respect, I find myself in complete agreement with what was laid down in *Fazaluddin's* case,[63] by the Calcutta High Court per KCD Gupta, J.:

> *It is true, if there was no evidence before the court as regards the genuineness of the signature, the court could not, in law, rely on its own examination of the signature to supply the evidence because the learned judge could not treat himself as an expert. I am unable to find anything in principle or authority which bars the judge of facts from using his own eyes and looking at the admitted signature along-with the disputed signature in deciding whether the evidence that has been given as regards the genuineness of the documents should be believed or not.*

If the opinion of the handwriting expert is found by a court to be honest and reliable after subjecting it to the recognised tests of soundness, it can even be considered better evidence than the evidence of indifferent witnesses whose motives are often mixed and whose powers of observation and recollection are very faulty. The observations of the expert are far more careful and guided by scientific knowledge and skill which where they exist must be duly appreciated. Prof. Wigmore the celebrated authority on the Law of Evidence, wrote in 1910 in his introduction to Mr. Osborn's book on *"Questioned Documents"* 2nd Edn:

> *A century ago the science of handwriting study did not exist. A crude empiricism still prevailed. These hundred years past have seen a vast progress. All relevant branches of modern science have been brought to bear. Skilled students have focussed upon this field a manifold of appurtenant devices and apparatus. A science and an art have developed. A firm place has now been made for the expert witness who is emphatically scientific and not merely empiric.*

63. AIR 1957 Cal 924.

An objection put forward to the opinion of the expert in this case is that he has admitted that there are deliberate attempts at disguise in a number of writings. The existence of disguise certainly makes the task of the expert and of the court more difficult. The obstacles placed by it are, however, not insurmountable. Certain rules have been formulated and discussed by Dr. Harrison, the Director of the Home Officer, Forensic Science Laboratory in Britain in his book on *Suspect Documents,* (1958), as guides for piercing the disguise. These are as follows:

1. Most disguise is relatively simple in nature.
2. Disguised handwriting exhibits less fluency and poorer rhythm than the normal hand.
3. Any change in slope introduced as a disguise is rarely constant.
4. Disguised handwriting often contains altered letters.
5. The internal consistency of handwriting is disturbed by the introduction of disguise.
6. Originality in disguise is rare.
7. Disguise is rarely consistent.
8. Certain features are rarely disguised.

Another objection put forward against Mr. Gregory as an expert witness in this case was that he had been acting as a consulting expert of the Criminal Investigation Department of Uttar Pradesh. It was, therefore, argued that he could not be impartial in his opinions but must be presumed to be interested in making the prosecution case successful. It has also been suggested that experts are bound to give opinions in favour of parties consulting them. The duty and interest of an expert; if he wants his individual opinion to carry some weight and enjoy a good reputation, is to be scrupulous and impartial. If the expert has some professional pride or even regard for his own self-interest, he will not, for the sake of some small immediate advantage, jeopardise the value of his opinion and degrade the status of his profession by making his knowledge and skill serve as tools of dishonest parties. An expert who gives dishonest opinions is quite certain to be exposed by ruthless cross-examination and to be soon found out by astute courts which do not and should not readily accept expert opinions without rigorously testing what an expert has to say. I do not think that a presumption is a legitimate weapon for demolishing the testimony of an expert with such a background and standing as those revealed by Mr. Gregory. His opinions could certainly be demolished by superior reasons to support contrary conclusions or by convincing proof that they are not honest.

One of the ways in which the honesty of an expert can be tested is to consider the number of instances in which he has given opinions contrary to the opinions which those who consult him may be presumed to desire. I find that Mr. Gregory has given quite a number of opinions rejecting the disputed handwritings sent to him after comparing them with the admitted handwritings. In other cases, I have also found that his opinions are not dogmatic or obstinate. It has been held in *Subodh Kumar Banerjee v Soshi Kumar Banerjee,*[64] that an expert is entitled to more credit if his answers indicate that he appreciates the other side of the case, and can and does look at the problems before him impartially. The general impression created by the replies to the cross-examination of Mr. Gregory, from this point of view also, is quite favourable.

64. AIR 1958 Cal 264.

The worth of the expert's opinions with regard to the handwriting of each appellant can only be judged by examining his reasons and comparing the admitted and the disputed writings about which the opinion was given. As I have already indicated, I propose to adopt the method of judging the reliability of the evidence of the handwriting expert with reference to each accused person. Another test which I propose to employ is to see whether the effect of the expert evidence is corroborated by other kinds of evidence in the case from other sources such as the approver's evidence about handwritings, the confession, and the evidence of other witnesses. I have already held that the evidence of the approver and the confession of Abdul Hameed can be used in this case for the purpose of finding corroboration for the evidence of handwriting as they are not so unreliable as to merit total rejection even if the part of the approver's statement relating to the two alleged meetings of conspirators is so thoroughly unreliable that it must be rejected.[65]

10.26.13 Court's Scrutiny of Handwriting[66]

It has been urged by the learned counsel for the appellant that the learned Sessions Judge has wrongly convicted the accused. The accused had, in fact, paid the amount of Rs 40 to Rajeshwar Singh in the presence of Sawan Mal and that it was fully proved from evidence but the conclusion drawn by the learned Sessions Judge was quite wrong. I do not agree with the learned counsel for the appellant on this point. After going through the evidence, I am of the view that the learned Sessions Judge was right in holding that it had been proved from the statements of Sarvshri Rajeshwar Singh, Prem Singh Pathania and Swan Mal that the signatures on the money order were not those of Rajeshwar Singh and Sawan Mal. Rajeshwar Singh had denied the receipt of the money. He was a student in the Government Higher Secondary School, Nagpur, and Sawan Mal (P.W.) who is alleged to have signed the money order receipt as an attesting witness in token of payment of the money was a teacher in that school. There is nothing brought on the record by the defence as to why these persons should have been interested in deposing against the accused. It is also pertinent to note that the specimen handwriting of the accused was taken in the presence of the magistrate, who had appeared as a witness for purpose of comparison and the same was sent to the handwriting expert who had not been examined as a witness although a report has been received from him. The prosecution had prayed for examination of the handwriting expert to prove the report but the learned Sessions Judge on the objection of the counsel for the accused rejected the application for examination of the handwriting expert as the name of the handwriting expert did not figure in the list of the witnesses and that the prayer was made at a very late stage and the case was pending since a very long time.

In this court the learned counsel for the appellant has taken up this objection that in the absence of examination of the handwriting expert it could not be said whether the signatures were forged or were those of Rajeshwar Singh and Sawan Mal. That is true but this fact is quite apparent from the record that the accused stated that he did not know English. But on the endorsement he has put down his signatures in English and again when the specimen signatures which have been proved by the testimony of the magistrate as also the investigating officer were written by the accused and that belies the stand of the accused that he does not know English. The learned Sessions Judge, no doubt, has wrongly rejected

65. *Devi Prasad v State of Uttar Pradesh*, AIR 1967 All 64 : 1967 Cr LJ 134 (All). Also see *Ravjappa v Nilakanta*, AIR 1962 Mys 53 : 1960 ILR Mys 1206 : (1962) 1 Cr LJ 441 (Mys); *State of Madhya Pradesh v Dhannelal*, 1961 (2) Cr LJ 233 (MP); *Amir Chand v Lok Nath*, AIR 1951 P&H 90(1) : AIR 1952 J&K 26 : 1952 Cr LJ 1230 (Nag); *Sripada Sinai Duclo v State of Goa, Daman and Deo*, 1976 Cr LJ 145.
66. *Salig Ram v State of Himachal Pradesh*, (1972) 2 Sim LJ 335 : 1973 Cr LJ 1030 (HP).

the prayer of the prosecution for examining the handwriting expert. But in the absence of the non-examination when the necessary material is there the court under section 73 of the Indian Evidence Act, can also examine the disputed handwriting with the specimen handwriting which is taken by the magistrate and is admitted by the accused to have been written by him.

From the comparison of the same I find that the disputed signatures are also in the hand of the same person who has written the specimen writing. The accused has furnished a very funny explanation about the specimen handwriting. According to him he does not know English and that the investigating officer had written down on one paper and he asked him to copy the same. He copied out the same with the specimen. It is really unbelievable that an illiterate person can copy the writing and I think the learned sessions judge was right in not accepting this explanation given by him about the specimen signatures and I am of the view after comparison of the specimen handwriting with the disputed one that they are written by the same person, *i.e.*, the accused. Therefore, the non-examination of the handwriting expert is not going to make any difference.

10.26.14 Court as Expert: Miscarriage of Justice[67]

Now while it is competent on the part of a judge or a magistrate to compare the disputed signatures with the admitted signature for himself, *vide* section 73 of the Indian Evidence Act, it is unsafe to rely entirely on such personal comparison. Reference may be made in this connection to the decisions in some important cases; *JC Glastaun v Sonatan Pal*, AIR 1925 Cal 485 : 78 IC 668 ; *Darshan Singh v Prabhu Singh*, AIR 1946 All 67 : ILR 1946 All 130 and *Kessarbai v Jethabhai Jivan*, AIR 1928 PC 277 : 28 Mad LW 737. Thus, it cannot be said that there was a judicial enquiry of the matters before the court; the decision was rather arbitrary and so resulted in a manifest miscarriage of justice.[68]

10.26.15 Court Incompetent as Expert[69]

Learned counsel for the appellant has urged that the court itself has assumed the role of an expert in this case. I do not, however, think that the court's competence to use its own eyes for the purpose of deciding whether the two handwritings placed before it were similar or not can be questioned.

It has been held in *Parsad Mahto v Mt Jasoda Koer,*[70] that where a case against a person depends upon a comparison of the handwriting the court is competent to use its own eyes for the purpose of deciding whether certain handwritings placed before it are similar or not. In a matter of this kind, the court cannot certainly act like an automation accepting without scrutiny an expert's opinion as infallible.[71]

10.26.16 Specimens[72]

The only question involved in this revision is whether a court under section 73, Indian Evidence Act, can direct an accused person to give his signatures at the instance of the investigating agency so that after comparison from an expert these could be used against him as evidence. The learned counsel for the State relied on a Full Bench decision of Patna High Court in *Gulzar Khan v State of Bihar,*[73] to argue that such a thing was permitted by law. He also tried to derive help from *State of Bombay v Kathi Kalu Oghad,* AIR 1961 SC 1808 : (1962) 3 SCR 10 : (1961) 2 Cr LJ 856 (SC). In *T Subbiah v SKD Ramaswamy Nadar*[74] *Gulzar Khan's* case (supra) was noticed but it was not followed. Similarly, *Kathi Kalu Oghad's* case was referred and was distinguished. In this case para 10. *Kathi Kalu Oghad's,* case (supra), was reproduced *in extenso*, in para 14, which contains the facts of that case. The learned judge of the Madras High Court observed:

> *Nowhere in this passage we find that section 73 of the Evidence Act authorises the court to take the finger impression or specimen handwriting of the person present in court in the course of investigation by the police.*

The learned judge further observed:

> *This passage makes it abundantly clear that the Supreme Court was not concerned with any other question in relation to the facts of each of these cases. I am, therefore, of the view that there is no basis for the contention of the learned counsel that the Supreme Court has at least indirectly approved the point that the magistrate can take handwriting or signature of the accused in the course of investigation.*

Similar view was expressed by a Division Bench of the Kerala High Court in *Alovsious John v State of Kerala.*[75]

In view of the above cited judgments it is clear that section 73 of the Indian Evidence Act does not contemplate that the accused can be asked, persuaded or coerced to give his handwriting or thumb impressions at the instance of the police so that these may be, at a later stage, used against him. The learned Additional Sessions Judge took pains to make a detailed reference. The learned magistrate transgressed the provisions of the law in directing Dharamvir Singh petitioner to give his signatures at the instance of the police. The order being bad in law amounts to illegality and requires to be quashed. Accepting the reference of the learned Additional Sessions Judge, Ambala, the order is set aside.[76]

10.26.17 Specimen & Article 20(3) of Constitution[77]

What is challenged in this criminal revision application is an order of the city Magistrate, 3rd court, Ahmedabad, asking the accused persons, namely the applicants, to go to the police station and give their handwritings and signatures to the police. It is true that the giving of signatures or giving of handwriting is not hit by Article 20 of the Constitution as held by their lordships of the Supreme Court in *State of Bombay v Kathi Kalu.*[78] But the question before me is not whether the giving of signatures or giving of handwriting is hit by Article 20 of the Constitution, but the question is whether the Magistrate has the power to ask the accused persons who are on bail to go to the police and give their specimens of signatures and handwriting. The powers of Magistrates and police officers are prescribed under various laws. Those powers cannot be

enlarged. There must be something in the law for the exercise of power if such power is to be exercised by a police officer or by a Magistrate. If there is no provision in the law for the exercise of a power, that power cannot be exercised by a police officer or by a Magistrate or by a judge.

The learned counsel for the government and the learned counsel for the complainant rely on section 156 and section 157, Code of Criminal Procedure. Of course, the police has got powers of investigation, but that does not mean that the police can compel an accused person to give his specimen signature and handwriting. Section 73 of the Evidence Act provides as follows:

> *73. Comparison of signature, writing or seal with others admitted or proved. In order to ascertain whether a signature, writing or seal is that of the person by whom it purports to have been written or made, any signature, writing or seal admitted or proved to the satisfaction of the court to have been written or made by that person may be compared with the one which is to be proved, although that signature, writing or seal has not been produced or proved for any other purpose. The Court may direct any person present in Court to write any words or figures for the purpose of enabling the Court to compare the words or figures so written with any words or figures alleged to have been written by such person.*

The court may direct any person present in court to write any words or figures for the purpose of enabling the court to compare the words or figures so written with any words or figures alleged to have been written by such person. If the accused is present in court, then the powers given under section 73 of the Evidence Act can be used by the court. But that is not what is being done now. The accused are not before the court and the case against them is still under investigation. No provision of law has been pointed out to me, whereby such a power can be exercised.

The revision application is, therefore, allowed and the order passed by the learned Magistrate is set aside.

10.26.18 Powers of Magistrate for Handwriting Specimen [79]

The learned Counsel for the appellants contended that the prosecution could not obtain the specimen handwritings of the accused for comparison with the letter (Exhibit P 1). He has also submitted that the learned Additional Chief Judicial Magistrate, Bhiwani, did not take any precautions by giving the accused time to think and by apprising them that they were not obliged to give their specimen handwritings. He also did not warn the accused that the disputed letter, if found to be in the handwriting of any one of them, the same could be used against them. A perusal of the court proceedings noted on application (Exhibit P.J.) will go to show that no such precautions were taken by the learned Magistrate. The learned Additional Chief Judicial Magistrate Mr. Vinod Jain was examined by the prosecution as P.W. 4. In his cross-examination, he admitted that before writing statements of the accused, who were not assisted by any counsel, he did not warn them that the statements could be used against them. He stated that though it is not mentioned in the order that the accused were allowed to think, but he allowed them time to think. He further stated that he could not say whether it was necessary for him to append a note about the fact whether time was given to the accused to think or not. He stated further that Sub-Inspector Hira Lal was present throughout in the court when the accused made their statements.

The learned Counsel for the appellants in support of his aforesaid contention cited *State of Uttar Pradesh v Ram Babu Misra*, AIR 1980 SC 791 : (1980) 2 SCC 343 : (1980) 2 SCWR 25. In that case, the Investigating Officer moved the Chief Judicial Magistrate, Lucknow, to direct the accused to give his specimen writing for the purpose of comparison with certain disputed writings. The Chief Judicial Magistrate held that he had no power to do so when the case was still under investigation. The plea of the State was rejected by the High Court and

79. *State of Haryana v Jagbir Singh*, 1996 Cr LJ 2545 : 1996 (1) Cri CJ 706 : 1996 (1) Rec Cri rule 735.

thereafter the matter was taken by the State before the Hon'ble Supreme Court. The Hon'ble Supreme Court held that section 73 of the Evidence Act did not enable Magistrate to give such a direction when the case was still under investigation. Section 73 of the Evidence Act lays down as under:

> 73. *Comparison of signature, writing or seal with others admitted or proved*—In order to ascertain whether a signature, writing or seal is that of the person by whom it purports to have been written or made, any signature, writing or seal admitted or proved to the satisfaction of the court to have been written or made by that person may be compared with the one which is to be proved, although that signature, writing, proved for any other purpose.

The court may direct any person present in court to write any words or figures for the purpose of enabling the court to compare the words or figures so written with any words or figures alleged to have been written by such person.

This section applies also, with any necessary modifications, to finger-impressions."

The Hon'ble Supreme Court in *Ram Babu Misra's* case (AIR 1980 SC 791) (supra) considered the provisions of section 73 of the Evidence Act and observed as under (para 4):

> *The second paragraph of section 73 enables the court to direct any person present in court to give specimen writings for the purpose of enabling the court to compare such writings with writings alleged to have been written by such person. The clear implication of the words 'for the purpose of enabling the court to compare' is that there is some proceeding before the court in which or as a consequence of which it might be necessary for the court to compare such writings. The direction is to be given for the purpose of enabling the investigating or other agency 'to compare'. If the case is still under investigation there is no present proceeding before the court in which or as a consequence of which it might be necessary to compare the writings. The language of section 73 does not permit a court to give a direction to the accused to give specimen writings for anticipated necessity for comparison in a proceeding which may later be instituted in the court.*

The learned Deputy Advocate General for the State-respondent, on the other hand, contended that the only bar on the Magistrate is that the Magistrate cannot under section 73 of the Evidence Act issue a direction to the accused to give his specimen handwriting. He contended that, in the instant case, as a matter of fact, the learned Additional Chief Judicial Magistrate, Bhiwani, did not issue any such direction to the accused to give specimen handwriting and it was the voluntary act of the accused to give their specimen handwritings for comparison.

After carefully perusing the application (Exhibit P. J) moved by the Investigating Officer before additional Chief Judicial Magistrate, Bhiwani, and the proceedings conducted thereupon by the learned Magistrate, we have no doubt that the Investigating Officer had prayed before the learned Magistrate for obtaining the specimen handwritings of the accused for comparison. The learned Magistrate proceeded to record the statements of the accused and it was thereafter that he passed the following order in respect of Jagbir Singh accused on 10 September 1991:

> *Present A.P.P. for the State, both the accused in custody with Investigating Officer Hira Lal, Sub-Inspector of C.I.A. staff, Bhiwani. In view of the statement of the accused, the application is allowed. Let specimen handwriting of the accused be obtained.*

Similar order was passed by the learned Magistrate on 10 September 1991 in respect of Umed Singh accused. The said orders are in substance a direction of the learned Magistrate for obtaining the specimen handwritings of the accused. That being so, in view of the law laid down by the Hon'ble Supreme Court in *Ram Babu Misra's* case (AIR 1980 SC 791) (supra) the learned Magistrate had no jurisdiction under section 73 of the Evidence Act to issue such a direction to the accused to give specimen handwriting. Apart from it, the learned Magistrate did not observe any precautions, while recording the statement of the accused, which contained an admission of the accused Jagbir Singh about the disputed letter being

in his handwriting. Resultantly, the report of the Handwriting Expert is of no consequence. Besides it, if the statement of Daya Nand (P.W. 7) be believed that he had suspicion on Jagbir Singh accused about sending the two letters, one to Telu Ram and the other to him, as early as on 6th/7 September 1991, then the conduct of Daya Nand in not expressing his suspicion on Jagbir Singh in the Daily Diary Report No. 4 dated 8 September 1991 (Exhibit P.M.) throws considerable doubt about these two letters being in existence by that time. As a prudent man, Daya Nand-complainant (P.W. 7) was expected to express suspicion on Jagbir Singh, accused in the said report. Faced with the situation arising out of the non-mentioning of the suspicion on the accused in the report registered *vide* Daily Diary Report No. 4 dated 8 September 1991 (Exhibit P.M.), Daya Nand (P.W. 7) tried to wriggle out of it by saying that he did not make any such statement as is mentioned in the Daily Diary Report (Exhibit P.M.) before S.H.O. Mahender Singh Bhatti. He further stated that, as a matter of fact, it was the S.H.O. himself who got the said report written at his dictation and got the same signed from him. Sub-Inspector Mahender Singh Bhatti (P.W. 12) on the other hand stated, on oath, that on 8 September 1991 he recorded Daily Diary Report (Exhibit P.M.) on the statement of complainant Daya Nand. It will, thus, appear that the prosecution evidence is discrepant regarding the recording of Daily Diary Report (Exhibit P.M.) There appears to be no valid reasons to disbelieve the statement of SI Mahender Singh Bhatti (P.W. 12) regarding the Daily Diary Report (Exhibit P.M.) having been prepared on the basis of the statement made by complainant Dayanand on 8 September 1991. Daya Nand-complainant is a literate person and is a teacher by profession. It cannot be expected that he would sign without any murmur on the Daily Diary Report and without caring to know the contents thereof. In these circumstances, the non-mentioning of suspicion on the accused Jagbir Singh in the said Daily Diary Report (Exhibit P.M.) lodged on 8 September 1991, after the alleged receipt of the letter (Exhibit p 1) addressed to Daya Nand and the letter addressed to Telu Ram, aforesaid, assumes significance and casts a serious and reasonable doubt about the veracity of the prosecution case. Not only this, there is no reference of the letter addressed to Telu Ram, aforesaid in the First Information Report (Exhibit P.L) lodged by Daya Nand. The complainant Daya Nand mentioned in the First Information Report (Exhibit P.L) about the letter addressed to him and about his suspicion based on the said letter in the following words:

> *Now I have full suspicion that Umed Singh and Jagbir Singh have kidnapped my son Manoj Kumar with an intent to kill him. They have either concealed him somewhere or have killed him because a letter written by Jagbir Singh has been found in my house* vide *which ransom of Rs 25,000 has been demanded. I identify his handwriting. I have kept the letter in my house which I will produce before you.*

In view of what has been discussed above, we are of the opinion that the prosecution evidence does not prove beyond shadow of reasonable doubt the receipt of the said letter demanding ransom from Daya Nand and, in any case, there is a great suspicion about the appellant Jagbir Singh writing the said letter and leaving it at the residence of Daya Nand.[80]

10.26.19 Section 73 Cr PC, Confession & Specimen Handwriting[81]

The question that arises for our consideration is how an Investigating Agency is to deal with such a situation? Where should it make such an application? In the face of provisions of sections 24, 25 and 26 of the Evidence Act police cannot force any accused. It cannot record that the writing recovered by the police is written by the accused. It shall be hit by anyone of the above

80. *State of Haryana v Jagbir Singh*, 1996 Cr LJ 2545 : 1996 (1) Cri CJ 706 : 1996 (1) Rec Cri R 735.
81. *Sanjay Goel v State of Uttar Pradesh*, 2001 (3) All Cri R 2384 : 2002 (1) Rec Cri R 356 : 2002 Cr LJ 625 (All).

said provisions of the Evidence Act. No doubt the answer to this question is very difficult but the court cannot shirk from resolving this controversy.

Section 164, Code of Criminal Procedure is the only section which permits a Judicial Magistrate to record a voluntary confession of an accused. If a Magistrate can record a voluntary confession of an accused on an application made by the police on the production of that accused we find it difficult to accept that under the same provision, *i.e.*, section 164, Code of Criminal Procedure why cannot a Magistrate direct the accused whose suspected handwriting has been recovered by the police and if that handwriting is in the form of a confession of his guilt why not such a Magistrate competent to direct such an accused on an application moved by the Investigator before it to give his specimen handwriting so that the recovered handwriting of his may be compared with his specimen writing. However, the courts have to comply with all those safeguards to which an accused is entitled under section 164, Code of Criminal Procedure. If the courts are precluded as argued by the learned Counsel for the defence from making any such direction the dictum of police having unfettered powers shall be thrown to winds. Investigation is nothing but a collection of facts and circumstances as evidence. Obtaining expert's opinion during investigation on a disputed document is nothing but collection of evidence as defined by section 45 of the Evidence Act itself. Thus, in our opinion, section 73 in no way lays any impediment in the exercise of such power by the Judicial Magistrate in the course of investigation. Such a direction may be made under section 164, Code of Criminal Procedure.

Learned counsel for the appellant has cited three decisions of the Apex Court—(1) *State of Uttar Pradesh v Ram Babu Misra*, AIR 1980 SC 791 : (1980) 2 SCC 343 : (1980) 2 SCWR 25 ; (2) *State of Bombay v Kathi Kalu Oghad,* AIR 1961 SC 1808 : (1962) 3 SCR 10 : (1961) 2 Cr LJ 856 (SC) and (3) *Amarjeet Singh v State of Uttar Pradesh,* 1998 SCC (Cri) 1609, wherein the Apex Court has held that during investigation the Magistrate has no power to direct an accused to give his handwriting. Without having any dispute with these decisions, we have probed the issue and we feel that what we have discussed was probably never brought to the notice of the Apex Court while dealing with the situation in those decisions. In one of the judgments, the Apex Court has gone to the extent of directing the Government to amend the provisions of section 73 of the Evidence Act. It is indicative of its anxiety. It has encouraged us to deal this issue in the above manner.

As discussed by us, in our opinion, the handwriting opinion, so obtained during investigation, can be read into evidence despite the bar created by section 73 of the Evidence Act. It has been strenuously urged by Mr. Gopal Chaturvedi, learned Counsel for the complainant that the intrinsic material provided by document admitting his guilt can still be read in evidence as if there is no order passed by the Magistrate for the appellant to give his handwriting. The application contains only the order of production of the applicant and he has just signed the writings with a note "taken in my presence". There is no direction of the Magistrate that the accused should give his specimen writing. The appellant was never commanded by the court to do so. The appellant had every opportunity to decline to give his writing. No objection was ever raised by the appellant in this connection. As a matter of fact he had acquiesced to and rewrote the contents of his alleged written confession, which was ultimately sent by the investigating agency to the Government Handwriting Expert for comparison with his specimen writing, *i.e.*, the confessional statement of the appellant recovered from the room. He sought adjournment once on the ground of his inability on that day to give his writing. His application for adjournment was rejected but at no point of time the appellant had objected or opposed or declined to give his specimen writing nor the court has ever commanded him to do so. In the result there is no bar to the admissibility of this writing in evidence. It shall be a different question what value can be attached to this confession? The contention is that

this written confession has an intrinsic value and the content can legitimately be read by the court. The court itself is competent to compare the disputed handwriting with the admitted writings of the appellant and derive its own conclusions whether the writing is of the same person, *i.e.,* the appellant, and if the court can legitimately come to such a conclusion the admissibility of the document cannot be doubted or challenged. No accused can be compelled to be a witness against himself under the law except as provided by law itself. In that respect he is thoroughly protected, but as earlier stated, the appellant was never compelled by the court. The court had only summoned him but refrained itself from passing any order or direction to the appellant to give his specimen writing or write down the confession again. This we have found on an examination of the record. In the circumstances, we are of the opinion that this confession can be read in evidence and it is not covered by any legal bar. Protection of section 73 of the Evidence Act, so far as the present set of fact and circumstances *vis-a-vis* this written confessional statement are concerned, is not available at all. We, therefore, hold the opinion of the handwriting expert admissible in evidence. Even if for the sake of argument, we accept this argument, yet we can read its content intrinsically.

10.26.20 Admitted Standards[82]

The prosecution called evidence with a view to show that this permit was not signed by W Bennet. Whether Mr. Bennet was available to disprove his own signature is not stated. Of course, he may have left the country. The evidence called to prove that the signature was not genuine was that of Ananta Kumar Purkait, P.W. 5, who was a clerk in Mr. Bennet's office and claimed to know Mr. Bennet's signature. In his examination-in-chief he stated that the signature on Ex. 3 appeared to be like that of Mr. Bennet though he was not sure whether it was Mr. Bennet's signature. In cross-examination he stated that he was very familiar with Mr. Bennet's handwriting and that the signature on Ex. 3 appeared to be similar to that of Mr. Bennet. Later be said that he had no doubt in his mind that the signature on Ex. 3 was the signature of Mr. Bennet. If the evidence be true, then the prosecution was bound to fail. The prosecution, however, tried to suggest that their own evidence should be disbelieved, and they called a handwriting expert. According to that witness the signature purporting to be that of Mr. Bennet on Ex. 3 was not his genuine signature. A handwriting expert's evidence is of very little value and as the learned Sessions Judge points out, the genuine signature with which the handwriting expert compared the disputed signature was merely regarded as genuine because Ananta Kumar Purkait said it was genuine. This witness had stated that the signature on Ex. 3 was also genuine. It seems to me that the evidence of Ananta Kumar Purkait is much more valuable than that of the handwriting expert. But in any event the evidence failed to establish that the permit was not genuine and as I have said, if there was any doubt in the matter the accused was entitled to the benefit of the doubt and to be acquitted.

An attempt was made to show that the writing in the body of the document was not the writing of any clerk in Mr. Bennet's office. But the evidence of the witness who deposed to this is not accepted by the learned Sessions Judge and rightly, how could a man swear that the handwriting on a document was not the handwriting of any one of a large number of clerks in an office?[1]

10.26.21 Photographs[83]

The conspiracy was headed by Yau Mockchi who in a sense was the brain behind the whole racket. The discovery with him of the visiting card and photograph of Laxmipat and the

82. *Tamanlal Rathi v State of West Bengal*, 1952 Cr LJ 1951 (Cal).
83. *Laxmipat Choraria v State of Maharashtra*, AIR 1968 SC 938 : 1968 Cr LJ 1124.

photograph and addresses of Balchand was an incriminating circumstance as Ethyl Wong was connected with Yau Mockchi on the one hand and these brothers at the other. Further, letters and writings of all the brothers were seized which were related to the conspiracy. Unfortunately, the originals were not available at the trial but only Photostats of the letters. The photostats have been proved to our satisfaction to be genuine photographs of the letters. The copies were made through the Indian Embassy and bore the certificate. The use of the photostats without the originals was questioned before us but not in the High Court. Since it was a pure question of law, we allowed it to be raised. It is submitted that expert testimony as to handwriting can only be based upon the examination of the originals and not on photographs. It is pointed out that there is nothing in the Evidence Act which makes a photograph of a disputed writing the basis of conviction. Nor, it is submitted, expert testimony can be invited about it. Reliance is placed on *M'Cullough v Munn,*[84] and *Phipson* on *Evidence,* 10th Edn, p 146.

In our opinion, this submission cannot be accepted. Apart from the fact that this was not argued in the High Court and the handwriting was admitted there, the law as propounded is not sound. The originals were suppressed by the appellants after they were returned. The order of the Supreme Court of Hong Kong has not been produced before us and we do not know why the original documents were returned. Adequate precaution against the suppression of these documents apparently was not taken. This was perhaps necessary because the offence was a part of an international smuggling racket, in which offenders had to be tried in two different countries and both countries needed the documents as evidence. If the Photostats were not available this prosecution would have been greatly jeopardized.

Even if the originals be not forthcoming, opinions as to handwriting can be formed from the photographs. It is common knowledge that experts themselves base their opinion on enlarged photographs. The photos were facsimiles of the writings and could be compared with the enlargements of the admitted comparative material. In *Phipson's book* (10th Edn) paras 316/317, the rule as to identification of handwriting is stated from the Code of Criminal Procedure, 1865 as follows:

> *Comparison of a disputed writing with any writing proved to the satisfaction of the judges to be genuine shall be permitted to be made by witnesses,.....*

In dealing with the scope of the rule, Phipson observes:

> *Under the above Act, both the disputed and the genuine writings must be produced in court, and the former, if lost, cannot be compared, either from memory or from a photographic copy, with the latter, and the latter must also be duly proved therein." (Para 317).*

Phipson himself in para 316 observes that the production of "real" evidence is not now compulsory. For the first part of the proposition in para 317 reference is made to (1908) 2 IR 194 (CA). That was an action for libel contained in a letter alleged to have been written by the defendant. The original was lost but a photographic copy of the letter was available, and the envelope had been preserved. The photograph was seen by the jury but the judge ruled that the photograph was evidence of the contents of the letter but not of the handwriting and could not be compared with other admitted writings. The jury gave a verdict for the plaintiff which was set aside by the divisional court and a new trial was ordered. At the second trial, the photograph was not tendered but a plain copy was put in. The trial resulted in a verdict for the defendant. The divisional court refused to set aside the verdict. The plaintiff then relied upon *Lucas v Williams and Sons,*[85] claiming that the photograph was evidence. The Lord Chancellor, Holmes, LJ, observed:

84. 1908 (2) IR 194.
85. (1892) 2 QB 113 : 61 LJQB 595.

> *The plaintiff would have been justified in putting in the photograph as evidence of the contents of the libel, and apparently it was the only legal evidence by way of copy of its contents; and think they might also on the authority of the decision in Brookes v Tichborne*, [(1850) 5 Ex 929] *have used it for purposes of calling attention to peculiarities of spelling and use of capital letters and punctuation.*

At the first trial Lord Chief Baron ruled (with which Wright, J., agreed in the King's Bench):

> *That upon the loss of the original letter the photograph was admissible to prove the contents of that letter, but that it could not be used for purposes of comparison with genuine documents.*

The above observations have received adverse comments from *Wigmore* (3rd Edn), Vol III, para 797. The earlier cases probably took into account the possibility of trick photography and the changes likely by adjustment of the apparatus. Wigmore rightly points out that unless we are prepared to go to the length of maintaining that exact reproduction of the handwriting by photography is in the nature of things impossible, the photograph must be admissible in proof. Wigmore then observes:

> *The state of the modern photographic art has long outlawed the judicial doubts above quoted. All that can be said is that a photograph of a writing may be made to falsify, like other photographs and like other kinds of testimony, and that a qualified witness's affirmation of its exactness suffices to remove this danger – as much as any such testimonial danger can be removed. Accordingly, it is generally conceded that a photographic copy of handwriting may be used instead of the original, so far as the accuracy of the medium is concerned.*

In the foot-notes to the above passage many cases are cited from various countries and in regard to the Irish case just cited by us, the author observes that it "raised a doubt which was perversely unnecessary".

On the whole, we think that if the court is satisfied that there is no trick photography and the photograph is above suspicion, the photograph can be received in evidence. It is, of course, always admissible to prove the contents of the document, but subject to the safeguards indicated, also to prove the authorship. This is all the more so in India under section 10 of the Evidence Act to prove participation in a conspiracy. Detection and proof of crime will be rendered not only not easy but sometimes impossible if conspirators begin to correspond through photographs of letters instead of originals. Many conspiracies will then remain unproved because one of the usual methods is to intercept a letter, take its photograph and then to send it on and wait for the reply. But evidence of photographs to prove writing or handwriting can only be received if the original cannot be obtained and the photographic reproduction is faithful and not faked or false. In the present case no such suggestion exists and the originals, having been suppressed by the accused, were not available. The evidence of photographs as to the contents and as to handwriting was receivable.[86]

10.26.22 Forged Postcards[87]

The postcards along with some others recovered in the course of different investigations were sent to Nasik for getting an expert opinion as to whether the same were forged or not. P.W. 1, BN Kulthe, expert in forged currency, banknotes and other security items who examined the postcards when produced in court, stated:

> *They were all in sealed conditions. On opening the parcel I found that there was a huge number of postcards and on examination, I found that those were printed from the blocks which were also in the sealed parcels. There were also some genuine postcards in the parcel. The forged postcards*

86. *Laxmipat Choraria v State of Maharashtra*, AIR 1968 SC 938 : (1968) 2 SCR 624 : 1968 Cr LJ 1124. Also *see SP Chokhani v State of Maharashtra*, AIR 1951 Ngp 226.
87. *Parshotam Dass v State*, 1975 Cr LJ 309.

have been printed from blocks manufactured by photography, single and reply postcards. The fine details of Ashoka pillar in the stamp have been impaired due to reproduction and the fine lines in the background appear thick and broken at place. The shapes of letters and dotted lines of the address appear thick and irregular in size. The buff paper used for printing the forged post-cards is of a lighter shade in colour and of smooth surface. The forged postcards have been printed 4 on a sheet and cut while introducing stags which are wider than those found in the genuine postcards.

The deposition disclosed that some of the postcards which were examined by P.W. 1 at Nasik were genuine while many of them were forged. Giving reasons for his opinion that he had found the postcards forged, he deposed that the inks used in printing them differed in shades when compared with the genuine postcards.

A sealed parcel bearing the seals of the India Security Press, Nasik was opened, and the witness stated that the seals on the cloth were genuine.

As the appellant was being prosecuted on account of 2,000 forged postcards allegedly recovered from the Everest Printing Press of which he was the proprietor, the witness on being shown the 20 packets containing them identifying the same stated in examination-in-chief:

These postcards are marked packetwise as Ex. P.W. one-first to 20 of 100 postcards each.

The cross-examination reveals that the identity of the postcards examined by P.W. 1 at Nasik and those shown to him in court in packets Ex. P.W. one-first to 20 was never questioned.

10.26.23 Signature on fictitious bill[88]

The petitioner being the Branch Manager of Indian Overseas Bank opened Cash Credit and Demand loan accounts in fictitious names. The petitioner opened 12 fake Cash Credit and Demand Loan accounts, and sanctioned loans in these accounts against the third party fixed deposit, which was closed by the fictitious Bill of Digi Export. The expert opinion of the forensic lab has verified the signature on the fictitious bill of Digi Export and have confirmed that it was the signature of the petitioner on said bill. The directors of Digi Export have revealed during investigation that such bill was not applied by them. The petitioner along with his associates has caused wrongful loss to the Indian Overseas Bank and wrongful gain to themselves to a tune of more than Rs4 Crores. The petitioner was missing since the fraud was detected in the Branch and his missing report was lodged at P.S. Malviya Nagar to mislead the Police. The petitioner seems to deviate himself from his official banking duties and violated banking rules and regulations which resulted in loss of faith on his person. If the petitioner is released on bail, he may further tamper the prosecution evidence or abscond himself. Therefore, the Bail Application is rejected at this stage.

10.26.24 Copies Admissible[89]

1. On the other hand, Mr. NS Bhatia, the learned counsel for the State of Punjab, vehemently contended that no objection was raised about the admissibility of the secondary evidence at the stage of the trial by the counsel for the accused and it is not open for the learned counsel for the appellants now to raise such objection at this stage. The learned State counsel has relied on *Ajjarapu Subbarao v Pulla Venkata Rama Rao*[90] wherein it was held that a question of proof of a document is a question of procedure and can be waived, if the objection to the secondary evidence is not taken when the same is being allowed to be recorded. The same objection cannot be allowed to be raised in appeal at the appellate stage. The non-raising of objection in fact amounts to a waiver of formal proof by the party against whom evidence is tendered.

88. *Hare Krishna Mishra v State*, 2018 (1) ADR 439 : Bail Appln. No. 2472 of 2016, Decided on 03/08/2017(Del HC).
89. *Tara Ram Chand v State of Punjab*, 1971 Cr LJ 1201 (HC).
90. AIR 1964 AP 53 : (1963) 2 Andh WR 307 : (1963) 2 Andh LT 442.

Similarly, it was held in a case reported in *Mst. Basanti v Phole,*[91] as to the admissibility of a document, *e.g.,* on the score of the document being a copy, should be taken when the witness who is produced to prove to its contents deposes about it. If such objection is not raised at an early stage of the case, it cannot be entertained later on in appeal. I am in perfect agreement with the authorities cited above. It is to be noted that when the evidence of Sarwan Kumar (P.W. 12), who proved the notices Exhibits PR, PS, PT and PU, was being recorded, no such objection was raised on behalf of the appellants. The question of proof is a question of procedure and can be waived. If the counsel for the appellants would have taken objection to the admissibility of the said evidence at the trial that there was no proof on the file of the case that the original documents have been lost, it was open to the prosecution to produce some official of the court or any other witness, who could have deposed regarding the missing file in question, and the objection could be met in this manner. I am clearly of the opinion that this contention of the learned counsel for the appellants is without any force, and the secondary evidence adduced by way of the copies of the notices issued to Kartar Singh appellant in the form of Exhibits PR, PS, PT and PU, cannot be ruled out from consideration.

The learned counsel for the appellants next referred to the provisions of section 65, clauses (e) and (f) of the Indian Evidence Act and contended that according to clause (e) and the proviso thereto, if the original is a public document within the meaning of section 74, only a certified copy of the document is admissible as secondary evidence and no other copy is admissible. He contended that in view of the provisions of section 74 of the Indian Evidence Act, keeping in view clause (ii) of sub-section (1) thereof, the records of the acts of the official bodies and tribunals are public documents. His contention is that the file relating to the encroachment of appellant Kartar Singh maintained in the municipal office is a public document and according to the interpretation given by him to the provisions of section 65, clause (e) and proviso thereto, only certified copies of the notices could be produced as secondary evidence. He contended that the copies of the notices Exhibits PR, PS, PT and PU, nowhere contained the certificate by the competent authority that the same are the correct copies of the originals. Therefore, the same are not admissible in evidence.

Mr. NS Bhatia, the learned counsel for the State of Punjab, on the other hand, contended that the interpretation sought to be put forth by the learned counsel for the appellants to the provisions of section 65 of the Indian Evidence Act read with its proviso, is untenable and the said provisions cannot be interpreted in the manner as is being suggested by him. He relied on a case reported in *Chikka Veerasetty v Nanjundachari*[92], wherein it was held that the provisions of section 65 of the Indian Evidence Act, postulate the admissibility of the uncertified copies of the public document if the originals are destroyed. After considering the respective contentions of the learned counsel for the parties, I am of the considered opinion that this objection of the learned counsel for the appellants is without any merit. Clause (c) of section 65, which provides that in case of clause (e) or (f) a certified copy of the documents but no other kind of secondary evidence is admissible, seems to apply to a case in which a public document is still in existence on the public records and that provision appears to have be an intended to protect the originals of public records from the range to which they would be subject by constant production of such documents in courts in evidence, and the said clause does not interfere with the general rule of evidence given in clause (c), *i.e.,* in case where the original is destroyed or lost. Where the original documents have been destroyed and are not available, it is open to the parties concerned to produce uncertified copies in order to prove the contents of the original documents. If the provisions of clause (e) and the other clauses providing for the production of the certified copies of the documents, under section 65 of the Indian Evidence Act are read in the manner as is being sought to be interpreted by the learned counsel for the appellants, the provisions of

91. AIR 1955 HP 37.
92. AIR 1955 Mys 139 : ILR 1955 Mys 616.

clause (c) of section 65 of the Evidence Act would become redundant in the case where the public document has been destroyed and is not available. In my opinion, clause (c) is quite independent of the provisions of clauses (e) and (f) of section 65 of the Indian Evidence Act and would apply to all cases whether they are public documents or otherwise if the originals are proved to have been lost or not available. Therefore, this objection of the learned counsel for the appellants is overruled.[93]

10.26.25 Carbon Copy as Specimen[94]

The next contention of Shri A Gangadhara Rao for the appellants is that Ex. P-1 is inadmissible in evidence and was wrongly admitted in evidence and that it was wrongly and unlawfully used for comparison of handwriting. Ex. P-1 is written in carbon. P.W. 6, the assistant collector of Central Excise has deposed as follows:

> *Ex. P-1 is a carbon copy. The range officer to minimise the scriptory work, was tearing off the counter-foil and putting it underneath the inner foil with a carbon paper in between and writing the manuscript portion in the inner foil. It is an irregular practice. I pointed out such irregularities in the cases of several range officers. I cannot now give their names.*

It appears from the evidence that strictly speaking, the foil and the counterfoil ought to have been written independently. If they were so written, each foil would be directly in the handwriting of the officer, who issues it (without being a carbon copy). But, due to the irregular practice followed by the officers to save duplication of their work of writing, the foils happened to be in carbon. In this particular case, it is not known for certain as to how it was written and in particular whether the foil was kept under a carbon paper which, in turn, was under a counterfoil.

But, in any case, it appears that, even according to the usual practice, the foil used to be given to permit-holder, was in carbon. In fact, Ex. P-l was the piece which was issued and which actually functioned as permit and enabled the transport of tobacco successfully and so as to make a semblance of lawful transport. It is the very document which was handed over to P.W. 3 and which induced P.W. 3 to believe that the consignment was duty-paid tobacco which was validly transported.

To prove the offence concerned in this case, it was Ex. P-l which was essential and had to be proved. Let us suppose that there was a counterfoil of Ex. P-1 written in pencil and that it was also available to the prosecution for filing in evidence. Even then it would not affect the fact that Ex. P-l was a permit and it was Ex. P-l, and not the counterfoil which was in fact utilised for committing the offence and was received and acted on by P.W. 3 and can be identified by him as such and that, therefore, it is Ex. P-l which must be produced in evidence and proved and not the counterfoil.

Section 62 of the Indian Evidence Act runs as follows:

> *Primary evidence means the document produced for the inspection of the court.*

The document which is said to have been issued by A-1 and which actually functioned in the commission of the offence and which was received by P.W. 3 and can be identified by P.W. 3 is, according to the prosecution, Ex. P-1. So, it was itself primary evidence. Therefore, the contention of the learned advocate for the accused that Ex. P-1 is secondary evidence and that the pencil counterfoil would be the original is not acceptable.

---

93. *Tara Ram Chand v State of Punjab*, 1971 Cr LJ 1201 (HC).
94. *Gutta Sriramulu Naidu v State of Andhra Pradesh*, (1963) 1 Andh LT 57 : (1963) 2 Cr LJ 546 (AP).
Also see *Makhan Lal v State*, AIR 1958 Cal 517 : 1958 Cr LJ 1178 : ILR (1959) 1 Cal 563; *Nityananda v Rashbehari*, AIR 1953 Cal 456 : (1952) 89 Cal LJ 204.

In *Sarkar* on *Evidence* (vol 1, 10th Edn) at p 553, it is mentioned as follows:

> *Carbon copies produced by typewriters may for all practical purposes be regarded as equivalent, though the impression on the lower sheets are likely to be imperfect. They are produced by the same stroke which makes the surface impression. In Federal US Co v Indiana L and M Co, 176 Ind 328), in the case of machine carbon copy in triplicate, each one was held an original.*

Explanation 2 to section 62 of the Indian Evidence Act runs as follows:

> "Where a number of documents are all made by one uniform process as in the case of printing, lithography, or photography each is primary evidence of the contents of the rest; but, where they are all copies of a common original, they, are not primary evidence of the contents of the original."

In the present case, if the writer of Ex. P-1 has adopted the usual practice, the counterfoil would be in pencil while the foil (Ex. P-1) would be in carbon. If he wanted to save scriptory work, it is open to him to place the foil above the counterfoil and write with pencil. In such case, the foil would be in pencil and the counterfoil would be in carbon. But, it so happened that the usual practice was to keep the foil below the counterfoil so that the foil would be in carbon and the counterfoil would be in pencil. But, from the nature of the preparation of foil and counterfoil, both would have been written simultaneously by the same person and by the same strokes of the same pencil.

In *Nityananda Roy v Rashbehari Roy,*[95] the learned judge of the Calcutta High Court observed as follows:

> *As I have already stated, what was sought to be proved out of Ex. P-1 was the signature which the petitioner was alleged to have affixed to it. It is, however, not the original signature but a copy appearing on a carbon copy. This carbon copy of the signature may be a piece of secondary evidence within the meaning of section 63(2), Evidence Act, is a copy made by a mechanical process which ensures its correctness, but simply because it is secondary evidence of a proper form, it does not follow that the prosecution was entitled to adduce it in evidence all at once.*
>
> *According to the prosecution, the original was in the possession of the petitioner, and the case, therefore, came under section 65(a). Evidence Act, which speaks of documents in the possession of the party against whom they are sought to be used. But in order that secondary evidence of such documents may be given, it is essential that the procedure laid down in section 66 of the Act should be strictly complied with.*
>
> *The procedure there prescribed is that the party desiring to make use of secondary evidence must, in the first instance, serve a notice upon the party in whose possession the original may be, 'requiring him to produce the original and it is only when such notice is not complied with that the right to give secondary evidence arises. There are certain "exceptions to the rule" laid down in section 66 but it is perfectly clear, "that none of them applies to the present case".*
>
> In that case, the complainant was a private party. He himself wrote the body of the receipt and the accused merely signed it. It was open to the complainant to insist on being given the pencil copy instead of the carbon copy. Still, the complainant's case was that he took the carbon copy. This version of the complainant was commented upon adversely by the learned judges in the following terms:
>
> *The "complainant" came to the court with the somewhat strange story that he entrusted to the petitioner a quantity of gold of the value of about Rs 3,000 and took care to obtain a receipt from him, but that, at the same time, he allowed the petitioner, who was the guarantor of the receipt, 'to keep the original with him and was himself content to receive only a copy.' The manifestly unusual character of a transaction of that kind was commented on by the defence.....*
>
> In that case, the learned judges held that the carbon copy was not a good basis for comparison of signature for the following reasons:

95. AIR 1953 Cal 456 : (1952) 89 Cal LJ 204.

1. *There is authority of books like Osborn or Brewster that carbon copies, particularly copies made on carbon paper used in this country, "cannot generally be relied upon" for purposes of comparison, because the impression made upon such carbon paper is "generally irregular and blotched".*
2. *The deposit on the carbon paper were 'generally wiped off when the paper was folded with the result that all traces of the distinctive characteristics of the writings on it became blurred.*
3. *The accused signed his name on the original of the carbon copy with a fountain pen which was unusual as the common practice was to write with a pencil, if carbon copy were to be available.*

Ground No. 1 states a general proposition, and leaves scope for exceptions in particular cases. The impression in Ex. P-1 is not irregular or blotched. It is very clear and was obviously prepared with carbon paper of good quality. So, in this case, ground No. 1 does not affect the usefulness of Ex. P-1 for comparison or identification of writing. Whether in a particular case, a carbon writing would be less clear and less fit for comparison and identification of writing than a writing in pencil would depend upon the comparative qualities of the pencil and carbon paper.

If a good pencil were used with a bad carbon paper, the pencil copy would be clearer and fitter for comparison than the carbon copy, but the position would be otherwise if the carbon paper was of a good quality and the pencil of a bad quality. Ground No. 2 also does not apply since, in this case, the carbon copy is good, and the impressions are very clear especially as regards the signature. The distinctive characteristics of the writing are all visible and have not become blurred in Ex. P-1. According to the prosecution, in Ex. P-1 not only the signature but the entire writing is in the handwriting of A-1 and therefore, ample material is available for identifying the writing as made in the hand of A.1. Ground No. 3 does not apply to this case for, though it is not known as to whether the counterfoil was in fountain pen or pencil, there is no defect in Ex. P-1. So that decision is easily distinguishable on facts.

In *Makhan Lal Sen Gupta v State,*[96] it was held by the Calcutta High Court that a carbon copy of a search list with certain ink writings on it was not admissible under section 62, Evidence Act. They further observed that, when a mere glance at the document would show that even a part from the ink writings the whole of it could not have been made by one uniform process, it would not satisfy the requirements of section 62 and other sections of the Evidence Act. In the present case, there is no contention that there are any ink writings in Ex. P-1 or that there is any room for doubting the fact that Ex. P-1 as well as its counterfoil were made in one writing.

In the instant case, Ex. P-1 was written and issued by a government officer (accused-1) in his capacity as a government officer, *i.e.,* public servant. In fact, Ex. P-1 was a document issued on behalf of the Central Government as permit. Such permits were being issued, as a general practice to licensees for transport of tobacco and were being accepted and used by them.

So, there would be nothing unusual or worth of comment in merchant receiving the permit, Ex. P-1 which was written and signed in carbon. When a merchant received a permit in carbon copy issued by the government he would be entitled to use it as primary evidence and he need not call for the pencil copy to be filed as original.

The prosecution was not in a position to prove by direct evidence as to who was the person to whom A-1 handed over the permit, Ex. P-1. But the prosecution could and did prove that Ex. P-1 was not handed over to P.W. 2 the person in whose favour it was issued. The learned special judge has observed that the T.P.I. permits were in the nature of cheques because they were evidence of duty having been paid on the tobacco covered by them. This observation is substantially correct. In the case of a cheque issued by a person, the foil is always

96. AIR 1958 Cal 517 : 1958 Cr LJ 1178 : ILR (1959) 1 Cal 563.

primary evidence, even if it were prepared by copying from the counterfoil. In this case, Ex. P-1 is a permit which was issued, irrespective of the general practice by which a counterfoil (corresponding to each foil) was being written and maintained. I am unable to agree that in this particular case, Ex. P-1 was only secondary evidence.

Assuming for argument's sake, without admitting, that Ex. P-1 is secondary evidence and that the counterfoil was written in pencil and that the counterfoil would be the original, even then. Ex. P-1 would be admissible in evidence. The pencil counterfoil along with the other counterfoils in the same book ought to have been in the ordinary course of business left by A-1 in the office and ought to be available with the central excise department. There is evidence of an excise officer (P.W. 1) that the book was not found in the office of range No. 3. So, under section 65(c) of the Evidence Act, secondary evidence can be given of the contents of that pencil counterfoil when the original has been lost or when the party offering evidence of its contents cannot, for any other reason not arising from his own default or neglect, produce it in reasonable time.

If the foil were in the possession of the accused, then he must have got the possession by fraud, *i.e.,* taking into possession and retaining something which he ought to have left in the government records of his office. Under proviso 3 to section 66 of the Evidence Act, no notice is necessary for producing secondary evidence 'when it appears or is proved that the adverse party has obtained possession of the original by fraud or force". Hence, I find that Ex. P-1 was the primary evidence (as we are concerned in this case with what Ex. P-1 contains and not with what is contained in a counterfoil of Ex. P-1 even if there be one) and that even if it were secondary evidence, it was admissible in evidence and was rightly admitted in evidence by the learned special judge.

The identity of the signature and handwriting in Ex. P-l with the signature and handwriting of A-1 has been proved by the witnesses, P.Ws. 6, 8, 17 and 18. They all say that they are familiar with the handwriting and signature of A-1 having become acquainted with the writing and signature in the course of their official duties.

I do not see any reason to disagree with the findings of the learned special judge that Ex. P-1 is in the handwriting and bears the signature of A-1.[97]

10.26.26 Certified Photo-copy Admissible as Substitute for the Original[98]

Learned Advocate Mr. Dodia appearing for accused No. 1 in the trial Court has cross-examined PW 5, at length, but no material contradictions have come on record by the said cross-examination. We are not able to refrain ourselves from making an observation that in this case a deliberate attempt is made to tire out witnesses. For an illustration even after the witness deposed that a portion of the Forensic Science Laboratory report containing material details was torn, a certified true copy was produced. This copy was not certified as true copy by the Customs Officers. It was certified as true copy by the Forensic Science Laboratory officers of the rank of "Assistant Director" and still the cross-examination was made on the line that the Forensic Science Laboratory report at Exh. 101 is a concocted one. This question was repeated. It was then repeated for the third time. Thereafter, it was suggested to the witness that he was not giving out the true facts. The last part of para 45 is suggestive of the fact that the witness is exhausted and tired out. The witness stated that.

> *".....If you are asking for the reason of tallying this information before the Court, then the answer is that I cannot have any such information or any proof of that."*

97. *Gutta Sriramulu Naidu v State of Andhra Pradesh*, (1963) 1 Andh LT 57 : (1963) 2 Cr LJ 546 (AP). Also see *Makhan Lal v State*, AIR 1958 Cal 517 : 1958 Cr LJ 1178 : (1959) ILR 1 Cal 563; *Nityananda v Rashbehari*, AIR 1953 Cal 456 : (1952) 89 Cal LJ 204.
98. *Gulam Nurmamad Theim v State of Gujarat*, 2003 Cr LJ 356 (Guj).

It will also be appropriate to note that the Xerox copy which was sent by the Forensic Science Laboratory after certifying to be true copy has come from the official record of the Forensic Science Laboratory and this Court has no reasons to believe that an officer of Forensic Science Laboratory had any interest in concocting the report against the accused. At no stage, it is the defence of the accused that he had enmity with *X*, *Y* or *Z* of the prosecution agency or that of the Forensic Science Laboratory and therefore, he is wrongly booked.

10.26.27 Authorship from Contents[99]

1. Learned trial judge as well as the learned judges of the High Court have found that there were sufficient number of admitted or proved letters which might well enable Jasawalla and the complainant to identify the signatures of the appellant in the disputed letter. They also laid stress substantially on the contents of the various letters, in the context of the other letters and telegrams to which they purport to be replies and which form the chain of correspondence, as indicating the genuineness of the disputed letters.

Learned counsel objected to this approach on a question of proof. We are, however, unable to see any objection. The proof of the genuineness of a document is proof of the authorship of the document and is proof of a fact like that of any other fact. The evidence relating thereto may be direct or circumstantial. It may consist of direct evidence of a person who saw the document being written or the signature being affixed. It may be proof of the handwriting of the contents, or of the signature, by one of the modes provided in sections 45 and 47 of the Indian Evidence Act.

It may also be proved by internal evidence afforded by the contents of the document. This last mode of proof by the contents may be of considerable value where the disputed document purports to be a link in a chain of correspondence, some links in which are proved to the satisfaction of the court. In such a situation the person who is the recipient of the document, be it either a letter or a telegram, would be in a reasonably good position both with reference to his prior knowledge of the writing or the signature of the alleged sender limited though it may be, as also his knowledge of the subject-matter of the chain of correspondence, to speak to its authorship.

In an appropriate case the court may also be in a position to judge whether the document constitutes a genuine link in the chain of correspondence and thus to determine its authorship. We are unable, therefore, to say that the approach adopted by the courts below in arriving at the conclusion that the letters are genuine is open to any serious legal objection. The question, if any, can only be as to the adequacy of the material on which the conclusion as to the genuineness of the letters is arrived at. That, however, is a matter which we cannot permit to be canvassed before us.

10.26.28 Acceptance of Writer without Direct Evidence[100]

In our opinion, Ex. P-4 has also been proved to have been written by the appellant. It is true that there is no direct proof that the appellant wrote it, nor even proof by any witness that it is in the handwriting of the appellant. But in law that is not necessary. Section 3 of the Indian Evidence Act says:

> *A fact is said to be proved when after considering the matters before it, the court either believes it to exist, or considers its existence so probable that a prudent man ought under the circumstances of the particular case to act upon the supposition that it exists.*

99. *Mobarik Ali Ahmed v State of Bombay*, AIR 1957 SC 857 : 1958 SCJ 111 : 1957 Cr LJ 1346 (SC).
100. *Rayappa Asari, Re,* 1972 Mad LW (Cri) 48 : 1972 Cr LJ 1226 (Mad).

There is nothing in this to show that the proof must be direct. In fact, just as the fact that a murder was committed by an accused may be inferred from circumstantial evidence, it is also permissible in law to infer the authorship and genuineness of a document from circumstantial evidence.

In this particular case there are the following circumstances to prove that Ex. P-4 was written by the appellant. (1) It was recovered from inside the house of the appellant. (2) The contents of Ex. P-4 strongly suggest that the appellant was the author. It refers in detail to the relationship between the appellant and Kamala, and in particular it also refers to their stay in the house of Planiasari of Chinnamariamman Koil Street, Kannakurichi, Salem-8. Reading it with the evidence of P.W. 7 we have no doubt that it refers to P.W. 7. Thus, the evidence of P.W. 7 itself lends corroboration to the contents and the authorship and truth of Ex. P-4. (3) It seems to us that the handwriting in Ex. P-4 is similar to the admitted signatures of the appellant in his statement under section 342, Code of Criminal Procedure before the committal court and the trial court. We may also observe that as a matter of probability it is unlikely that any other person writes out such a letter and kept it on box. Ex. P-4 shows that Kamala was unfaithful to the appellant and that he was not at all happy with her.[1]

10.26.29 Typescript[101]

Next it was argued that the letter was not typed on the office typewriter that was in use in those days, *viz.* article B and that it had been typed on the typewriter article A which did not reach Nagpur till the end of 1946. On this point evidence of certain experts was led. The High Court rightly held that opinions of such experts were not admissible under the Indian Evidence Act as they did not fall within the ambit of section 45 of the Act. This view of the High Court was not contested before us. It is curious that the learned Judge in the High Court, though he held that the evidence of the experts was inadmissible, proceeded nevertheless to discuss it and placed some reliance on it. The trial magistrate and the learned Sessions Judge used this evidence to arrive at the finding that as the letter was typed on article A which had not reached Nagpur till the end of December 1946, obviously the letter was ante-dated. Their conclusion based on inadmissible evidence has, therefore, to be ignored.

[Author's Note: It was an unfortunate decision. Thus, reversed.]

10.26.30 Interested Witness[102]

The opinion of Mr. Bennet suffers from the defect that it was given by a remunerated witness. He knew before-hand why he had been called and what the party calling him wished to be proved. The witness stated that 10 days before he came to court he was approached by the appellant about this case. The appellant told him that he repudiated the two signatures on X and Y. The witness was also given a copy of the evidence of the government handwriting expert before he was examined in court. He further admitted that he had been paid his fees in two instalments before he came to depose. It is not improbable that he had an unconscious bias in favour of the appellant. These circumstances to a great extent detract from the weight to be attached to the witness's opinion.

10.26.31 Corroboration Needed[103]

1. What is more, defence produced documents from Kidderpore Maternity Hospital in 1941, in the records of which the girl who gave birth to the child signed her name as "Nanda Rani wife of Bani Gupta of 36, Tollygunge Circular Road". This writing and signature were said to be of Shefali and opinion has been given by handwriting expert to be of Shefali. Shefali Ghose, however, denied having given birth to a child at any time in the Kidderpore Maternity Hospital or having made that writing or signature. There was no direct evidence, nor there was any circumstance to provide evidence that the writing and signature purporting to be of Nanda Rani was that of Shefali. The learned Magistrate rightly rejected the claim of Baidya Nath Ghose to prove this writing and signature as being of Shefali because Baidya Nath Ghose does not come within any of the categories mentioned in section 47 of the Indian Evidence Act. In the absence of any direct and substantive evidence on the point, the opinion of the handwriting expert which could have only corroborative value has no use at all. Moreover, the evidence in the expert's testimony is the reason given by him and not the assertion of opinion divorced from reasons. Having examined the writings themselves in the background of the reasons mentioned by the expert witness I am definitely of the view that the opinion of the expert cannot be accepted.[1]

10.26.32 Handwriting evidence need Corroboration[104]

As to the value of expert evidence on disputed handwriting their lordships of the Supreme Court have in *Ramchandra v State of Uttar Pradesh,*[105] observed that it is not safe to treat expert evidence as to handwriting as sufficient basis for conviction. Their lordships, however, have added that such evidence may be relied upon along with other various, items of external and internal evidence relating to the disputed documents.[106]

10.26.33 Indefinite Expert Report - Useless[107]

I would like to mention in particular that although a handwriting expert (P.W. 7) was examined to depose that some disputed signatures of the District Veterinary Officer, SP Dwari (marked X/1 to X/3 compared with his admitted signatures A/1 to 1/15) were forged according to his report (Ext. 27), such evidence is of inconclusive character, because, in the absence of a finding by the appellants for misappropriation of cash no reasonable conclusion can be drawn that either of the appellants committed the forgery. In this connection the authorities are, *Murarilal v State of Madhya Pradesh*, AIR 1980 SC 531 : (1980) 1 SCC 704 : 1980 Cr LJ 396, relied upon in a case reported in *BK Kutty v State*, (1984) 1 Ori LR 597 : 1984 Cr LJ 1289 : 1984 (2) Crimes 183 laying down the principle that it may be hazardous to base a conviction solely on the opinion of the handwriting expert without any independent corroboration.

Before closing the case, I would note the contention of Mr. P.K. Ray to the effect that for the prosecution of the appellants under section 5(2) read with section 5(1)© sanction for the prosecution under section 6 of the Act was neither obtained nor proved in this case. This contention does not merit consideration in view of the fact pointed out by the learned Special

103. *Baidya Nath v Shefali,* (1962) 1 Cr LJ 19 (Cal).

105. AIR 1957 SC 381.
106. *Abhayanand Mishra v State of Bihar*, AIR 1959 Pat 328 : 1959 Cr LJ 893 (Pat). Also see *Ram Chandra v State of Uttar Pradesh*, AIR 1957 SC 381 : 1957 Cr LJ 559; *Shakti Kumar v Subodh Kumar*, AIR 1964 SC 529; *State v A Gopalan*, Mad LJ 1966 (Cr) Ker 67; *Sudhindra Nath Dutt v R*, AIR 1952 Cal 423.
107. *Ajodhya Prasad Misra v State of Orissa*, 1985 Cr LJ 1401 : 1985 (1) Ori LR 326.

Judge that by 3 May 1978, when cognizance of the offence was taken, the appellants had ceased to be public servants, for, appellant Ajodhya had already been retired and appellant Balaram had been dismissed from service. Apart from the decision reported in *State (SPE, Hyderabad) v Air Commodore Kailash Chand*, AIR 1980 SC 522 : (1980) 1 SCC 667 : 1980 Cr LJ 393, the latest decision is reported in *RS Nayak v AR Antulay*, AIR 1984 SC 684 : (1984) 2 SCC 183 : 1984 Cr LJ 613, *RS Nayak v AR Antulay*, in which it was held that the relevant date with reference to which a valid sanction is *sine qua non* for taking cognizance of an offence committed by a public servant as required by section 6 is the date on which the court is called upon to take cognizance of the offence of which he is accused. In view of this proposition, it was not a case in which sanction under section 6 of the Act was necessary.

For the foregoing reasons, in disagreement with the learned Special Judge, I hold that the charges framed against the appellants were not brought home to them beyond reasonable doubt and so the order of conviction and sentence cannot be sustained. Accordingly, the same is set aside and the appellants are acquitted. Fines, if realised, may be refunded. Both the appeals are allowed.

10.26.34 Corroboration Needed[108]

I would next come to the charge of forgery. The case of the prosecution was that a few days after the payment of Rs 325 by P.W. 1 to the appellant, the latter returned the Registration Book with a false entry purported to have been signed by the Regional Transport Officer (P.W. 7) which had been forged and affixing a false seal. It was in the evidence of P.W. 8, one of the investigating officers, that he had taken the specimen signatures and writings of the appellant in the presence of a Magistrate (Mr. R.K. Hota) and Exts. 17 were the specimen writings and signatures of the appellant. Mr. R.K. Hota had not been examined as a witness for the prosecution. It was, indeed, unfortunate that while examining the appellant, the trial court did not take care to ask him as to whether these specimen writings and signatures had been taken from him. The evidence of P.W. 3, the handwriting expert, was that the signature (Y-1) purported to be that of the Regional Transport Officer had not been written by P.W. 7 as compared by him with his specimen writings. It was not in his evidence that this signature had been written by the appellant. P.W. 7 had not testified that this signature, which was not his, was in the hand of the appellant. As regards the disputed entry (Y-2), the evidence of P.W. 3 was that it was in the hand of the appellant as compared by him with the specimen writings of his. It was not in the evidence of P.W. 7, who was supposed to be acquainted with the writing of the appellant, that this writing was in the appellant's hand. The appellant had denied to have written "Y-2". The evidence of the Expert (P.W. 3) in this regard had not received any corroboration. There was no specific evidence that the appellant had been instrumental in putting a false seal in the Registration Book.

It has been laid down by the Supreme Court in *Murarilal v State of Madhya Pradesh*, AIR 1980 SC 531 : (1980) 1 SCC 704 : 1980 Cr LJ 396, that it may be hazardous to base a conviction solely on the opinion of a handwriting expert. But the hazard in accepting the opinion of any expert, handwriting expert or any other kind expert, is not because experts, in general, are unreliable witnesses – the quality of credibility or incredibility being one which an expert shares with all other witnesses – but because all human judgment is fallible and an expert may go wrong because of some defect of observation, some error of premises or honest mistake of conclusion. The science of identification of handwriting is not so perfect, as observed by their Lordships of the Supreme Court. In appropriate cases, corroboration may be sought although there is no rule of law or rule of prudence which has crystallised into a rule

108. *BK Kutty v State*, 1984 Cr LJ 1289 : 1984 (2) Crimes 183 : 1984 (1) Ori LR 597.

of law that opinion evidence must never be acted upon unless substantially corroborated. In the circumstances of the present case, it would not be reasonable and proper, in my view, to base a conviction of the appellant for forgery in respect of the entry marked 'Y-2' without any corroboration.[1]

10.26.35 Brief Reports[109]

In his examination-in-chief Sri Sen gave briefly the reasons in support of his view. He explained that considering presentation, pen-pressure, spacing, relative sizing, terminal, slope, movement, location,, the disputed writing appears to be the writing of the person who wrote Ex. P-17, Ex. P-18, Mr. Chaudhry contended that the reasons given by Sri Sen in support of his opinion were inadequate. It is not necessary for an expert to give reasons at great length in support of his opinion. It is sufficient if the expert gives his reasons briefly. It is always open to the opposite party to require the expert to elaborate any particular point further in cross-examination.

Sri Sen gave out opinions from time to time. Exhibit D-4 is his opinion dated 30 June 1951. Exhibit P-30 is his opinion dated 10 December 1951. Exhibit P-31 is his opinion dated 16 July 1952. In Ex. D-4 Sri Sen wrote that, it was necessary to have signatures of Sarju Mal, Shyam Lal and M. Singh for purposes of comparison. Again in Ex. P-30 Sri Sen wrote:

> *I am unable to identify the writer or writers of the rest of the writings on the basis of the present materials.*

Sri Sen gave the supplementary opinion (Ex. P-31) on 16 July 1952. Mr. Chaudhry argued that the supplementary opinion carries no weight, as Sri Sen had already stated earlier that he was unable to say anything further without additional material. Sri Kehar Singh, Inspector, S.P.E., Lucknow, is P.W. 9. He stated before the court that when the expert demanded more documents for comparison, Sri Kehar Singh sent Exs. P-21 to P-26 again. Exhibits P-21 to P-26 marked by the court correspond to six papers, which were marked by Sri Sen at 14 to 19.

A perusal of the three opinions (Exs. D-4, P-30 and P-31) shows that, five papers marked by Sri Sen as 1 to 5 were used by him as the basis for comparison for purposes of the two opinions (Exs. D-4 and P-30). But for the supplementary opinion (Ex. P-31), he utilised papers marked by him as 14 to 19 in addition to the five papers marked by him as 1 to 5. It, therefore, appears that when Sri Sen gave his supplementary opinion (Ex. P-31) on 16 July 1952, he had with him some additional material, which was not in his possession when he wrote Ex. D-4 or Ex. P-30. It is not, therefore, surprising that, in his supplementary opinion (Ex. P-31) Sri Sen was able to say something about the writing Q-l,

Mr. Chaudhry contended that after all Sri Sen's statement is merely his opinion, and it is not safe to base the appellant's conviction on the opinion of an expert. Sri Sen's opinion is not the only material for holding that the disputed writing and signature are the appellant's writing and signature. We have also got Ram Gopal's statement on the same point. The statements of Ram Gopal and Sri Sen are sufficient to prove that Exs. P-3, P-4 and P-5 were written by the accused.

These three payment orders purport to have been issued by Sri M. Singh, Residential Engineer. Sardar Manmohan Singh appeared before the court as P.W. 3. He stated that the three

---

109. *Prem Shanker Misra v State of Uttar Pradesh*, 1956 All LJ 910 : (1957) 2 Lab LJ 177 : 1957 Cr LJ 108 (All). Also see *Haji Mohammad Ekramul Haq v State of West Bengal*, AIR 1959 SC 488 : 1959 SCJ 443 : 1959 SCR Supp (1) 922; *State of Vindhya Pradesh v Krishna Nand*, AIR 1953 VP 21; *State of Bihar v Karu Gope*, AIR 1954 Pat 131 : 1953 BLJR 488 : 1954 Cr LJ 201 (Pat).

signatures purporting to be signatures of M. Singh appearing on the three payment orders are not his signatures. Exhibits P-9 to P-16 are specimen signatures of Sardar Manmohan Singh. In his opinion (Ex. P-30) Sri Sen stated that the person, who wrote the writing marked as 6 to 13, did not write the signatures marked Q-3, Q-6 and Q-9. Thus, from the statements of Sardar M. Singh and Sri Sen it is clear that, somebody forged signatures, which purport to be the Resident Engineer's signatures on Exs. P-3, P-4 and P-5.

Sri Sen was unable to say which person prepared these signatures Q-3, Q-6 and Q-9. It is, however, clear that the three signatures are forged. Further, the body of the three payment orders was prepared by the accused. The charge of forgery has, therefore, been proved against the accused on three counts. These payment orders were prepared in the name of one Sarju Mal. There is evidence to the effect that, a person purporting to be Sarju Mal was committed for the purpose of cheating. So, the offence committed by the accused falls under section 468, Indian Penal Code.

10.26.36 Reports Inadmissible[110]

The document, however, was sent to the expert and it would appear that the opinion forwarded by the expert in writing threw doubt on the genuineness of the document. But the expert was not examined and nothing further was done in that behalf.

The lower appellate court appears to have taken the view that though the expert did not enter into the witness box and did not prove his opinion, a communication received from him could be regarded as evidence and as such can be considered in dealing with the question as to whether the document is genuine or not.

Indeed, in more than two places in his judgment, the learned judge has referred to the opinion of the expert and he has in fact found that the circumstantial evidence which arose about the genuineness of the document was corroborated by the opinion of the expert.

Now in relying on the opinion of the expert the learned judge was really acting upon evidence which had not been proved according to the Evidence Act. The opinion sent by the expert in writing cannot prove itself.

It was essential that the expert should have stepped into the witness box and then perhaps for convenience he may have been permitted to put her opinion on the record so as to enable the opponent to cross-examine him in reference to that opinion.

Unless the expert stepped into the witness box, the opinion expressed by him in a communication to one of the parties could not be treated as evidence under the Evidence Act. Unfortunately, the lower appellate court lost sight of this fact.[1]

10.26.37 Reasons and Illustrations[111]

From the order it appears that the report of the handwriting expert who examined those documents containing grounds of his opinion has been supplied to the accused and on that basis that point has not been considered. The learned advocates appearing for the petitioner and for accused No. 6 state that no such grounds of his opinion have been supplied. The bare opinion of the Chief State Examiner of Questioned Documents, CID, GS, Ahmedabad has been annexed with this application. The learned assistant government pleader is not able to satisfy us by showing that the grounds of opinion have been also supplied to the accused. It is, therefore, necessary to consider whether the accused are entitled to claim the grounds or reasons which led the handwriting expert to give an opinion in respect of the writings in

110. *Parwat Vedu Patil v Sukdev Shivram Patil*, AIR 1956 Bom 617 : 1956 Cr LJ 1069 (Bom).
111. *Chander Bhan v State of Gujarat*, 1971 Cr LJ 167 (Guj).

question. Section 173, sub-section (4) of the Code of Criminal Procedure requires the police officer in-charge of the case to furnish or cause to be furnished to the accused, free of cost, a copy of the report forwarded under sub-section (1) and of the first information report recorded under section 154 and of all other documents or relevant extracts thereof, on which the prosecution proposes to rely, including the statements, The words "and of all other documents or relevant extracts thereof, on which the prosecution proposes to rely" would obviously cover not only the opinion but also grounds or reasons for giving such an opinion given by the handwriting expert. If, therefore, the grounds are sought to be relied upon by the prosecution for determining the question of identity of the handwritings of certain documents in the case, they form one homogeneous document and cannot be separated. It is not that his opinion can be exhibited as in case of some other opinions,, and it has, therefore, to be proved. The expert has, therefore, to be examined and he would have to state before the court his grounds for such an opinion. Those grounds should, therefore, be supplied to the accused if they are sent by him to the investigating officer and that would be in the nature of a statement obtained from him as it were under section 162 of the Code of Criminal Procedure. Besides, the opinion becomes relevant in any such case under section 45 of the Evidence Act. At the same time, section 51 of the Evidence Act provides that whenever the opinion of any living person is relevant, the grounds on which such opinion is based is relevant. In other words, the grounds on which any such opinion is based an opinion which he ultimately gives are both relevant in any such inquiry and if the prosecution were to rely upon any such opinion as a piece of evidence against the accused in any criminal trial, that has to be supplied to the accused under section 173(4) of the Code. If the grounds are not supplied, the accused would not be able to know on what basis such an opinion was arrived at. He would be put to disadvantage in his defence, and fairness in a criminal trial demands that they have to be supplied to the accused. The accused should not be taken unawares at the time of trial for after all, the intention of the Legislature behind section 173(4) of the Criminal Procedure Code is to apprise the accused of all such evidence that is likely to be produced against him in the case. Now when no such grounds, on which the opinion has been given by the expert, are supplied to the accused, as urged before me, the learned Magistrate shall see that the same are supplied to each one of the accused before the trial or inquiry commences.

Now so far as the photographic enlargements of the disputed and admitted writings of the accused are concerned, it is difficult to say that they would be covered within the meaning of "and of all other documents or relevant extracts thereof, on which the prosecution proposes to rely" for the reasons that what the prosecution relies upon are the original documents before the court which are said to have been forged and all that the accused are entitled to claim is only the copies thereof. The copies of such documents have been supplied to the accused and there is no grievance in that respect. The photographic enlargements are taken by the handwriting expert with a view to facilitate his work in arriving at the correct opinion in respect of those writings and they cannot, therefore, be treated as the documents on which the prosecution can be said to rely for the case against the accused. If they are, however, placed before the court at the time of giving evidence, they can be taken for the purpose of facilitating the appreciation of the grounds of the opinion given by the handwriting expert and in respect of which his evidence is being recorded. They can as well be seen by the accused at that stage. If, however, they desire to have any photographic enlargements for the purpose of their defence, it would be open to the accused to make a suitable request to the court for being permitted to take such photographs in the presence of any officer of the court. But they cannot claim as of right any such photographic enlargements of such writings made by the handwriting expert for giving an opinion in respect thereof. The learned Magistrate was, therefore, right in rejecting that part of the request of the accused.

10.26.38 Enlarged Photographs Necessary[112]

It was the submission on behalf of the State, as stated earlier, that the insistence of the accused on the enlarged photographs is not proper because the prosecution does not propose to rely on them. Arguments are advanced before us on the strength of evidence led in the trial court wherein at one stage the handwriting expert said that when he formed an opinion and gave the report with reasons, he had referred to the enlarged photographs and from that he has based an opinion about the particular handwriting before him. It is also stated before us that in answer to the question by the court, the handwriting expert stated that he could have given the opinion without the enlarged photographs. Now whether he could have given the opinion without the enlarged photographs is something which has been brought from him in a hypothetical way because according to the submissions made before us it was a clear case of the handwriting expert that he had referred to the enlarged photographs for forming the opinion. So first of all we shall have to see whether for giving an opinion and also for forming an opinion about the particular handwriting by the prosecution or defence advocate or the defence expert, or for the assessment of the court it would be necessary to have the enlarged photographs. For that it will be worthwhile to refer to the opinions of some experts who have written books on such subjects. The book "*Questioned Documents*" *by Albert S Osborn*, 2nd Edn in chapter V at p 30 mentions that photographs are useful in nearly every questioned document investigation and in many cases it is impossible without them to present the facts to a court and jury in an effective, convincing manner. It further mentions that photographs often make clear what otherwise may be hidden or indistinct, and this fact alone is sufficient reason for their use. It is further observed at p 40 last paragraph that the most important reason for making photographs of a disputed document is that by this means the writing in question can be accurately enlarged so that every quality and characteristic of it can be clearly and properly interpreted whether the facts so shown point to genuineness or to forgery.

Hanna F Sulner in the book "*Disputed 'Document*", 1966 Edn, chapter 4 has observed: "the only proper presentation of proof and the best way to demonstrate the experts reasoning is through the use of a photo enlargement chart representing his opinion." It is further observed at p 32: "it is sufficient to say that any attorney involved in a case requiring the type of demonstrative evidence described before, should seek the service of a competent document expert who is familiar with the various techniques and modern methods of photographing documents or portions of a document." It is further observed in the last paragraph at p 32 that "in most of the questioned document problems it is not only advisable, but imperative to use charts with photo-enlargements because without them it is almost impossible to present the facts to the court and jury in a convincing and effective manner."

In the book "*Law of Disputed and Forger Documents*" by J Newton Baker, 1955 Edition, in Chapter VII, section 71 at p 117, it has been observed:

> *The enlarged photograph provides invaluable assistance in the comparison of the various signatures, especially when the proportions of the writing are so enlarged that the faintest lines or marks, or erasures or additions, which otherwise could not be seen or were so hidden as to escape casual observation, can be appreciated." It is further observed: "To proceed with the trial of a disputed signature without specially prepared and sufficient photographs is plain indiscretion and wilful stupidity that usually proves very costly, and the attorney of experience has seen the reason to regret having done so."*

In the book "*Scientific Evidence in Criminal Cases*" by Andre A Moonsens, Ray Edward Moses and Fred E Inbay, 1973 Edition, Item No. 6 in chapter 2 at p 40 reference to scientific reports, it has been observed: "Unless adequate resources are available to the defendant, the State should not have exclusive pretrial rights to scientific data solely on the strength of the theory that it was the product of analysis and interpretation by the State's employees in the State's laboratories."

---

112. *Pravinkumar Lalchand Shah v State of Gujarat*, 1982 Cr LJ 763 : 1981 Guj LH 373 : 1982 (23) Guj LR 116.

At p 41 it has been observed: "In these situations, to deny the defence pre-trial access to the State expert's report is to deny it any pre-trial discovery, for its experts have nothing to examine unless the defence has had the opportunity timewise, and has been farsighted enough to show good cause why its expert should be allowed to participate in the State-conducted examination." It is further observed that "not only should an effort be made to discover the expert's reports, but the discovery motion should also request photographs, notes, diagrams, tape recordings and sketches the expert may have made during his examination. These can be evaluated by a defence expert". It has been further observed in the last paragraph at p 41 that "State fingerprint experts who will testify as to the identity of latent prints, typically use enlarged photographs which should be examined by the defence prior to trial." Though all the references made to the books by the experts on this subject clearly show that in order "to appreciate the handwriting, help of enlarged photographs is a must, even otherwise common practice at the court has clearly shown that in order to come to a proper conclusion about the handwriting, assistance from enlarged photographs is always necessary. If the prosecuting agency has all the resources available to it and can get the opinion of an expert, will it be sufficient to merely throw the opinion and reasons of the expert at the accused when the opinion of the prosecution expert is formed after referring to the enlarged photographs which would clearly show the distinguishing feature? Can that be denied to the accused if the intent of the Legislature by amending the provisions of section 173 of the Code was to make all possible data available to the defence for the proper preparation of the case of the accused before the commencement of the trial? That is the point that has to be considered. It was argued on behalf of the State that the accused could get the photographs either by getting the original before the trial court and getting the photograph or by paying the amount for the requisite copies. We are here concerned with the important aspect of the availability of all the materials to the accused for his proper defence even before the commencement of the trial. It may be that sometime before the trial starts the prosecution would realise as to on what material the evidence of a particular witness is based and if he is an expert witness what he has followed and on what he has relied. If he had got some advantage of referring to some material for coming to his conclusion and if that is found when the trial is proceeding, would it debar the defence from raising a point that in order to prepare for proper defence, the copies of the enlarged photographs on which the expert has relied should be given? If that opportunity is available to the accused, the accused can show the photographs to a private handwriting expert and get proper help. It may be that the accused person who is able to spend may call a private handwriting expert in the court and get the copies prepared but it would be too much to expect that the expert would come to the court and by looking merely to the documents would be in a position to give an opinion and also instruct the advocate of the accused to put questions to challenge the opinion given by the State handwriting expert or there may be cases where the advocate of the accused having sympathy for the accused may himself prepare with the help of the expert's aid and books by properly studying the handwriting. In both the cases the enlarged photographs would be quite necessary. It cannot be said by the State that the persons who can afford the photographs only will be having that benefit by making payment and those who cannot afford it would be deprived of that opportunity. This aspect can never lie in the mouth of a State, as the Legislature has enacted the statute in the form of section 173 of Code of Criminal Procedure with the object of giving the accused a proper opportunity for preparing his defence.

But when this question arises, we have before us a judgment of this court to which we have already referred to and that is in the case of *Himatlal Ratilal Rajyagar v State of Gujrat*.[113] Therein it has been observed by this court that the grounds on which any opinion is based and the opinion which a handwriting expert may ultimately give are both relevant under

113. 12 Guj LR 167 : 1971 Cr LJ 165.

section 45 of the Evidence Act in any such inquiry and if the prosecution were to rely upon any such opinion as a piece of evidence against the accused in any criminal trial, that has to be supplied to the accused under section 173(4) of the Code. But in that very judgment it has been observed:

> *However, photographic enlargements of the disputed and admitted writings of the accused would not be covered within the meaning of "and of all other documents or relevant extracts thereof, on which the prosecution proposes to rely" for the reason that what the prosecution relies upon are the original documents before the court which are said to have been forged and all that the accused are entitled to claim is only the copies thereof. The photographic enlargements are taken by the handwriting expert with a view to facilitate his work in arriving at the correct opinion in respect of those writings and they cannot, therefore, be treated as the document on which the prosecution can be said to rely for the case against the accused. The accused cannot claim as of right any such photographic enlargements of such writings made by the handwriting expert for giving an opinion in respect thereof.*

As this is the pronouncement by this court, Messrs MB Shah and JM Panchal, the learned Public Prosecutors stated that the proposition of law propounded by this court being quite correct, we should not try to consider it in a different way. In this judgment it was observed that it would be sufficient if the accused were given the copies of the forged documents. With respect to the learned judge we may observe that whenever the question of forgery arises, it is a question of making out the handwriting or signature of somebody else and creating a forged document and using it. Whether those particular writings are forged or genuine is a question to be considered. So far as the statement obtained by the police or any other document is concerned, a mere copy of it prepared in the handwriting of somebody else is sufficient because it conveys the contents of the statement or document in original. But so far as a forged writing is concerned, if the opinion is to be given on the mode, pressure, habit of writing,, by looking to the original writing in an enlarged form, can it be said that a mere copy of the writing would give the accused an idea as to what he has to meet with? It can never. It is well-nigh impossible for the prosecution to supply the exact mode of the original writing and the original signatures. So, the only possibility is by giving the photographs and as considered earlier from the opinion of the experts so far as the handwritings are concerned, a naked eye will not be able to do proper investigation into the mode of writing and it would be very difficult for coming to any conclusion about the document being forged or otherwise. For that, scientific help of the enlarged photographs is necessary and if that is available to the prosecution, can it be denied to the defence? So, one thing can be said that mere supply of the copy of the document which is a disputed document would not meet the requirements because the prosecution relies on the original document and its copy written by somebody or prepared by somebody would not give a fair chance to the accused in a trial as it would not be the exact reproduction to test the peculiarity of the writing.

It should be noted that under the old Criminal Procedure Code to which we have already referred to, the accused were not entitled to any copies. We have also considered that with the laudable object of making available to the accused a fair chance of preparing his defence, section 173(4) and (5) are added in the statute by amending Act 26 of 1955. The object of this amendment was *firstly* to avoid delay and to expedite the trial and *secondly*, that before the commencement of the trial the accused must have the clear picture of his case. So far as the Sessions cases are concerned or the warrant trials are concerned prior to the amendment, there were two stages. Before the committal order, evidence was led by the prosecution before the committal court and the defence was entitled to cross-examine, if at all necessary. But that required the prosecution to lay on the table the entire case on which the prosecution relies against the accused. This was known to the accused before the commencement of the sessions trial. Likewise, there was trial before the framing of the charge so far as the complaints, warrant cases based on police reports were concerned. That position has continued so far as the private complaints are concerned

wherein the copies would not be available. But in those cases, also before the charge is framed, the accused would know what is the case of the prosecution. For cases based on the police report, in order to avoid this duplicity and in order to make available to the accused the material on which the prosecution relies, the procedure is changed. In those trials if the expert came with the enlarged photographs, they were available to the accused for observation and if the expert relies on the enlarged photographs, can it not be said that the prosecution relies on the documents? The close examination of the enlarged photographs is the only mode on which the expert relies for forming his opinion. If these things are considered, then it can well be said that they are the documents necessary for the defence and therefore strict hyper-technical way of interpreting the words of section 173(5)(a) or section 207(v) would not be meeting the spirit of the enactments. In the case of *Willie (William) Slaney v State of Madhya Pradesh,*[114] Bose J, observed:

> *The Code is a code of procedure and, like all procedural laws, is designed to further the ends of justice and not to frustrate them by the introduction of endless technicalities. The object of the Code is to ensure that an accused person gets a full and fair trial along certain well-established and well-understood links that accord with notions of natural justice.*

This, therefore, clarifies as to what is the necessity for considering the privilege or right of the accused even in a procedural law. We are considering this because it was attempted to be argued that the provisions of the Criminal Procedure Code being merely procedural, there is no substantive right in the accused and therefore, it does not cut at the root of the ultimate finding of a court. This argument is based on the question whether the court has in the ultimate analysis reached a correct finding where the trial is still proceeding and the accused has to come to vindicate his right in order to get the copies necessary for his defence. We are observing this because from this judgment it has been attempted to be shown to us that the court has also observed that except where there is something so vital as to cut at the root of jurisdiction or so abhorrent to what one might term natural justice, the matter resolves itself to a question of prejudice. Some violations of the Code will be so obvious and it may be possible to show that having regard to all that occurred no prejudice was occasioned or that there was no reasonable probability of prejudice. The question here is still not too ripe as to consider whether any prejudice has been caused to the accused or not. Here is the question of considering the right to the accused to get a particular copy in order to formulate his defence properly. In the case of *Naryana Rao v State of Andhra Pradesh*,[115] the question of not supplying the copies to the accused was considered and therein it was observed that non-compliance of the provisions of section 173(4) has not the result of vitiating the proceedings and the subsequent trial. In that case some copies were not given to the accused and the trial proceeded and then a grievance was made. Considering the amended provisions, the Supreme Court observed as follows (at pp 740–41):

> In order to simplify commitment proceedings preceding the trial of accused persons by a Court of Session, section 207A was added by way of amendment of the Code in 1955. From sub-sections (3) and (4) of that section it is clear that in cases exclusively triable by a Court of Session, it is the duty of the Magistrate while holding a preliminary inquiry, to satisfy himself that the documents referred in section 173 have been furnished to the accused and if he found that the police officers concerned had not carried out his duty in that behalf, the Magistrate should see to it that that is done.

It was submitted on behalf of the State that this judgment merely shows that the Magistrate is to see that the documents referred to under section 173 have been furnished to the accused. It is, therefore, the submission that if the prosecution does not rely on the documents themselves, those documents will not be the documents referred to in section 173 and therefore the documents are not required to be given to the accused. We have to appreciate that under section 207 of the Code of Criminal Procedure, 1973, the Magistrate has to supply those documents. But prior

114. AIR 1956 SC 116 : (1955) 2 SCR 1140 : 1956 Cr LJ 291.
115. AIR 1957 SC 737 : (1958) SCR 283 : 1957 Cr LJ 1320.

to that the Magistrate had to be satisfied and in this very Supreme Court judgment it has been observed that if the Magistrate finds that some documents are not supplied, then the Magistrate should see to it that it is done. Those powers of the Magistrate or the court still continue and if the court finds that the police officer has not sent the requisite document required under section 173(5)(a), then it can certainly direct their production. This we have already considered. But the important observations of the Supreme Court in *Naryana Rao's* case (supra) are as follows:

> *The provisions contained in section 173(4) and section 207A(3) have been introduced by the Amending Act of 1955, in order to simplify the procedure in respect of inquiries lending up to a Sessions trial, and at the same time, to safeguard the interests of accused persons by enjoining upon police officers concerned and Magistrates before whom such proceedings are brought, to see that all the documents, necessary to give the accused persons all the information for the proper conduct of their defence are furnished.*

The portion which we have emphasised would clearly show that the court has not merely to be satisfied by referring to only the documents sent by the police along with the report but the court has to see that the accused persons must have all the information for the proper conduct of their defence. If it can well be said that the necessity of enlarged photographs is there for the defence of the accused, then that cannot be denied to him. We have already considered from the books referred to above that necessity of enlarged photographs is there not only for the expert to reach an opinion but it would be also necessary for the court to come to a proper conclusion about the writings. It does not require to be stressed that the opinion of a handwriting expert is merely an opinion evidence and it is not conclusive. It merely corroborates the evidence led by the witnesses who are familiar with the writings. But in order to come to the conclusion whether the disputed writing is forged or otherwise the prosecution as well as the defence and the court will be required to look to the writing and especially the court shall have to form its own opinion. In order to form this opinion it has been considered by the experts that the presence of enlarged photographs would be of great assistance and if that is necessary for the court, can it be said that they are not the documents which are required to be produced in the court? In the case of *State (Delhi Administration) v Pali Ram,*[116] the Supreme Court has observed (at p 25 of Cr LJ):—[1]

> It is not the province of the expert to act as judge or jury. The real function of the expert is to put before the court all the materials, together with reasons which induce him to come to the conclusion, so that the court, although not an expert, may form its own judgment by its own observation of those materials..... Ordinarily, it is not proper for the court to ask the expert to give his finding upon any of the issues, whether of law or of fact, because, strictly speaking, such issues are for the court or jury to determine. The handwriting expert's function is to opine after a scientific comparison of the disputed writing with the proved or admitted writing with regard to the points of similarity and dissimilarity in the two sets of writings.

These observations clearly show that the expert has to put before the court all the materials together with the reasons which induce him to come to the conclusion. What are those materials? Can it be said that a mere piece of paper on which he has given the opinion and reasons for it, is the material, or the basic material on which he has based his opinion like the enlarged photographs? If the expert has based his opinion on the strength of enlarged photographs, mere reproduction of the reasons would not be sufficient. The court also would not be able to appreciate whether the expert has given a proper opinion or not without referring to the enlarged photographs and finding out the points of similarity or dissimilarity, whatever they may be. So, it is very clear that in order to appreciate the handwriting, enlarged photographs would be necessary and even if the prosecution does not produce them or merely says orally that they do not propose to rely on them, can it not be said that they are the documents on

116. AIR 1979 SC 14 : (1979) 2 SCC 158 : 1979 Cr LJ 17.

which the expert relied to come to the conclusion and therefore they are the documents on which the prosecution relies?

It was submitted on behalf of the State that so far as the giving of copies is concerned, no principle of jurisprudence is involved. A faint reliance was placed on the judgment of the Supreme Court in *Narayan Rao's* case (supra). But that was a question of prejudice but there also the Supreme Court has observed that the documents are necessary for proper conduct of the defence of the accused. Here it is not the question of prejudice because the accused have come with a grievance at the initial stage. The trial has not concluded and therefore if at this stage the court finds that it is necessary for the proper defence of the accused that the enlarged photographs should be supplied, then other questions of prejudice,, would not arise. Reliance was placed on the case of *Bashir Hussain Peshimam v Gulam Mohommed Ismail Peshimam,*[117] by the State to canvass a point that so far as giving of the copies is concerned, the principle of jurisprudence is not involved. In the case before the Bombay High Court there was a question of supplying copies of the statements in a private complaint. So far as the Code of Criminal Procedure is concerned, the copies of the statement and the documents on which the prosecution relies are to be supplied in a case filed on the police report. When that insistence was made, the Bombay High Court negatived it by observing that section 173(4) applies only when investigation is made by a police officer and that too under Chapter XIV of the Code. It was further observed that section 173(4) is purely procedural and only directory. It does not also enact any fundamental principle of criminal jurisprudence as such and hence it cannot be argued that such copies should be made available to the accused on a principle analogous to the one contained in the section. It was further observed that a warrant case instituted on a private complaint is governed by the procedure under sections 252 to 259 and as these sections do not contain any provision similar to section 173(4) for furnishing such copies, the accused is not entitled to get such copies. These observations are made because there was insistence before the court that even in a case where Chapter XIV does not apply and even if it is a case not based on the police report, on the analogy of section 173(4), the copies should be given. This was negatived. Not only that but in that case Mr. Jethmalani, the learned counsel who appeared for the defence, wanted to make the provisions all-embracing by submitting that the prosecution must supply the copies of statements of all persons whom the prosecution did not propose to examine during the trial because that referred to the provisions which were not contained in the Code and still an analogy was being attempted to be applied. The Bombay High Court has observed that section 173(4) is purely procedural and it does not also enact any fundamental principle of criminal jurisprudence. But in the case before us section 173(4) clearly applies. A fine distinction has been attempted to be made that if these principles (propounded by the Bombay High Court) are applied, then because under section 173(5)(a) the police is required to forward only those documents on which the prosecution proposes to rely and it under section 207(v) the court has to give copy of any other document or relevant extract thereof forwarded to the Magistrate with the police report under sub-section (5) of section 173, then if the documents are not forwarded, the strict compliance would not require giving the copies of the enlarged photographs. But we feel that this is too technical an argument because we propose to consider "all documents on which the prosecution proposes to rely" in a broader amplitude with a view to appreciating the availability of the material to the accused for his proper defence. The basic principle of criminal jurisprudence is of fair trial. From the documents supplied to the accused by the prosecution, there must be a guarantee of a fair trial inasmuch as the accused should be informed of all the materials on which the prosecution relies and also all the materials which are to be employed by the prosecution against the accused so that he can prepare his proper defence. In such a case the fundamental principle of criminal

117. AIR 1966 Bom 253 : ILR 1966 Bom 770 : 1966 Cr LJ 1395.

jurisprudence is certainly involved. But in spite of this judgment of the Bombay High Court in the case of *Bashir Hussain* (supra) which showed that in any case instituted on a private complaint not covered by Chapter XIV, the accused is not entitled to copies, the same Bombay High Court in the case of *Govind Raghunath Sawant v BA Kakade,*[118] considered that the copies should be given to the accused for the offences under the Railway Property (Unlawful Possession) Act, 1966. The judgment in *Bashir Hussain's* case (supra) is of a single Judge. *Raghunath Sawant's* case (supra) is also of a single judge. In that case the accused applied for the copies of the statements of the witnesses and the application was rejected by the Presidency Magistrate on the ground that cases under the Railway Property (Unlawful Possession) Act, 1966 involved the procedure under section 252 of the Code of Criminal Procedure and onwards and not under section 251A of the Code of Criminal Procedure and hence copies of documents referred to under section 173(4) of the Code of Criminal Procedure could not be claimed as of right by the accused. The Bombay High Court held that even though there may be no statutory or technical reason why the prosecuting authority should *suo motu* supply copies to the accused or produce them in court, yet for protection and enforcement of fundamental right of defence under Article 22(1) of the Constitution of India and also on ground of ordinary principles of natural justice it is the moral and ethical duty of the prosecutor to at least produce before the court the statements of the witness whom he wants to examine when the accused applies for such production. We must say that we are not considering this aspect on the moral and ethical duty. But we are considering it as the substantive right of the accused and trying to appreciate whether this particular demand of the accused is supported by the principles of criminal jurisprudence. The Bombay High Court considered the impact of Article 22(1) of the Constitution of India on the defence of an accused. The Bombay High Court considered that this is not merely a technical or formal matter or ritual matter; it has to be real. The defence of the accused must be backed by adequate instructions from the client, which can be taken only if the prosecuting machinery enables the defence counsel to know in advance what it has against the accused. This would be all the more applicable when the provisions permit the accused to have the copies of all the documents on which the prosecution proposes to rely. Article 22(1) of the Constitution provides that the accused shall not be denied the right to consult, and to be defended by a legal practitioner of his choice. The Bombay High Court in the above referred judgment in the case of *Govind Raghunath Sawant* (supra) observed that though in a particular case the mandatory provision of section 173(4) of the Code of Criminal Procedure may not be applicable if the accused wants to defend himself with the assistance of counsel and even though the counsel feels it necessary to have statements of the witness for cross-examination under section 145 of the Evidence Act, the prosecution cannot withhold production of such statements in court and the court should not feel powerless and impotent to compel production of such statements. If in the case before the Bombay High Court where provisions of section 173(4) were not applicable and still the Bombay High Court considered it necessary from the broad aspect of considering the defence of the accused that the copy should be made available, there is all the more reason in the instant case to interpret section 173(5) and section 207(v) in a manner which would be advancing the cause of justice so far as the defence of the accused is concerned. So the above referred judgment of the Bombay High Court considered the impact of section 173(4) on a broader canvass and in a different tone from the one in which the decision in the case of *Bashir Hussain* (supra) was given. We for ourselves think that so far as the present dispute before us is concerned the requirement of documents on which the prosecution relies would also cover the enlarged photographs on the basis of which the examiner of questioned document of the State has based his opinion. This we consider from the point of view of the substantial assistance to the accused

118. (1977) 77 Bom LR 214 : 1975 Mah Cri rule 420.

persons in their own defence. In the case of *Maneka Gandhi v UOI,*[119] the Supreme Court, in para 56, observed:

> *The principle of reasonableness, which legally as well as philosophically, is an essential element of equality or non-arbitrariness pervades Article 14. Like a brooding omnipresence and the procedure contemplated by Article 21 must answer the test of reasonableness in order to be in conformity with Article 14. It must be "right and just and fair" and not arbitrary, fanciful or oppressive; otherwise, it should be no procedure at all and the requirement of Article 21 would not be satisfied.*

Article 21 of the Constitution of India, protects the life and personal liberty of an individual by providing that no person shall be deprived of his life or personal liberty except according to procedure established by law. So, the importance of procedure established by law is also enshrined in Article 21 of the Constitution. The Criminal Procedure Code has provided for the procedure about a criminal trial having safeguards for the accused persons in their defence. After 1955 a step in advance was taken in facilitating the accused to formulate his defence properly by providing for the copies of the documents *i.e.*, the enlarged photographs on which the ultimate finding of the document produced by the prosecution, *i.e.*, the reasons of the expert, rests. If the opinion of the expert is based on the strength of observation of enlarged photograph, can it be said that the right given to the accused was protected by refusing a copy of it? If the prosecution can have the same right, denial of that right to the accused would be making the provisions of section 173(5) nugatory. In the case of *Supdt. and Remembrancer of Legal Affairs, West Bengal v Satyen Bhowmick*,[120] in para 22, the Supreme Court has observed that the court has now widened the horizon of the concept of liberty, as contained in Article 21 so as to give the word 'procedure' a very wide connotation. Then the above referred passage from *Maneka Gandhi's* case (supra) was reproduced. In the case of *Satyeen Bhowmick* (supra) the Supreme Court considered the provision of section 14 of the Official Secrets Act. It was observed that section 14 did not in any way deprive the valuable rights of the accused to get copies of the statements of witnesses recorded by the police or the documents obtained by the police during the investigation,, and while considering investigation, and while considering this aspect, , the Supreme Court considered that if section 14 of the Official Secrets Act is considered to deprive the accused of getting any copies of the statement of witnesses, then it would be difficult to uphold the constitutional validity of section 14, as the procedure would become extremely unreasonable, harsh and prejudicial to the accused as a result of which the case would have been tried according to a procedure which will not be in consonance with the provisions of Article 21 of the Constitution. Of course, therein there was a case of providing copies to the accused tried under the particular Act but the provisions of the Code of Criminal Procedure were made applicable and even in such a case the copies were considered essential.

In the case of *Hussainara Khatoon v Home Secy., State of Bihar, (Patna)*[121] Supreme Court considered Article 39A of the Constitution. This was considered from the point of view of free legal service as an inalienable element of 'reasonable, fair and just' procedure. Therein it has been observed that the right to free legal services is clearly an essential ingredient of "reasonable, fair and just" procedure for a person accused of an offence and it must be held implicit in the guarantee of Article 21. It has been further observed that it is a constitutional right of every accused person who is unable to engage a lawyer and secure legal services on account of reasons such as poverty, indigence or in communicated situation and the State is under a mandate to provide a lawyer to an accused person if the circumstances of the case and the needs of justice so requires. Article 39A of the Constitution is in Part IV pertaining to Directive Principles of State Police. The first line of Article 39A is very important. According to that the State shall secure that the operation of the legal system promotes justice, on a

119. AIR 1978 SC 597 : (1978) 1 SCC 248 : (1978) 2 SCR 621.
120. AIR 1981 SC 917 : 1981 Cr LJ 341 : (1981) 2 SCC 109.
121. AIR 1979 SC 1369 : (1979) 3 SCR 532.

basis of equal opportunity.....Thereafter there is the pronouncement about free legal aid by suitable legislation or schemes. But the first part of Article 39A clearly says that operation of the legal on equal opportunity. This is what we are endeavouring to emphasise. In the present case before us, prosecution has all the materials available to it to get the opinion of the handwriting expert on the strength of the enlarged photographs. If that is denied to the accused, can it be said that the operation of the legal system would promote justice on the basis of equal opportunity? In order to follow Article 39A in its true spirit, the opportunity must be equal to the accused as well as to the prosecution and if provisions like section 173(5) require the police or the State to give copies of the material documents to the accused, the accused cannot avail that opportunity properly, if the basis on which the prosecution based the opinion of the handwriting expert would not be available to the accused. As considered by the Supreme Court in the case of *Hussainara Khatoon* (supra) merely because an accused person cannot afford money, he should not be deprived of the opportunity for securing justice. The argument advanced by the State that the documents may be available to the accused for defence if he spends for getting the enlarged photographs can never be appreciated.

A faint attempt was made to strictly interpret the provisions of section 173(5) by saying that it refers to documents, mainly statements recorded by the police and also documents on which the prosecution proposes to rely and therefore it would not cover the enlarged photographs on which the opinion was based. Under section 3 of the Evidence Act 'document' is defined and in the illustrations, words printed, lithographed or photographed are considered as documents. Further under the provisions of section 62 of the Evidence Act, *Explanation* 2, where a number of documents are all made by one uniform process as in the case of photography, each is primary evidence of the contents of the rest. So, if reliance is placed on the photograph, it would be primary evidence. It is not that only the negative of the photograph would be the primary evidence but if the reliance is placed on the positive, it is discernible to the eye and from that the opinion is given it also forms part of the evidence on which the prosecution can be said to rely. Mr. J.M. Panchal, the learned Public Prosecutor, wanted to make a fine distinction about the expert evidence on the strength of section 45 of the Evidence Act. According to him this provision makes the opinion upon the point of identity of handwriting given by the handwriting expert relevant and those persons who gave evidence are experts. It is, therefore, his submission that only the opinion given by the expert would be sufficient and that would be the relevant evidence and therefore there would not arise any question of the photographs on the strength on which he based his opinion. Technically the argument advanced by Mr. Panchal on the strength of section 45 of the Evidence Act would show that mere opinion given by the expert would be sufficient and if this argument is taken to its logical end, the reasons for arriving at the opinion also would not be considered necessary. But this stretching of section 45 is not proper because this court in the case of *Chimanlal Bhogilal Shah v State of Gujarat,*[122]106 has observed that if the prosecution relies on the opinion of the handwriting expert, the accused is entitled to know in advance the reasons of the handwriting expert, for giving such an opinion. If the accused is not supplied with the copy of the reasons, he would not be in a position to confront the handwriting expert properly at the time of the trial. Under section 46 of the Evidence Act, facts, not otherwise relevant, are relevant if they support or are inconsistent with the opinion of experts when such opinion are relevant. It cannot be said that the opinion of the expert is supported by his reasons which are based on examination of the enlarged photographs. Therefore, if the principles embodied in *Chimanlal Bhogilal Shah's* case (supra) are considered properly, then the accused cannot defend effectually without the basis on which the expert proposes to support his opinion or finding, meaning thereby, the photographs. So even this argument attempted to be advanced on behalf of the State would

122. (1973) 14 GLR 807.

not be available. It was submitted on behalf of the State that this is too early a stage for the defence to make a grievance because the trial has not proceeded and it has not shown whether the accused has in any way been deprived of the opportunity to defend himself properly. On the contrary, this argument, if accepted, would create a hurdle in the way of defence because then after the trial the question of prejudice shall have to be examined while this is before the case proceeds any further and the accused wants the copies of the enlarged photographs just to get sufficient help for his defence from the opinion of the expert who would be in a position to help the accused if the enlarged photographs of the handwriting are available for his examination. Therefore, it is the basic requirement according to the accused which will further his chance of defending himself properly and that is rightly submitted. So, it is not that this is a very early stage. The question of prejudice quite often comes up in some cases where the person goes to the trial unmindful of the consequences of his carelessness or neglect in asserting his own right. Under the civil proceedings when a suit is filed on the strength of a plaint, the copy of the plaint is always required to be served to the defendant. If the advocate engaged by the defendant at the initial stages insists on the plaint, he is entitled to it. But if without getting the copy he permits the whole suit to be prosecuted, if he attempts to defend the defendant in the case without a copy of the plaint and gets a decision, then it cannot lie in his mouth to say that the entire proceeding is vitiated because he was not given a copy of the plaint about which he never made a complaint. Here the grievance is made at the early stage and if that grievance is found to be justified inasmuch as the absence of the enlarged photographs would deprive the accused of making out a proper ground for his defence for obtaining the expert advice which has been available to the prosecution, then it will not be in consonance with the criminal jurisprudence which insists on equal opportunity both to the accused as well as the prosecution.

In view of the decisions quoted above, we feel that it should not be the prosecution alone who should have the benefit of scientific method and we feel that the accused also must have that benefit and in order to have that benefit and to give him fair opportunity of defending himself, we consider that the enlarged photographs are a must and we also consider that because the State handwriting expert has based his opinion and the reasons for his conclusion after perusing the enlarged photographs and also that because the enlarged photographs will be necessary to aid the accused and also the court for coming to the proper conclusion about the handwriting, those enlarged photographs can be said to be the documents on which the prosecution proposes to rely and therefore we think that those documents must be available to the accused before the State handwriting expert steps into the witness box or at least to be available to the accused free of cost during the trial to get help from his expert. We are conscious that the duty of giving copies to the accused is now on the court and a time may come when the court will be required to give copies but the court will be doing it with the assistance of the State and the State should never consider the question of expenses while affording an opportunity to the accused to defend himself properly. We are observing this mainly because at some stage during the trial in the lower Court it was stated that the enlarged photographs would cost as much as Rs 2,000 and the State would be required to spend for that. This can never be a consideration before a court when the question of sufficient opportunity to the accused to defend himself is involved. Nor should the court deter from coming to a judicious conclusion on the point of dispute merely because the agency of the court would be required to supply those copies. The entire endeavour shall have to be made by the State to facilitate the observance of the procedure enacted by the Code of Criminal Procedure with its proper interpretation made by the courts from time to time.

In view of the discussions made above, we allow the applications and hold that the accused persons are entitled to the enlarged photographs of the disputed as well as specimen

handwriting and signatures. Rule in all these applications is made absolute. We are thankful to all the advocates who have helped us in deciding this matter.[123]

10.26.39 Evaluation of the Opposing Experts' Evidence[124]

3. Letter Ex. P.W. 20/B has been written by accused Niaz Ali to Raj Mohammad. According to Shri ML Sharma (P.W. 20), it is dated 4 April 1990. This letter also describes the incident of 25th which finds mention in the application (Ex. PMM). It mentions that in the night, Soddo Din, Jai Paul, Tara and Kiran Chauhan climbed the house of the accused persons and started pelting stones. They hurled abuses on which alarm was raised and villagers gathered on which these persons got down and went away. The entire honour had come to an end and that he should inform as to when he was coming or what is to be done and that he should bring Gulzar with him and also the weapon even if the service was to be sacrificed or anything may happen since "*Ab Unka Kam Karna Hai*". He should be informed soon as to on what date he was coming and that the letter is concluded by the wording "*Dil to Aisa Karta Hai Ke Aaj He Bhag Jayon, Par Kya Karyen*".

Learned counsel for the accused submitted that these letters have not been proved to have been written by the accused to whom they have been assigned by the prosecution. In support, the expert opinion of Shri NK Jain (D.W. 1) has been referred. We do not see any substance in this submission for the reason that Shri ML Sharma (P.W. 20) has clearly pointed out that these communications are in the handwriting of the accused.

> ***Looking to the statements of these experts. proving their expert opinion, we prefer to depend on the opinion given by Shri ML Sharma (P.W. 20), Government Examiner on Questioned documents. It is more satisfactory and satisfying. It is more reasonable and dependable. It is more scientific as compared to the opinion of Shri NK Jain (D.W. 1), which is not so thorough and convincing. It is neither reasoned nor satisfactory. There is natural tendency on the part of the expert to support the view of the person who had called him.***

It can, therefore, be said that there is sufficient material on the record for coming to the conclusion that the accused were conspiring with each other and the object of conspiracy was not only the family of Jai Paul but also the deceased. The common object of the conspiracy has been established and the accused had an intention to eliminate the deceased. As to motive, we have already noticed that the families were at logger-heads. They had been fighting with each other and their relations were totally inimical, therefore, it is hardly possible to say that there was no motive for the commission of the crime by the accused.

10.26.40 Specimen Writing — During Trial[125]

In the course of his elaborate arguments, Shri Marwah has tried to make out these points:

(i) The expression "any person" in section 73 includes a person accused of an offence.

(ii) The word "court" in section 73 includes the court of the Magistrate competent to try the offence or hold an inquiry in respect thereof against such accused person under the Code of Criminal Procedure.

(iii) Section 73 does not offend Article 20(3) of the Constitution, because by giving a direction to an accused person to give his specimen handwriting the court does not compel that accused 'to be a witness against himself. *State of Bombay v Kathi Kalu Oghad,*[126] has been relied upon.

(iv) There is nothing in section 73 which prohibits the court from sending the specimen writing obtained by it from the accused to a handwriting expert for opinion after comparison of the same by him with the disputed writing, even if that expert happens to be the government expert of Questioned Documents. A court is fully competent under section 73, to make an order directing the accused to write down words or figures if the ultimate purpose of obtaining such specimen writing is to enable the court trying the case, or inquiring into it, to compare that specimen writing with the disputed one to reach its own conclusion, notwithstanding the fact that, in the first instance, the court thinks it necessary in the interest of justice to send that specimen writing together with the disputed one, to an expert to have the advantage of his opinion and assistance.

(v) The specimen writings taken from an accused person by the court under the second paragraph of section 73 are to all intents and purposes, "admitted writings" within the purview of the first paragraph of the section which read with illustration (c) of section 45, Evidence Act, clearly indicates that such specimen writings can legally be used for comparison with the disputed writing by a handwriting expert, also, irrespective of whether such expert is examined as a witness by any of the parties, or as a court witness by the court acting *suo motu* or on being moved by the prosecution or the defence.

(vi) The government expert of Questioned Documents is supposed to be a high officer of integrity who is not under the influence of the investigating officer and he is expected to give his opinion truthfully about the identity or otherwise of the two sets of writings on objective observations. The mere fact, therefore, that in the instant case, he has been summoned as a prosecution witness will not prejudice the accused, particularly when the court, in the circumstances of the case, thinks it necessary to take the assistance of the expert for reaching its own conclusion on this point.

(vii) The order of the Magistrate, construed as a whole, shows that, in substance, the ultimate purpose of directing the accused to give his specimen writings is that the Magistrate wants to compare the specimen thus obtained, with the disputed writing, to form a just opinion about its identity, after availing himself of the advantage of the expert's opinion.

(viii) This course was adopted by the magistrate in the interests of justice taking into account the conduct of the accused who had been absconding for a long time and was declared a proclaimed offender, and thus avoided to give his admitted or specimen writings at the investigation stage, and later, (it is contended) tampered with the prosecution witness (Tek Chand) who was expected to prove the disputed writing and who, in consequence of the tampering by the accused, realised from his police statement during the proceedings in court, in such a situation, even on the principle underlying section 540 Code of Criminal Procedure, 1898, which governs these proceedings, and is analogous to the principle underlying section 73, para (2). The Magistrate was competent to use the specimen writing thus obtained, for securing the opinion and evidence of the government expert, with a view to assist himself (magistrate) informing his own opinion with regard to the identity of the writing, Ex. P.W. 21 F.

(ix) The action of the Magistrate inasmuch as it sought the specimen writing of the accused to be sent, in the first instance, to the government expert for his opinion and evidence far from being prohibited, was consistent with the principle enunciated by the Bombay High Court in Rudragouda Venkangouda v Basangouda Danappagouda, AIR 1938 Bom 257 : 40 Bom LR 202 which received the imprimature of this court

in *Fakhruddin v State of Madhya Pradesh,* AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197. This principle is to the effect that comparison of the other documents not challenged as fabricated, upon its own initiative and without the guidance of an expert is hazardous and inconclusive.

Points (i) and (iii) are well-settled and beyond controversy.

For points (iv) to (ix) Shri Marwah relies on *Gulzar Khan v State,* (1962) 2 Cr LJ 84 : 1962 BLJR 604 : AIR 1962 Pat 255 (FB) and *B Rami Reddy v State of Andhra Pradesh,* (1971) 2 Andh WR 94 : (1971) 2 APLJ 174 : 1971 Cr LJ 1591 (AP). Shri Marwah further maintains that the view taken by a learned judge of the Calcutta High Court, in *Hiralal Agarwalla v State,* ILR (1957) 2 Cal 928 : AIR 1958 Cal 123 : 1958 Cr LJ 367 followed in the impugned judgment by the Delhi High Court, and also by the Bombay High Court in *State v Poonam Chand Gupta,* ILR 1958 Bom 299 : AIR 1958 Bom 207 : 1958 Cr LJ 619, inasmuch as it is held therein that the second clause of section 73 limits the power of the court to obtain the specimen writing of the accused exclusively for own purpose *viz.*, for comparison with the disputed writing by the court itself, is too narrow and incorrect.

The question that falls to be determined in this case is

> Whether a Magistrate in the course of an inquiry or trial on being moved by the prosecution, is competent under section 73, Evidence Act, to direct the accused person to give his specimen handwriting so that the same may be sent along with the disputed writing to the government expert of Questioned Documents for examination, "with a view to have the necessary comparison"?

There appears to be some divergence of judicial opinion on this point. In *Hiralal Agarwala v State,*[127] a learned single judge of Calcutta High Court took the view that section 73 does not entitle the court to assist a party to the proceedings. "It entitles the court to assist itself to a proper conclusion in the interests of justice. It is not open to the Magistrate to send the specimen writing obtained from the accused for examination to an expert who is a prosecution witness". It was, however, conceded that "it is perfectly open to the court to call its own photographer, take the enlargements under its own supervision, study them, and if necessary call its own expert as a court witness in order that it might be assisted to a proper conclusion".

The dictum in *Hiralal Agarwalla's* case was followed by a learned single judge of the Bombay High Court in *State v Poonam Chand Gupta,*[128] wherein it was held that the second clause of section 73 limits the power of the court to direct a person present in court to write any words or figures only where the court itself is of the view that it is necessary for its own purposes to take such writing in order to compare the words or figures so written by such person. The power does not extend to permitting one or the other party before the court to ask the court to take such writing for the purpose of its evidence on its own case.

In *T. Subbiah v SKD Ramaswamy Nada*[129] Krishnaswami Reddy, J, of Madras High Court adopted a similar approach in coming to the conclusion that section 73, Evidence Act gives no power to a Magistrate at the pre-cognizance stage or in the course of police investigation, to direct an accused person to give his specimen handwriting. K Reddy, J, was careful enough to add that "the court for the purpose of comparison can take extraneous aid by using magnifying glass, by obtaining enlargement of photographs or by even calling an expert, all these to enable the court to determine by comparison. There is no basis for the view that the court cannot seek extraneous aid for its comparison but on the other hand, there is an indication in section 73 of the Evidence Act itself that such aid might be necessary".

127. *Hiralal Agarwalla v State,* AIR 1958 Cal 123 : ILR (1957) 2 Cal 928 : 1958 Cr LJ 367.
128. *State of Maharashtra v Poonam Chand Gupta,* AIR 1958 Bom 207 : ILR 1958 Bom 299 : 1958 Cr LJ 619.
129. AIR 1970 Mad 85 : 1969 Mad LW (Cri) 117 : 1970 Cr LJ 254.

As against the above view, a Full Bench of Patna High Court in *Gulzar Khan v State*[130] held that a Magistrate has the power under section 73, Evidence Act to direct, even before he has taken cognizance of the offence, an accused person to give signatures, specimen writings, fingerprints or footprints to be used for comparison with some other signatures, handwritings, fingerprints or footprints which the police may require in the course of investigation. It was remarked that in section 73, the word 'court' must be equated with the court of the Magistrate in a case triable by him or before it is committed to Sessions in a case triable by the Court of Session. As a matter of fact, in every case where the accused is arrested and required to give his specimen handwriting or signature, or thumb-impression, he is arrested under a warrant which must be issued by a Magistrate, or when the police arrest without a warrant in a cognizable offence under section 60 of the Code of Criminal Procedure, he must be produced before a magistrate without unreasonable delay and the procedure under sections 60 to 63 of the Code as also under Article 22 of the Constitution has to be followed and that attracts the provisions of section 73 of the Evidence Act.

In taking this view, the Patna High Court sought support from the decision of this court in *State of Bombay v Kathi Kalu Oghad*[131] wherein the police had obtained from the accused three specimen handwritings to show whether a chit, Exhibit 5, was in the handwriting of the accused, in the course of police investigation of the case, and it was held to be inadmissible by the Bombay High Court, for a different reason *viz.,* on the ground that it was hit by Article 20(3) of the Constitution. This court had held that those specimen writings were admissible.

In *B Rami Reddy v State of Andhra Pradesh,*[132] the High Court of Andhra Pradesh took a similar view. Following the ratio of *Gulzar Khan v State of Bihar,*[133] (supra), it was held that the court does not exceed its powers under the section in directing an accused to give his thumb-impression to enable the police to make investigation of an offence as even in such a case the purpose is to enable the court before which he is ultimately put up for trial to compare the alleged impressions of the accused, with the admitted thumb-impressions.

At the outset, we may make it clear that the instant case is not one where the Magistrate had made the impugned order in the course of the police investigation. Here, the Magistrate has taken cognizance of these two companion cases. The evidence of most of the prosecution witnesses has been recorded. The problem before us is, therefore, narrow than the one which was before the Patna and Andhra Pradesh High Courts in the aforesaid cases. All that we have to consider is, whether the High Court was right in holding that the order dated 20 May 1972 of the Magistrate calling upon the accused before it, to give his specimen handwriting, was beyond the scope of section 73, Evidence Act.

Before considering the scope of section 73, it will be appropriate to have a look at the legislative background of this provision. Section 73 like many other provisions of the Indian Evidence Act, is modelled after the English Law of Evidence as it existed immediately before the enactment of the Indian Evidence Act in 1872.

The English Law on the subject, as amended by the English Acts of the years 1854 and 1865, was substantially the same as incorporated in section 73 of the Indian Evidence Act. Section 48 of the English Act II of 1855 was as follows:

> *On an inquiry whether a signature, writing or seal is genuine, any undisputed signature, writing or seal of the party whose signature, writing or seal is under dispute may be compared with the disputed one, though such signature, writing or seal be on an instrument which is not evidence in the case.*

130. (1962) 2 Cr LJ 84 : 1962 BLJR 604 : AIR 1962 Pat 255 (FB).
131. *State of Bombay v Kathi Kalu Oghad,* AIR 1961 SC 1808 : (1962) 3 SCR 10 : (1961) 2 Cr LJ 856 (SC).
132. *B. Rami Reddy v State of Andhra Pradesh,* (1971) 2 Andh WR 94 : (1971) 2 AP LJ 174 : 1971 Cr LJ 1591 (AP).
133. (1962) 2 Cr LJ 84 : 1962 BLJR 604 : AIR 1962 Pat 255 (FB).

Section 48 was repealed and the Criminal Procedure Act, 1865 was passed by the British Parliament. Section 8 of that Act, which still holds the field, provides:

> *Comparison of disputed writing with writing proved to be genuine:* Comparison of a disputed writing with any writing proved to the satisfaction of the judge to be genuine shall be permitted to be made by witnesses; and such writings, and the evidence of witnesses respecting the same may be submitted to the court and jury as evidence of the genuineness or otherwise of the writing in dispute.

This section applies in both Civil and Criminal Courts by virtue of section 1 of the Act.

Apart from this section, it was well-settled that the court in the case of disputed writing, was competent to obtain an exemplar or specimen writing. In any case, the court was competent to compare the disputed writing of the person in question. The position, as it obtained after the passing of the Criminal Procedure Act, 28 and 29 Vict. C. 18, has been summed up by Taylor as follows:

> *Under the Statutory Law, it seems clear … that the comparison may be made either by the witnesses acquainted with the handwriting, or by witnesses skilled in deciphering handwriting, or without the intervention of any witnesses at all, by the jury themselves (Cobbett v Kilminister), or in the event of there being no jury, by the court.....It further appears that any person whose handwriting is in dispute, and who is present in court, may be required by the judge to write in his presence, and that such writing may be compared with the document in question. Deed Devine v Wilson, (*1855) 10 Moo PC 502 (530) *:* 110 rules 83; *Cobbett v Kilminister*, (1865) 4 F and F 490 *(*See *Taylor On Evidence by Johnson & Bridgman, Vol 2, Paras 1870 and 1871, p 1155).*

Let us now compare it with section 73 of the Indian Evidence Act, which runs as under:

> **73. Comparison of signature, writing or seal with others admitted or proved.** *In order to ascertain whether a signature, writing or seal is that of the person by whom it purports to have written or made, any signature, writing or seal admitted or proved to the satisfaction of the Court to have been written or made by that person may be compared with the one, which is to be proved, although that signature, writing or seal has not been produced or proved for any other purpose.*
>
> *The Court may direct any person present in court to write any words or figures for the purpose of enabling the Court to compare the words or figures so written with any words or figures alleged to have been written by such person.*

It will be seen that the first paragraph of section 73 is, in substance, a combined version of section 48 of the English Act II of 1855 and section 8 of the English Criminal Procedure Act, 1865. The Second paragraph of section 73 is substantially the same as the English Law condensed by Taylor in the above quoted portion of para 1871.

Just as in English Law, the Indian Evidence Act recognises two direct methods of proving the handwriting of a person:

1. By admission of the person who wrote it.
2. By the evidence of some witnesses who saw it written.

These are the best methods of proof. These apart, there are modes of proof by opinion. They are:

(i) By the evidence of a handwriting expert (section 45).

(ii) By the evidence of a witness acquainted with the handwriting of the person who is said to have written the writing in question (section 47).

(iii) Opinion formed by the court on comparison made by itself (section 73).

All these three cognate modes of proving involve a process of comparison. In mode (i), the comparison is made by the expert of the disputed writing with the admitted or proved writing of the person who is said to have written the questioned document. In (ii), the comparison takes the form of a belief which the witness entertains upon comparing the writing in question, with an exemplar formed in his mind from some previous knowledge or repetitive observance of the handwriting of the person concerned. In the case of (iii), the comparison is made by the court with the sample writing or exemplar obtained by it from the person concerned.

A sample writing taken by the court under the second paragraph of section 73, is, in substance and reality, the same thing as "admitted writing" within the purview of the first paragraph of section 73. The first paragraph of the section, as already seen, provides for comparison of signature, writing,, purporting to have been written by a person with others admitted or proved to the satisfaction of the court to have been written by the same person. But it does not specifically say by whom such comparison may be made. Construed in the light of the English Law on the subject, which is the legislative source of this provision, it is clear that such comparison may be made by a handwriting expert (section 45) or by one familiar with the handwriting of the person concerned (section 47) or by the court. The two paragraphs of the section are not mutually exclusive. They are complementary to each other.

Section 73 is therefore to be read as a whole, in the light of section 45. Thus, read, it is clear that a court holding an inquiry under the Code of Criminal Procedure in respect of an offence triable by itself or by the Court of Sessions, does not exceed its powers under section 73, if, in the interests of justice, it directs an accused person appearing before it, to give his sample writing to enabling the same to be compared by a handwriting expert chosen or approved by the court, irrespective of whether his name was suggested by the prosecution or the defence, because even in adopting this course, the purpose is to enable the court before which he is ultimately put up for trial, to compare that disputed writing with his (accused's) admitted writing, and to reach its own conclusion with the assistance of the expert.

In the instant case, the magistrate, as the extract from his order dated 20 May 1972, shows after considering the peculiar circumstances of the case, and recalling the observation of the Calcutta High Court in *Hiralal Agarwalla v State,* ILR (1957) 2 Cal 928 : AIR 1958 Cal 123 : 1958 Cr LJ 367 to the effect, that section 73 entitled "the court to assist itself for a proper conclusion in the interest of justice", expressly "applied this test to the present case". The peculiar circumstances which weighed with the magistrate in directing the accused to execute sample writing to be compared, in the first instance, by the Government expert of Questioned Documents, included the contumacious conduct of the accused and the resiling of the material witness, Tek Chand, which, according to Mr. Marwah, was possibly due to his having been suborned or won over by the accused. It was apparent from the record that the accused was playing hide and seek with the process of law and was avoiding to appear and give his sample writing to the police. The magistrate therefore, had good reason to hold that the assistance of the government expert of Questioned Documents was essential in the interest of justice to enable the magistrate to compare the sample and the questioned writings with the expert assistance so obtained and then to reach a just and correct conclusion about their identity. Although the order of the magistrate is somewhat inartistically worded, its substance was clear that although initially, the specimen writing sought from the accused was to be used for comparison by the government expert, the ultimate purpose was to enable the court to compare that specimen writing with the disputed one, Ex. P.W. 21 F, to reach a just decision.

In the revision petition filed by the accused before the High Court a grievance is sought to be made out that the magistrate's order will work prejudice to the defence and enable the prosecution to fill gaps and loopholes in its case. This contention was devoid of force. Once a magistrate is seized of a case, duly forms an opinion that the assistance of an expert is

essential to enable the court to arrive at a just determination of the issue of the identity of the disputed writing, the fact that this may result in the "filling of loopholes" in the prosecution case is purely a subsidiary factor which must give way to the paramount consideration of doing justice. Moreover, it could not be predicted at this stage whether the opinion of government expert of Questioned Documents would go in favour of the prosecution or the defence. The argument raised before the High Court was thus purely speculative.

In addition to section 73 there are two other provisions resting on the same principle, namely. Section 165, Evidence Act and section 540, Code of Criminal Procedure, 1898, which between them invest the court with a wide discretion to call and examine anyone as a witness, if it is *bona fide* of the opinion that his examination is necessary for a just decision of the case. In passing the order which he did, the magistrate was acting well within the bounds of this principle.

The matter can be viewed from another angle, also. Although there is no legal bar to the judge using his own eyes to compare the disputed writing with the admitted writing, even without the aid of the evidence of any handwriting expert, the judge should, as a matter of prudence and caution, hesitate to base his finding with regard to the identity of a handwriting which forms the sheet anchor of the prosecution case against a person accused of an offence, solely on comparison made by himself. It is, therefore, not advisable that a judge should take upon himself the task of comparing the admitted writing with the disputed one to find out whether the two agree with each other; and the prudent course is to obtain the opinion and assistance of an expert.

It is not the province of the expert to act as a judge or jury. As rightly pointed out in *Titli v Jones*[134] the real function of the expert is to put before the court all the materials, together with reasons which induce him to come to the conclusion, so that the court, although not an expert, may form its own judgment by its own observation of those materials. Ordinarily, it is not proper for the court to ask the expert to give his finding upon any of the issues, whether of law or fact, because strictly speaking, such issues are for the court or jury to determine. The handwriting expert's function is to opine after a scientific comparison of the disputed writing with the proved or admitted writing with regard to the points of similarity and dissimilarity in the two sets of writings. The court should then compare the handwritings with its own eyes for a proper assessment of the value of the total evidence.

In this connection, the observations made by Hidayatullah J,. (as he then was) in *Fakharuddin v State of Madhya Pradesh*[135] are apposite and may be extracted (at pp 1328, 1329):

> *Both under sections 45 and 47 the evidence is an opinion, in the former by a scientific comparison and in the latter on the basis of familiarity resulting frequent observations and experience. In either case, the court must satisfy itself by such means as are open that the opinion may be acted upon. One such means open to the court is to apply its own observation to the admitted or proved writings and to compare them with the disputed one, not to become handwriting expert but to verify the premises of the expert but in one case and to appraise the value of the opinion in the other case. The comparison depends on an analysis of the characteristics in the admitted or proved writings and the finding of the same characteristics in a large measure in the disputed writing. In this way, the opinion of the deponent whether expert or other is subjected to scrutiny and although relevant to start with becomes probative. Where an expert's opinion is given, the court must see for itself and with the assistance of the expert come to its own conclusion whether it can safely be held that the two writings are by the same person. This is not to say that the court must play the role of an expert but to say that the court may accept the fact proved only when it has satisfied itself on its own observation that it is safe to accept the opinion, whether of the expert or other witnesses.*

Since even where proof of handwriting which is in nature comparison exists, a duty is cast on the court to use its own eyes and mind to compare the admitted writing with the disputed

134. AIR 1934 All 273 : ILR 56 All 428.
135. AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197.

one to verify and reach its own conclusion, it will not be wrong to say that when court seized of a case, directs an accused person present before it to write down a sample writing, such direction in the ultimate analysis, "is for the purpose of enabling the court to compare" the writing so written with the writing alleged to have been written by such person, within the contemplation of section 73. That is to say, the words "for the purpose of enabling the court to compare" do not exclude the use of such 'admitted' sample writing for comparison with the alleged writing of the accused by a handwriting expert cited as a witness by any of the parties. Even where no such expert witness is cited or examined by either party the court, may, if it thinks necessary for the ends of justice, on its own motion, call an expert witness, allow him to compare the sample writing with the alleged writing and thus give his expert assistance to enable the court to compare the two writings and arrive at a proper conclusion.

For all the foregoing reasons, we are of opinion that in passing the orders dated 20 May 1972 relating to the disposal of the application dated 11 December 1970, the learned additional district magistrate did not exceed his powers under section 73, Evidence Act. The learned judges of the High Court were not right in holding that in directing the accused by his said order dated 20 May 1972, the Magistrate acted beyond the scope of section 73 or in a manner which was not legal.

Accordingly, we allow this appeal, set aside the judgment of the High Court, and restore the order dated 20 May 1972, of the magistrate who may now repeat his direction to the accused to write down the sample writing. If the accused refuses to comply with the direction, it will be open to the court concerned to draw under section 114, Evidence Act, such adverse presumption as may be appropriate in the circumstances. If the accused complies with the direction, the court will in accordance with its order dated 20 May 1972, send the writing so obtained, to a senior Government Expert of Questioned Documents, named by it, for comparison with the disputed writing and then examine him as a court witness.[136]

10.26.41 Specimen Writing — During Police Investigation[137]

Shri OP Rana, learned counsel for the appellant contended that section 73 of the Evidence Act conferred ample power on the magistrate to direct the accused to give his specimen writing even during the course of investigation. He also urged that it would be generally in the interests of the administration of justice for the magistrate to direct the accused to give his specimen writing when the case was still under investigation, since that would enable the investigating agency not to place the accused before the magistrate for trial or enquiry, if the disputed writing, as a result of comparison with the specimen writing was found not to have been made by the accused. While we agree with Mr. Rana that a direction by the Magistrate to the accused to give his specimen writing when the case is still under investigation would surely be in the interests of the administration of justice, we find ourselves unable to agree with his submission that section 73 of the Evidence Act enables the magistrate to give such a direction even when the case is still under investigation.

Section 73 of the Evidence Act is as follows:

> **73. Comparison of signature, writing or seal with others admitted or provide.** *In order to ascertain whether a signature, writing or seal is that of the person by whom it purports to have been written or made, any signature, writing or seal admitted or proved to the satisfaction of the court have been written or made by that person may be compared with the one which is to be proved, although that signature, writing or seal has not been produced or proved for any other purpose.*

136. *State (Delhi Administration) v Pali Ram,* AIR 1979 SC 14 : 1979 Cr LJ 17 : (1979) 2 SCC 158.
137. *State of Uttar Pradesh v Ram Babu Misra*, AIR 1980 SC 791 : (1980) 2 SCC 343 : (1980) 2 SCWR 25.

> *The court may direct any person present in court to write any words or figures for the purpose of enabling the court to compare the words or figures so written with any words or figures alleged to have been written by such person. This section applies also with any necessary modifications to finger-impression.*

The second paragraph of section 73 enables the court to direct any person present in court to give specimen writings "for the purpose of enabling the court to compare" such writings with writings alleged to have been written by such person. The clear implication of the words "for purpose of enabling the court to compare" is that there is some proceeding before the court in which or as a consequence of which it might be necessary for the court to compare such writings. The direction is to be given for the purpose of "enabling the investigating or other agency to compare". If the case is still under investigation there is no present proceeding before the court in which or as a consequence of which it might be necessary to compare the writings. The language of section 73 does not permit a court to give a direction to the accused to give specimen writings for anticipated necessity for comparison in a proceeding which may later be instituted in the court. Further, section 73 of the Evidence Act makes no distinction between a Civil Court and Criminal Court. Would it be open to a person to seek the assistance of the Civil Court for a direction to some other person to give sample writing under section 73 of the Evidence Act on the plea that it would help him to decide whether to institute a civil suit in which the question would be whether certain alleged writings are those of the other person or not? Obviously not. If not, why should it make any difference if the investigating agency seeks the assistance of the court under section 73 of the Evidence Act on the plea that a case might be instituted before the court where it would be necessary to compare the writings?

We may also refer here to section 5 of the Identification of Prisoners Act, 1920, which provides:

> *If a magistrate is satisfied that, for the purpose of any investigation or proceeding under the Code of Criminal Procedure, 1898 it is expedient to direct any person to allow his measurements or photograph to be taken, he may make an order to that effect, and in that case the person to whom the order relates shall be produced or shall attend at the time and place specified in the order and shall allow his measurements or photograph to be taken as the case may be, by a police officer:*
>
> *Provided that no order shall be made directing any person to be photographed except by a magistrate of the first class:*
>
> *Provided further, that no order shall be made under this section unless the person has at some time been arrested in connection with such investigation or proceeding.*

Section 2(a) of the Act defines "measurements' as including "finger-impressions and footprint impressions".

There are two things to be noticed here. First, signature and writing are excluded from this range of section 5 of the Identification of Prisoners Act and, second, 'finger impressions' are included in both section 73 of the Evidence Act and section 5 of the Identification of Prisoners Act. A possible view is that it was thought that section 73 of the Evidence Act would not take in the stage of investigation and so section 5 of the Identification of Prisoners Act made special provision for that stage and even while making such provision, signature and writings were deliberately excluded. As we said, this is a possible view but not one on which we desire to rest our conclusion. Our conclusion rests on the language of section 73 of the Evidence Act.

Section 73 of the Evidence Act was considered by us in *State (Delhi Administration) v Pali Ram*[138] where we held that a court holding an enquiry under the Code of Criminal Procedure,

138. AIR 1979 SC 14 : 1979 Cr LJ 17 : (1979) 2 SCC 158.

was entitled under section 73 of the Evidence Act to direct an accused person appearing before it to give his specimen handwriting to enable the court to compare it with disputed writings. The present question whether such a direction, under section 73 of the Evidence Act can be given when the matter is still under investigation and there is no proceeding before the court was expressly left open. The question was also not considered in *State of Bombay v Kathi Kalu Oghad,*[139] where the question which was actually decided was that no testimonial compulsion under Article 20(3) of the Constitution was involved in a direction to give specimen signature and handwriting for the purpose of comparison.

The view expressed by us in the earlier paragraphs on the construction of section 73 Evidence Act was the view taken by the Madras High Court in *T Subbiah v SKD Ramaswamy Nadar,* AIR 1970 Mad 85 : 1969 Mad LW (Cri) 117 : 1970 Cr LJ 254, the Calcutta High Court in *Farid Ahmed v State of West Bengal,* AIR 1960 Cal 32 : 1960 Cr LJ 56 : ILR (1960) 2 Cal 60 (Mitter J. at p 32) and *Priti Ranjan Ghosh v State of West Bengal,* (1973) 77 Cal WN 865, the High Court of Punjab and Haryana in *Dharamvir Singh v State*, 1975 Cr LJ 884 : 1974 Pun LJ (Cri) 439 : 1975 Cur LJ 132 the High Court of Madhya Pradesh in *Brij Bhushan Raghunandan Prasad v State of Madhya Pradesh,* AIR 1957 MP 106 : 1957 Cr LJ 855 : ILR 1957 MP 236, the Orissa High Court in, (1972) 2 Cal WR 1332, and the in what Appeal No. Allahabad High Court in the Judgment under appeal. A contrary view was taken by the Patna High Court in *Gulzar Khan v State,* (1962) 2 Cr LJ 84 : 1962 BLJR 604 : AIR 1962 Pat 255 (FB) and the High Court of Andhra Pradesh in *B. Rami Reddy v State of Andhra Pradesh,* (1971) 2 Andh WR 94 : (1971) 2 APLJ 174 : 1971 Cr LJ 1591 (AP). "We do not agree with the latter view".[140]

10.26.42 Exemplars to be taken in Open Court[141]

Apart from the ocular evidence as stated above, the prosecution strongly relied upon the evidence of the Handwriting expert (PW-33) and also his opinion given on a comparison of the alleged signatures of the accused appearing on various TDS certificates, specimen signature cards, credit vouchers/withdrawal slips, with the admitted signatures taken from the accused. On the basis of the evidence of the expert, according to whom the signatures in the documents marked in "*Q"* series are tallying with the specimen signatures alleged to have been obtained from the accused, it is contended by the prosecution that inasmuch as the testimony of the expert clinchingly establishes that it was the accused who had fabricated the documents in question *i.e.*, T.D.S. certificates by forging the signatures of a fictitious Engineer and filing them along with Income-tax returns, the prosecution successfully proved the involvement of the accused in the commission of offence.

But, it should be borne in mind that the opinion of an expert in writing is the weakest and the least reliable evidence and that it is not at all safe to base a conviction upon the opinion of writing expert alone. Courts have refused to act upon the evidence of expert unless it is corroborated by independent evidence. In a catena of decisions, it was ruled by the Apex Court that it would be highly unsafe to convict a person on the sole testimony of an expert. Therefore, the evidence of the expert (PW-33) who deposed in court basing on the opinion given by him earlier, cannot be said to be a conclusive proof. It is so more particularly because of the fact that the said evidence is not corroborated by any independent evidence. Apart from that, as seen from the evidence on record the specimen signatures which were sent to the expert for examination were not obtained in open Court and they were obtained during the course of investigation by the C.B.I. Such an opinion based on the specimen signatures which are not taken in open Court, cannot be relied upon by the Court as it is not a valid opinion. Therefore,

139. AIR 1961 SC 1808 : (1962) 3 SCR 10 : (1961) 2 Cr LJ 856 (SC).
140. *State of Uttar Pradesh v Ram Babu Misra*, AIR 1980 SC 791 : (1980) 2 SCC 343 : (1980) 2 SCWR 25.
141. *M Durga Prasad v State of Andhra Pradesh*, AIR 2004 AP 2714 : 2004 Cr L J 242

conviction cannot be based solely placing reliance on such opinion. Thus, the evidence on record is not sufficient to hold that A3, A7 and A8 have fabricated and forged the documents, as alleged by the prosecution. However, the prosecution was able to establish the guilt of A1 as he did not scrutinise the relevant file in spite of the endorsement by PW-5 for scrutiny and thereby enable A3 to obtain refund orders from him. But since the very charge against A3 is held as not proved, it is not safe to convict A1 for the said offence. Accordingly, A1, A3, A7 and A8 are acquitted of the charges under sections 465 and 471 I.P.C.

10.26.43 [142]Paper Tear Evidence Admissible

The question is, as to whether the recovery of Ex. P-57 is an incriminating evidence against the accused. The case of the prosecution is, that a sheet of paper (Ex. P-5) was torn out from this book which was marked by handwriting expert Mr. Puri (P.W. 22) as Q '2', is an important link in the case. Ex. 1 was produced to Surajmal (P.W. 1) on April 28. It is in Roman English and reads, *"Wada Pura Nahin Lash Hotel Kay Ass Pass"*. According to Krishan Gopal (P.W. 3), Ex. P-5 was found lying in the lawns of his house. He resides along with his brother, Mahavir Prasad, father of deceased Rajesh, in Amba Bari, Jaipur. Though the authorship of Ex. P-6 has not been proved to be of the accused, but, as we shall presently show it can be said on the material on record that the sheet of paper (Ex. P-5) was torn out from the practical copy (Ex. P-57) which was recovered from the possession of the accused on his information under section 27 of the Evidence Act, from nowhere else but from the house of the accused. Though, apart from the fact that the name of Miss Seema is written on Ex. P-57 there is no other evidence that Ex. P-57 is in any way connected with the crime, and is a piece of substantial evidence against the accused. Mr. Frank Anthony, the learned advocate for the accused, in support of his submission that the statement of Mr. Puri (P.W. 22) handwriting expert to the effect that the sheet (Ex.P-5) was torn out from the other part of the sheet marked B-18 is not an expert opinion within the meaning of section 45 of the Evidence Act, has referred to *Hanumant Govind v State of Madhya Pradesh,*[143] in which it has been held that opinion of expert that a particular letter was typed on particular machine does not fall within the ambit of section 45 and is inadmissible, this ruling will not apply to the present case, because, here we are not dealing with the question as to whether a typed material was typed on a particular type machine, but we are dealing as to whether the sheet of paper (Ex. P-5) was torn out from Ex. P-57 exercise book. We are of the opinion that the question as to whether the paper on which a document is written has been torn out from a copy is an expert opinion. Under section 45 of the Evidence Act, when the court has to form an opinion upon a point of science, the opinion on that point of persons specially skilled in such science is a relevant fact. In "Websters' Dictionary" "Science" has been defined as possession of knowledge as distinguished from ignorance. Knowledge is acquired through study and practice. In journal published by the Forensic Science Society in July, 1980 (Vol 20) at p 149 dealing with Broader Basis of Forensic Science, it has been dealt as to what type of information is produced by forensic scientist. It is (1) information to help in the decision on whether a crime has been committed; (2) corroborative evidence of (1) and (3) evidence to incriminate or eliminate an individual. It has been observed: "The adjective Forensic which goes back to Roman times, means "related to, used in or connected with a court of law". Forensic science is, therefore, science used in connection with a court of law. The application of science to the apprehension and conviction of criminals is only part of the whole field of science applied in this way." Thus, to our mind the evidence as to whether a paper which contains incriminating material against the accused has been torn out from another copy is an information connected with the forensic science. Wilson R Harrison in his book *"Suspected Documents"* at p 43 has said:

142. 1981 Cr LJ 1253.
143. AIR 1952 SC 343 : (1952) SCR 1091 : 1952 SCJ 509.

If the edge of a suspect document is seen to be irregular, an accurate record of its outline should be preserved, as it may prove possible to match this irregular edge with that another document which subsequently comes to hand. Evidence such as this has no occasion proved to be a value when anonymous letters are being investigated, for these are often written on scraps of paper torn from sheets which later become available to the investigators.

At the same page (bottom), the author dealing with "perforations" has said:

Paper rarely tears evenly along the performations[sic]. The slight irregularities in tearing may prove of value should it be required to prove that a sheet was torn from a particular counterfoil.

The author at p 44 under Fig. 3-10 while explaining has said:

An enlarged photograph (2X) provides the best evidence of matching through the uneven tearing of perforation.

Fluorescence is one of the items to be observed in the examination and comparison of paper. The same author dealing with "The fluorescence of paper" has observed at p 90:

The exposure of paper to ultraviolet light is a useful test when a document consists of several pages and the substitution of one or more is suspected. The forger may be able to match the general colour and appearance of an unwater-marked sheet as viewed under ordinary conditions of lighting, but unless a very similar paper has been chosen, it is unlikely to exhibit the same fluorescence in ultra-violet light.

The pages of any suspect document should be exposed side by side and their fluorescence compared: no decision should be made until both sides of all the sheets have been examined, for the back and front surfaces may differ in their fluorescence. With a single page document, the actual colour of the fluorescence may have little significance, so that the attention should be concentrated on the discovery of places where there is some modification of either colour or intensity, for these may well be the sites of erasures.

Osborn in his book, *"Questioned Documents"* (Second Edn) chapter XXVI dealing with paper and Questioned documents has observed:

It has been conclusively shown that several questioned documents or widely different dates were all written on paper that originally formed one sheet, as was clearly proved by the matched indentations on the edges of the several pieces where they had been torn apart. The sheet of paper on which an anonymous letter was written has been shown to have come from a blank book from which it had been torn, which book had been in the possession of one who was accused of writing the letter.

Thus, we are of the opinion that it is possible for an expert, if he is one to examine and say, as to whether a sheet of paper on which the questioned document is written came from a particular copy or not. No doubt, in order to establish the identity of the papers, on the questioned as well as the others in the blank copy, from which the sheet, from which the questioned document is said to have been torn out, the colour, thickness, finish or surface, watermark, wove or laid style, cutting, size, ruling, fluorescence have to be looked into. But, it does not appear to be necessary that before the identity of the two papers can be established, all the aforesaid things must be similar, and in a given case only some of the things may enable the expert to give an opinion about the identity of the two papers.

Mr. Puri (P.W. 22), the expert, is working as an Assistant Director (Documents) in the New State Forensic Science Laboratory, Rajasthan, since June 1959. He has stated that he is an expert of handwriting and other alleged problems and also received training prior to his appointment in the Punjab CID Scientific section, Phillaur, Bihar Police Laboratory, Patna, Indian Security Press, Nasik and Government of India Mint, Calcutta for over one and a half years. In the year 1971, he also received advance training in the subject in the Home Office Forensic Science Laboratory at Cardiff in UK for a period of about six months, having been sponsored by Government of India. He has stated that the page containing disputed writing

marked "Q 2" (Ex. P-5), the reverse side of which is marked "Q 2" (R) was removed from the note book marked "B" from the place opposite to page B-18 (R). He opined that the edges of the side, which was pulled marked "Q 2" (R) match with the relevant edges of the pages B-18 (R). He prepared a comparison chart marked Ex. P-148, which also contains enlarged photographs. He had examined the documents "Q 2" (R), (Ex. P-5) and B-18 (R) (Copy Ex. P-57) by placing them side by side of the paper B-18 (R) is the reverse side. We are, therefore, of the opinion that on the evidence of Mr. Puri it can be said that the sheet on which Ex. P-5 was written was taken out from Ex. P-57, and the other sheet of it is B-18 (R). We have already reproduced as to what is written in Ex. P-5 and we are of the opinion that it is an incriminating evidence, and the fact that the copy from which the sheet on which Ex. P-5 was torn was recovered on the information of the accused at his instance from his house, connects the accused with the crime.[1]

10.26.44 Incomplete Evidence[144]

Dr. BR Sharma (P.W. 22) undoubtedly had the qualifications of an expert, although he had not published any paper with regard to the comparison and identification of printed matters. But his evidence, even if admissible, does not necessarily lead to the conclusion that the number on the ticket Ex. P-3, was forged, and not printed in due course on any of the eight machines on which the numbers of the lottery tickets for the Third Draw were printed. Only three Exhibits were sent to Dr. Sharma for examination and comparison. They were:

(i) One Haryana State Lottery ticket marked "A" allegedly produced by Sh. Kanti Lal;

(ii) One genuine ticket produced by Sh. G.S. Kale which is Ex. P-l;

(iii) One allegedly forged ticket which is Ex. P-3. The further circumstance that robbed his evidence of determinative value was that his opinion was invited only on the narrow point whether these three tickets were printed with the same printing machine. The witness examined these tickets and answered the reference in the negative. Reasons in support of his opinion are mentioned in his report (Ex. PAB). In cross-examination, however, Dr. Sharma stated that he was required to compare the marks (the number) on the ticket (Ex. P-l) with the machine (Ex. P-10) and therefore, the establishment of individual characteristics of the machines was neither possible nor necessary. For such identification, the witness added:

"We need a number of machines to establish the individuality of the machines with reference to other machines." The witness further conceded:

"I did try to find out data in the letter *X* to give a definite opinion either in positive or negative form. There can be slight differences in the dimensions of the letters and digits due to the proper and improper inking. I could not find significant differences which could permit to say that the letter *X* was not printed with the letter-face, which was sent to me on Ex. P-l and Ex. P-21. I did not compare the letter *X* on Exs. P-l and P-3 *inter se* as it would not have served any useful purpose, nor I was required to so do. In this case it was not possible to give a definite opinion on the printing of letter *X* as it was a single letter."

He further stated that he had not compared the inks on Ex. P-l and Ex. P-3, and therefore, could not say whether there was or not any difference in the inks used in printing the numbers on these tickets. Thus, Dr. Sharma's opinion on his own showing could not be definite and conclusive. P.W. 6 and P.W. 12 revealed that the numbers on the tickets relating to the Third Draw were printed in the Thompson Press on eight different machines and not only on the

144. *Chatt Ram v State of Haryana*, AIR 1979 SC 1890 : (1979) Cr LJ 1411 : 1979 Cri LR (SC) 590.

machine (Ex. 10) which alone was examined by Dr. Sharma in relation to the three tickets sent to him. Thus, Dr. Sharma's evidence did not clinch the issue as to whether the ticket Ex. P-3 was a forged one.

The last witness in this set is Joginder Singh Overseer (P.W. 26). He was the supervisor of the Lotteries Department of Thompson Press in which the lottery tickets were printed. He examined the four tickets in question, each bearing No. X-78410, on 8 December 1969, including Ex. P-l and Ex. P-3. In his opinion, Ex. P-l (which was the ticket produced by Shri G.S. Kale), was genuine for the following reasons:

1. The series type *X* corresponds to the genuine type face in Chalthenem 18, condensed bold.
2. Movement of the digits on the ticket is similar to the movement of the digits of machine No. 386008 of Tutilo numbering machine, made in Germany and which is available with the Thompson Press, Faridabad.
3. The numbering of counterfoils produced is similar to the genuine numbering machine. It was printed by a Machine No. 386012 of Tutilo number machine made in Germany and which is available in Thompson Press, Faridabad.
4. The space between No. and alphabets is same on the ticket and the counterfoil.
5. Type of series are same on the ticket and counterfoil, *i.e.,* Chalthenem 18, Bold Condensed.
6. Inking of ticket is genuine, *i.e.,* with densed black.

The witness further opined that the ticket (Ex. P-3) is not genuine for these reasons: —

1. Ink shade is not the same in the genuine ticket, *i.e.,* Ex. P-l.
2. Distance between No. and *X* is a little more.
3. There is no alignment with *X* and slanting position."

In cross-examination, the witness revealed that he had ample training regarding the comparison of printed disputed documents and had written an article entitled "Detection on Forgeries in Printed Material". The witness admitted that in (Ex. P-3) the type face is also from 'CHALITHENEM) 18 bold condensed but it is from a brand-new type face. The witness conceded:

> *It is possible that numbering of Ex. P-3 was done with Tutilo machine rather it was printed with a Tutilo make machine. It is true that the size of the type of spacing of the digits were the same in Exs P-1 and P-3. We used dense black ink in our printing the tickets while this ink was not in Ex. P-3 but they were not of the same shade although both were black.*

The witness added that he had examined the ink shades with a magnifying glass and found that while the ink used in Ex. P-l was of their press, it was not so in the cases of the other three tickets. The witness, however, did not perform any chemical test to ascertain the identity of the ink.

Assuming arguendo, that Joginder Singh had the necessary skill, scientific knowledge and experience of an 'expert' and his opinion was admissible under section 45, then also it would be highly unsafe to condemn Ex. P-3 on his opinion alone, as a forged document. The dissimilarities between Ex. P-1 and Ex. P-3 on the basis of which he has characterised the number on Ex. P-3 as a forged number, may be natural variations. His opinion does not indubitably exclude the possibility of the number in question on Ex. P-3 having been printed in the ordinary course on one of the eight Tutilo machines of the Thompson Press. In cross-examination, he did not rule out this possibility. His opinion that the questioned number on Ex. P-3 had not been printed with the same ink with which the number on Ex. P-l and the

other lottery tickets were printed in their press cannot pass muster. The only reason for this difference in the printing ink given by him, is that the ink used in printing the questioned number on Ex. P-3 is less dense or lighter in shade than that of Ex. P-l. Thus, variation in density of ink may be due to an innocuous cause. The witness never examined the ink chemically. This circumstance pointed out by the witness was too precarious to be a safe basis for a finding of forgery.

Even if it is assumed for the sake of argument that the number on Ex. P-3 had been forged, that by itself would not show that Chatt Ram, appellant forged it or participated in its forgery. Nor would the mere fact that Chatt Ram presented this ticket before the officers concerned and claimed the special prize on knowledge or belief of its forged character.

Nor where the two circumstances pointed out by the counsel for the state such as would unerringly raise an inference that the appellant possessed the *mens rea* requisite for an offence concerned for claiming the special prize. These two circumstances (which have been set out in a foregoing part of this judgment), at the most, raise suspicion about the requisite guilty knowledge or belief on the part of the appellant. But suspicion is no substitute for proof.

To sum up, even if the evidence of P.Ws. 6, 12, 22 and 26 were assumed to be admissible under section 45, Evidence Act, it was not sufficient to establish beyond reasonable doubt that the ticket Ex. P-3 was a forged document. Further, even on the assumption that the ticket Ex. P-3 was a forged document, the evidence on the record did not indubitably lead to the conclusion that the appellant Chatt Ram was concerned in forging it or had the requisite guilty knowledge of its forged character when he presented it and claimed prize on its basis before the officers concerned. It is immaterial if at any subsequent point of time he came to know of its forged character.

Since, in any event, the evidence on the record is insufficient to sustain the conviction of Chatt Ram appellant under sections 467, 471 Indian Penal Code the legal question posed by the High Court is rendered wholly academic and it is not necessary to decide the same for the purpose of this appeal.[1]

10.26.45 Refusal to Give Specimen — Contempt of Court[145]

With the introduction of such "requested" specimens in criminal cases, questions regarding possible self-incrimination in violation of the Fifth Amendment of the United States Constitution arose. These matters were effectively dealt with by the Supreme Court in two separate decisions in recent years. In *Scherber v California,* 384 US 757 : 86 S. Ct. 1826 (1966) the defendant argued that the taking of blood specimen to determine alcohol content, over his objection, was a violation of his privilege against self-incrimination. The court held that while the Fifth Amendment does protect an individual from being compelled to testify against himself, the taking of his blood did not involve testimonial compulsion. The court touched upon our field by stating that the Fifth Amendment privilege did not afford protection against compulsion to "Submit to fingerprinting, photographing, or measurements, to write or speak for identification".

Handwriting specimens were more directly involved in a decision rendered the following year in *Gilbert v California,* 388 US 263 (1967). The defendant provided handwriting specimens to federal agents in connection with federal offences, and these specimens were subsequently used to prosecute him on local charges. He argued that such use was in violation of his privilege against self-incrimination. The court rejected this contention and held that "a

145. *EF Afford Jr. and Ronald M Dick*, *International disguise in court-ordered handwriting specimens*, Journal of Police Science and Administration, 6 (4), 420, (1978).

mere handwriting exemplar, in contrast to what is written, like the voice or body itself, is in identifying physical characteristic outside its protection.

The introduction of such handwriting specimens also provoked questions concerning possible violations of privileges against unreasonable searches and seizures as provided by the Fourth Amendment. The Supreme Court has also dealt with this question in recent years. In *United States v Mara*, 10 Cri L 2235 (7th Cir), 1971 the court held that:

> Handwriting, like speech, is repeatedly shown to the public, and there is no more expectation of privacy in the physical characteristics of a person's script than there is in the tone of his voice.

The decisions cited clearly reflect the attitude of the Supreme Court that the introduction of requested handwriting specimens does not involve violations of privileges provided by the Fourth and Fifth Amendments.

The Schmerber decision, in holding that the Fifth Amendment privilege did not afford protection against compulsion to write for identification purposes, is a far cry from the early rulings that specimens had to be in the case for some other purpose. It can be looked upon as a landmark decision in that it has paved the way for compelling a person to provide handwriting specimens through a court order or grand jury proceedings. This has led to the common practice today of securing court-ordered specimens, and courts have held the failure to provide such specimens constitutes contempt. Additionally, some courts have held that providing specimens that are deliberately disguised also provides ground for contempt proceedings. Some periphery procedures that have evolved have yet to be ruled upon by the higher courts. An example is a recent complimentary ruling by a trial judge in New Orleans that because handwriting experts are also so accurate now, it is an infringement of the individual's rights to have him repeat the pertinent material letter for letter.[1]

10.26.46 Evidentiary Value[146]

The opinion of a handwriting expert, even if it may be said to be of reliable nature, is not conclusive on the point that the signatures alleged to have been forged, were really made by the accused. The opinion of the expert is only corroborative and not a substantive piece of evidence.[2]

10.26.47 Magistrate as Handwriting Expert[147]

Where the magistrate after considering the opinion of handwriting expert compared the writing on the forged document and the subsequent writings of the accused and came to the conclusion that the document was forged, it was held that he ought not to have taken the role of an expert. His opinion was certainly influenced by the opinion of the expert. He did not discuss how he could come to his belief on simply seeing the handwriting on the forged document and the specimen handwriting of the accused. If he wanted to rely upon his own knowledge, he ought to have given his own reasons why he thought that the forged document was in the hand of the accused. If he had any independent expert knowledge about the handwriting he ought to have given reasons for his belief independently according to his own knowledge. In the absence of such reasons the decision of the magistrate was held not justified.

146. (1978) Cr LJ (NOC) 194.
147. (1978) Cr LJ (NOC) 128 (Cal).

10.26.48 Counterfeiting Currencies[148]

"Counterfeiters all over the world must be singing in ecstasy, if there is heaven on earth, it is here, here, here", for, according to the Kerala High Court Indian law does not make counterfeiting of currency notes of any country in the world, other than that of India, an offence.

The High Court has persuaded itself by a process of judicial activism in reverse gear, that making of such counterfeit notes is not an offence under section 489A of the Indian Penal Code and that having in possession such counterfeit currency notes is not an offence under section 489C of the Indian Penal Code. Such a view has been taken even though there is nothing in the language of these sections to warrant such an interpretation as will become evident presently.

Facts.—The six respondents herein were charged with offences punishable under sections 120B, 489A, 489B and section 420 read with sections 51 and 34, Indian Penal Code. The prosecution case against them was that in furtherance of a conspiracy entered into by accused Nos. 1 to 4 to forge and counterfeit American Dollar notes of 20 dollar denomination, they indulged in counterfeiting by printing 2000 such notes. Respondents 1 and 2 were further alleged to have been in possession of 148 forged currency notes knowing the same to be forged, with intent to use these forged notes as genuine. The respondents were committed by the Magistrate to stand their trial before the Sessions Court, for offences under sections 120B, 489A and 489C read with sections 511 and 34, Indian Penal Code. It was contended by the respondents accused before the Sessions Court that a charge under sections 489A and 489C of the Indian Penal Code could be lawfully levelled only in the case of counterfeiting of 'Indian' currency notes and not in the case of counterfeiting of "foreign" currency notes. The contention was upheld by the Sessions Court at the threshold of the trial and the accused were discharged. Aggrieved by the order of the Sessions Court discharging the respondents, the petitioner (State of Kerala) filed a Revision Petition before the High Court of Kerala. The High Court by its order under appeal confirmed the order of discharge rendered by the Sessions Court holding that "in the absence of an explanation similar to that in the case of bank notes, section 489A and the sections that follow which relate to counterfeiting of currency notes do not apply to cases of counterfeiting of dollar bills". The petitioner thereupon filed an application under Article 134(1)(c) of the Constitution for leave to appeal to the Supreme Court. By its order under appeal, the High Court certified it as a fit case for appeal to the Supreme Court as "the case involves considerably important questions of law as to whether counterfeit American dollar notes will fall within the purview of sections 489A and 489C of the Indian Penal Code." That is how the matter has come up before this court.

Relevant Provisions.—The anatomy of the relevant provisions requires to be X-rayed at the outset. The concerned provisions may, therefore, be screened:

> **[[s 489A] Counterfeiting currency-notes or bank-notes.** Whoever counterfeits, or knowingly performs any part of the process of counterfeiting, any currency-note or bank-note, shall be punished with [149][imprisonment for life], or with imprisonment of either description for a term which may extend to ten years, and shall be liable to fine.
>
> Explanation.—For the purposes of this section and of sections 489B, [150][489C, 489D and 489E] the expression "bank note" means a promissory note or engagement for the payment of money to bearer on demand issued by any person carrying on the business

148. Judgment and Order rendered by the Kerala High Court in Cr LJ 263 of 1975 on November 17, 1976, giving rise to the present appeal by certificate of fitness under article 134(c) of the Constitution of India.
149. Subs. by Act 26 of 1955, section 117 and Schedule, for "transportation for life" (w.e.f. 1-1-1956).
150. Subs. by Act 35 of 1950, section 3 and Sch II, for "489C and 489D".

of banking in any part of the world, or issued by or under the authority of any State or Sovereign Power, and intended to be used as equivalent to, or as a substitute for money.]

[[s **489C] Possession of forged or counterfeit currency-notes or bank-notes.** Whoever has in his possession any forged or counterfeit currency-note or bank-note, knowing or having reason to believe the same to be forged or counterfeit and intending to use the same as genuine or that it may be used as genuine, shall be punished with imprisonment of either description for a term which may extend to seven years, or with fine, or with both.]

Analysis.—An analysis of section 489A reveals that:

(i) counterfeiting "any" currency note or bank-note is an offence;

(ii) knowingly performing any part of the process of counterfeiting any currency note or bank-note is also an offence; and

(iii) the prohibition against counterfeiting or performing such process applies to currency notes as also to bank-notes as defined by the *explanation* to section 489A. And inasmuch as the aforesaid *explanation inter alia* means any engagement for the payment of money to the bearer issued by or under the authority of any State or sovereign power provided it is intended to be used as equivalent to or substitute for money the prohibition also extends to counterfeiting,, of currency notes of any other sovereign power.

Outcome.—This analysis reveals that the legislative embargo against counterfeiting envelops and takes within its sweep "currency notes" of all countries. The embargo is not restricted to "Indian" currency notes. The Legislature could have, but has not, employed the expression "Indian currency note. If the legislative intent was to restrict the parameters of prohibition to "Indian currency" only, the Legislature could have said so unhesitatingly. The expression "currency note" is large enough in its amplitude to cover the currency notes of "any" country. When the Legislature does not speak of currency notes of India the court interpreting the relevant provision of law cannot substitute the expression "Indian currency note" in place of the expression 'currency note' as has been done by the High Court. The High Court cannot do so for the court can merely interpret the section; it cannot re-write, recast or redesign the section. In interpreting the provision, the exercise undertaken by the court is to make explicit the intention of the Legislature which enacted the legislation. It is not for the court to reframe the legislation for the very good reason that the powers to "legislate" have not been conferred on the court. When the expression "currency note" is interpreted to mean "Indian currency note", the width of the expression is being' narrowed down or cut down. Apart from the fact that the court does not possess any such power, what is the purpose to be achieved by doing so? A court can make a purposeful interpretation so as to 'effectuate' the intention of the Legislature and not a purposeless one in order to "defeat" the intention of the legislators wholly or in part. When the court (apparently in the course of an exercise in interpretation) shrinks the content of the expression "currency note", to make it referable to only "Indian currency note", it is defeating the intention of the Legislature partly inasmuch as the court makes it lawful to counterfeit notes other than Indian currency notes. The manifest purpose of the provision is that the citizens should be protected from being deceived or cheated. The citizens deal with the transact business with each other through the medium of currency (which expression includes coins as also the paper currency that is to say currency notes). It is inconceivable why the Legislature should be anxious to protect citizens from being deceived or cheated only in respect of Indian currency notes and not in respect of currency notes issued by other sovereign powers. The purpose of the legislation appears to be to ensure that a person accepting a currency note is given a genuine currency which can be exchanged for goods or services and not a worthless piece of paper which will bring him nothing in return, it being a counterfeit or a forged

currency note. Would the Legislature in its wisdom and anxiety to protect the unwary citizens extend immunity from being cheated in relation to Indian currency notes but show total unconcern in regard to their being cheated in respect of currency notes issued by any foreign State or sovereign power? In the modern age a tourist from a foreign country may bring from his own country into Indian currency to the extent permissible under the law in India. So also, he may obtain foreign currency in exchange of Indian currency whilst in India provided he does so to the extent permissible by the Foreign Exchange Regulation Act, 1973.[151]

10.26.49 Specimen Signatures in Open Court[152]

The first respondent remained *ex-parte* and the second respondent contended before the trial court that he was a party to the transaction and that he had not executed any letter of guarantee. According to him he accompanied the first respondent to the appellant bank with a salary certificate and that he had not signed any document. Thus, according to him the alleged deed of guarantee was only a forged one. Thus, he denied the liability to pay the amount as claimed in the plaint.

After framing necessary issues, the trial court examined P.W. 1 and D.W. 1 and marked Exits. A-1 and A-12. After hearing both sides the lower court considered the matter and held that the second respondent was not liable. Thus, the suit was decreed only against the first respondent with costs. As the liability of the second respondent was exonerated, this appeal is filed to the plaintiff bank.

Counsel for both sides was heard. According to the learned counsel appearing for the appellant the second respondent is also liable for the suit claim in view of the letter of guarantee. In view of the fact that D.W. 1 admitted his signature in Ext. A-12 acknowledgement and in view of the fact that no reply notice was sent by the second respondent, it was argued that the second respondent was liable in view of Ex. A-6 deed of guarantee executed by the second respondent on 6 August 1979. It was also argued that the lower court was not correct in holding that the signature of the second respondent differs from the admitted signatures. It was also argued that the lower court should not have compared the signatures without calling an expert's opinion. Thus, the point arising for consideration is as to whether the lower court was correct in exonerating the liability of the second respondent.

The first respondent was drawing amounts from the appellant Bank at MG Road Branch, Trivandrum under cash credit facility for the purpose of his textile firm called Sajitha Textiles. Ext. A-1 is the pronote and Ext. A-2 is the deed of hypothecation executed by the first respondent for an amount of Rs 20,000 on 12 August 1978, Ext. A-3 was the letter of guarantee executed by the second respondent on 12 August 1978. When the amount came to Rs 30,000 Ext. A-4 fresh pronote was executed by the first respondent and Ext. A-5 agreement of hypothecation was executed afresh by the first respondent on 6 August 1979. Ext. A- 6 is the fresh agreement of guarantee executed by the second respondent on 6 August 1979. Later when the amount came to Rs 40,000 the first respondent executed Ext. A-7 pronote and Ext. A-8 agreement of hypothecation on 22 April 1981. The first respondent did not contest the suit. Thus, he has admitted his liability. But the second respondent contended that he had not executed Exts. A-3 and A-6 agreement of guarantee. On a perusal of the signatures in Exts. A-3 and A-6 with that of the admitted signature in the summons and *vakalatnama*, the lower court held that the signatures differ. Thus, the lower court exonerated the liability of the second respondent. The case of the second respondent was that he went along with the

151. *State of Kerala v Verghese*, AIR 1987 SC. Also see *M Durga Prasad v State of Andhra Pradesh,* 2004 Cr LJ 242 : 2003 (2) Andh LD (Cr) 545 (AP).
152. *New Bank of India v Sajitha Textiles*, AIR 1997 Ker 201 : 1997 (1) BC 620 : 1998 (35) Bank LJ 345.

first respondent to the plaintiff bank along with Ext. A-9 salary certificate and that he did not sign any documents. In view of the denial of the signature, the burden of proof was on the plaintiff to prove that the signature in Exts. A-3 and A-6 were that of the second respondent. In the absence of an expert opinion it was only just and proper on the part of the lower court to compare the signatures with the admitted signature. Thus, the lower court held that the signatures differ in Exts. A-3 and A-6 from the admitted signatures of the second respondent. As the expert's opinion was not called for at the instance of the plaintiff, the learned counsel appearing for the appellant was not justified in blaming the lower court for comparing the signature with the admitted signature. It is true that reasons were not stated by the lower court to show how the signatures differ. Even if Exts. A-3 and A-6 were signed by the second respondent, it is to be noted that Ext. A-6 was dated 6 August 1979, whereas Ext. A-3 is of an earlier date, *i.e.,* 12 August 1978. Under section 73 of the Indian Evidence Act the court can compare the signature on the disputed documents with the admitted signatures. The learned counsel appearing for the appellant argued that the lower court ought to have directed the second respondent to put his signature on a blank paper in open court and then ought to have compared the signature with the admitted signature. But in view of the admitted signature in Ext. A-12 acknowledgement summons and *Vakalatnama*, there was no necessity to get a further signature of the second respondent in open court. Further, to prove signature under section 73 of the Indian Evidence Act, to get a signature of the second respondent in open court was only directory and it was not mandatory. When the court is satisfied that there are admitted signatures of the second respondent available in court, there was no necessity to get another signature of the second respondent in open court.

Even if Ext. A-6 is the letter of guarantee executed by the second respondent the suit ought to have been filed within the period of three years from the date of Ext. A-6. Ext. A-6 is dated 6 August 1979 and the suit is not filed against him within the period of three years from 6 August 1979. The period of limitation is three years coming under Article 55 of the Limitation Act. The decision reported in *United Commercial Bank v BM Mahadeva Babu,*[153] held that the suit against the guarantor for enforcement of guarantee should be filed within the period of three years from the date of guarantee as the period of limitation is as prescribed by Article 55 of the Indian Limitation Act. As the suit was not filed within the period of three years from the date of Ext. A-6, the appellant cannot enforce the guarantee against the second respondent. For that reason, the appellant cannot get a decree against the second respondent. In this context the learned counsel appearing for the appellant argued that the question of limitation was not taken up by the second respondent in his written statement or before the lower court. But a question of law can be taken up even before the appellate court. Thus, it is futile to contend that the question of limitation cannot be urged by the second respondent before this court. Under Article 55 of the Indian Limitation Act the period fixed is three years. Thus, as the suit was not filed within the period of three years from the date of Ext. A6, the second respondent is not liable for the suit claim. Thus, I do not find any reason to interfere with the judgment and decree of the lower court.

For the above reasons the judgment and decree of the lower court are confirmed, and this appeal is dismissed. In the peculiar circumstances, both parties are to bear their costs.[154]

10.26.50 Indefinite Expert Opinion[155]

Since, the appellant has denied the authorship of those letters and claimed that the same have been fabricated, it was desirable for the prosecution to examine Ms. Vani in connection with those letters. The appellant is alleged to be the author of the letters more particularly letters E. P-l, P-6, P-7 and P-9. From the opinion of P.W. 3, the handwriting expert, the prosecution has sought to corroborate the evidence of P.W. 1 regarding the authorship of those letters. The opinion of P.W. 3, the Assistant Director in the State Forensic and Science Laboratory, Hyderabad, in our view cannot be said to be of a clinching type to attribute the authorship of those letters to the appellant. P.W. 3 during his statement deposed:

> *In my opinion (1) there are similarities indicating common authorship between the red enclosed writings marked as section 12 to section 23 and the red enclosed writings marked as Q-4 to Q-7. But no definite opinion can be given on the basis of the present standards. (2) No opinion can be given on the authorship of the red enclosed signatures and -writings marked as Q-1 to Q-3 and Q-8 to Q-15 on the basis of present standards.*

The expert further opined:

> *When all the writing characteristics are considered collectively, they led to the conclusion that there are similarities indicating common authorship between the standard writings marked S-12 to S-25 and the questioned writings marked Q-4 to Q-7. But no definite opinion can be given on the basis of the present standards. Extensive admitted writings are required for offering a definite opinion.*

During his cross-examination P.W. 3 admitted:

> ***Question.*** *From the available standards you cannot say that the signatures of Exs. P-7 and P-9 is of the same person who wrote Exs. P-7 and P-9.*
>
> ***Answer.*** *We can compare truly like signatures with signatures and writings with writings and not a signature with writing.*

Thus, the evidence of P.W. 3, is not definite and cannot be said to be of a clinching nature to connect the appellant with the disputed letters. The evidence of an expert is a rather weak type of evidence and the courts do not generally consider it as offering 'conclusive' proof and, therefore, safe to rely upon the same without seeking independent and reliable corroboration. In *Magan Bihari Lal v State of Punjab,*[156] while dealing with evidence of a handwriting expert, this court opined (at p 1093):

> *We think it would be extremely hazardous to condemn the appellant merely on the strength of opinion evidence of a handwriting expert. It is now well-settled that expert opinion must always be received with great caution and perhaps none so with more caution than the opinion of a handwriting expert. There is a profusion of precedential authority which holds that it is unsafe to base a conviction solely on expert opinion without substantial corroboration. This rule has been universally acted upon and it has almost become a rule of law. It was held by this court in* Ram Chandra *v* State of Uttar Pradesh,[157] *that it is unsafe, to treat expert handwriting opinion as sufficient basis for conviction, but it may be relied upon when supported by other items of internal and external evidence. This court again pointed out in Ishwari Prasad Mishra v Md Isa, AIR 1963 SC 1728, that expert evidence of handwriting can never be conclusive because it is, after all, opinion evidence, and this view was reiterated in Shashi Kumar v Subodh Kumar*[158] *where it was pointed out by this court that expert's evidence as to handwriting being opinion evidence can rarely, if ever, take the place of substantive evidence and before acting on*

155. *S Gopal Reddy v State of Andhra Pradesh,* AIR 1996 SC 2184 : 1996 Cr LJ 3237 : 1996 AIR SCW 2803.
156. AIR 1977 SC 1091 : (1977) 2 SCC 210 : 1977 Cr LJ 711.
157. AIR 1957 SC 381 : 1957 Cr LJ 559.
158. AIR 1964 SC 529.

such evidence, it would be desirable to consider whether it is corroborated either by clear direct evidence or by circumstantial evidence. This court had again occasion to consider the evidentiary value of expert opinion in regard to handwriting in Fakhruddin v State of Madhya Pradesh,[159] *and it uttered a note of caution pointing out that it would be risky to find a conviction solely on the evidence of a handwriting expert before acting upon such evidence, the court must always try to see whether it is corroborated by other evidence, direct or circumstantial.*

We are unable to agree, in the established facts and circumstances of this case, with the view expressed by the courts below that P.W. 1 is a competent witness to speak about the handwriting of the appellant and that the opinion of P.W. 3 has received corroboration from the evidence of P.W. 1. P.W. 1 admittedly did not receive any of those letters. He had no occasion to be familiar with the handwriting of the appellant. He is not a handwriting expert. The bald assertion of P.W. 1 that he was "familiar" with the handwriting of the appellant and fully "acquainted" with the contents of the letters, admittedly not addressed to him, without disclosing how he was familiar with the handwriting of the appellant, is difficult to accept. Section 67 of the Evidence Act enjoins that before a document can be looked into, it has to be proved. Section 67, of course, does not prescribe any particular mode of proof. Section 47 of the Evidence Act which occurs in the chapter relating to "relevancy of facts" provides that the opinion of a person who is acquainted with the handwriting of a particular person is a relevant fact. Similarly, opinion of a handwriting expert is also a relevant fact for identifying any handwriting. The ordinary method of proving a document is by calling as a witness the person who had executed the document or saw it being executed or signed or is otherwise qualified and competent to express his opinion as to the handwriting. There are some other modes of proof of documents also as by comparison of the handwriting as envisaged under section 73 of the Evidence Act or through the evidence of a handwriting expert under section 45 of the Act, besides by the admission of the person against whom the document is intended to be used. The receiver of the document, on establishing his acquaintance with the handwriting of the person and competence to identify the writing with which he is familiar, may also prove a document. These modes are legitimate methods of proving documents but before they can be accepted, they must bear sufficient strength to carry conviction. Keeping in view the inconclusive and indefinite nature of the evidence of the handwriting expert P.W. 3 and the lack of competence on the part of P.W. l to be familiar with the handwriting of the appellant, the approach adopted by the courts below to arrive at the conclusion that the disputed letters were written by the appellant to Ms. Vani on the basis of the evidence of P.W. 1 and P.W. 3 was not proper. The doubtful evidence of P.W. 1 could neither offer any corroboration to the inconclusive and indefinite opinion of the handwriting expert P.W. 3 nor could it receive any corroboration from the opinion of P.W. 3. We are not satisfied, in the established facts and circumstances of this case, that the prosecution has established either the genuineness or the authorship of the disputed letters allegedly written by the appellant from the evidence of P.W. 1 or P.W. 3. The courts below appear to have taken a rather superficial view of the matter which relying upon the evidence of P.W. 1 and P.W. 3 to hold the appellant guilty. We find it unsafe to base the conviction of the appellant on the basis of the evidence of P.W. 1 or P.W. 3 in the absence of substantial independent corroboration, internally or externally, of their evidence, which in this case is totally wanting.[160]

10.26.51 Judge as Handwriting Expert[161]

The entire set of charges against the accused, including the conspiracy charge, basically rest on the documentary evidence. To that extent, the first necessary ingredient is that the

159. AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197.
160. *S Gopal Reddy v State of Andhra Pradesh,* AIR 1996 SC 2184 : 1996 Cr LJ 3237 : 1996 AIR SCW 2803.
161. *Vishwanath Mahadev Karkhanis v State of Maharashtra,* 1991 Cr LJ 3146 (Bom) : 1992 (1) All Cr LR 162 : 1991 (2) Bom CR 565.

incriminating documents in question which are attributed to the accused must be held to have been proved. This proof involves the identity and proof of the handwriting and more importantly identity and proof of the signatures. As far as both these aspects are concerned, it is pointed out by Mr. Nakhwa that there is a serious lacuna in the present investigation. He stated that there was no difficulty whatsoever for the Central Bureau of Investigation to have obtained admitted handwritings and signatures of the accused which was for some reason never done. At a very late stage, obviously after the investigation was more or less complete, it did apparently occur to the concerned authorities that it was necessary to fix the identity of the documents and their nexus with the concerned accused who had been placed on trial. For this purpose, the prosecution adopted a wholly unsatisfactory procedure and a strange one. A host of witnesses have been summoned, all of whom fall into two broad categories. They are all persons who have retired from the services of the Western Railway several years earlier. The first category of these witnesses claim that they knew the particular accused insofar as they were working with them in the department. The second category of witnesses claims that at some point of time or the other, the concerned accused were subordinates to them. This makes little difference because these persons admitted that they have retired from service several years earlier and it was demonstrated by Mr. Nakhwa that one of these persons has retired in the year 1971 and that he is solemnly deposing in evidence in the year 1983. The time frame is more or less common in the case of the witnesses and it is quite amazing that all of them uniformly depose in evidence that they do recall that during the years that they were in service, they had occasion to see the handwriting and signatures of a concerned accused and that their eye-sight and memory is so precise and so sharp and so reliable that they are able to tell the court that the handwriting and signatures on documents shown to them in court belonged to a particular accused. Mercifully, the learned Special Judge himself, in the judgment, has realised the weakness of evidence of this type, but the learned Special Judge has got over it by following an equally unsatisfactory procedure. The learned Special Judge states that he has conveniently resolved the entire challenge of the defence under this head by taking out the *Vakalatnamas* that were filed by the accused before the court and has satisfied himself from the signatures appearing thereon that the documents were signed by the accused. It is quite true that in a given case for the purposes of satisfying itself the court may even look at the admitted signatures on a *Vakalatnama* or documents filed before the court for the purpose of resolving a minor controversy. In the present case, however, the lacuna was far more substantial insofar as the prosecution has not discharged the basic burden cast on it and that lacuna, to my mind, could not have been cured by the learned Special Judge coming to the assistance of the Prosecution by stating that the infirmities pointed out by the defence have been undone through the comparison of the signature on the *Vakalatnamas* before the court, which still leave out the handwritings.

10. Mr. Lambay, the learned Additional Public Prosecutor, has stoutly defended the procedure adopted by the Prosecution by pointing out that under section 73 of the Evidence Act, it is quite permissible for a witness to identify a handwriting and signatures with which he is familiar. Mr. Lambay has also pointed out that if at all there was any shadow of doubt, as an additional precaution and safety measure that the learned Special Judge has resolved the controversy by making a comparison with the *Vakalatnamas* that were filed in the court. Unfortunately, this submission is unacceptable insofar as it would be a dangerous precedent to permit identification and proof of this type, and in the present case, it suffers from an inherent weakness that makes the method of proof wholly unsatisfactory. To this extent, the lacuna pointed out by Mr. Nakhwa with regard to the entire set of documents proved by the prosecution by this method will have to be upheld and it will have to be, consequently, held that none of the documents in question can be said to have been proved.[1]

10.26.52 Court can Act as Handwriting Expert[162]

It has been constantly laid down by this court that where a case rests squarely on circumstantial evidence the inference of guilt can be justified only when all the incriminating facts and circumstances are found to be incompatible with the innocence of the accused or the guilt of any other person. (See: *Hukam Singh v State of Rajasthan*, AIR 1977 SC 1063 : (1977) 2 SCC 99; *Eradu v State of Hyderabad*, AIR 1956 SC 316 : 1956 Cr LJ 559 ; *Earabhadrappa v State of Karnataka*, AIR 1983 SC 446 : (1983) 1 SCC 330 : 1983 Cr LJ 846 ; *State of Uttar Pradesh v Sukhbasi*, AIR 1985 SC 1224 : 1985 Cr LJ 1479 : 1985 (2) Crimes 465 ; *Balwinder Singh v State of Punjab*, AIR 1987 SC 350 : (1987) 1 SCC 1 : 1987 Cr LJ 330 ; *Ashok Kumar Chatterjee v State of Madhya Pradesh*, AIR 1989 SC 1890 : 1989 (2) Crimes 423).

The circumstances from which an inference as to the guilt of the accused is drawn have to be proved beyond reasonable doubt and have to be shown to be closely connected with the principal fact sought to be inferred from those circumstances. In *Bhagat Ram v State of Punjab*[163] it was laid down that where the case depends upon the conclusions drawn from circumstances, the cumulative effect of the circumstances must be such as to negative the innocence of the accused and bring the offences home beyond any reasonable doubt.

In *Padala Veera Reddy v State of Andhra Pradesh*,[164] it was laid down that when a case rests upon circumstantial evidence, such evidence must satisfy the following tests:

1. the circumstances from which an inference of guilt is sought to be drawn, must be cogently and firmly established;
2. those circumstances should be of a definite tendency unerringly pointing towards guilt of the accused;
3. the circumstances, taken cumulatively, should form a chain so complete that there is no escape from the conclusion that within all human probability the crime was committed by the accused and none else; and
4. the circumstantial evidence in order to sustain conviction must be complete and incapable of explanation of any other hypothesis than that of the guilt of the accused and such evidence should not only be consistent with the guilt of the accused but should be inconsistent with his innocence.

In *State of Uttar Pradesh v Ashok Kumar Srivastava,*[165] it was pointed out that great care must be taken in evaluating circumstantial evidence and if the evidence relied on is reasonably capable of two inferences, the one in favour of the accused must be accepted. It was also pointed out that the circumstances relied upon must be found to have been fully established and the cumulative effect of all the facts so established must be consistent only with the hypothesis of guilt.

What is important is that the possibility of the conclusions being consistent with the innocence of the accused must be ruled out altogether.

Some dispute appears to have been raised before the High Court as also before us that the hotel records should not be relied upon to indicate that the appellant had stayed in "Ashoka Lodge".

Ajit (P.W. 2), room-boy of the "Lodge", in his statement on oath has given out that the appellant had come with his wife and child to the "Ashoka Lodge" and had taken one room on the ground-floor for his stay. The necessary entry [Ex. P-1(a)] was made by the Manager of the "Lodge" in the "Register of Lodgers". The appellant had put his signature on the Register

162. *Ajit Savant Majagavi v State of Karnataka*, AIR 1997 SC 3255 : 1997 AIR SCW 3315 : 1997 Cr LJ 3964.
163. AIR 1954 SC 621 : 1954 Cr LJ 1645.
164. AIR 1990 SC 79 : 1989 All AC (Cri) 236 : 1990 Cr LJ 605.
165. (1992) 2 SCC 86 : 1992 Cr LJ 1104 : 1992 AIR SCW 640.

which is Ex. P-1(b). The appellant, his wife and the child had been taken by the room boy to Room No. 113 where he also supplied an extra bed. The Hotel Manager though mentioned as a witness in the charge-sheet was not examined as he had already left the service of the "Lodge". These facts stand proved by the statement of the room-boy and the High Court has already recorded a finding that the appellant had stayed in Room No. 113 of the "Ashoka Lodge".

The original records were also placed before us and we have perused those records. Since learned counsel of the appellant contended that the appellant had not stayed in the "Ashoka Lodge", we looked into the "Register of Lodgers". It contains the relevant entry against which signature of the appellant also appears. His signature also appears on the *Vakalatnama* filed by him in this appeal. In the presence of the learned counsel for the parties, we compared the signature of the appellant on the *Vakalatnama* with the signature in the "Register of Lodgers". A mere look at the signatures was enough to indicate the similarity which was so apparent that it required no expert evidence. This comparison was done by us having regard to the provisions of section 73 of the Evidence Act which provides as under:

> **73. Comparison of signature, writing or seal with others admitted or proved.** In order to ascertain whether a signature, writing or seal is that of the person by whom it purports to have been written or made, any signature, writing or seal admitted or proved to the satisfaction of the Court to have been written or made by that person may be compared with the one which is to be proved, although that signature, writing or seal has not been produced or proved for any other purpose.

The Court may direct any person present in court to write any words or figures for the purpose of enabling the Court to compare the words or figures so written with any words or figures alleged to have been written by such person.

The section consists of two parts. While the first part provides for comparison of signature, finger impression, writing,, allegedly written or made by a person with signature or writing,, admitted or proved to the satisfaction of the court lo have been written by the same person, the second part empowers the court to direct any person including an accused, present in court, to give his specimen writing or fingerprints for the purpose of enabling the court to compare it with the writing or signature allegedly made by that person. The section does not specify by whom the comparison shall be made. However, looking to the other provisions of the Act, it is clear that such comparison may either be made by a handwriting expert under section 45 or by anyone familiar with the handwriting of the person concerned as provided by section 47 or by the court itself.

As a matter of extreme caution and judicial sobriety, the court should not normally take upon itself the responsibility of comparing the disputed signature with that of the admitted signature or handwriting and in the event of the slightest doubt, leave the matter to the wisdom of experts. But this does not mean that the court has not the power to compare the disputed signature with the admitted signature as this power is clearly available under section 73 of the Act: See *State (Delhi Administration) v Pali Ram.*[166]

We have already recorded above that on the comparison of the signature in the "Register of Lodgers" with the appellant's signature on the *Vakalatnama*, we have not found any dissimilarity and are convinced that the appellant himself had signed the "Register of Lodgers" in token of having taken Room No. 113 in "Ashoka Lodge" on rent wherein he had stayed with his wife and the child.

On an overall consideration of the matter, we are of the opinion that the High Court, in reversing the judgment of the trial court, had fully adhered to the principles laid down by this court in various decisions and there is no infirmity in its judgment.

166. AIR 1979 SC 14 : (1979) 2 SCC 158.

The circumstances, the conduct and behaviour of the appellant conclusively establish his guilt and no amount of innovative steps by him including sporting a beard and latter shaving off the beard and the head could conceal the offence or his identity. It was rightly remarked by the famous Urdu poet Amir Meenai in a couplet:

Qareeb hai yaro jo Roz-i-Mahshar

Chhupey ga kushton ka khoon keonkar

Jo chup Rahegi Zaban-i-Khanjar

Lahoo Pukarega Aastin ka

Translated into English, it will mean:

On the day of judgment, you will not be able to conceal the killing of innocents. If the sword will keep silent, the bloodstains on your sleeves will reveal your guilt.

For the reasons stated above, we find no merit in the appeal which is dismissed. The appellant is on bail. His bail bonds are cancelled. He shall be taken into custody forthwith to serve out the life sentence. Appeal dismissed.[167]

10.26.53 Comparison of Signatures without the Aid of Expert[168]

As a sample of oral evidence, our attention was invited to the evidence of P.W. 58. P.W. 58 in the Chief Examination has stated as follows:

I cast my vote in Mavilayi polling station. The polling station was in Cherumavilayi UP School. (Ext. P-711 marked) Ext. P-711 counterfoil confronted to the witness and the witness denies the signature (Ext. P-712 marked). Ext. P-712 counterfoil shown to the witness. The signature in that also is denied by the witness. Ex. P-891 declaration shown to the witness. Witness admits the signature. Voter No. 142 Utheranchalil KK Chandia w/o Chandran of polling station No. 69 is myself. I have still doubt whether Ext. P-712 is signed by me. I am certain that the signature found in Ext. P-711 is not my signature.

On the above evidence the conclusion of the learned Judge is as follows:

According to P.W. 53 she had cast only one vote No. 142. The corresponding counterfoil is marked as Ext. P-711. When this was confronted to the witness she denied the signature therein. Ext. P-712 is the counterfoil corresponding to voter No. 239. The signature is Ext. P-711 and Ext. P-712 are almost similar. There is a slight variation. But that does not affect the petitioner's case, as the signature in Ext. P-712 is exactly similar to the signature put by the witness in the deposition. Therefore, it is clear the voter No. 142 and 239 in Ext. P-60 is one and the same person and that voter has cast more than one vote. In the result, I declare that vote cast against counterfoil No. 070975 (Ext. P-711) of polling station No. 69 and the vote cast against counterfoil No. 070258 (Ext. P-712) polling station No. 69 are void.

In another instance the learned Judge held as follows:

The signature of the witness in the deposition does not tally with the signature found in these two counterfoils. On a comparison of the signature in Ext. P-713 and P-714 I have little doubt that the same witness has cast two votes. Therefore, I declare that vote cast against counterfoil No. 070653 (Ext. P-713) of polling station No. 69 and the vote cast against counterfoil No. 070309 (Ext. P-714) of polling station No. 69 are void.

While appreciating the evidence of P.W. 69 the court held as follows:

P.W. 69 admits that he is voter No. 1392 in Ext. P-53 electoral roll. The witness also admits that voter No. 563 in Ext. P-47 refers to him. According to this witness he had cast vote in polling station No. 53. The two counterfoils were shown to the witness and he denied both. In the cross-examination, however, he stated that he has no connection with Kadampeth house

167. *Ajit Savant Majagavi v State of Karnataka*, AIR 1997 SC 3255 : AIR 1997 SCW 3315 : 1997 Cr LJ 3964.
168. *O Bharathan v K Sudhakaran,* AIR 1996 SC 1140 : JT 1996 (2) SC 384 : 1996 AIR SCW 685.

and that voter No. 1392 in Ext. P-53 is not himself. The signatures in the two counterfoils are not closely similar. So, it cannot be said that both votes were cast by P.W. 69. The signature in Ext. P-762 has got similarity with the signature of the witness in the deposition. So, the vote against Ext. P-761 must have been cast by some other person. Therefore, I hold that the vote cast against counterfoil No. 062682 (Ext. P-761) in polling station No. 61 reads invalid vote.

The evidence of P.W. 146 reads as follows:

My father's name is Chathukutty. My house is Challivalappil. My mother's name is Lakshmi and I am a driver by profession. Ext. P-50. Sl. No. 192 Balakrishnan Chathukutty aged 30 is myself. Sl. No. 47 in Ext. P-103. Balakrishnan Chathukutty Nambiar is not myself. My father is not Chathukutty Nambiar. (Counterfoil Nos. 12084 and 056691 are marked as Ext. P-936 and 937). Witness denies both the signatures. I have cast only one vote.

Cross-examination by 1st respondent's counsel:

In Ext. P-50 against Sl. No. 642 the house No. shown is 245. It is not my house number. I have no connection with the house by name Krishnalayam. Sl. No. 642 is of Krishnan Nambiar. I am a member of Thiyya community. Witness says that he is in possession of driving licence and shown the same before court and his name has been written there as CV Balakrishna. The driving licence also contains a photograph of the witness.

On the above evidence, the High Court found as follows:

P.W. 146 Balakrishna admits that his father's name is Chathukutty and his mother's name is Lakshmi. He also admits that he is voter No. 1192 in Ext. P-50 electoral roll, but he denies that he is voter No. 47 in Ext. P-103 electoral roll. The voter No. 47 is one Balakrishnan Chathukutty Nambiar and according to this witness his father is not Chathukutty Nambiar and that he belongs to Thiyya community. But it is pertinent to note that in Ext. P-50 voter No. 1192 is shown as resident of house No. 245, in the original voters' list of polling station No. 50, house No. 245 is described as Krishnalyam and voter No. 642 is one T. Krishan Nambiar. P.W. 146 is not in a position to explain as to how his name happened to be included as a resident of the house of Krishnan Nambiar. So, even in the admitted entry there is voter No. 1192 in Ext. P-50. The corresponding counterfoil is marked as Ext. P-93. Even though the witness denies his signature therein, that is to be taken as his admitted signature as it corresponds with his admitted entry. The signature in Ext. P-937 is strikingly similar to the signature in Ext. P-36 counterfoil. So, it is clear that the person who put the signature in Ext. P-937 must have put the signature in Ext. P-936 also. Therefore, it is proved that there is not only similarity in the name but there is close similarity between the two signatures also. So I hold that P.W. 146 had cast two votes. In the result, I declare that the votes cast against counterfoil No. 120847 (Ext. P-936) in polling station No. 115 and the vote cast against counterfoil No. 056691 (Ext. P-937) in polling station No. 56 are void.

Likewise, while commenting on P.W. 149 the court held as follows:

According to witness she had cast, vote in polling station No. 91 as voter No. 683. The corresponding counterfoil, marked as Ext. P-942, was shown to the witness. She denied the signature therein. Ext. P-943, the counterfoil of voter No. 1143 in Ext. P-78 was shown to the witness. She denied that signature also. But on a bare perusal of these two signatures it can be seen that there is close resemblance between the two. The similarity in name and the close resemblance of the two signatures in the counterfoils would clearly establish that P.W. 149 had cast two votes. In the signature in Ext. P-942 and 943 the first letter 'K' is' so conspicuous and the style of writing and the figure of the signatures are exactly similar. Under the above circumstances, I hold that P.W. 149 had cast two votes. Therefore, the vote cast against counterfoils No. 093440 (Ext. P-942) in polling station No. 91 and the vote cast against counterfoil No. 091398 (Ext. P-943) in polling station No. 89 is declared void.

Similar are the cases rendering 65 witnesses at least. This is not seriously disputed by the learned counsel for the first respondent. Though the signatures are challenged, the learned Judge overruled the objection raised by the learned counsel for the appellant herein that unless the disputed signatures are compared with the admitted signatures, the same cannot be taken into account proceeded to compare the signatures by himself and found that they are either similar or slightly varying.

> *It appears that the learned Judge has decided the question of void and invalid votes on insufficient materials and evidence in the case. Majority of the witnesses denied that they have voted more than once and they have also denied their signatures in the counterfoils. Under such circumstances, the learned Judge could have summoned documents containing admitted signatures for comparison by an expert and also by comparing them himself. Instead the learned Judge understood the hazardous task of comparing hundreds of disputed signatures which are not having individual characteristics to set aside the election of a candidate, the appellant herein.*

The learned Judge in the course of the judgment has observed as follows:

> *Most of the witnesses either denied their signatures or expressed their inability to identify their signatures, in the case of some well-educated persons when counterfoils containing the signature were shown to them they stated that they could not identify the signatures. Every reasonable prudent person would be able to identify his signature whenever the signature is shown to him.*

Notwithstanding the above fact, namely, the learned Judge while doubting the testimony of the witnesses, instead of confronting them in a legal way to get the truth, jumped to his own conclusion. The learned Judge in the course of appreciating the scope of section 73 of the Evidence Act and having given a finding that under section 73 of the Evidence Act a disputed signature could be compared only with the admitted signatures, proceeded to compare the signatures found in the counterfoils to find out whether both the signatures were to be by the same person.

On the peculiar facts of this case, the learned Judge erred in taking upon himself the task of comparing the disputed signatures on the counterfoils without the aid of an expert or the evidence of persons conversant with the disputed signatures. Therefore, the approach made by the learned Judge is not in conformity with the spirit of section 73 of the Evidence Act. Though the rulings of this court in *State (Delhi Admn) v Pali Ram,*[169] and *Fakhruddin v State of Madhya Pradesh,* [170]were brought to his notice, the learned Judge proceeded to compare the disputed signatures by himself and decided the issue. While doing so, the learned Judge observed as follows:

> *So all these witnesses are in the habit of occasionally putting their signature. Strangely enough most of the witnesses either denied their signature or expressed their inability to identify their signature. Even in the case of some well-educated person counterfoils containing the signatures were shown to them. They stated that they could not identify the signatures. Every reasonable prudent person would be able to identify his signature whenever the signature is shown to him. It is clear that these witnesses denied their signatures or failed to identify the signature with a definite purpose that at least one signature should not be taken as the admitted signature so as to make a comparison with the denied signature, it is also possible that the witnesses who had cast more than one vote pretended that they could not identify any of the signatures to make believe that they had not cast more than one vote. The denial of the signatures and failure of these witnesses to identify their own signatures are to be viewed in the background of similarity of the signatures found in the various counterfoils.*

Again the learned Judge observed as follows:

> *It is true that under section 73 of the Evidence Act a disputed signature could be compared only with the admitted signature or signature proved to the satisfaction of the court to have been written or made by that person. Reliance was placed on the decision reported in State (Delhi Admn) v Pali Ram, AIR 1979 SC 14, and contended that it is not advisable that a Judge should take up the task of comparing the admitted handwriting with the disputed one to find out whether the two agree with each other and the prudent course is to obtain the opinion and assistance of an expert. This opinion was expressed by the Supreme Court in a criminal case while considering the question whether the accused had committed the offence of forgery and cheating. In* Fakhruddin *v* State of Madhya Pradesh, *AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197, the Supreme Court observed that comparison of the handwriting by the court with the other documents not challenged as fabricated, upon its own initiative and*

169. AIR 1979 SC 14 : (1979) 2 SCC 158 : 1979 Cr LJ 17.
170. AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197.

> *without the guidance of an expert is hazardous and inconclusive. These observations were made in the facts and circumstances of such case. But, in the instant case, a comparison of the signature found in the counterfoil are made to ascertain whether both signatures were put by the same person.*

In the instant case, several witnesses who are alleged to have exercised their franchise more than once admitted that their names have been included in the electoral roll. They would say that they cast only one vote. In cases where their names are entered more than once in the electoral roll these witnesses admitted one entry and denied the other. The counterfoil corresponding to the admitted entry in the electoral roll must contain the signature of the voter. Even though this signature has also been denied by the witness or rather failed to be identified by the witness, it can safely be taken as the admitted signature of the witness. That signature could be very well compared with the signature appearing in the disputed counterfoil.

So, the standard of strict proof can be insisted only in the election petition wherein the election is sought to be set aside on the ground of corrupt practice. In the instant case it can only be said that standard of proof should be of high nature, as an election petition is not liable to be set aside on vague or inaccurate evidence, and the court must uphold an election when two different views are reasonably possible, from the evidence adduced in the case:

> *As already pointed out by me the close similarity in the signature in the counterfoils is also a strong proof to show that the entry related to the same person. It is also important to note that most of the witnesses denied their signatures on both the counterfoils. They could not identify their own signature and it is also clear that many of these witnesses changed their signatures and put different signatures in the deposition. In some cases, the witnesses were asked to give specimen signatures and these specimen signatures were taken in open court and they are marked as exhibits in the case. The specimen signatures in many cases do not tally with the signatures found in the counterfoil of the voter, who admittedly cast his vote as voter against a particular serial number. With this broad outline in the evidence I propose to consider the evidence of each witness who allegedly cast vote more than once.*

It is on the basis of such conclusion the learned Judge arrived at the finding that 269 votes were void as one voter has voted twice. As pointed out earlier at least in the cases of 65 such witnesses (that means 30 votes) where the signatures are not admitted the findings of the learned Judge cannot be supported for the reasons given earlier. If those 130 votes which were declared void, and found polled in favour of the appellant herein are taken into account in his favour, certainly the appellant must be found to have secured more votes than the first respondent herein.

The learned Judge in our view was not right either in brushing aside the principles laid down by this court in *State (Delhi Admn) v Pali Ram,*[171] on the ground that it was not a criminal case or taking upon himself the hazardous task of adjudicating upon the genuineness and authenticity of the signatures in question even without the assistance of a skilled and trained person whose services could have been easily availed of. Annulling the verdict of popular will is as much a serious matter of grave concern to the society as enforcement of laws pertaining to criminal offences, if not more. Though it is the province of the expert to act as Judge or jury after a scientific comparison of the disputed signatures with admitted signatures, the caution administered by the court is to the course to be adopted in such situations could not have been ignored unmindful of the serious repercussions arising out of the decision to the ultimately rendered. To quote, it has been held in *State v Pali Ram:*[172]

> *The matter can be viewed from another angle also. Although there is no legal bar to the Judge using his own eyes to compare the disputed writing with the admitted writing, even without the aid of the evidence of any handwriting expert, the Judge should, as a matter of prudence and*

171. AIR 1979 SC 14 : (1979) 2 SCC 158 : 1979 Cr LJ 17.
172. AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197.

caution, hesitate to base his finding with regard to the identity of a handwriting which forms the sheet-anchor of the prosecution case against a person accused of an offence, solely on comparison made by himself. It is, therefore, not advisable that a Judge should take upon himself the task of comparing the admitted writing with the disputed one to find out whether the two agree with each other; and the prudent course is to obtain the opinion and assistance of an expert.

The necessity for adhering to the said sound advice and guidance is all the more necessary in a case where hundreds of signatures are disputed and the striking dissimilarities noticed by the court at the time of the trial of the Election Petition.

The learned counsel appearing for the first respondent was not able to convince us that the learned Judge was right in comparing the signatures himself at any rate in the peculiar facts and circumstances of the case and rendering the findings against the appellant herein. As we are satisfied on the peculiar facts of this case also that the learned Judge was not right in deciding hundreds of the disputed signatures by comparing the counterfoils by himself to declare the votes as void. We need not go into other arguments advanced before us.

As we find that at least 130 votes are validly polled in favour of the appellant for the reasons given earlier then he must be held to have secured 43 votes more than then first respondent herein.

In the result, we hold that the learned Judge was not right in declaring the election of the appellant as void and declaring the first respondent as duly elected. Accordingly, the appeal is allowed, and the Election Petition is dismissed with costs throughout.[173]

10.26.54 Court should use Expert Help[174]

After the arguments were concluded on 6 October 1989 and judgment was reserved, on my careful comparison of the signatures of P.W. 2 found in Exs. D-3 to D-5 (disputed) and his admitted signatures in Exs. P-2, P-4 and in his deposition in court, I was of the opinion that it was better that a Handwriting Expert offered his opinion regarding the admitted and disputed signatures of P.W. 2 to facilitate arriving at a safe conclusion with regard to the identity of the signatures in Exs. D. 3 to D. 5, which formed the sheet-anchor of the defence case. On 24 October 1989 I heard the defence counsel as well as the counsel for the respondent and basing my view on the principle of law laid down by the Apex Court in *State (Delhi Administration) v Pali Ram*[175] I directed that the disputed writings of P.W. 2 in Exs. D-3 to D-5 and the admitted writings of P.W. 2 in his court deposition, Exs. P-2 and P-4 be forwarded to the Handwriting Expert attached to the State Forensic Laboratory for comparison and opinion. Accordingly, the aforementioned documents were sent to the Handwriting Expert, who by his report dated 4 December 1989, offered his opinion. On 7 December 1989 on the plea made by the learned counsel for the defence as well as the prosecution, I directed issue of summons to AS Ramu; Scientific Assistant Grade-1, Forensic Science Department, Madras-4, to appear before the court with all necessary material to give evidence in respect of his opinion offered in D.O.C. No. 359 of 1989 dated 4 December 1989 and T.No. 7220/89 D.O.C. 359/89, dated 4 December 1989 on 13 December 1989. I also directed the office to take Xerox copies of the opinion of the Expert and furnish those copies to the prosecution as well as the accused on or before 11 December 1989.

On 13 December 1989 the Expert was examined in court and both the parties were afforded an opportunity to question the Expert. The disputed signatures in Exs. D-3 to D-5 were marked by him as Q-l, Q-2 and Q-3 respectively. The admitted signature of P.W. 2 in Ex. P-2 was numbered by him as S-1. The admitted signature of P.W. 2 on the reverse of Ex. P-4 was

173. *O Bharathan v K Sudhakaran,* AIR 1996 SC 1140 : JT 1996 (2) SC 384 : 1996 AIR SCW 685.
174. *Palania Pillai v State,* 1991 Cr LJ 1563.
175. *State v Pali Ram*, AIR 1979 SC 14 : (1979) 2 SCC 158 : 1979 Cr LJ 17.

marked as S-2. The admitted signatures of P.W. 2 in his deposition before Additional Special Judge, in seven sheets, were marked as S-3 to S-15. The deposition itself was marked as Ex. C-l before this court. Out of the seven sheets, the first six sheets contain the signature of P.W. 2 on either side, while in the last sheet, it is found only on one page, where the deposition has ended, the other side of the paper being blank. The Expert deposed that he had examined the above signatures found in Q-l to Q-3 and S-1 to S-15 carefully and that the person who wrote the red enclosed signatures stamped and marked as section 1 to section 15, did not write the red enclosed signatures similarly stamped and marked as Q-l to Q-3. The reasoning sheet enclosed by him was marked as Ex. C-2. The enlargements of the signatures of P.W. 2 (admitted as well as disputed) were marked as Ex. C-3. The opinion expressed by him in court, forms part of his report as well, which is included in Ex. C-2. The Expert has deposed that he has been giving evidence in courts for the last 5 years and he has offered his opinion in more than 100 cases. The learned counsel for the appellants, strenuously cross-examined him on various aspects, and in the ultimate analysis, his opinion was that the variations pointed by the defence were only natural variations and were not distinctly different. He deposed that in Ex. C-2, one was the opinion and the other was the reasoning. When he was questioned about the signature of the Scientific Officer in the report, he stated that he (AS Ramu) analysed the admitted and disputed signatures and the Scientific Expert appended his signature after seeing the analysis done by him, because it was the procedure in the Department, that a Gazetted Officer had to put his signature. He was questioned about the quality of paper, pen pressure, different kinds of movements, pen-lifts He conceded that in the report he had only given the differences in the admitted and the disputed signatures and had not given the similarities which, however, had been taken into consideration, when the report was given. Usually, similarities were not noted down. He categorically replied that a person cannot forge his signature, though he could disguise it. He clarified it, by stating that if one wanted to disguise, he can do it in a different way. Forgery meant, according to him, trying to put the genuine signature of the man concerned, deceptively. It is not a case of P.W. 2 attempting to forge his own signature, since the man did not write in the usual manner he does. To a court question, he definitely stated that from a study of S-1 to S-15 and Q-l to Q-3, the persons who had put the signatures S-1 to S-15 had not put in differently in Q-l to Q-3.

After the recording of the evidence of the court witness, I again heard the submissions of the prosecuting and the defence counsel. They referred to me, passages from "*Handwriting and Thumb-print Identification and Forensic Science* by HR Hardless, 1970 Edition as well as from *Metha's Treatise on Handwriting Identification and Finger Prints"*. They also referred to certain decisions of the Supreme Court on the acceptability of otherwise of the opinion of the Handwriting Expert, while drawing my attention to the relevant recorded evidence.

As far as the evidence of the Handwriting Expert is concerned, the law is settled that such opinion evidence, cannot be stated to be conclusive. The court is competent to compare the disputed and admitted writings, even without examining an Expert to satisfy itself from its own observations, to arrive at conclusions; but, as a matter of prudence and caution, it was always better to have the opinion of an Expert, to facilitate the scrutiny of those signatures, through the eyes of the court. It will be relevant at this stage to quote the observations of the Supreme Court in *Fakhruddin v State of Madhya Pradesh:*[176]

> *Evidence of the identity of handwriting receives treatment in three sections of the Indian Evidence Act. They are sections 45, 47 and 73. Handwriting may be proved on the admission of the writer, by the evidence of some witnesses in whose presence he wrote. This is direct evidence and if it is available the evidence of any other kind is rendered unnecessary. The Evidence Act also makes relevant the opinion of a handwriting expert (section 45) or of one who is familiar*

176. AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197.

with the writing of a person who is said to have written a particular writing. Thus, besides direct evidence which is of course the best method of proof, the law makes relevant two other modes. A writing may be proved to be in the handwriting of a particular individual by the evidence of a person familiar with the handwriting of that individual or by the testimony of an expert competent to the comparison of handwritings on a scientific basis. A third method (section 73) is comparison by the court with a writing made in the presence of the court or admitted or proved to be the writing of the person.

Both under section 45 and section 47, the evidence is an opinion, in the former by a scientific comparison and in the latter on the basis of familiarity resulting from frequent observations and experience. In either case the court must satisfy itself by such means as are open that the opinion was be acted upon. One such means open to the court is to apply its own observation to the admitted or proved writings and to compare them with the disputed one, not to become an handwriting expert but to verify the premises of the expert, in the one case and to appraise the value of the opinion in the other case. This comparison depends on an analysis of the characteristics in the admitted or proved writings and the finding of the same characteristics in large measure in the disputed writing. In this way the opinion of the deponent whether expert or other is subjected to scrutiny and although relevant to start with becomes probative. Where an expert's opinion is given, the court must see for itself and with the assistance of the expert come to its own conclusion whether it can safely be held that the two writings are by the same person. This is not to say that the court must play the role of an expert but to say that the court may accept the fact proved only when it has satisfied itself on its own observation that it is safe to accept the opinion whether of the expert or other witnesses.

While on the topic of appreciation of the evidence of Expert, it will be relevant to refer to the observations of the Supreme Court in two of its pronouncements. In *Bhagwan Das v State of Rajasthan,*[177] the Supreme Court took the view that where the opinions of the author were neither shown to have been given in regard to circumstances exactly similar to those in the particular case before court; nor were they put to the medical witness, it was not a satisfactory was of disposing of the evidence of the witness to discredit it on the ground that the doctor was a comparatively young man and his statements did not accord with the opinions expressed in the books.

Similarly, in *Sunderlal v State of Madhya Pradesh,*[178] the Supreme Court observed as follows:—

The conviction of the accused by the High Court was mainly based on passages from the text book of Modi on Medical Jurisprudence and Toxicology *and these passages had not been put to Dr. Dube when he was in the witness box with the result that the High Court was not right in coming to the conclusion adverse to the accused by merely relying upon these passages. It is therefore evident that before reliance can be placed on authoritative textbooks by either party to attack the evidence of an expert, it would be necessary to draw the attention of the expert to those passages and furnish him an opportunity to explain the same.*

Before closing the consideration of the defence case, the evidence of the Handwriting Expert, examined by me, will have to be considered. The evidence of the Expert is categoric that the person who had written S-1 to S-15 had not written Q-l to Q-3. I have carefully perused the evidence of the Expert and I am satisfied that the reasons given by him are acceptable. I am not taking the evidence of the Expert as conclusive, to arrive at a conclusion, but I have taken his opinion to lend assurance to my own study of the admitted and disputed signatures. A close look at the admitted and disputed signatures with a magnifying glass certainly shows that the author of Q-1 to Q-3 could not be P.W. 2. The way in which the first four letters "Muru" have been written in D-3 to D-5 portrays a mechanical imitation. Even the first letter 'S' is patently at variance, so also the penultimate letter "A" and the letter "g". It is, of course, true that the Expert has been cross-examined on, the several movements, pen-lifts, pen pressure,

177. *Bhagwan Das v State of Rajasthan*, AIR 1957 SC 589 : 1957 Cr LJ 889 : 1957 SCJ 515.
178. AIR 1954 SC 28 : 1954 Cr LJ 257.

pen score, hesitation symptoms, The answers given by the Expert, on the differences pointed out to him, as natural variations, to my mind, is certainly acceptable. I am unable to agree that P.W. 2 himself had sought to forge his signature, by writing differently, in Exs. D-3 to D-5. When I consider the case law placed before me, I will refer to the authoritative text books, on handwriting and fingerprints with specific reference to the passages brought to my notice by the learned counsel for the appellants. Suffice to say that I am satisfied that P.W. 2 had not signed Exs. D-3 to D-5 and the case of the defence that P.W. 2 had signed those documents on 29 September 1984, has to be rejected, outright.

While considering Exs. D-3 to D-5, the trial Judge had taken note of the documents filed along with the statement of A-l. Those documents show that A-l had functioned as President of the Southern Division between 1978 and 1984. It may, therefore, be taken that A-l was taking an active interest in the Union activities. However, as rightly pointed out by the trial Judge, there is no material placed before the court to hold that A-l had a leading role in organising the All India Conference at Madras between 12 and 16 October 1984. As stated earlier, we do not have any evidence from the signatories, who were office-bearers, found in those documents as having authorised the appellants to collect the donation. It may be that the defence need not have to prove its case by strict standards of proof, as is expected of the prosecution, but, at the same time, when a partial onus is thrust on them, the defence must basically inspire confidence, as probable. That inspiration is not forthcoming in defence trotted out in this case.

In paras 16 and 19 I have already considered four of the cases relating to the appreciation of evidence of handwriting experts. Two other cases have been cited on this aspect, which I will presently refer to.

In *Iswari Prasad Misra v Mohd Isa*[179] the Supreme Court while considering section 45 of the Indian Evidence Act, regarding the relevancy of opinions of experts held, that the evidence given by experts of handwriting can never be conclusive, because it was after all opinion evidence. In that case the Supreme Court, sans the evidence of the two experts, who contradicted themselves, arrived at the conclusion that the evidence given by the attesting witnesses, the scribe and the appellant, was wholly satisfactory to prove execution of the document by the respondent and that the said evidence did not really need to be corroborated by the opinion of experts. On facts, in this appeal, P.W. 2, having denied his signatures in Exs. D-3 to D-5 and the evidence of D.W. 3 having been rejected, and my comparison of the admitted and the disputed writings of P.W. 2, having been found to enure in favour of the prosecution, the evidence of expert has played only a minor role, in helping me to arrive at my conclusions. Further, the expert evidence has not been considered, for proof of the prosecution case, but only to the limited extent of the defence case being probable by preponderance.

In *Ram Narain v State of Uttar Pradesh,*[180] the Supreme Court held that the opinion of the Handwriting Expert given in evidence was no less fallible than any other expert opinion, but such opinion was worthy of acceptance if there was internal and external evidence relating to the writing in question supporting the experts view. The question in each case calls for determination on the court's appreciation of evidence. Ultimately, the facts unfurled in each case, would dictate to the court, the weight that could be attached to the evidence of expert in the light of its own observation relating to the admitted and the disputed writings. As I have already held, on reasons assigned by me that P.W. 2 had not written Exs. D-3 to D-5, no further discussion on the expert's evidence would be necessary. However, reference to textbooks cited by Sri NT Vanamamalai need mention. HR Hardless in his book *Handwriting and Thumb-print Identification and Forensic Science*, 1970 Edn, has stated

179. AIR 1963 SC 1728 : (1963) 2 SCR 723 : 1963 BLJR 226.
180. AIR 1973 SC 2200 : (1973) 2 SCC 86 : 1973 Cr LJ 1187.

at p 2 that a competent expert assigns reasons for his opinion in a report. The reasons are specific and not mere generalities and the points of similarity or dissimilarity marked and indicated in the photographs are both apparent and appealing to laymen. An expert's opinion is accepted by a court when the reasons given are both apparent and convincing. At p 10 the author has stated as follows:

> *These persons are unaware of the fact that variations in the signatures of the same person must exist in the forms of corresponding letters. A human hand is not a printing machine to give exactitude in regard to forms of letters on all occasions and under different occasions.*

On these passages it was argued that the expert has not specifically dealt with the similarities and the opinion being general would be of no probative value. Further, in view of the human hand not being a printing machine, allowances should have been given by the expert on the features like pen pressure, pen score, pen lift hesitation, quality of paper, As I have discussed earlier, the expert has been cross-examined and I am satisfied, that he has offered his opinion, in the background of these features and the variations pointed out by the defence between the admitted and the disputed signatures, were only natural.

Mehta in his book on *Handwriting Identification and Fingerprints* has stated at p 38 that the pen pressure of a forged writing is usually not smooth and it shows a varying density due to the constant interruptions in movement and speed. At pp 47, 48, 49, 51 and 52 the author refers to the writing habits *viz.:*

1. The movement of writing;
2. The pen position;
3. The pen pressure;
4. The shading;
5. The relative position of the letters;
6. The formation of the letters;
7. The alignment;
8. The spacing;
9. The variations;
10. The slant;
11. The arrangement;
12. The style;
13. The condition of the strokes;
14. The size and proportions; and
15. The general execution.

The author states that there are other technical reasons which are advanced by the experts. Though the expert has been questioned in general on these aspects, specific passages from the authors had not been brought to his notice to furnish him an opportunity to explain his opinion on that basis. The expert has stated in his evidence that the characteristics in the handwriting in Exs. D-3 to D-5 differed significantly from the standard handwriting, which included among other things the five categories suggested by the defence. The expert has also answered that he had noticed all the characteristics, though he had not specified them in the report. I am satisfied that the dissimilarities noticed by him in the admitted and the

disputed writings would be sufficient to hold against the defence. To arrive at my conclusion of dissimilarities, the expert's opinion was to some extent helpful and the findings against the accused are not based solely on the evidence of the expert. Therefore, the discussion on expert's evidence need not have to detain us anymore.[181]

10.26.55 Typewriting Identification Evidence Admissible[182]

The reference made in this appeal to the Constitution Bench is for deciding the important question of law: Whether the opinion of a typewriter expert is admissible in evidence under section 45 of the Indian Evidence Act, 1872?

The respondent S.J. Chaudhary was being tried in the Court of Additional Sessions Judge, New Delhi, on charges punishable under section 302 of the Indian Penal Code and sections 3 and 4 of the Explosive Substances Act, 1908 in Sessions Case No. 36 of 1983. The prosecution wanted to examine a typewriter expert for proof of certain incriminating facts against the respondent based on the identity of a typewriter on which a material document was alleged to have been typed. An objection was taken to the admissibility of the opinion evidence of the typewriter expert under section 45 of the Indian Evidence Act, 1872 (for short "Evidence Act") based on the decision of this court in *Hanumant v State of Madhya Pradesh,* and the trial court upheld that objection, Criminal Revision No. 105 of 1987 was filed in the Delhi High Court by the prosecution challenging that order. The Delhi High Court has dismissed the revision, hence this appeal by special leave.

The present criminal appeal came up for hearing before a Division Bench comprising of two learned Judges of this court. The correctness of the observations in *Hanumant's* case (AIR 1952 SC 343) by a Bench of three learned judges on this point was doubted and reconsideration thereof was sought on behalf of the appellant. Accordingly, by order dated 22 March 1990 the Division Bench took the view that this important question of law involved in this appeal should be considered and decided by a larger Bench. This question of law is the only point involved for decision in this appeal and the decision thereon would dispose of the appeal.

In *Hanumant Govind,*[183] while dealing with one of the arguments advanced therein, it was stated thus:

> *Next it was argued that the letter was not typed on the office typewriter that was in those days,* viz.*, article B, and that it had been typed on the typewriter article A which did not reach Nagpur till the end of 1946. On this point evidence of certain experts was led. The High Court rightly held that opinion of such experts was not admissible under the Indian Evidence Act as they did not fall within the ambit of section 45 of the Act. This view of the High Court was not contested before us. It is curious that the learned judge in the High Court, though he held that the evidence of the experts was inadmissible, proceeded nevertheless to discuss it and placed some reliance on it. The trial magistrate and the learned Sessions Judge used this evidence to arrive at the finding that, as the letter was typed on article A which had not reached Nagpur till the end of December, 1946, obviously the letter was ante-dated. Their conclusion based on inadmissible evidence has therefore to be ignored.*

The above passage in that decision is the basis of the view taken that the opinion of a typewriter expert is not admissible under the Evidence Act and that it does not fall within the ambit of section 45 of the Act. It is significant that this view taken by the High Court in that case was not even contested in this court and, therefore, the decision in *Hanumant* proceeds on the concession that the evidence of a typewriter expert is not admissible in evidence under

181. *Palania Pillai v State,* 1991 Cr LJ 1563.
182. *State (through CBI/New Delhi) v SJ Choudhary*, AIR 1996 SC 1491 : 1996 Cr LJ 1713 : 1996 AIR SCW 1128.
183. AIR 1952 SC 343 : (1952) SCR 1091 : 1952 SCJ 509.

section 45 of the Act. In our opinion, the decision in *Hanumant* cannot be taken as deciding that point even though on the basis of that observation the evidence of typewriter expert was excluded as inadmissible. This question of law has, therefore, to be answered without any further assistance being available from the decision in *Hanumant*.

In the Indian Evidence Act, 1872, Chapter II relating to "Relevancy of Facts" contains sections 5 to 55 and therein under the heading "Opinions of Third Persons, when relevant" are sections 45 to 51. Section 45 reads thus:

> [s **45] Opinions of experts**. When the court has to form an opinion upon a point of foreign law or of science, or art, or as to identity of handwriting [184][or finger impressions], the opinions upon that point of persons specially skilled in such foreign law, science or art, [185][or in questions as to identity of handwriting] [186][or finger impressions] are relevant facts.

Such persons are called experts.

Illustration (c) to section 45 is as under:

> (c) The question is, whether a certain document was written by A. Another document is produced which is proved or admitted to have been written by A.
>
> The opinions of experts on the question of whether the two documents were written by the same person or by different persons are relevant.

The plain meaning of section 45 is that the court in order to form an opinion upon a point of foreign law, or of science, or art, or as to identity of handwriting, or finger impressions can treat the opinion upon that point of person specially skilled in such foreign law, science or art, or in questions as to identity of handwriting, or finger impressions as relevant facts. In other words, the opinion of persons specially skilled in such foreign law science, or art, or questions as to the identity of handwriting or finger impression, called experts therein, are relevant facts. The opinion of such experts is admissible in evidence as relevant facts by virtue of section 45 of the Evidence Act.

In our opinion, irrespective of the view taken on the question of meaning of the word handwriting in section 45 to include typewriting, the word "science", occurring independently and in addition to the word "handwriting" in section 45, is sufficient to indicate that the opinion of a person specially skilled in the use of typewriters and having the scientific knowledge of typewriters would be an expert in this science; and his opinion about the identity of typewriting for the purpose of identifying the particular typewriter on which the writing is typed is a relevant fact under section 45 of the Evidence Act. It is obvious that the Indian Evidence Act when enacted originally in 1872 did not specifically mention typewriting in addition to handwriting because typewriters were then practically unknown. However, the expression "science", or in section 45 in addition to the expressions "foreign law" and "handwriting" use in the section as originally enacted, and the expression 'finger impressions' inserted in 1899 is sufficient to indicate that the expression "science, or art" therein is of wide import. This expression 'science, or art' cannot therefore, have a narrow meaning in section 45 and each of the words "science" and 'art' has to be construed widely to include within its ambit the opinion of an expert

184. Ins. by Act 5 of 1899, section 3. For discussion in Council as to whether "finger impressions" include "thumb impressions", *see* Gazette of India, 1898, Pt VI, p 24.
185. Ins. by Act 18 of 1872, section 4.
186. Ins. by Act 5 of 1899, section 3. For discussion in Council as to whether "finger impressions" include "thumb impressions", *see* Gazette of India, 1898, Pt VI, p 24.

in each branch of these subjects, wherever the court has to form an opinion upon a point relating to any aspect of science or art.

The meaning of the word "science" as understood ordinarily with reference to its dictionary meaning must be attributed to the word as used in section 45 of the Indian Evidence Act. Some of the meanings given in the dictionaries are:

The Oxford Encyclopaedic English Dictionary:

> *Science... (a) systematic and formulated knowledge, esp. of a specified type or on a specified subject (political science), (b) the pursuit or principles of this....*
>
> *The New Shorter Oxford English Dictionary, vol 2:*
>
> *Science..... (2a) Knowledge acquired by study acquaintance with or mastery of a department of learning... (3a) A particular branch of knowledge or study; a recognized department of learning....*
>
> Collins Dictionary of the English Language:
>
> *Science (1) the systematic study of the nature and behaviour of the material and physical universe, based on observation, experiment, and measurement, and the formulation of laws to describe these facts in general terms. (2) the knowledge so obtained or the practice of obtaining it. (3) any particular branch of this knowledge: the pure and applied sciences. (4) any body of knowledge organised in a systematic manner. (5) skill or technique...*

It is clear from the meaning of the word "science" that the skill or technique of the study of the peculiar features of a typewriter and the comparison of the disputed typewriting with the admitted typewriting on a particular typewriter to determine whether the disputed typewriting was done on the same typewriter is based on a scientific study of the two typewritings with reference to the peculiarities therein; and the opinion formed by an expert is based on recognised principles regulating the scientific study. The opinion so formed by a person having the requisite special skill in the subject is, therefore, the opinion of an expert in that branch of the science. Such an opinion is the opinion of an expert in a branch of science which is admissible in evidence under section 45 of the Indian Evidence Act.

There cannot be any doubt that the opinion of an expert in typewritings about the questioned typed document being typed on a particular typewriter is based on a scientific study of the typewriting with reference to the significant peculiar features of a particular typewriter and the ultimate opinion of the expert is based on scientific grounds. The opinion of a typewriter expert is an opinion of a person especially skilled in that branch of the science with reference to which the court has to form an opinion on the point involved for decision in the case. In our opinion, on a plain construction of section 45 giving to the word 'science' used therein its natural meaning, this conclusion is inevitable; and for supporting that conclusion, it is not necessary to rely on the further reason that the word 'handwriting in section 45 would also include typewriting.

Statutory Interpretation by Francis Bennion, 2nd Edn, section 288 with the heading "Presumption that updating construction to be given" states one of the rules thus:

> *(2) It is presumed that Parliament intends the court to apply to an ongoing Act a construction that continuously updates its wording to allow for changes since the Act was initially framed (an updating construction). While it remains law, it is to be treated as always speaking. This means that in its application on any date, the language of the Act, though necessarily embedded in its own time, is nevertheless to be construed in accordance with the need to treat it as current law.*

In the comments that follow it is pointed out that an ongoing Act is taken to be always speaking. It is also, further, stated thus:

> *In construing an ongoing Act, the interpreter is to presume that Parliament intended the Act to be applied at any future time in such a way as to give effect to the true original intention. Accordingly the interpreter is to make allowances for any relevant changes that*

have occurred, since the Act's passing, in law, social conditions, technology, the meaning of words, and other matters. Just as the US Constitution is regarded as a living Constitution, so an ongoing British Act is regarded as "a living Act". That today's construction involves the supposition that Parliament was catering long ago for a state of affairs that did not then exist is no argument against that construction. Parliament, in the wording of an enactment, is expected to anticipate temporal developments. The drafter will try to foresee the future and allow for it in the wording.

An enactment of former days is thus to be read today, in the light of dynamic processing received over the years, with such modification of the current meaning of its language as will now give effect to the original legislative intention. The reality and effect of dynamic processing provides the gradual adjustment. It is constituted by judicial interpretation, year in and year out. It also comprises processing by executive officials.

There cannot be any doubt that the Indian Evidence Act, 1872 is, by its very nature, an "ongoing Act."

It appears that it was only in 1874 that the first practical typewriter made its appearance and was marketed in that year by the E Remington and Sons Company which later became the Remington typewriter. Obviously, in the Indian Evidence Act enacted in 1872 typewriting could not be specifically mentioned as a means of writing in section 45 of the Evidence Act. Ever since then, technology has made great strides and so also the technology of manufacturer of typewriters resulting in common use of typewriters as a prevalent mode of writing. This has given rise to development of the branch of science relating to examination of questioned typewriting.

In "*Questioned Documents*", 2nd Edn, by Albert S Osborn in the Chapter of "questioned typewriting" this aspect is considered and, therein at p 598, it is stated thus:

The principles underlying the identification of typewriting are the same as those by which the identity of a person is determined or a handwriting is identified. The identification in either case is based upon a definite combination of common or class qualities and features in connection with a second group of characteristics made up of divergences from class qualities which then became individual peculiarities.

The mathematical principles outlined in the fourteenth Chapter show how remote is the possibility of coincidence of even a few scars or deformities on a person, and the coincidence of scars and deformities are as remote with typewriters as with persons.

In "*Photographic Evidence*" by Charles C Scott, 2nd Edn, vol 1, under the heading "Typewriting Identity or Non-identity of Typing" it is stated thus:

But even as the nationality of an individual may be perplexing but does not in any way hamper the determination of his personal identity by means of his fingerprints, his handwriting, or other reliable indications, so also the fact that it is often difficult to determine the make of a typewriter used in typing a document does not lessen the reliability of the scientific determination that a certain typewritten document was typed on a particular machine regardless of its make. By the use of the proper microscopes and test plates the document examiner often can determine the question and by the use of photographic comparison charts he can demonstrate his findings, usually with unimpeachable certainty.

From a comparison of the typewriting on a document which is a subject of controversy with specimens known to have been made on a certain typewriter it is usually possible to determine whether or not what typewriter was used in typing the subject document, provided the subject document contains sufficient typewriting and the specimens from the known machine are of a suitable kind. This is true because every typewriter when it comes off the assembly line is an individual and writes exactly like no other typewriter. When a typewriter is brand new the differences between it and other typewriters coming off the assembly line at the same time are extremely minute and elusive, but theoretically at least there are identifying differences that can be discovered by microscopic examination and demonstrated photographically. Furthermore, the more a typewriter is used the more individualistic it becomes; and the easier it is to identify its

typewriting. In some instances, through overuse, misuse, or abuse a typewriter develops so many peculiarities that its typing can be identified readily with the naked eye.

In "*Law of Disputed and Forged Documents"* by J Newton Baker, while dealing with the basic principles of identification of typewriting generally it is stated:

… Since typewriting possesses individuality it can be compared and identified in the same manner as handwriting …

Therein while discussing individuality of typewriting, it is stated thus:

The individuality of the typewriter is established by the character of its type of impression on the paper. These characteristics of typewriting can be analysed, compared and differentiated and can be positively identified as those of a particular typewriter. This individual comparison and identification of characteristics may establish the genuineness or forgery of a typewritten instrument and when admitted in evidence is sufficient proof.

The occurrence of similar irregularities in typewriting in two or more machines is practically impossible. The rule that the typewriter creates for itself a certain distinctive character of writing which identifies one certain machine from all other machines is well-established. To prove that two instruments were written on a particular typewriter similar coincidence of characteristics must be shown in both instruments, and these coincidences considered collectively must demand a single conclusion.

In "*Typewriting Identification (Identification System for Questioned Typewriting)"* by Billy Prior Bates, the conclusion of the principles is stated thus:

Conclusion.—Typewriting identification is based on the same principle underlying handwriting identification, or any other thing which has a great number of possible variations.

The identification of a typewritten document can be likened to the identification of a particular person, A person may be identified in general by his sex, size, features,, and in addition, for example, by a radical mastectomy scar. A typewriter may be identified in general by characteristics such as type, design and size, possessed by all machines of a specific make and model, and in addition, for example, by a flaw in the serif on the letter E.

No opinion as to identity should be based upon only a few dissimilarities (or similarities). It is the combination of measurements and characteristics which all together make up the conclusion.

When good, clear specimens are available in sufficient amount for a scientific identification of the twelve points of comparison, it is possible to show with absolute certainty that a document was, or was not, produced by a particular machine.

The mathematical probability of the same combination of these characteristics divergent from the norm appearing in two machines is practically nil. The evidence of the twelve points of comparison can be conclusive proof.

It is, therefore, clear that the examination of typewriting and identification of the typewriter on which the questioned document was typed is based on a scientific study of certain significant features of the typewriter peculiar to a particular typewriter and its individuality which can be studied by an expert having professional skill in the subject and, therefore, his opinion on that point relates to an aspect in the field of science which falls within the ambit of section 45 of the Indian Evidence Act. Such opinion evidence of experts in the field has long been treated as admissible evidence in similar jurisdictions like the United States as is evident from these standard textbooks on the subject.

In the present case, even without resort to the word "handwriting" in section 45 to include typewriting therein, in the view we have taken, the word "science" is wide enough to meet the requirement of treating the opinion of a typewriter expert as an opinion evidence coming within the ambit of section 45 of the Evidence Act. We may, however, add that the long accepted practice of judicial construction which enabled the reading of the word "telegraph" to include "telephone" within the meaning of that word in Acts of 1863 and 1869 when telephone was not invented, would also be available in the present case to

read "typewriting" within the meaning of word "handwriting" in the Act of 1872. This is so because what was understood by handwriting in 1872 must now in the present times after more than a century of the enactment of that provision, be necessarily understood to include typewriting as well, since typing has become more common than handwriting and this change is on account of the availability of typewriters and their common use much after the statute was enacted in 1872. This is an additional reason for us to hold that the opinion of the typewriter expert in this context is admissible under section 45 of the Indian Evidence Act.

As a result of the above discussion, we hold that the observations made in the above extract in the decision in *Hanumant* on the basis of a concession does not reflect the correct position of law on this point and should, therefore, be treated as no longer good law on the point.

For the aforesaid reasons, we hold that the opinion of the typewriter expert in the present case is admissible under section 45 of the Evidence Act and the contrary view taken by the trial court and the High Court is erroneous. This appeal is accordingly allowed, and the impugned orders of the trial court and the High Court are set aside.[187]

187. *State (through CBI/New Delhi) v SJ Choudhary*, AIR 1996 SC 1491 : 1996 AIR SCW 1128 : 1996 Cr LJ 1713.

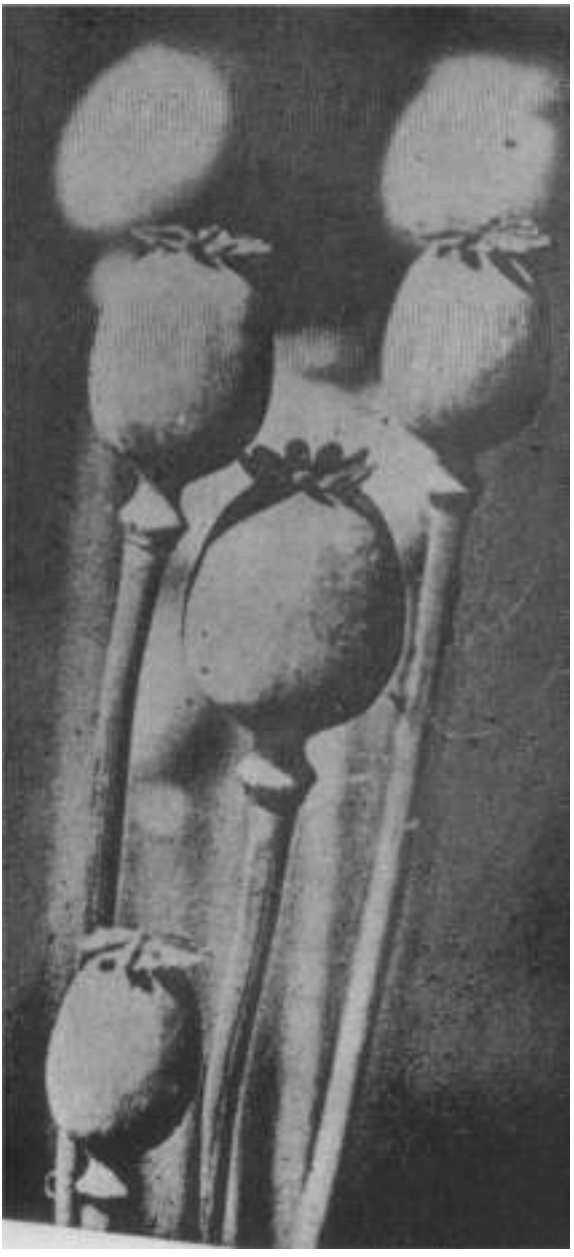

Fig. 11.1

The portion of the poison, which is found in the stomach, is not that which caused death but the surplus of the quantity which has already produced the fatal effects by its absorption in the system.

—Orfila

11.1 IMPORTANCE

Poisons are frequently involved in homicidal, accidental, or suicidal deaths. They are sometimes used to destroy animals and plants. The detection of poisoning and their identification is an important aspect of forensic science.

The investigation of cases of poisoning is one of the most difficult tasks for the reasons:

1. The quantity of a poison required to kill a victim is extremely small in some cases. For example, the fatal dose of nicotine is about 50 milligrams. On administration, it gets mixed in about 50 kilograms of body material. Thus, there is only one milligram in one kilogram of the body material. The analyst has to search for one part per million parts of the body material.
2. He is not only to detect it but also to estimate its quantity, to determine whether a fatal dose was administered to the victim or not.
3. The metabolism of the poison destroys the original form of the poison. The metabolites may not be amenable to detection/estimation.
4. Most of the poisons are easily available. The poisoner has easy access to them.
5. They are easily administered through food and drinks.
6. Symptoms of some poisons correspond to symptoms of some diseases. The victim and his near and dear ones think that he is suffering from some ailment. For example, the symptoms of strychnine poisoning correspond mostly to Diarrhea.
7. Poisons are administered in secrecy after winning the confidence of the victim.
8. The variety of poisons available is legion.
9. The ever-increasing numbers of synthetic drugs, which are used as poisons, aggravate the problem further.
10. Some drugs are very close to one another in their chemical and physiological behaviour. Their identification requires the most refined analytical techniques and an experienced analyst.
11. Body material, in which the poisons are found, is a complex mixture of organic, inorganic and biological substances. They interfere in the isolation, detection and estimation of the poisons. In fact, the most difficult task of a toxicologist is to isolate the poison in pure form. Once it is done, it is comparatively easier to identify and estimate the quantity.

11.2 NATURE

A poison is a substance, which on ingestion, inhalation, absorption, injection, or development in the body, in relatively small amounts may cause structural or functional disturbance to the body to injure health or to destroy life. In fact, any substance can act as a poison when taken in excess. Food materials (e.g., salt) and other substances may act as poisons. However, in Forensic toxicology, poisons are those substances, which are harmful even in small amounts.

The enacted law does not define "poison". However, legally, poisoning is established if it is proved that:

1. A substance (poison, stupefying or intoxicating agent or an unwholesome drug) was administered with the intention to cause hurt or knowing that the substance was likely to cause hurt.
2. There were witnesses who saw the victim consuming the poison.
3. There is no evidence of disease in the victim before or after death.

11.2.1 Administration

The most frequent method of administration of poison is through food. The poison is mixed in sweetmeats, cooked food, or a drink. It is substituted for a medicine. The victim is made to inhale a poisonous gas or vapours from a poisonous liquid. Or, the poison may be injected into the body.

> *A lady doctor was found dead in the hospital quarters with a hypodermic needle still in her left arm and the syringe lying by her side. Pheno-thiazine derivative (Siquil) and phenobarbitone were detected in the washings of the syringe and the needle. The drugs were also detected in the body of the deceased. (CH)*

A poison can be introduced through the vagina. It is done for causing abortion. Anus and skin pores are used for irritant poisons such as ground chillies. They are sometimes used to get confessions. Powdered chillies are also used to blind a person temporarily to rob him of his belongings.

> *A mother applied some medicine to the scalp and hair of her two daughters (aged 6 and 4 years) for killing lice. After some time the two children were given a bath. About four hours after the bath, both the girls were found dead. Zinc phosphide was detected from the hair and the viscera of both the deceased. (CH)*

11.2.2 Action of Poisons

11.2.2.1 Action mode

Basically, the action of most of the poisons is to prevent the supply of oxygen to body tissues. Failure of the availability of oxygen stops the normal functioning of the body, and the victim dies. The mode of this blocking oxygen to the brain varies. Examples:

1. In carbon monoxide poisoning, the gas combines with haemoglobin, the oxygen carrier, blood and thus, blood is unable to carry oxygen to various parts of the body.
2. The glycoside poisons, Digitalis affects the heart and the pumping of blood for circulation stops.
3. Opium and its derivatives/alcohol/ barbiturates paralyse the respiratory centers, stopping the breathing.

The action of poison may be local or remote. For example, strong acids and alkalis destroy parts of the body with which they come in contact. They are local poisons.

Alcohol, opium and its derivatives affect the victim when they enter the bloodstream. They are known as remote action poisons. Some poisons have both local and remote actions.

Most of the poisons affect the victim immediately. If the person survives for some time, the poison is eliminated through body excretions (vomitus, purges). However, some poisons accumulate, overtime, in the body, and when a certain level is reached, the person dies. Arsenic and some other metallic compounds are such poisons. It is for this reason that Arsenic has been a favourite with criminals through the ages. It is still used as a homicidal poison in India.

Most of the metallic poisons accumulate in the body.

11.2.2.2 Factors affecting Action of Poison

The action of poison is dependent upon a number of factors. The important ones are:

1. **Habituation;** an individual may have developed the habit of taking poisonous substances. For example, some snake charmers get snakebites regularly. Thus, they become immune to snake bite poisoning; some, *sadhus*, living away from civilization take arsenic regularly. They remain unaffected by the usual fatal doses of arsenic. It is said that kings in the olden days used to take Arsenic to prevent Arsenic-poisoning. Addiction to liquor, cannabis, and opium has a common phenomenon. The addicts are unaffected by the usual fatal doses of the materials they intake.

2. **Dosage**; the dosage of poison has a significant bearing on its action. The smaller the dose, less troublesome is the action. The minimum fatal dose, of course, varies with the nature of the poison and the individual.

   Nine children were affected due to ingestion of whooping-cough mixture, six of them died in hospital. Sodium nitrite detected in the cough mixture was far in excess of the expected quantity. Nitrite was also detected in the stomach wash as well as in the viscera of the victims. (CH)

3. **Administration mode**; the method of administration of the poison is an essential factor in the action of poisons. Those poisons, which are directly injected into the bloodstream, have an immediate effect. Those, which are administered through food, may get eliminated through vomit and diarrhea. Those inhaled (with air or alone) may get absorbed in the bloodstream and affect the victim almost immediately.

   Snake venom is a deadly poison when injected into the bloodstream. The victim may die. If this poison is taken orally, it is practically harmless, unless, of course, the venom enters in the blood through some wound in the mouth, throat, or food canals. It is for this reason that some people suck out the venom from the bite with mouth if a breast pump is not available for the purpose.

4. **Victim's health**; the health/age/allergy to the poison of the victim has a profound effect on poisoning. As a rule, the weaker the person is, the quicker and severer the action is. Thus, children/ old persons are affected more easily and more severely than young and healthy adults are.

5. **Physical state of the poison;** the physical state, whether the poison is solid/liquid/ gaseous, influences the effect of the poison. Even in solid state, whether the poison is in fine coarse or emulsified affect the action. Whereas 30 grams of ordinary mercury is not dangerous when compared to 0.06 grams of emulsified mercury is.

6. **Empty Stomach;** a poison taken orally in empty stomach, has quicker and severer effect.

7. **Unusual substance;** an unusual substance may upset the stomach of some persons. They eliminate the poison through vomits and diarrhea.

11.2.2.3 Fatal Poisoning

Table 1 gives the name of common poisons, their fatal doses, and fatal reaction time:

Table 11.1

Fatal Doses of Poisons

Poison	Fatal dose	Fatal period
Abrus Precatorius	Extract from 0.l g seeds (by injection)	3 to 5 days
Aconite	1.0 to 2.0 g of root	1 to 5 hours
Alcohol (Absolute)	250 to 500 ml	A few hours
Arsenic	0.1 to 0.2 g	one-second to 2 days
Atropine	0.1 to 0.2 g	One day
Barbiturate	4 to 20 g	A few hours to several days
Barium Carbonate	4 g	A few hours to several days

Cannabis (bhang, ganja and charas)	Resin extract toxic	Usually non fatal
Carbon monoxide	30% saturation	30 minutes in an atmosphere of 1% CO, 4 hours in an atmosphere containing 0.25% CO
Caustic alkali	5 g	Within 24 hours or longer
Chloral hydrate	3 to 5 g	Few minutes to few days
Chloroform	Usually 30 ml	Few minutes to few days
Copper sulphate	15g	1 to 3 days
Cyanide	0.1 to 0.3 g (of KCN)	Few minutes to 24 hours
Dhatura	1.5 g seeds	Within 24 hours
D.D.T.	2 g onwards	Few hours to few days
Endrine	0.6 to 1g	2 to 3 hours
Ergot	varied 2.5 g onward, 0.5 to 1.5 mg of ergotamine injection .26 mg of ergotamine orally	1 to 7 days
Gammexene	12 g	
Heroin	0.2 g	
Kuchila	One powdered seed	1 to 2 hours
Lead salts	Not known	One day to several days
Madar (Aak)	Not known	A few hours
Mercury salts	0.2 to 0.5 g	Few hours to several days
Mushrooms	Uncertain	One day to several days
Methyl alcohol	30 to 250 ml	1 to 4 days
Nicotine	0.06 g	A few minutes
Nitric acid	5 to 10 ml	A few hours to several days.
Oleander (Kaner)	8 to 12 seeds	A few hours
Opium	1 g Crude Opium, 0.25 g morphine by mouth or 0.03g morphine by	A few hours to a few days
Organo phosphorus insecticides	injection 0.1 g to 0.2 g	A few hours
Oxalic acid	4 to 16 g	A few minutes to few hours
Quinine	Uncertain	A few minutes to several days
Snake venom	0.02 g (injection)	A few days
Strychnine	0.05 g	Within 2 hours
Sodium nitrite	2 g	30 minutes to 3 hours
Sulphuric acid	4 ml	A few minutes to several Weeks.
Zinc phosphide	0.8 g	Within a day

Notes.—

1. The fatal doses are only approximate. They vary with individuals, their health, their reaction (vomiting!), the period over which they are administered and the mode of administration.

2. The list is not exhaustive. For example, it does not include:
   - Phenols, formalin, cocaine, some poisonous plants of known and unknown nature and industrial solvents.
   - The hypnotics, tranquilizers, mandrax, meprobamate, diazepam and even LSD which are now not uncommon in India.
   - Slow poisoning on the mass scale due to atmospheric pollution, adulteration of foodstuffs, radiation and effects of war gases.

11.3 CLASSIFICATION

Different persons, concerned with poisons classify them in many ways. For example, poison may be organic, inorganic, or biological material.

11.3.1 Inorganic Poisons

An inorganic poison may be a metal, a metalloid, a non-metal element, an acid or a base, an oxide or a salt. It may be a gas, a liquid or a solid. Common poisons of this category are arsenic, antimony, lead salts, mercury salts, strong acids, strong alkalis, cyanides, fluorides, carbon monoxide, hydrogen sulphide, chlorine, bromine, iodine, and phosphorus.

Three patients died during intra-venous saline drip in a hospital. Barium was detected in the viscera of the deceased. The 'saline' being injected and the saline bottles lying in stock were found to contain barium chloride solution instead of saline containing sodium chloride. (CH)

Firearm shooting instructors, working in indoor firing ranges, suffer from lead poisoning, as in shooting lead vapours are released in the air.

11.3.2 Organic Poisons

Organic poisons include the ever-increasing synthetic drugs, alcohols, petroleum products, insecticides, chloro compounds (especially chloroform), aromatic and organo-phosphorus compounds.

Some dockworkers, while unloading copper ingots from a cargo ship developed giddiness and vomiting. They were rushed to hospital, where one of them died. Blood from the surviving labourers showed the presence of methaemoglobin. The viscera of the deceased person showed the presence of nitro aniline. The copper ingots, they handled, were stained with some yellow material which on examination was found to be p-nitro aniline. Some bags stored along with the ingots contained p-nitro aniline. (CH)

11.3.3 Biological Poisons

The biological poisons include all poisonous plants and their parts (leaves, bark, seeds, fruit, stems and roots) and extracts from these plants. The well-known poisonous materials from plants are opium, strychnine, cocaine, atropine, cannabis resin, nicotine, cardiac glycosides (digitalis), aconite and many more. Another set of biological poisons come from the animal kingdom. Snake venom and other toxins are the important ones. They have not been used for criminal purposes to any appreciable extent. However, they cause numerous accidental deaths and it is a field with vast potentialities.

Poisons have also been classified according to their misuse. Thus, there are homicidal poisons, suicidal poison; or, accidental poisons, which are often involved in poisoning incidents.

11.3.4 Homicidal Poison

Homicidal poisons are misused to kill persons. Some common homicidal poisons are arsenic, aconite, opium, and potassium cyanide.

11.3.5 Suicidal Poisons

The poisons commonly used to commit suicides are called suicidal poisons. Usually, a suicide uses any poison easily accessible to him. Barbiturates, opium, arsenic, pesticides, and insecticides are such poisons.

A person working in an electroplating factory consumed electroplating liquid in order to commit suicide. Post-mortem examination revealed highly congested stomach. Chemical examiner found presence of Copper sulphate and cyanide in the viscera. The chemicals were also present in the sample liquid seized from the factory. (CH)

11.3.6 Accidental Poisons

Accidental poisoning occurs due to:

1. Poisons are mistaken for food articles or medicine.
2. The gas valve is not enclosed. Or, the raw coal is allowed to burn in closed rooms.
3. Careless handling of poisonous materials like insecticides/herbicides/pesticides.
4. Overdose of a medicine, like barbiturates.
5. Quack doctors prescribe wrong medicine.

Three separate persons took mag-sulf[1] *crystals from a chemist's shop for laxative use. After ingestion of the same two of them died. The viscera examination showed the presence of oxalic acid. When the Mag-sulph packet from the same shop checked, it contained oxalic acid instead of mag-sulf crystals. (CH)*

Poisons also are classified according to their effects. Thus, we have:

11.3.7 Cardiac Poisons

Cardiac poisons affect the heart. Digitalis and aconite cardiac poisons are the common examples.

11.3.8 Respiratory Poisons

The respiratory poisons affect the breathing organs. Poisonous gases, such as Sulphur dioxide, Carbon monoxide, Hydrogen sulphide, and Chlorine are the examples.

11.3.9 Nervous System Poisons

The nervous system poison affects the nervous system, such as (the brain, nerves, and spinal cord). Examples are opiates, strychnine, and hyoscine.

11.4 POISONING

The best/easiest way to kill a person and to get away with the murder, is poisoning.

Many poisoning cases remain unreported and uninvestigated. This is because the offence is committed after winning the confidence of the victim. If the poison for administration is selected /administered carefully, even the victim may not suspect the crime.

The first requirement in any investigation of a poisoning case is to establish the *corpus delicti*. Answers to the following questions help to fix it.

1. Trade name form magnesium Sulphate.

1. Was the victim healthy, free from any disease?
2. Was the attack of 'sickness' sudden or slow?
3. What was the time interval between the onset of the attack and the death/recovery?
4. What did the victim eat/ drink just before the attack?
5. What was the time interval between the taking of the food or drink and the onslaught of the sickness?
6. Was the leftover food/drink normal? Or, did it contain some poison?

   Some people from Ratnagiri complained of vomiting after taking cooked rice. The rice used for the preparation had been purchased from a ration shop. Endrin was detected in their vomitus and in the rice sample from the shop. (CH)
7. Did any other person(s) take the same food? If so, what was the effect on them?
8. Was the smell of the breath of the victim abnormal?
9. Were the excretions (vomit, purges and saliva) of the victim abnormal?
10. What were the observations/diagnosis/impressions of the doctor the poisoning incident?
11. Was the victim under any financial/emotional/physical stress?
12. Did the victim have suicidal tendencies?
13. Did the victim, his relatives, friends or enemies purchase any poison in the recent past?
14. Did the victim, his relatives or other acquaintances have access to poisonous materials?
15. Did the victim handle poisons/dangerous materials in the course of his duties/ hobbies?
16. Did he ever suffer from sudden attacks of illness?
17. Did the victim suffer from pains or other disabilities?
18. How did the victim act or behave before death/unconsciousness?
19. What were the symptoms before/after the collapse?
    - Did he feel difficulty in breathing or did he vomit or purge?
    - Did he show abnormal physical signs such as convulsions, delirium, paralysis, papillary changes, cyanosis or drowsiness?

Insecticides, pesticides, and dangerous drugs are easily available in India. They are often used for homicide/suicide crimes. They also cause accidental deaths. Organo-phosphorus pesticides have become notorious in this regard, in current times.

11.5 LOCATION AND COLLECTION

The main sources for the evidentiary clues in poisoning cases are:

1. The scene
2. The onlookers, participants, attendants; they observe the activity or body condition of the victim.
3. The victim
4. The doctor who treated the victim
5. The drug store, the chemical stores, herbarium,

6. The autopsy surgeon
7. The culprit
8. The vehicle used for transportation

11.5.1 The Scene

The evidentiary clues collected from the scene are varied in nature:

1. Vomitus
2. Purged material
3. Urine/faeces or their stains.
4. Clothes, bedsheets, and bed covers
5. Medicines, the victim or his family may be using.
6. All containers of medicines
7. Remnants of food or drink which the victim might have taken or discarded, including sugar, salt, spices, flour, baking powder and cooking recipes
8. Containers of food and drink, bottles and tins, found at the scene/garbage
9. Utensils used for cooking/eating
10. Solids and liquids contained in traps of the sinks

11.5.2 The Victim

The victim may be alive or dead. In both cases, he is the most important direct source of poison. The evidentiary clues may be on his person or on his garments. The materials that are collected from the deceased are:

1. Clothes
2. Stains, if any
3. Autopsy material

11.5.2.1 Autopsy Materials

For the detection of poisons and toxicological examination, the following autopsy materials are collected:

1. **Blood; i**t is the most important autopsy material. About 50 ml of blood is collected from artery/vein/heart or from the chromic gutter. Spilt blood at the scene is not collected.
2. **Urine; i**t is the second best toxicological material. The total amount of urine is collected through a urethral catheter or on opening, the bladder is punctured and urine is collected.
3. **Stomach contents; i**t is the most important toxicological material. The total contents of the stomach are collected.
4. **Intestines with contents**; 30 cm of intestines are collected.
5. **Liver/gall bladder with its contents**; 100 g
6. **Kidneys;** half of each kidney
7. **Spleen; h**alf in adult and whole in children

8. **Bile**
9. **Lung** (in cases of volatile poisons): Tied at the open ends
10. The following materials are also helpful:

1)	Brain	= whole
2)	Lung	= one
3)	Heart	= whole
4)	Muscles	= 500 g
5)	Bone	= 500 g
6)	Hair and nails	= 10 g (or 20 to 100 hair)

Bones, hair, and nails are useful for chronic metal poisoning. Lung, heart, and brain are helpful for gaseous and volatile poisons. Muscles prove useful in a putrefied body. Muscles are resistant to putrefaction and are not easily decomposed.

11.5.2.2 Non–fatal Cases

In non-fatal poisoning cases also, the victim is the most important source of evidence. He can give information on the various food, drink or smoking items, which may have initiated the onslaught. He is the best source to describe symptoms. In addition, the following articles are sent for toxicological examination in such cases.

Purges and vomitus, if any

1. Saliva and other excretion stains, if any
2. Urine: Whole amount
3. Stomach washings
4. Blood 50 ml, preferably more
5. The stains bearing clothes
6. Residual food, drinks, drugs, medicine, containers,

11.5.2.3 Reports and Opinions

The following documents are also sent to the toxicologist:

1. **Statement of the victim; i**t contains his opinion relating to the nature of poison(s), the symptoms and its effect, if any.
2. **The statements of witnesses, if any**. They reveal action/behaviour of the poisoned victim.
3. **Post-mortem/medico-legal reports; t**hey are the most important documents. They are sent along with the findings of the medico-legal expert.
4. **Treatment report;** the statement/report of the doctor, who treated the victim before his death, is sent along with the treatment chart and medical history of the victim.
5. **The investigating officer's report;** it gives the facts about the purchase, storage and handling of poisons.
6. **Copy of the FIR**
7. **Examination request letter**; it contains details of the exhibits and the nature of the examination required.

In addition to the usual precautions required in handling, packing, and dispatching putrefied materials (blood and stomach contents) need special care:

1. They are stored in cold rooms/freezers.
2. They are dispatched at the earliest.
3. The only preservative used for viscera is common salt. If acids are suspected to be the poisons, no preservative is used.
4. The name of the preservative used is mentioned.
5. The packing of the materials is done in such a way, that the material does not spill over, the container does not break, and the contents are not contaminated due to breakage, seepage or dirty containers.

11.6 THE PROBLEMS

The investigating officer should aim at finding answers to the following questions from the concerned persons:

1. Was the victim poisoned?
2. What was the name/nature of the poison administered?
3. When was the poison administered?
4. What was the source of poison?
5. What was the dose of the poison administered?
6. How was it administered?
7. Did the victim die of poisoning? Or, did he die of some other cause?
8. Was there some contributory cause, to cause death?
9. Was only one/or more than one poisons administered?
10. Was the poison given in single/multiple doses?

A female took some liquid from a bottle to commit suicide. While still in a semi-conscious state, she breast-fed her six months old baby. Both mother and baby died. Eldrin was detected in the remnants of the bottle and viscera of the deceased. (CH)

11.7 EVALUATION

The isolation, identification and estimation of poison from the autopsy material are complex and daunting tasks, especially if the analyst has no background knowledge of the poisoning case. It is, therefore, necessary to acquire the necessary background before starting the analysis.

11.7.1 Residual Poison

Residual poison at the scene of the crime, with the culprit or at the source of procurement makes it comparatively easy to identify, isolate, and estimate the poison.

If the poison has been administered through food or drink, it is easier to search for the poison in the residual food or drink.

11.7.2 Medico-legal Examination

The observations of the doctor indicate certain poisons:

1. Strong acids and alkalis cause burn wounds in the mouth, tongue, throat of the alimentary canal, and stomach. They, thereby, perforate, soften and ulcerate the tissues on coming in contact with them. The colour of the tissues changes from normal to red, reddish-brown or even black. Nitric and picric acids may change the skin yellow. Food materials can also bring about changes in colour. In the latter case, however, inflammation of tissues will be absent. Disease, putrefaction or both may bring about perforation and ulceration, change in colour, softening of the flesh tissues. The medico-legal expert finds the correct cause.
2. Alcohol, carbolic acid, chloroform, ether, opium, hydrocyanic acid, and yellow phosphorus emit a characteristic smell, which may give an indication about their identity.
3. Dhatura, aconite, alcohol, nicotine, atropine, hyoscine and belladonna dilate pupils. Opium alkaloids and chloral hydrate contract them.
4. Iodine reacts with starch in the food to give violet colour.
5. Powdered glass, metallic powders or plastic material may be found sticking to the surface (mouth, food canal, stomach and intestines) coming in contact with them.
6. Fragments of leaves and the bark of poisonous plants are found in the viscera, sometimes.

11.7.3 Symptoms

Symptoms often indicate the nature of poisons:

1. **Vomiting; s**ome irritating poisons like arsenic, acids, alkalis, excess of liquor and certain metallic salts cause vomiting
2. **Diarrhoea; s**ome poisons cause vomiting/diarrhoea.
3. **Cramps:** metallic poisons like arsenic, antimony and lead cause cramps.
4. **Delirium;** dhatura, cannabis, alcohol, atropine, hyoscine and LSD cause delirium.
5. **Convulsions;** strychnine, nicotine and cyanides cause convulsions.
6. **Paralysis; s**nake venom, aconite and arsenic cause paralysis.
7. **Coma; b**arbiturates, opium and its products, carbon monoxide, chloroform and excess of liquor, snakebites may cause coma.

Certain diseases also give similar symptoms. They, therefore, are only rough indicators.

11.7.4 Isolation

The isolation of an unknown poison from viscera and other body parts requires systematic processing. Usually, it involves the following steps:

1. The visceral material is hashed into slurry.
2. The slurry is divided into three to six equal parts.
3. One part is weighed and acidified. It is steam distilled.
4. The residue from the part is made alkaline and steam distilled again.

Volatile poisons, gases, alcohols, phenols, phosphorus, organic liquids and solvents (basic, acidic, neutral) are distilled over in steps (3) and (4).

5. The individual volatile poisons are tested in the distillates.
6. The non-volatile organic compounds are then extracted. A weighed portion of the material is acidified. It is saturated with ammonium sulphate and filtered. The filtrate is extracted with chloroform. The extracts contain acidic and neutral organic compounds.
7. The acidic aqueous layer left after the extraction, is made alkaline and again extracted with chloroform or ether. The solvent extracts basic organic compounds.

Steps 6 and 7 extract all organic compounds. The quantity extracted depends upon their relative solubilities in the two media and also upon the thoroughness of the extraction technique.

The main difficulty is interference by fats and proteins. They are precipitated by ammonium sulphate, sodium sulphate, or by other techniques and the precipitate removed. There are modifications of the original method suggested by Stass and Otto more than a century ago.

Isolation of metallic poisons is done through one of the two oxidation processes: wet and dry.

In the wet process, the organic matter is destroyed by hydrochloric acid and potassium chlorate or by nitric acid and sulphuric acid mixtures. An excess of oxidizing agent is used for complete oxidation. Thus, after the destruction of organic matter, only inorganic anions and cations are left.

In the dry process (used only when the metallic poison is non-volatile) the material is burnt to ash and the ash is tested for the suspected metal poisons.

Isolation and identification of plant materials (leaves, root, bark,) is a difficult job. Identification is done by the microscopic study of the viscera and related materials. Quantitative separation of vegetable matter is difficult. For the identification of active principles both chemical and biological methods are used.

Microscopy of the visceral mass reveals certain inorganic materials, like glass and other similar irritants. Some particles are handpicked.

11.7.5 Classical Identification Techniques

The following conventional techniques are employed extensively for the identification of poisons:

11.7.5.1 Colour tests

Some colour tests are very sensitive and can detect a class of poisons in minute quantities. These reactions are often not specific for an individual poison.

11.7.5.2 Melting points

Melting points of an organic substance are often characteristic. For confirmation mixed melting point is taken. The suspected poison is mixed with an authentic sample, and if the melting point is not depressed, the identity of the suspected poison is established.

The greatest difficulty in toxicology is to procure the poison in sufficiently pure form to get the melting point, even within a close range. Once the substance is guessed, the mixed melting point even with not so pure a sample establishes the identity.

11.7.5.3 Boiling points

The liquid poisons are identified by their boiling points. Some heavy oils and high boiling point liquids are distilled under reduced pressure. Reference to standard boiling points of liquids indicates the identity.

11.7.5.4 Crystal structure

Most of the substances or their derivatives have definite crystal structures. The substances or their derivatives are crystallised, and the crystal structure is studied.

11.7.5.5 Microscopy

Vegetable materials, such as seeds, flowers, leaves, bark, wood fragments, and root particles are identified through microscopy or through their physiological effects. Likewise, some biological materials are identified through microscopy.

For metallic poisons, the following general tests for metals are used in toxicology:

11.7.5.6 Reinsch test

It is a good screening test. A copper wire, foil, or strip is placed in boiling dilute hydrochloric acid solution of the product. A grey-black deposit indicates arsenic, antimony, bismuth and mercury metals, which are identified by individual tests. For example, for arsenic, the grey black copper foil is cut into small pieces, taken into a Reinsch tube and heated over a low flame. Characteristic octahedral crystals of arsenic oxide are seen on the cold part of the tube under a microscope.

11.7.5.7 Dithizone

It is a more or less universal reagent to give coloured complexes with heavy metals. The reagent is dissolved in chloroform, and the product is shaken with the solution containing metallic poison from the viscera. The reagent in the chloroform takes up heavy metals, which are identified by individual tests.

11.7.5.8 Spectrography

Ash obtained in the dry oxidation process of viscera or the product collected by any of the above processes is spectrographed. The elements are identified from their characteristic spectra. The amount is estimated from the densities of the lines if a weighed quantity is used for the analysis.

The criminals frequently use alkaloid poisons. They are detected by the following general tests:

11.7.5.9 Mayer's reagent

Potassium mercuric iodide prepared under specific conditions precipitates most of the alkaloids.

11.7.5.10 Wagner's reagent

Iodine in potassium iodide solution precipitates most of the alkaloids.

11.7.5.11 Phospho acid reagent

Phosphotungstic or phosphomolybdic acids form yellow precipitates with alkaloids. Tannins, platinic acid, picric acid, gold chloride also precipitate alkaloids.

11.7.6 Modern Techniques

In recent decades, many sensitive techniques are used in a toxicological analysis. They are dependable, and the degree of purity required for their examination is not very high. Besides, the techniques are sensitive, specific and require only minute quantities. They, however, involve costly equipment, advanced training in the handling of the equipment and sufficient experience in the work to interpret the results correctly.

> *Some years ago, a labourer went into a pit to clean it. Suddenly he collapsed and died at the spot. It was suspected that the pit might have had some poisonous gases inside. The worker must have died by inhaling them. The responsibility for his death and hence for compensation would then fall on the factory management. However, if the worker had died of heart failure, his family would get compensation from his insurance company. It was, therefore, necessary to determine whether the worker died of heart failure or poisonous gases in the pit.*
>
> *At the autopsy, a bubble of air (gases) was collected from the lungs of the deceased. The same was analysed by a mass spectrograph (a costly and highly sophisticated instrument). Complete data about the nature and quantities of the constituents of the air bubble were obtained. It corresponded with the standard air composition. The analysis established that the man did not die from gas poisoning as was originally suspected. Heart failure was declared as the cause of his death. (CH)*

Some of the important techniques are:

11.7.6.1 Chromatography

Thin Layer Chromatography (TLC), Gas and Liquid Chromatography (GLC) and High Performance Liquid Chromatography (HPLC) are being used increasingly in toxicology:

- TLC is a method of choice with all toxicologists. It is simple, inexpensive, quick, fairly accurate and applicable in most of the cases. Besides, the sample need not be pure as the process itself 'purifies' the sample.
- In gas chromatography, a measured amount of the substance to be tested is injected into the column head placed in a heated chamber where it is vapourised or pyrolysed. A carrier gas takes the product through a separating column containing a stationary phase. The constituents of the product are separated due to differential adsorption/de-adsorption as they travel through the column. The separated entities are then passed through a detector, which is connected to an automatic recorder. The constituents produce changes, which are amplified and recorded on the chart of the recorder. The chromatogram, thus obtained, is compared with chromatograms of standard suspected compounds for identification. Quantitative estimation is made from the peak area, automatically given by an integrator, attached to the instrument.
- The technique is being used increasingly for gaseous, liquid and volatile poisons. The poisons which pyrolyse to give identifiable products (e.g., barbiturates), have also been identified and estimated by the technique.
- In high performance liquid chromatography, a liquid instead of a gas is used as the carrier. Thus, the technique is used for non-volatiles poisons.

11.7.6.2 Mass Spectrography

Mass spectrograph has now become an excellent tool for the identification of poison in an extremely small amount. The instrument is coupled with GLC or HPLC. Almost all types of poisons, especially organics, are identified with the technique.

11.7.6.3 Spectrophotometry

Ultraviolet, visible light and infrared rays are employed in spectrometers for the detection, identification and estimation of a host of poisons. The sample to be identified is mixed in

a suitable substance (solid or liquid) and a beam of the rays (infrared, visible light rays or ultraviolet rays) is passed through the sample. The energy consumed depends upon the molecular structure of the compound. The absorption is recorded on a graph. The trace thus obtained is characteristic of the compound, like the fingerprints of a man.

UV spectrogram has been utilised for quantitative analysis also.

The technique has been made more sensitive by using F.T.I.R. instrument.

11.7.6.4 X-Ray Diffraction

The technique uses diffraction of X-rays when they are passed through the substance. The diffraction pattern depends upon the disposition of various groups and radicals in the molecule. The pattern is photographed and compared with known diffraction patterns to establish the identity. The comparison is now done by the computers, which carry the relevant software for such comparisons.

The technique is useful for both organic and inorganic poisons in powdered form.

The technique is used to identify barbiturates, alkaloids, glass and clays.

11.7.6.5 Neutron Activation Analysis (NAA)

When various elements are bombarded with neutrons they become radioactive. The extent and nature of radioactivity depend upon the nature of the element and its quantity. The activity is measured by spectrometers. The measurement gives both qualitative and quantitative analysis.

Neutron activation analysis is one of the most sensitive techniques known for analysis. It can detect and estimate quantities of elements as small as a picogram (10^{-12} g) specifically and accurately. It is used in the detection of metallic poisons, notably arsenic and lead in body tissues like hair and nails.

> *It seems that on St. Helena, Napoleon suffered from chronic arsenic poisoning it was decided to check the fact through Neutron Activation Analysis. Napoleon's hair, were kept in a French museum. They were used for the test:*
>
> *A hair weighed sample (1.72 mg) was sealed in a polythene container. The sample and a standard arsenic solution, sealed in silica, ampoule were irradiated by thermal neutrons for one day at 1012 neutrons per cm^2 per second in a nuclear reactor at the Atomic Energy Research Establishment, Harwell. The hair sample was compared with the standard arsenic by modified Gutzeit technique. The activity of the sample and the arsenic content of the hair were calculated.*
>
> *The value found for the sample of hair was 10.38 parts per million. This is high by comparison with the normal mean arsenic content of about 0.8 PPM. Unfortunately, it was not possible to make any distribution studies, as no further hair samples were available. (CH)*

11.7.6.6 Scanning Electron Microscopy

The scanning electron microscopy has come up in a big way to identify biological materials as the technique gives very high magnification that permits easy identification. It is used for the identification of cannabis and its products. With EDX, it is also used to identify and quantify metallic contents of the clue materials.

11.7.6.7 Radio Immuno Assay (RIA)

Radio Immuno Assay technique is exceptionally useful for materials in small amounts. It is applicable even to contaminated samples. Poisons in viscera are often in small amounts and contaminated. The technique is highly useful in such situations. The technique is sensitive, specific and rapid. The main advantage is that the materials do not require extensive pre-treatment. It is being used increasingly for the identification of poisons.

11.8 INDIVIDUAL POISONS

11.8.1 Arsenic

It is one of the oldest poisons known to man. It has been extensively used/misused through the ages to poison human beings, animals and pests.

11.8.1.1 Nature

Arsenic in the metal or metalloid form is not poisonous but its oxides are highly poisonous. Arsenic oxide, called Arsenic in common parlance, is a white tasteless and odourless powder. It is somewhat soluble in water. It is, therefore, administered in all types of foods and drinks.

It is potent poison. A pinch of the poison can kill two adults. A teaspoonful is sufficient to kill about a score of persons.

11.8.1.2 Use

Arsenic is extensively used in Ayurvedic medicine system for the treatment of syphilis, rheumatism and skin diseases. It is a strong insecticide. It is used as such for the preservation of wood, wallpaper and other articles.

11.8.1.3 Administration

For homicidal abuse, Arsenic is mixed with various food articles, cooked food, sweetmeats, sharbats (soft drink), milk, tea, coffee, liquor and medicines.

> *In a case from Firozabad, the victim was related to the accused and was living with him. He developed illicit intimacy with the wife of the accused. Subsequently, the accused administered poison in milk to the paramour. The victim died in less than three hours of taking the milk. The dead body was taken to cremation grounds and set on fire.*
>
> *In the meanwhile, the news of the suspicious death spread out. Partially burnt body was taken out from the pyre with the help of the police. Arsenic was detected in the viscera of the deceased. A white powder, recovered from the house of the accused, was identified as arsenic. (CH)*

Apart from foodstuffs, arsenic has been administered through tobacco and cigarettes. It has also been administered as holy water. It has been mixed in 'enema' fluid. It has also been injected into the vagina for abortion.

The poison is more effective in solution and dust form.

11.8.1.4 Symptoms

Arsenic poisoning has the following symptoms:

1. Giddiness and nausea,
2. Burning pain in the throat and stomach,
3. Salivation,
4. Vomiting, retching (they may save life),
5. Thirst,
6. Cramps,
7. Severe diarrhoea,
8. Convulsions,
9. Coma.

When a heavy dose is taken, it may cause immediate death without most of the above symptoms. Sometimes excessive vomiting eliminates the poison and the victim is saved.

Sometimes abnormal symptoms also appear. They are paralysis, maniacal behaviour, delirium and disorders in speech, memory, hearing and vision.

11.8.1.5 Post-Mortem Findings

The body may have shrunk. The eyes are usually found sunken. The mucous membranes of mouth, pharynx, stomach and intestines are sometimes found swollen and ulcerated. The stomach wall is often found embedded with arsenic particles and streaked blood.

Liver, spleen, kidney, and heart are all affected characteristically, which permit guess of the identity of the poison.

11.8.1.6 Fatal Dose: 100 to 150 mg

11.8.1.7 Fatal Period

- 2-3 hours in acute cases
- 12-24 hours in less acute cases
- In some cases, death occurs after a number of days.
- It is a cumulative poison; i.e., it accumulates in the body. When the accumulation reaches the critical stage, the victim dies. Thus it is used in slow poisoning Death may take months when Arsenic is administered in small doses.

11.8.1.8 Detection

The poison is detected through the following tests:

1) **Reinsch test**.—It is a good screening test. A copper wire, foil or strip is placed in a boiling dilute hydrochloric acid solution of the product. A grey black deposit indicates arsenic, antimony, bismuth and mercury metals, which are identified by individual tests. For example, for arsenic, the grey black copper foil is cut into small pieces, taken into a Reinsch tube and heated over a low flame. Characteristic octahedral crystals of arsenic oxide are seen on the cold part of the tube under a microscope.
2) **Marsh test**.—It is a very delicate test. The suspected substance containing arsenic-compounds is put in a vessel generating hydrogen gas (Woulffe's bottle). The gas, arsine is formed. It bums with a garlic smell and characteristic flame, depositing a light grey residue.
3) **Gutzeit test**.—A silver nitrate paper turns yellow if it is held in vapours coming out of a heated mixture containing arsenic, zinc and sulphuric acid.
4) **Bettendorf: reaction**.—Oxidized viscera is heated with stannous chloride and strong hydrochloric acid. Blackish precipitate indicates arsenic.
5) **Spectrographic analysis**.—Arsenic is also detected and estimated by spectrographic analysis.

11.8.1.9 Estimation

Quantitative estimation of arsenic is done by using the Marsh test, Gutzeit test, or spectrographic analysis. The Marsh test is considered the best all round tests for the purpose. Iodometric titration is useful after wet destruction of biological materials.

11.8.1.10 Toxicological Materials

1. Vomitus, purges
2. Blood, urine
3. Stomach contents
4. Intestines
5. Liver, kidney, spleen
6. Burnt bones and ash, in case the victim has been cremated.
7. Hair, nails and skin (especially scrapings from the soles of the feet). They are useful in slow poisoning.

11.8.2 Cyanides

Cyanides are among the deadliest poisons. They combine with haemoglobin of blood and stop the formation of oxyhemoglobin, the supplier/transporter of oxygen to the tissues.

11.8.2.1 Nature

The important members of this class are hydrogen cyanide, potassium cyanide, sodium cyanide, mercuric cyanide and silver cyanide. Cyanides are also widely, distributed in nature. Kernels of some stone fruits contain cyanide in significant quantities.

Double salts of cyanides (e.g., ferro- or ferri- cyanides) are practically non-toxic, provided hydrogen cyanide is not liberated from them.

11.8.2.2 Use

Cyanides are extensively used in industry, particularly in metallurgy of silver and gold, in hardening steel, in classical photography and in electroplating Cyanides are used as insecticides and in some pharmaceutical preparations. Cyanides are also used to kill diseased and unwanted animals and pets.

11.8.2.3 Administration

Cyanides are, ordinarily, used for suicidal purposes. They are taken as such or in food materials. The quick and almost painless death encourages their use for the purpose. Cyanides are also used through food for homicidal poisoning. Potassium cyanide is the commonest cyanide used as a poison.

> *A person got his imbecile nephew heavily insured. After about a month, he invited him for a drink and mixed potassium cyanide in his drink. The man collapsed and died immediately. (CH)*

Accidental deaths caused due to cyanide poisoning occur because of ingestion of cyanides mistaking them for medicine, inhalation of cyanide fumes from insecticidal preparations or from the excessive use of cyanide containing materials.

Accidental cyanide poisoning of cattle takes place when they eat plants containing cyanides in some form. Linseed and Juar Kadvi are notorious for the purpose.

Seven cattle were found dead in the vicinity of water effluent from an electroplating factory. Cyanide was detected in the effluent water sample and in the viscera of all the dead animals. (CH)

11.8.2.4 Symptoms

Cyanide is a potent poison, as mentioned earlier. It acts quickly. The effect/symptoms appear within a few seconds and the victim is dead within a few minutes. The symptoms are:

1. Bitter taste
2. Burning sensation
3. Smell of bitter almonds
4. Salivation
5. Giddiness
6. Numbness and oppression
7. Convulsions and paralysis

11.8.2.5 Post-Mortem Findings

1. Skin becomes red or violet in colour.
2. Hands and jaws are clenched.
3. Froth appears in the mouth.
4. Pupils dilate.
5. There is smell of bitter almonds.
6. Potassium cyanide is hydrolysed on intake into potassium hydroxide and hydrogen cyanide. Potassium hydroxide may, in addition, produce symptoms of strong alkali poisoning: inflammation and ulceration of the mouth, food tract and stomach, especially if a large dose of potassium cyanide is taken/ingested.

11.8.2.6 Isolation

The cyanide is isolated from the tissues and other biological materials by steam distillation of the acidified (with dilute sulphuric acid) solution of the slurry. The distillate is collected in a cold caustic alkali solution.

11.8.2.7 Detection

1) **Odour:** Characteristic odour of bitter almonds.
2) **Colour test**:
   - **Prussian Blue Test:** The solution containing cyanide is made alkaline with caustic potash, 0.5 ml of freshly prepared ferrous sulphate solution and a few drops of ferric chloride solution are added to it. The mixture is warmed and acidified with dilute sulphuric acid. Blue colour or a blue precipitate indicates the presence of cyanide.
     The sensitivity limit of the test is 0.2 microgram.
   - **Sulphocyanide Test:** The alkaline solution containing cyanide is treated with a few drops of yellow ammonium sulphide. It is then evaporated to dryness on

a hot water bath. The residue is dissolved in a few drops of dilute hydrochloric acid. It gives blood red colour with one drop of ferric chloride solution.
Its sensitivity limit is 0.25 microgram.

11.8.2.8 Estimation

The cyanide is estimated by titrating it against silver nitrate solution in the presence of dilute sodium hydroxide solution. End-point is noted with an acetone solution of rhodamine, which gives change of colour from yellow to pink.

1 ml of N/200 silver nitrate solution = 0.266 mg HCN
= 0.652 mg KCN
= 0.4915 NaCN

11.8.2.9 Toxicological Materials

1. Vomitus, purges
2. Blood
3. Viscera
4. Intestine
5. Brain matter
6. Liver

The accused and his wife, along with the victim, rented and occupied a room under false names and address in a hotel at Varanasi. They placed an order for four bottles of soda and ice, which were immediately supplied to them. About half an hour later, the waiter came back with potato chips, and knocked at the door. The woman partly opened the door and took the articles. After some time the waiter returned to collect the utensils and knocked at the door. As the woman unbolted the door, the waiter pushed the door open and entered the room. He saw the deceased lying unconscious on the cot. The couple told the waiter that the deceased was unconscious due to excessive drinking They also allured the waiter by offering him Rs 20 for not disclosing it to anybody. However, the waiter at once ran to the manager and told all. Meanwhile, the couple attempted to run away but were apprehended by the manager and handed over to the police. Potassium cyanide and alcohol were detected in the left over portions of the drink and in the viscera of the deceased. Traces of potassium cyanide were also detected in the vomit stains on the towel, shirt and vest of the deceased. A whisky bottle recovered from the scene of occurrence was found to contain a few drops of alcohol. (CH)

11.8.3 Copper Sulphate

Anhydrous copper sulphate is a white powder. It crystallises with water to give blue crystals.

11.8.3.1 Use

It is frequently used in industry, horticulture, and as a disinfectant in swimming pools and as medicine.

11.8.3.2 Administration

The administration of the poison is rarely homicidal. Accidental and suicidal intakes are comparatively more frequent. It is taken through the mouth either in pure form or mixed with food. It, however, can be administered through the vagina, rectum, and abraded surface and by injection.

11.8.3.3 Symptoms

1. Metallic taste
2. Burning sensation in the stomach
3. Salivation, thirst and nausea
4. Vomiting and diarrhoea
5. Convulsions and paralysis in severe cases
6. Coma and death

11.8.3.4 Post-Mortem Findings

1. Greenish blue froth.
2. Mucous membrane of alimentary canal is inflamed and ulcerated
3. Copper may be found deposited inside

11.8.3.5 Isolation

1. Viscera are incinerated in an electric furnace at 550° C and copper is detected in the residue.
2. Organic matter of the viscera is oxidized with sulphuric and nitric acids. The solution is then tested for the copper.

11.8.3.6 Detection

1. Copper salts in acidic solution give black precipitate with hydrogen sulphide.
2. Potassium ferrocyanide solution gives a chocolate brown precipitate with copper salts in acetic acid medium.
3. An acidic solution of copper salts deposits copper on an iron wire/strip.
4. Spectrography of materials containing copper gives reliable identification.

11.8.3.7 Estimation

The following methods are common for estimation of copper:

1. **Spectrography**
2. **Colourimetry**: Sodium diethyldithiocarbamate forms a complex with copper, which is soluble in amyl alcohol. It is estimated with a colourimeter from the solution from colour intensity.
3. **Iodometric titration** also gives reliable results.

11.8.3.8 Toxicological Materials

1. Vomitus, stomach washings
2. Stomach contents
3. Intestines
4. Liver, kidneys

11.8.4 Barbiturates

Barbiturates are hypnotics and sedatives. The number of these substances has increased tremendously in recent years. They are derivatives of barbituric acid. They are white, odourless and slightly bitter in taste. Fatal poisoning occurs due to excessive doses. They are frequently met with in suicide cases. In homicidal cases, they are given when the victim is drunk. Accidental barbiturate poisoning is rare.

> *A female was found dead in the bed. Some blood was seen near her mouth. She had taken bread and tea before going to bed. The nightgown and the bed sheet were stained with blood and there were also some brown stains, probably from tea. Barbiturate was detected in the bloodstains and the brownish spots separately. Barbiturate and ethyl alcohol were detected in the viscera and the post-mortem blood sample from the deceased. (CH)*

11.8.4.1 Classification

The barbiturates are classified according to the time they take to act on the body. Thus, we have:

1) **Long acting barbiturates**.—they are — Barbitone, Pheno-barbitone, Methyl Phenobarbitone, Commercially, the products are known as Medinal, Veronal, Gardenal, Luminal, Somonal, Prominal, The action of these barbiturates usually commences after an hour or more and lasts for 6 to 10 hours.

2) **Intermediate acting barbiturates**.—They are Allobarbitone, Butobarbitone and Amylobarbitone. Their commercial names are Dial, Amytal and Soneryl, respectively.

   The action of these barbiturates starts in about 30 minutes and their effect lasts for 5 to 6 hours. They are less likely to leave the patient sleepy the next day than the long-acting barbiturates. Therefore they are widely used against insomnia.

3) **Short acting barbiturates**.—They are Cyclobarbitone and Pentobarbitone. Commercial names are Phenedran, Cyclonal, Nembutal, Seconal. They are effective within 15 minutes and their action lasts for 2 to 3 hours only. They are especially suited for people who have difficulty in going to sleep.

4) **Ultra short acting barbiturate.—**They are Pentothal, Thiopentone sodium, Hexa barbitone. These are used as rapidly acting anaesthetics. They are given alone or in combination with inhalation anaesthetics.

11.8.4.2 Use

They are/were widely used in combination with other medicines to give relief from pain and to induce sleep.

11.8.4.3 Administration

Barbiturates are commonly given through the mouth but they are also injected.

11.8.4.4 Symptoms

1. Mental confusion
2. Coma, which may last for days
3. Muscular weakness
4. Death

11.8.4.5 Post-mortem findings: nothing characteristic

11.8.4.6 Detection

1. A few drops of Millon's reagent give a white precipitate.
2. Fusion with caustic soda gives out ammonia.
3. Melting points are characteristic.
4. The solution of barbiturates gives violet colour with isopropylamine and cobalt nitrate solution. Solutions are taken in absolute alcohol.
5. Thin layer chromatography gives characteristic R_f values.
6. UV and IR spectra are characteristic.
7. Gas chromatography gives characteristic traces of pyrolysed products.

11.8.4.7 Estimation

1. **Semi-quantitative method.** The area of the developed spot by the crime material on thin layer chromatogram is compared with the spot area of a known amount of the barbiturate.
2. By titrating the alcoholic solution of barbiturate with silver nitrate solution. The end-point is observed by the appearance of slight yellow turbidity.
3. By spectrophotometry and gas chromatography

11.8.4.8 Toxicological Materials

1. Stomach contents
2. Urine, blood
3. Kidney
4. Brain
5. Liver

11.8.5 Organo-phosphorus Compounds

The organo-phosphorus insecticides are deadly poisons. They are easily available. They are, therefore, being used increasingly for homicidal and suicidal purposes. The poisons are also involved in accidental poisoning.

11.8.5.1 Nature

Organo-phosphorus compound, like poisons, has become common only in the past few decades. They are alkyl and aryl phosphates. They are powerful insecticides and are deadly poisons. Important ones are: Folidoll (parathion), Tik 20 (Sumithion, diazinone), Malathion, Meta Systox, Rogor (Dimethoate), Dimecron (Phosphamidon), Fenitrothion, Fensulphothion, Thio-demeton, Dalf, Diptera, Baytese, H.E.T.P., T.E.P.P., O.M.P.A.

They are complex organic compounds containing sulphur, phosphorus and other organic radicals, mostly in the form of alkyl and aryl phosphate.

11.8.5.2 Use

These compounds are used extensively in agriculture and horticulture. They are also used to kill household bugs, flies, and other pests.

11.8.5.3 Administration

These Insecticides are administered through food and drinks. Their inhalation proves fatal. Some of them are easily absorbed by human skin. They can be injected.

11.8.5.4 Symptoms

1. Headache, giddiness and nausea
2. Salivation and vomiting
3. Diarrhoea, spasm, abdominal cramps
4. Mental confusion and delirium
5. Paralysis, coma and death

11.8.5.5 Post-mortem Findings

1. Nothing characteristic, though usual signs of asphyxial death are seen in many cases.
2. Kerosene oil like smell.
3. Pulmonary edema.

11.8.5.6 Isolation

Organo-phosphorus compounds are steam volatile. The tissues and other biological materials are acidified with phosphoric acid and steam distilled. The distillate is extracted with hexane, which on evaporation gives organo-phosphorus insecticide.

11.8.5.7 Detection and Estimation

- **Colour test**. Parathon, Sumithion having para-nitro-phenyl group, give yellow colour on heating with alkali.
- The nitro group in the compound is reduced to amino group, which after diazotisation and coupling with B-naphthol gives intense coloured dyes.
- **Thin layer chromatography (TLC)**. TLC on silica gel-G using rhodamine B spray, followed by exposure to bromine vapours, gives purple spots against white background. R_f values are characteristic for each individual organo-phosphorus compounds.
- **UV Spectrophotometry**.

A young girl of 20 years was residing with the warden of the working women's hostel in Lucknow. During the absence of the hostel inmates during the daytime, she was seen reading up to 4 pm. A female cook was also present in her room. In the evening she gave money to the cook to bring vegetables, and who, on returning, found that the room was bolted from inside and there was no response. The warden, on her return in the evening, got the door broken open and was surprised to find the girl dead. An organo-phosphorus insecticide (NOK 99) was detected in the viscera and in the vomit stained clothes and bedding The insecticide was also detected in the blood and faecal stains on the dhoti and petticoat of the deceased. (CH)

11.8.5.8 Toxicological Materials

1. Vomitus
2. Urine, blood
3. Stomach contents
4. Liver

Organic-phosphorus poisoning can be detected even in putrefied bodied.

11.8.6 Vegetable Poisons

Plant poisons are more frequently used in the East than in the West. The common vegetable poisons are derived from poppy, dhatura, oleander and Madar. Other important poisons derived from plants are strychnine (obtained from Kuchila, i.e., Strychnos nux vomica), nicotine (from tobacco), aconite (Mitha Zahar, from Aconitum napellus) and atropine (from Atropa belladonna). Besides, there is a host of other poisons, which are available in the plant kingdom and are used from time to time.

11.8.6.1 Opium

11.8.6.1.1 Nature

Opium is the dried juice of unripe white poppy heads. It is plastic when fresh and moist, but on complete, drying it becomes hard and brittle. It is dark brown in colour in the dried state. It is grown in many parts of the world, including India. Its cultivation is restricted in India and in most of the other countries. Usually, the governments supervise the cultivation and harvesting. However, smuggling of the opium from the licensed farms continues.

Opium is a complex mixture of alkaloids. The most important constituent is morphine, which is extensively used as such in the form of its salt. Its derivative heroin is used only illegally as its use is banned throughout the world. Other important alkaloids in opium are codeine, narcotine, papaverine and thebaine.

Opium is a habit-forming drug. It is not easy to give up the habit of taking opium, once it is acquired. Opium as such is used in India, while morphine, heroin and other derivatives are more common in Western countries. However, they are invading India also. Heroin is the most dangerous member of the family. Its use is illegal everywhere. "Smack" and "Brown Sugar" are other names of the crude form of heroin.

11.8.6.1.2 Use

Opium and its products are used extensively in all systems of medicine as painkillers, sedatives and as a narcotic.

> *A person aged 23 consumed liquid from a bottle labelled "Klesh Hari" (Pain Reliever). He died in a few hours on the way to the hospital. Alcohol and opium were detected in 'Klesh Hari' as well as in the viscera of the deceased. (CH)*

11.8.6.1.3 Administration

Opium, its constituents and their derivatives are ingested in many ways: orally, (alone or with food), by injection, and through smoking or inhalation. It is also possible to introduce them through wounds, rectum and vagina.

Opium is mostly used in suicides. Its bitter taste makes it unfit for homicidal purposes, though it is sometimes used for infanticide. Accidental poisoning by opium and its products is rather rare. It happens in cases where the addict may have exceeded his normal dose.

11.8.6.1.4 Symptoms

The effect of opium depends upon the quantity taken, health and habit of the individual and mode of administration. The following symptoms are common:

1. It causes excitement in the initial stage(s).
2. At the second stage, the person suffers headache, nausea and vomiting
3. In the third stage the person is drowsy, pupils contract and unconsciousness follow on taking more opium, which may end in death.

11.8.6.1.5 Post-Mortem Findings

The medico-legal expert finds:

1. Characteristic smell of opium; it is not present if the body has putrefied.
2. There are signs of asphyxia (froth in mouth and nostrils).
3. Opium is found in the stomach, in some cases.

11.8.6.1.6 Isolation

The slurry made from the viscera or other biological materials are treated with 5% acetic acid. Ammonium sulphate is used precipitate proteins. Material is heated on a water bath for about 6 hours. The filtrate is extracted with an organic solvent in an alkaline medium.

11.8.6.1.7 Detection

- **Huseman test**. A few drops of concentrated sulphuric acid are added to the dry residue are added and heated in boiling water bath for 30 minutes. After cooling, nitric acid is added to it. Red colour indicates opium.
- **Oliver's test.** The residue is taken in a few drops of dilute acetic acid. Two drops of hydrogen peroxide are added. A few drops of ammonium hydroxide are added to make the material alkaline. The resulting solution is agitated with a clean copper foil. When effervescence ceases the solution assumes wine red colour.
- **Meconic acid test.** Neutral solution of ferric chloride gives blood red colour, which persists even after the addition of dilute hydrochloric acid and mercuric chloride solution.
- Porphyroxin test. On heating the residue with dilute hydrochloric acid, it gives pink colour.
- Marquis reagent. It is: 2 ml concentrated sulphuric acid, containing 2 drops of formalin. The reagent gives purple-red to violet colour with opium.
- **Meck's reagent.** It is 1% selenious acid solution in concentrated sulphuric acid. The reagent gives brown to green colour.
- Thin layer chromatography (TLC). TLC gives characteristic R_f values for individual alkaloids of opium.

11.8.6.1.8 Estimation

The purified extracted residue is dissolved in neutral ethyl alcohol. A known volume of 0.02 N sulphuric acid is added to it and kept on a water bath. After 30 minutes the unreacted sulphuric acid is titrated against 0.02 N Na OH solution using methyl red as an indicator.

Each ml of 0.02 N-Sulphuric acid = 57.0 mg opium approximately.

11.8.6.1.9 Toxicological Materials

1. Vomitus
2. Blood, urine
3. Stomach contents
4. Intestines, liver, kidney, brain.

11.8.6.2 Dhatura

Dhatura (Datura fastuasa) exists in many varieties. It grows in the wild. It is also known as thorn apple. All parts of dhatura are poisonous but seeds and fruits are especially so. The active principles are hyoscyamine and hyoscine (Scopolamine). It also contains traces of atropine.

There are about 400 to 500 seeds in each fruit (Thorn Apple).

Fig. 11.2

Dhatura branch with flower and fruit

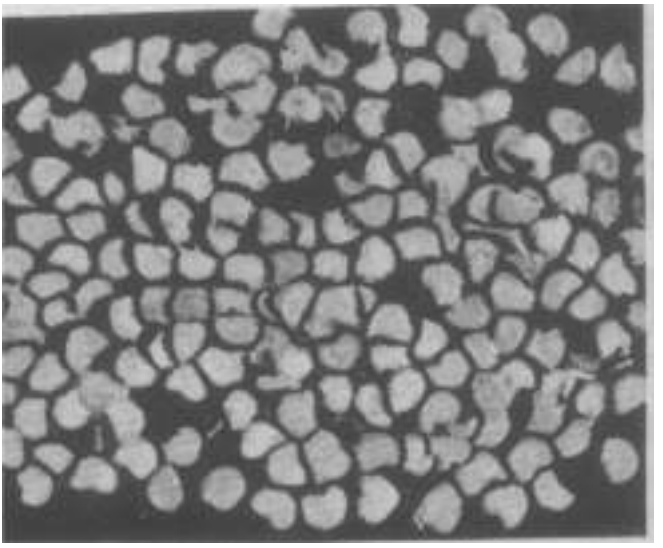

Fig. 11.3

Dhatura Seeds. One fruit contain 400-500 seeds.
The whole plant is poisonous especially the seeds.

11.8.6.2.1 Use/Abuse

Dhatura is used as a medicine, in Ayurveda system of medicine. It is misused as abortifacient. It is mixed in liquors to enhance the intoxication effect. The criminals often use it to stupefy their victims to:

- Rob them.
- Kidnap them (children).

11.8.6.2.2 Administration

Dhatura is administered in the following ways:

- Powdered seeds/ leaves are smoked after mixing them in tobacco.
- The powdered seeds are mixed in sweetmeats and given as PARSAD to the victims. Sometimes it is mixed with the food of the victims.
- Aqueous extracts of plants especially of the seeds, are mixed with liquor drinks and given to the victim.

A boy, in an unconscious state, was found at Kalyan railway station. He was taken to a hospital where he died. The viscera showed Dhatura poisoning A sadhu, from Hajimalang, had given him PRASAD a few hours earlier. The sadhu was located and searched. He still had some PRASAD. The examination showed dhatura in the PRASAD. (CH)

The complainant, with two other companions, was stationed at Durg railway station. An unknown person gave them PRASAD. They became unconscious. The complainant was relieved of his money. In the hospital, the victims recovered. Dhatura was detected in the stomach wash of all the 3 persons. The culprit could not be traced. (CH)

Accidental or suicidal dhatura poisoning cases are rare. It is usually used as a stupefying agent. Sometimes death occurs.

11.8.6.2.3 Symptoms

1. Bitter taste, difficulty in speech, excessive thirst, dryness of mouth and throat
2. Burning pain in the stomach
3. Dilated pupils, flushed face
4. High temperature — "hot as hare"(it inhibits sweating!)
5. Delirium, restlessness, confusion, hallucination, giddiness
6. Coma

11.8.6.2.4 Fatal Dose

- Dhatura is a non-fatal poison usually. However excessive dose: 100–125 seeds (60 mg of dhaturine) can prove fatal. Corresponding dose of dhaturine for children is about 4 mg; 60 mg of hyoscine (the active alkaloid).

11.8.6.2.5 Fatal Period

About 24 hours. Dhatura poisoning fatalities are rare.

11.8.6.2.6 Post-Mortem Findings

There is nothing characteristic. Seed may be found in viscera, gastrointestinal track may be congested and asphyxial signs are often present.

11.8.6.2.7 Solation

The meshed viscera slurry (minced tissues) or other biological materials are treated with 5% acid. Ammonium sulphate is used to precipitate the proteins. The material is heated over a boiling water bath for six hours. The filtrate is extracted with organic solvent in alkaline medium.

11.8.6.2.8 Detection

There are many tests for the poison, including the following:

- **Microscopic Test**. Microscopic examination of seeds or fragments of seeds picked up from stomach contents or vomitus shows characteristic features.
- **Physiological test**. One drop of the purified extracted residue (in 0.5% acetic acid) is installed in cat's eye which becomes dilated after a few hours.
- **Chemical test (Vitalis test).** A few drops of concentrated acid are added to dry residue in a porcelain basin and evaporated to dryness on a hot water bath. After cooling a drop of freshly prepared alcoholic caustic potash solution is added which gives violet colour.

- **Thin layer chromatography (TLC).** TLC gives different R_f values for different constituents of dhatura, such as atropine, and hyoscine.

11.8.6.2.9 Estimation

The extracted purified residue containing Dhatura alkaloids is dissolved in neutral ethyl alcohol. A known volume of 0.02 N sulphuric acid is added to it and kept on a water bath. After 30 min. the unreacted sulphuric acid is titrated against 0.02 N sodium hydroxide solution using methyl red indicator.

Each ml of 0.02 N sulphuric acid used = 5.786 mg atropine alkaloid.

11.8.6.2.10 Toxicological Materials

1. Vomitus
2. Purges and faeces
3. Stomach contents and wash
4. Blood and urine
5. Intestines.

11.8.6.3 Oleander

Fig. 11.4

Oleander is poisonous to humans and animals

11.8.6.3.1 Nature

Oleander is grown in gardens and on roadsides for the beauty of its flowers. It has two varieties, white oleander and yellow oleander.

All parts of the plants are highly poisonous. The active poisonous substances are, **'nerin'** in the case of white oleander and **"Cerberin"** and **"Thevetin"** in yellow oleander. They are

glycosides and behave like digitalis. The various parts of the plant are used as suicidal and homicidal poisons.

11.8.6.3.2 Use

Roots and leaves of the plants are used as medicine in cancer and ulcer treatment. They are also believed to be effective against venereal diseases. The bark in small doses is used as an antipyretic. The roots and leaves are used both internally and through vagina to cause abortion. It is also used as a cattle poison.

11.8.6.3.3 Administration

Oleander poisoning is often accidental when it is used as a medicine to secure abortion. Sometimes it is used as a suicidal poison. Homicidal administration is rather rare.

Oleander is administered in the form of pills. It is mixed with food materials, sweets, soft drinks and liquors. Or, it is administered in the form of decoctions of its roots and leaves.

11.8.6.3.4 Symptoms

1. Burning sensation in the mouth and throat,
2. Frothy salivation
3. Vomiting and diarrhoea with abdominal pain
4. Dizziness, jaw locking, fainting, and death

11.8.6.3.5 Post-Mortem Findings

Seeds or leaf fragments are often found even in putrefied bodies. The gastrointestinal track may be found congested.

11.8.6.3.6 Detection

1. It gives a pink colour on warming with sulphuric acid/phosphoric acid for some time, at 100° C.
2. Ether extract gives crimson colour with sulphuric acid and ferric sulphate.
3. Ether extract, when injected into a frog, produces convulsions in the frog

11.8.6.3.7 Toxicological Materials

1. Vomitus, purges, feces
2. Urine, blood
3. Stomach contents
4. Intestines

11.8.6.4 Madar (Aak, Akdo)

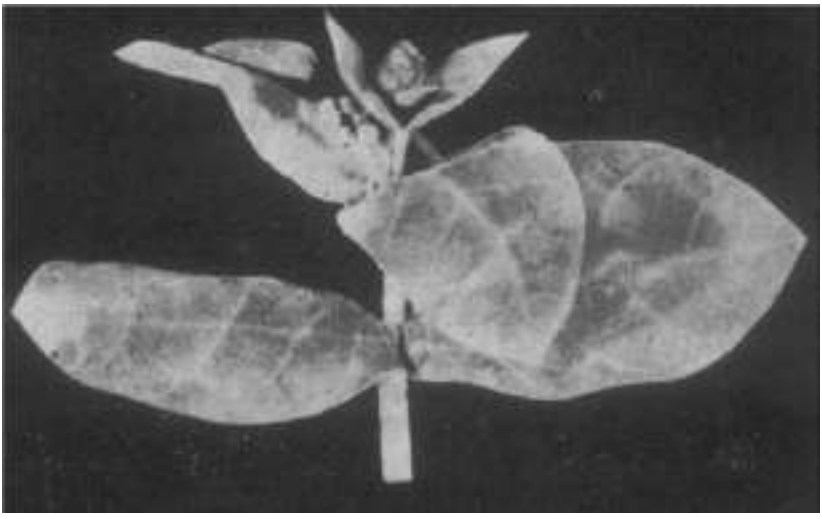

Fig. 11.5

A flowering branch of aak (the plant is used as medicine as well as poison)

11.8.6.4.1 Nature

Madar grows in the wild. All parts are poisonous. There are two varieties one has purple flowers and the other has white flowers. It contains a number of active principles which vary with terrain and climate. Some of the principles are highly poisonous.

11.8.6.4.2 Use

All the parts of the Madar are used in the Ayurvedic system of medicine. It is used to cause abortions and in the tanning of leather. Snake charmers sometimes keep the roots of the plant to control poisonous snakes, which do not like its smell.

They are also used to poison cattle. A rag smeared with madar juice is placed in the rectum of the animal.

Excessive doses of Madar preparations prove fatal. The various parts of the plant have been used for homicidal/suicidal purposes.

11.8.6.4.3 Administration

Madar leaves, flowers, juice and roots are used for criminal purposes. They are given orally/introduced into the body through vagina/rectum.

11.8.6.4.4 Symptoms

1. Bitter taste
2. Burning pain in the throat and stomach
3. Salivation
4. Restlessness

5. Breathing problems
6. Vomiting and diarrhoea
7. Dilated pupil
8. Convulsion, collapse and death

11.8.6.4.5 Post-Mortem Findings

1. Inflammation of food tract and stomach walls
2. Blood may be ooze out from the mouth and nostrils
3. Congestion in stomach, intestines, liver and brain

11.8.6.4.6 Detection

Madar extract is identified by:

1. Characteristic smell
2. Colour test
3. Biological test: injection of purified extract in a frog causes convulsions.

11.8.6.4.7 Toxicological Materials

1. Vomitus, purges, feces
2. Stomach contents
3. Intestines

11.8.7 Animal Poisons

Some species of snakes, scorpions, flies, and insects are poisonous. The most important from the fatal poisoning point of view is the snake. There are about 2500 species of snakes in the world, of which over 200 varieties are found in India. Some snakes are not poisonous or dangerously poisonous, only about 50 of them are dangerous. Some of them, e.g., cobra, krait and viper are very poisonous.

11.8.7.1 Snake Venom

Snake venom is a clear transparent liquid. It is toxic even in the dry state. Snake venom contains a number of poisonous materials, including **neurotoxins, haemotoxins, cardiotoxins,** which affect the body and its parts in different ways. They have usually the following toxic effects:

- **Neurotoxic effect.** The venom affects the nervous system. The person feels weak, giddy, and lethargic. The weakness slowly changes into paralysis.
- **Haemotoxic effect**. The blood does not clot. The wound continues to bleed. The toxin lysine, present in some venom, is responsible to lyse fibrinogen, the protein that promotes coagulation of blood and stops bleeding of wounds.

Snake venom is dangerous when injected into the blood stream. It is more or less harmless when taken orally. It is due to this reason that some people suck out the snake venom. If a person has injuries/ulcers in the mouth or in the food canal, he should not suck the venom. It may cause venom poisoning in him.

11.8.7.2 Administration

Snake venom is rarely used for criminal purposes though there are reported cases where animals were poisoned by snake venom. It was administered through the vagina or rectum. Alternatively, a snake may be made to bite an animal.

Deaths from accidental snakebite poisoning do occur in warm and moist climates.

11.8.7.3 Symptoms

The exact nature of the symptoms varies with the type of snake and the site of the bite but the general symptoms of the snake venom poisoning are:

1. Burning pain
2. Swelling and inflammation at the site of the bite
3. Giddiness, nausea and vomiting
4. Lethargy, muscular weakness, spreading paralysis
5. Bite from a krait may cause severe pain in the abdomen and convulsion before death
6. Difficulty in breathing, swallowing
7. Respiratory failure

11.8.7.4 Post-Mortem Findings

1. Bite marks on the body of the deceased.
2. Haemolysed purple blood
3. Local necrosis
4. Peeling of skin in some cases
5. Continuous blood oozing from the bite site, especially in viper bite

11.8.7.5 Detection

Local washings from the site of bite are also used to test snake poisoning. The extract is injected in frogs, with and without anti-venom serum. The frog without anti-serum should die and the other survives if there is snake poisoning.

11.8.7.6 Estimation

The fatal dose of the extract for a frog is determined. The total quantity is then calculated from the fatal dose.

11.8.7.7 Autopsy Materials

1. The skin around the bite
2. Blood
3. Kidney

11.8.8 Miscellaneous Poisons

11.8.8.1 Methyl Alcohol

11.8.8.1.1 Nature

Methyl alcohol (methanol) is a colourless liquid. Its boiling point is 64.7° C. It is miscible with water and alcohol in all proportions.

11.8.8.1.2 Use

Methyl alcohol is used as a solvent and in the manufacture of dyes and varnishes. It is also important constituent of denatured spirit (mentholated spirit). It is poisonous and causes blindness. It also proves fatal in many cases.[2] It comes to the public mostly as methylated spirit, which are 90 % alcohol and 10% methanol. In addition, contains pyridine and other chemicals to make it unfit/repulsive for drinking purposes.

11.8.8.1.3 Administration

Public consume methyl alcohol in the form of diluted methylated spirit, which is sold to the public by clandestine vendors as an alcoholic beverage.

11.8.8.1.4 Symptoms

1. Dizziness
2. Headache
3. Vertigo
4. Nausea and vomiting
5. Abdominal pain
6. Blurred vision, partial or complete blindness
7. Breathing difficulty, delirium
8. Convulsions, coma
9. Respiratory failure — death

11.8.8.1.5 Post-Mortem Findings

1. Mucous membrane of the stomach is inflamed
2. Lungs are swollen
3. Brain is congested

11.8.8.1.6 Fatal Dose

Fatal dose varies. Usual: 60-200 ml Yet 15 ml has caused blindness.

2. *Chandran v State of Kerala*, Appeal No. 1528 of 2005, decided on 4 April 2011 (Supreme Court), the tragic toll of the tragedy was: Dead, 31; blinded, 6; Seriously injured, 500].

11.8.8.1.7 Fatal Period

Fatal period is usually 24 to 36 hours. But in one case a person has died in one hour. In another case, death occurred after 4 days.

11.8.8.1.8 Isolation

It is isolated by steam distillation of the acidified minced tissues and other biological materials. The distillate contains methyl alcohol as well as ethyl alcohol, along with water.

11.8.8.1.9 Detection

11.28.1.9.1 Chromotropic acid test. — One drop of the distillate is mixed with one drop of 5% phosphoric acid and one drop of 5% $KMnO_4$ solution. After 5 minutes sodium bisulphite solution (5%) is added drop-wise, until the solution is clear. Then 5 ml of chromotropic acid solution (50 mg in 100 ml H_2SO_4) is added and heated in a water bath at 60° C for 30 minutes. A violet colour indicates the presence of methyl alcohol.

11.28.1.9.2 Schiffs reagent test.—To 5 ml of the distillate are added 2 ml of 3% $KMnO_4$ solution and 0.3 ml of concentrated phosphoric acid. After shaking, the contents are left for 10 minutes. Then 1 ml of 10% oxalic acid solution and 1 ml concentrated H_2SO_4 are added. After cooling, 5 ml of Schiff's reagent is added. The mixture is shaken thoroughly and kept for 30 minutes. A pink to purple colour is developed if methyl alcohol is present.

11.8.8.1.10 Estimation

Estimation is done by:

- Tests (1) and (2), described above under detection, through colorimetry.
- Spectrophotometry
- Gas chromatography

11.8.8.1.11 Toxicological Materials

1. Blood and urine
2. Vomitus
3. Stomach contents
4. Tissues

In an outbreak of poisoning due to illicit liquor in the districts of Kanpur and Nainital, many persons suffered from visual disturbances, lost their eyesight and died after consumption of the alleged liquor purchased from clandestine vendors. Ethyl alcohol and methyl alcohol were detected in the portions of viscera of some of the deceased persons, while the deaths of the other victims (from Nainital) were attributed to be due to consumption of tincture ginger prepared from denatured methylated spirit. (CH)

11.8.8.2 Abrus Precatorious (Indian Liquorice Gunchi, Rati)

The seeds are generally of red colour with a black spot at one end. Sometimes white seeds are also met with. The active principle of abrus precatorious seed is **'*abrin*'**, a thermolabile tox-albumin. The powdered seeds are usually employed for destroying cattle. Sometimes it is also used for homicidal purposes in the form of **'*suis*'** by pricking into the skin. Inflammation, oedema and necrosis surrounding the site of the puncture occur, followed by death within one to five days. The symptoms of abrus poisoning are very much like those of snake poisoning Abrin is deactivated by boiling. Gastric juices also reduce its poisonous properties. It is highly

poisonous if introduced in the blood stream. About 10 micrograms of Abrin, injected into the body, can kill a normal person.

Fig. 11.6

A flowering branch of aak (the plant is used as medicine as well as poison)

The sodium chloride solution of the fragments of the '*Sui*' or of the seeds, when injected into a fowl produces inflammation and necrosis at the site of injection, followed by the death of the bird within one to three days.

11.8.8.3 Aconite

Among Indian species, "*Aconitum Chasmanthum*" is the chief source of aconite. It is largely used in medicine. The root and all the parts of this plant are poisonous, the main toxic principle being **aconitine**. Cases of suicidal and homicidal poisoning by aconite do occur in India. The extract of aconite, when applied to the tongue, produces tingling and numbness sensations on the tongue and lips, lasting for several hours.

This is the characteristic and confirmatory physiological test of this poison.

The fatal dose is about 2 g of aconite root. 5 mg of the active principle aconite can prove fatal.

The fatal period is less than 20 hours.

11.8.8.4 Barium Carbonate

This is a fine white powder, largely used as rat poison. Free hydrochloric acid of the stomach converts it into soluble barium chloride—a highly poisonous substance.

11.8.8.5 Cannabis

The products of the cannabis plant are commonly known as *bhang*, *ganja* and *charas,* in India. In other countries the cannabis products are known by a host of other names.

Cannabis has a characteristic odour, which is more prominent when the substance is burnt.

The main active principles of the plant are cannabinol, cannabidiol, tetrahydrocannabinol (THC) and cannabidiolic acid. Tetrahydrocannabinol (THC) is mainly responsible for its physiological activities.

Fatal poisoning of human beings by cannabis products is rare. Continued excessive abuse can chronic poisoning The patient lives in a state of stupor and suffers from melancholia and hallucinations.

Cannabis or its products do not create poisoning problems in India.

11.8.8.6 Carbon Monoxide

Carbon monoxide is a highly poisonous gas. Carbon monoxide poisoning generally occurs when the victim sleeps in a closed room in which a coal '*angithi*' is burning

Carbon monoxide is absorbed in the blood through the lungs and forms carboxyhaemoglobin. The oxygen carrying capacity of the blood is reduced. It results in death when carbon monoxide blood saturation is over 40%. Air is safe only if carbon monoxide is less than 0.01%. If it exceeds 0.25% the exposed persons die in about 4 to 5 hours. 1% carbon monoxide in the air can kill a person in minutes (~15 minutes).

The detection and determination of carbon monoxide in the blood is done by Hartridge's Reversion Spectroscope.

11.8.8.7 Caustic Alkali

Caustic soda, caustic potash and other hydrates and carbonates act as corrosive poisons when consumed in the concentrated form. However, in the dilute form they act as irritant poisons.

The main symptoms are acrid and soapy taste, sense of heat and burning pain in the throat and stomach. Death may occur from suffocation due to inflammation of the glottis or from broncho-pneumonia.

11.8.8.8 Chloral Hydrate

This is a colourless, crystalline substance having a characteristic pungent smell. It is readily soluble in water and alcohol. In certain areas, it is known as '*Sukka Sharab*' (dry liquor). It is added to alcoholic drinks by clandestine vendors to increase the potency of the drink.

Chloral hydrate is also used as a hypnotic in medicine.

11.8.8.9 Cyanogenetic Glycoside

Certain naturally occurring vegetable substances such as bitter almond, linseed oil seeds, leaves of cherry laurel, kernels of common cherry, plum, peach, certain stone fruits, Juwar plant and other millets contain poisonous substances known as cyanogenetic glycosides. In the presence of water and a natural enzyme called emulsin, these cyanogenetic glycosides are readily hydrolysed and free hydrocyanic acid is liberated, which is a deadly poison.

The presence of cyanogenetic glycoside is tested by copper benzidine, guiacum or picric acid test papers.

Fig. 11.7

Poisonous plants killed many animals in district Mandi, HP, some years ago (Juwar plant)

11.8.8.10 Ergot

It is a parasitic fungus, attacking the grains of several plants such as rye, oats, wheat, barley and bajra in wet seasons. It is used in some medicinal preparations. It was largely used as an abortifacient. Its improper use by quacks results in deaths.

11.8.8.11 Kuchila (Strychnos nux vomica)

The seeds of Kuchila (*Strychnos nux vomica*) are grey coloured flat circular discs slightly concave on one side having a shining surface with short silky hair. These seeds contain two main alkaloids, **strychnine** and **brucine**. Both are poisonous but strychnine is about 10 times more poisonous than brucine.

The symptoms are stiffening of the body; starting sporadically and then continuously.

11.8.8.12 Lead Salts

Lead acetate, carbonate, chromate, nitrate and other salts of lead are poisonous. Lead poisoning known as plumbism occurs mainly among people working in industries and factories dealing with lead and its salts. The poisoning occurs due to inhalation of lead dust and fumes. It also results from tinned foodstuff, which gets contaminated with lead. Red lead, used as an abortifacient by quacks, may also produce poisoning Sometimes, lead particles due to gunshot injuries, which remain embedded in the body, may also produce poisonous symptoms after weeks or after long intervals.

In plumbism, the victim excretes lead through urine and faeces.

11.8.8.13 Mercury Salts

Metallic mercury is not considered to be poisonous but under certain conditions it undergoes some chemical changes in the body and acts as a poison. The vapours of mercury are poisonous. Soluble salts of mercury such as nitrate, sulphate and mercuric chloride (also known as corrosive sublimates) are highly poisonous. The symptoms of poisoning appear within half an hour. The main symptoms are, choking sensation in the throat, hoarse voice, difficulty in breathing and burning sensation in the abdomen.

Death takes place within a few hours after ingestion of the poison.

11.8.8.14 Mushrooms

These are forms of fungi. Edible mushrooms are used as vegetables but some varieties are poisonous. Several cases of mushroom poisoning have been reported in the literature. Some persons may show toxic symptoms by after eating even edible mushrooms due to body idiosyncrasy!

11.8.8.15 Mechanical Poisons

Diamond or diamond powder is a well-known mechanical poison. Powdered glass, needles and animal or vegetable hairs also act as mechanical irritants and poisons. When these are swallowed, they cause irritation of the stomach and bowels due to their sharp edges and points and sometimes rupture the intestine and cause death.

11.8.8.16 Nicotine

Tobacco is used throughout the world for smoking, in cigarettes, cigars, pipes, It is also chewed either alone or mixed with lime.

Tobacco contains an alkaloid 'Nicotine', which is one of the deadliest poisons. Only three to four drops of the pure nicotine, if taken internally, may prove fatal. Tobacco dry leaves contain from 0.6 to 6% nicotine. Persons consuming an excess of tobacco for a long period may suffer from chronic poisoning.

11.8.8.17 Oxalic Acid

It is a colourless crystalline substance, resembling sugar in appearance. It is soluble in water and alcohol. The concentrated solution of oxalic acid acts as a corrosive poison.

The symptoms appear immediately. They are: sour acidic taste, thirst, burning pain in the mouth, throat and stomach, feeling of numbness of the limbs, quick respiration, and coma. Death follows.

11.8.8.18 Quinine

Quinine is a well-known anti-malarial drug. Sometimes accidental poisoning occurs due to overdose or owing to the individual's idiosyncrasy. At times, the medicinal dose of quinine also produces poisoning in some persons.

Quinine is also used as an abortifacient, which sometimes proves fatal.

11.8.8.19 Sodium Nitrite

It is a white crystalline substance readily soluble in water. It is largely used in the dyeing industry. On account of its easy availability, the cases of nitrite poisoning are more frequent in areas near the dyeing industries.

The main symptoms are giddiness, headache, vomiting, purging, weakness, hurried breathing and unconsciousness, followed by death.

11.8.8.20 Mineral Acids

Sulphuric acid and nitric acid are used extensively in industry. In concentrated form, the acids are highly corrosive. They destroy the tissues when they act on them.

The internal administration of the concentrated acids produces intense burning pain from mouth to stomach; intense thirst and difficulty in swallowing Lips and mouth are corroded. Nitric acid action turns the skin yellow. Death may occur due to shock within a few hours.

Internal administration of acids, for murder, is not common but acid throwing cases often occur and they are on the increase. They produce severe burns and may cause even death (due to shock). However, there are a few reported cases of suicide by strong mineral acid ingestion.

11.8.8.21 Zinc Phosphide

It is a fine black powder commonly used as rat poison. Recently, human poisoning by zinc phosphide has increased considerably.

The main symptoms are frequent vomiting/purging, followed by unconsciousness. Being a fine powder it adheres in the crypts and cavities of the stomach and is not completely eliminated through vomiting. Death may ensue from the liberation of phosphine from the adhered material.

11.9 PRESENTATION

A chemical examiner's report is covered under section 293 of the Code of Criminal Procedure, 1973. That is, the report is accepted as evidence without the appearance/oral evidence of the chemical examiner. However, if the judges feel that personal attendance of the expert is essential, he can summon the chemical examiner, to elicit/ elucidate/elaborate or provide additional information on the topic.

In view of the fact that the reports are accepted as evidence, it is necessary that the reports are comprehensive, containing the information:

1. The mode of receipt of the articles for examination.
2. The date of receipt of the articles.
3. The description of packages: sealed/unsealed, seals intact, seals tallying with the specimen seals, number of seals, writings, signatures, thumb impression on the parcels.
4. The complete description of the articles.
5. The identification marks, the laboratory serial number, put by the examiner on the articles. All the packages and articles should carry the number, properly secured to the article or package.
6. The names of the tests carried out by the examiner with brief details.
7. The brief description of the observations made from these tests.
8. The brief description of the inferences drawn from these observations with reason.
9. The qualitative and quantitative results arrived at after these observations.
10. The date(s) of examination of the exhibits.
11. The photographs, sketches and diagrams, if any, are attached with the report with explanatory notes.
12. The negative evidence is explained.
13. The report is precise, concise, intelligible and in nontechnical language.

The courts are wary of accepting incomplete/bare reports as evidence.

11.10 JUDICIAL PROOF

In suspected homicidal poisoning cases, the judicial proof demands proof of the following entities beyond reasonable doubt:

1. The victim died of poisoning.
2. The accused had the motive for killing or injuring the victim.
3. The accused had the poison in his possession.
4. The accused had the opportunity to administer the poison.
5. The accused did administer the poison.

11.10.1 Poisoning

The following evidence proves the proposition that the victim died of poisoning:

1. The poison was found in the body, vomitus or purges of the person. It is the best proof of poisoning But it is not always available:
   - The body is missing, excessively putrefied, destroyed by cremation, eaten by the beasts,
   - Poison is metabolized to non-identifiable metabolites.
   - The poison is eliminated by vomiting, purges, stomach wash, antidotes.
2. The victim exhibited the symptoms of poisoning.
3. The body of the victim carries symptoms of poisoning.
4. There were witnesses who saw the victim administering/consuming the poison.
5. There was no evidence of disease in the victim before/after the death.[33]

11.10.2 Possession of the poison

The following evidence proves the possession of the poison with the suspect:

1. The poison was recovered from the suspect.
2. The suspect purchased the poison.
3. The poison was part of the household effects.
4. The hobby of the suspect involved access to the poison.
5. The suspect dealt with the poison officially.
6. The suspect had knowledge about the herbal poisons.
7. The accused had access to the poison.

11.10.3 Opportunity

The following evidence indicates the opportunity:

1. They were members of the household (family).
2. They were friends or acquaintances.
3. They were seen together.
4. Witnesses saw the administration.

11.10.4 Motive

The motive for poisoning is proved (found) from the background of the victim and the accused from the acts of omission and commission and the circumstantial evidence. For example, in the above case, the Supreme Court found that the accused had drawn money from the account of the victim by forgeries.

11.10.5 Absence of disease/other Causes

The medico-legal expert examines this angle as a part of post-mortem examination and certifies the cause of death. In the above referred case, the factum was taken into consideration and mentioned in their judgment.

---

3. *Anant Chintaman Lagu v State of Bombay,* AIR 1960 SC 500 : (1960) : 2 SCR 460 : 1960 Cr LJ 682 (SC).

ANNEXURE 1

POISONS OF ANIMAL ORIGIN

S. No.	Poison	Administration	Fatal Dose	Fatal Period	Symptoms	Evidentiary Clues	Active Principles	Action
1.	Venom Cobra Viper Sea snake	Bite " " "	 15 mg (dry) 40 mg (dry) 10 mg (dry)	Minute To hours/ Days	1. Burning at site. 2. Giddiness, 3. Weakness to paralysis 4. Salivation. 5. Speaking difficult 6. Breath slow 7. Ceasing of respiration 8. Bite marks 1 to 2 cm. deep 9. Local pain severe, swelling 10. Bleeding from bite site, gums, rectum, nose, etc.	1. Skin & tissue from bite site. 2. Vasculotoxic 4. Myotoxic
2.	Scorpion Venom	Sting	———	———	1. Severe pain 2. Burning pain 3. Headache,giddiness 4. Perspiration. 5. Cramps 6. Sometimes unconscious	1. Skin/ tissues around sting 2. Haemolysed blood 3. Washings from the sting	Toxalbumins	Neurotoxic Haemotoxic

ANNEXURE II

POISONS OF VEGETABLE ORIGIN

S. No.	Poison	Administration	Fatal Dose	Fatal Period	Symptoms	Evidentiary Clues	Active Principles	Action
1.	Abrus Precato-rious	1. Extract injected. Placed in the wound. 2. Powder formed into a 'sui' and inserted in the body	Extract from 1-2 seeds (90 - 120 mg) powder.	3-5 days	Site: Odema, inflammation. Loss of appetite. Severe pain. Death.	1. Residue of powdered seeds in the wound. 2. Clothes of the victim. 3. Body site attacked. 4. Paraphernalia used.	Abrin: 1 to 2 microgram fatal	Toxalbumin
2.	Aconite (*Mitha Zahar*)	1. Betel Leaf 2. Sweetmeats 3. Arrow poison	1 gm. Roots 250 mg extract 4 mg of alkaloid	1-24 hours	Tingling, numbness of the body parts in contact (lip, mouth,) salivation giddiness, convulsion. Respiratory paralysis.	Vomitus, stomach wash, viscera	Aconitine	1. Ventricular fibrilation 2. Respiration paralysis
3.	*Dhatura* (Road Poison)	1. Food (powder seeds in). 2. Tobacco/bidi. 3. Candy sweets	100-125 (1gm.) Seed powder, alkaloid 60 mg	24 hours	Bitter taste, dry mouth, flushed face, dilated pupils, vomiting, giddiness, confusion delirium, hallucination, stupor – coma–death.	Stomach contents (*Dhatura* Seeds), vomitus, purges	1. Hyoscyamine 2. Hyocine or (Scopvlamine) 3. Atropine	Hyocine used as truth serum.
4.	Madar Akdo, Calotropis	1. Snuff 2. Mixed food/ drink 3. Body orifices 4. Poison arrow	Variable uncertain	one-second to 8 hours, < 12 hours	Burning sensation on skin in contact, nausea, vomiting, diarrhea, dilated pupil. convulsion, delirium, collapse, death.	1. Wash from the site. 2. Viscera. 3. Affected tissue.	1. Calotoxin 2. Calotropin 3. Uscharin	1. Gastro-intestinal poison 2. Cerebrospinal poison

S. No.	Poison	Administration	Fatal Dose	Fatal Period	Symptoms	Evidentiary Clues	Active Principles	Action
5.	Capsicum (Chillies)	Introduced in body orifices	Usually non-fatal	———	1. Skin irritation, inflammation. 2. Intense Lachrimation	1. Washings 2. Viscera. 3. Affected tissue.	Capsicin	Local irritant
6.	Colocynth (bitterapple)	Oral	1–2 gm.	~24 hours	Severe abdominal pain	1. Washing 2. Viscera 3. Bloodstain 4. Vomiting	Colocynthin, resinous glycocide.	Irritant Affect kidney. Collapse, Death
7.	Croton tiglium (*Jamalgota*)	Oral Inhalation	4 seeds ~ 20 drops of oil.	~6 hours	Blisters, severe gastrointestinal and abdomen pain, and powerful purging	Washings, Viscera	Crotin	Toxalbumin Irritant
8.	Digitalis (Digitalis purpurea Floxglove)	Oral	1.5 mg digitoxin, 30 mg digitalin	~24 hours	Irritation of stomach nausea, vomiting, giddiness heart block, drowsiness, coma, death.	Viscera	1. Digitoxin 2. Digitalin 3. Digitalein 4. Digitonin	1. Affect heart muscles. 2. Cummulative action.
9.	Ergot	Oral	1 gm.	Variable > 24 hours, to 7 days	Irritation in throat, nausea, vomiting, diarrhea, pain in abdomen, cramps.	Viscera	1. Fungus growth on cereals especially rye. 2. Ergotoxin. 3. Ergoplamine 4. Ergometrine.	Contraction of muscles Hypoglycemia

S. No.	Poison	Administration	Fatal Dose	Fatal Period	Symptoms	Evidentiary Clues	Active Principles	Action
10.	Hyseyamus	Oral	15 – 30 mg of hyoscine or 125 mg of hyoscyamine	< 24 hours	Bitter taste, stomach pain, dry mouth, flushed face, dilated pupils, vomiting giddiness, dilirium stupor, coma, death	Stomach wash or Viscera	1. Atropine 2. Hyoscine 3. Hyoscyamine	Affects brain used as truth serum.
11.	Marking Nut	1. Skin 2. Oral 3. Orifices	10 mg	< 24 hours	Blisteron skin, severe gastrointestinal irritation, coma, death.	Blister fluid in rectified spirit.	1. Semecarpol 2. Bhilawanol.	Irritant (also used as abortifacient)
12.	Nicotine	1. Ingestion 2. Inhalation	50 mg	Uncertain minutes to hours	Burning, pain, bitter taste, nausea, weakness, coma.	Viscera, blood, urine	Nicotine	Paralysis of mid-brain, spinalcord
13.	Kuchila Nux Vomica (Strychnos)	Oral, wounds, skin	2 g powder/ 15-20 mg alkaloid	1-2 hours	Bitter, body stiffens, convulsions, blood stained froth	Viscera, spinal cord	1. Strychnine 2. Brucine 3. Loganin	Excessive stimulation of spinalchord
14.	Kaner, White Oleander	Oral/local	15 g roots (extract)	< 24 hours	Vomitting, pain in abdomen, Salivation, Breathing trouble, muscular twitching, Spasm, exhaution, death	Viscera	Nerin: 1. Neriodorin 2. Neriodorein 3. Karabin (all Glycosides)	Cardiac arrest, spinal cord spasm.
15.	Yellow Oleander	Oral	8-10 seeds	< 24 hours	Burning feeing, vomitting, motions, headache spasm coma, death	Viscera	Thevitin, Thevotoxin Cerebrin (glycosides)	Cardiac arrest, spasm

11.12 CASE LAW

11.12.1 Circumstantial Evidence for poisoning:[4]

Author's Summary

Landmark Judgment: It is a diabolical murder by the family doctor of the victim for money. The victim was diabetic moneyed patient under his treatment. He gave her an overdose of insulin while travelling with her on a train to Mumbai. It put her in coma. He on reaching Mumbai got her admitted in the hospital and vanished from the scene. The lady did not recover from the coma and died.

Postmortem of the deceased did not reveal the cause of death. However, the medico legal experts found that she did not suffer any fatal ailment.

The circumstantial evidence against the family doctor was substantial. He was convicted for murder by the trial court. The High Court and the Supreme Court maintained the conviction in spite of the fact that basic element of poisoning death were not proved.

Highlights italicised

Relevant Extracts Verbatim

Our findings thus substantially accord on all the relevant facts with those of the two courts below, though the arrangement and consideration of the relevant evidence on record is somewhat different. It is now necessary to consider the arguments which have been advanced on behalf of the appellant. The first contention is that the essential ingredients required to be proved in all cases of murder by poisoning were not proved by the prosecution in this case. Reference in this connection is made to a decision of the Allahabad High Court in *Mt. Gajrani v Emperor*,[5] and to two unreported decisions of this court in *Chandrakant Nyalchand Seth v State of Bombay*,[6] decided on February 19, 1958. In these cases, the court referred to three propositions, which the prosecution must establish in a case of poisoning:

(a) that death took place by poisoning;

(b) that the accused had the poison in his possession; and

(c) that the accused had an opportunity to administer the poison to the deceased.

The case in Cr. A. No. 98 of 1958, D/-4-11-1958 (SC) turned upon these three propositions. There, the deceased had died as a result of poisoning by potassium cyanide, which poison was also found in the autopsy. The High Court had disbelieved the evidence which sought to establish that the accused had obtained potassium cyanide, but held, nevertheless, that the circumstantial evidence was sufficient to convict the accused in that case. The court did not, however, accept the circumstantial evidence as complete.

It is to be observed that the three propositions were laid down not as the invariable criteria of proof by direct evidence in a case of murder by poisoning, because

- *evidently if after poisoning the victim the accused destroyed all traces of the body, the first proposition would be incapable of being proved except by circumstantial evidence.*

4. *Anant Chintaman Lagu v The State of Bombay,* AIR 1960 SC 500 : (1960) 2 SCR 460 : 1960 Cr LJ 682 (SC).
5. AIR 1933 All 394 : 34 Cr LJ 754.
6. Cr. A No. 120 of 1957.

- *Similarly, if the accused gave a victim something to eat and the victim died immediately on the ingestion of that food with symptoms of poisoning and poison, in fact, was found in the viscera, the requirement of proving that the accused was possessed of the poison would follow from the circumstance that the accused gave the victim something to eat and need not be separately proved,*

There have been cases in which conviction was maintained, even though the body of the victim had completely disappeared, and it was impossible to say, except on circumstantial evidence, whether that person was the victim of foul play, including poisoning Recently, this court in *Mohan v State of Uttar Pradesh*,[7] decided on November 5, 1959, held that the proof of the fact of possession of the poison was rendered unnecessary, because the victim died soon after eating *pedas* given by the accused in that case, and he had not partaken any other food likely to contain poison.

In *Dr. Palmer's* case, Notable Trials Series, strychnine was not detected, and the accused was convicted by the jury after Lord Chief Justice Campbell (Cresswell, J. and Mr. Baron Alderson concurring) charged the jury that the discovery of the poison on autopsy, was not obligatory, if they were satisfied on the evidence of symptoms that death had been caused by the administration of strychnine. The conduct of Palmer, which was also significant, was stressed inasmuch as he had attempted to thwart a successful chemical analysis of the viscera, and had done suspicious acts to achieve that end.

In *Dr. Crippen's* case,[8] the conduct of the accused after the death of Mrs. Crippen in making the friends and relatives believe that Mrs. Crippen was alive, was considered an incriminatory circumstance pointing to his guilt. No doubt, in *Dr. Crippen's* case, the body was found and poison was detected, but there was no proof that *Dr. Crippen* had administered the poison to her, that being inferred from his subsequent conduct in running away with Miss Le Neve. In the second case of this court, the poison was available to the victim, and it was possible that she had taken it to end an unhappy life.

The cases of this court which were decided, proceeded upon their own facts, kept in mind always, the sufficiency of the evidence, direct or circumstantial. To establish murder by poisoning will depend on the facts of each case. If the evidence in a particular case does not justify the inference that death is the result of poisoning because of the failure of the prosecution to prove the fact satisfactorily, either directly or by circumstantial evidence, then the benefit of the doubt will have to be given to the accused person. But if circumstantial evidence, in the absence of direct-proof of the three elements, is so decisive that the court can unhesitatingly hold that the death was a result of administration of poison (though not detected) and that the poison must have been administered by the accused person, then the conviction can be rested on it.

* * * * *

In (1952) NZLR 111, where the entire case law in England was presented for the consideration of the court, it was pointed out by the court that

- there was no rule in England that *corpus delicti* must be proved by direct evidence establishing the death of the person and
- further, the cause of that death. Reference was made to *Evans v Evans*,[9] where it was ruled that *corpus delicti* might be proved by direct evidence or by "irresistible grounds of presumption". In the same case, it has been pointed out that in New Zealand the court upheld numerous convictions, where the body of the victim was never found.

7. *Mohan v State of Uttar Pradesh*, AIR 1960 SC 659 : 1960 Cr LJ 1011.
8. Notable Trial Series.
9. 161 ER 466 (491).

The rule of law stated by Sir Matthew Hale in *Pleas of the Crown* Vol. 2, p. 290, that

> I would never convict any person of murder or manslaughter, unless the fact was proved to be done, or at least the body found dead" was not accepted in this and other cases.

Lord Goddard also rejected the statement as one of universal application, in the case to which we have already referred.

- The case of *Mary Ann Nosh*,[10] is illustrative of the proposition that even though the cause of death may not appear to be established by direct evidence the circumstances of the case may be sufficient to infer that a murder has been committed. In that case, the prisoner had an illegitimate son, 5 years old. There was evidence to show that the mother desired to put the child out of her way. One day in June, 1907, the mother left the house and returned without the child. She made several statements as to what had happened to the child, which were found to be untrue. As late as April 1908, the body of a child was discovered in a well. Decomposition had so far advanced that even the sex of the child could not be determined. There was nothing therefore to show whether the death was natural or violent, or whether it had occurred before or after the body was put into the well. The case was left to the jury. On appeal, it was contended that there being no proof how death took place, the judge should not have left the case to the jury but ought to have withdrawn it. Lord Chief Justice delivering the judgment of the Court of Appeal referred to the untrue statements of the prisoner about the whereabouts of the child, and observed as follows:

> *All these statements were untrue. She had an object in getting rid of the child, and if it had been lost or met with an accidental death, she had every interest in saying so at once. It is said there is no evidence of violent death, but we cannot accept that Mr. Goddard cannot have meant that there must be proof from the body itself of a violent death....In view of the facts that the child left home well and was afterwards found dead, that the appellant was last seen with it, and made untrue statements about it, this is not a case which could have been withdrawn from the jury.*

* * * * *

A case of murder by administration of poison is almost always one of secrecy. The poisoner seldom takes another into his confidence, and his preparations for the commission of the offence are also secret. He watches his opportunity and administers the poison in a manner calculated to avoid its detection. The greater his knowledge of poisons, the greater the secrecy, and consequently the greater the difficulty of proving the case against him. What assistance a man of science can give he gives; but it is too much to say that the guilt of the accused must, in all cases, be demonstrated by the isolation of the poison, though in a case where there is nothing else such a course would be incumbent upon the prosecution. There are various factors which militate against a successful isolation of the poison and its recognition. The discovery of the poison can only take place either through a post-mortem examination of the internal organs or by chemical analysis. Often enough, the diagnosis of a poison is aided by the information which may be furnished by relatives and friends as to the symptoms found on the victim, if the course of poison has taken long and others had an opportunity of watching its effect.

Where, however, the poison is administered in secrecy and the victim is rendered unconscious effectively, there is nothing to show how the deterioration in the condition of the victim took place and if no poison but disease is suspected, the diagnosis of poisoning may be rendered difficult. In *Champman's* case. Notable Trials Series, the victim (Maudmarsh) was

10. 1911 Cr App rule 225.

sent to Guys Hospital, where the doctors diagnosed her condition to be due to the various maladies "including cancer, rheumatism and acute dyspepsia". It is clear that doctors can be deceived by the symptoms of poison into believing that they have a genuine case of sickness on hand. In *Dr. Palmer's* case, Notable Trials Series, two medical witnesses for the defence diagnosed the case from the symptoms as being due to Angina Pectoris or epilepsy with the tetanic complications.

The reason for all this is obvious. Lambert in his book, "*The Medico-Legal Post-mortem in India*" (pp. 96, 99-100) has stated that the pathologist's part in the diagnosis of poisoning is secondary and has further observed that several poisons particularly of the synthetic hypnotics and vegetable alkaloids groups do not leave any characteristic signs which can be noticed on post-mortem examination, (see Modi's "*Medical Jurisprudence and Toxicology*", 13th Edition, pages 450-451 and Taylor's "*Principles and Practice of Medical Jurisprudence*", Volume II, page 229). The same is stated by Otto Saphir in his book "*Autopsy*" at pp. 71 and 72. In Dreisbach's "*Handbook of Poisons*" 1955, it is stated that pathological findings in deaths from narcotic analgesics are not characteristic. He goes further and says that even the laboratory findings are non-contributory. The position of the pathologist who conducts a post-mortem examination has been summed up by Modi in "*Medical Jurisprudence and Toxicology*", 13th Edn., p. 447 as follows:

> *In order to make a probable guess of the poison and to look for its characteristic post-mortem appearances, it is advisable that a medical officer, before commencing a post-mortem examination on the body of a suspected case of poisoning, should read the police report and endeavour to get as much information as possible from the relatives of the deceased regarding the quality and quantity of the poison administered, the character of the symptoms with reference to their onset and the poison and the development of the first symptoms, the duration of the illness, nature of the treatment adopted, and the time of death. He will find that in most cases the account supplied by the police and the relatives is very meagre, or incorrect and misleading His task is, therefore, very difficult, especially when many of the poisons except corrosives and irritants do not show any characteristic post-mortem signs and when bodies are in an advanced state of decomposition.....*

Similarly, Gonzales' *Legal Medicine and Toxicology*' states at p. 629:

> *The question of whether or not a negative toxicological examination is consistent with death by poison can be answered affirmatively, as many persons overcome by carbon monoxide die after twenty-four hours, at which time the gas cannot be determined in the blood by chemical tests. Likewise, the organs of individuals who have been poisoned by phosphorus may not contain the toxic substance responsible for the death if they have managed to survive its effects for several days.*

Many conditions seriously interfere with the toxicological examination, such as post-mortem decomposition.....

We need not multiply authorities, because every book on toxicology begins with a statement of such a fact. Of course, there is a chemical test for almost every poison, but it is impossible to expect a search for every poison. Even in chemical analysis, the chemical analyser may be unsuccessful for various reasons. Taylor in his "*Principles and Practice of Medical Jurisprudence*" (Vol. II, p. 228), gives three possible explanations for negative findings, *viz.*,

(1) the case may have been of disease only;

(2) the poison may have been eliminated by vomiting or other means or neutralised or metabolised; and

(3) the analysis may have been faultily performed.

Svensson and Wendel in "*Crime Detection*" have stated at p. 281 that:

> *Hypnotics are decomposed and disappear very quickly some even in the time which elapses between the administration and the occurrence of death.*

Circumstantial evidence in this context means a combination of facts creating a network through which there is no escape for the accused, because the facts taken as a whole do not admit of any inference but of his guilt. To rely upon the findings of the medical man who conducted the post-mortem and of the chemical analyser as decisive of the matter is to render the other evidence entirely fruitless. While the circumstances often speak with unerring certainty the autopsy and the chemical analysis taken by themselves may be most misleading No doubt, due weight must be given to the negative findings at such examinations. But, bearing in mind the difficult task which the man of medicine performs and the limitations under which he works, his failure should not be taken as the end of the case, for on good and probative circumstances, an irresistible inference of guilt can be drawn.

In the present case, the effort of the appellant has been to persuade the court that the death of Laxmibai was possibly the result of disease rather than by poison. During the course of the case and the appeal, various theories have been advanced and conflicting diagnoses have been mooted. The case of the appellant has wavered between death by diabetic coma and by hypoglycemia, though relying upon the condition of the arteries and the aorta and the rigidity of the neck, suggestions of coronary complications and renal failure have also been made. We have shown above that this was not a case of diabetic coma because of the absence of the cardinal symptoms of diabetic coma. This also is the opinion of Dr. Variava and Dr. Mehta, though Dr. Jhala, for reasons which we have indicated, accepted it. The appellant argued again the case from the angle of diabetic coma, but later veered in favour of hypoglycemia. This change is noticeable not only in the arguments before us but also throughout the conduct of the case is merely to confuse the issue, and create, if possible a doubt, which would take the mind away from the surrounding circumstances and focus it only upon the medical aspect of the case. Full advantage has been taken of the findings of Dr. Ugale and Dr. Miss Aneeja, which suggest partly an onset of diabetic coma, partly of hypoglycemia and partly of renal failure. There is no true picture of any one disease. The rigidity of the neck was not reflected in the chemical analysis of the cerebro-spinal fluid and was negatived, insofar as renal failure is concerned, by the negative findings about albumen. Diabetic coma stood ruled out by the presence of the Babinsky sign and the suddenness of the onset, the negative aspect of acetone and the rather remarkable failure of the specific treatment given for it to have worked any change. Driven from these considerations to such doubtful suggestions as coronary complications of which no physical evidence was found by Dr. Jhala, the appellant put his case on hypoglycemia, and relied upon the fact that at the hospital 40 units of insulin intravenously and another 40 units subcutaneously were administered. Medical textbooks were quoted to show that in the case of the hypoglycemic coma the introduction of even a small quantity of insulin sometimes proves fatal. The learned advocate general stoutly resisted this move, which was at variance with the case as set out before the High Court, because it is obvious enough that if one accepted the theory of hypoglycemic coma, the only injections of insulin causing such shock would be proved to have been given at the hospital and not by the appellant. Here, the position, however, is not so difficult for the state, because Laxmibai was found to have 4 oz. of pasty meal in her stomach, and with food inside her, the possibility of hypoglycemia taking place naturally was extremely remote. If it was hypoglycemic coma due to excessive administration of insulin, then it must have been administered prior to its onset, and who could have given it but the appellant? Even though coma supervenes suddenly, the patient passes through symptoms of discomfort, and Laxmibai would have told the appellant about it in the train. The appellant mentioned nothing of this to Dr. Ugale. If an excessive dose of insulin was given by the appellant, the question of intent would arise, and the conduct shows the intention. There were no pronounced symptoms of hypoglycemia either. Laxmibai just passed from unconsciousness to death without the

manifestation of any of the signs associated with the syndrome of hypoglycemic death. It is also to be remembered that hypoglycemic coma is generally overcome by the administration of a very small quantity of glucose 5 or 10 grams of glucose orally: *Treatment of Diabetes Mellitus* by Joslin, Root and White, p. 350. The 40 units given intravenously were mixed with 20 c.c. of glucose and carried the palliative with them. Even otherwise, Laxmibai was receiving glucose by intragastric drip, and during the three and a half hours there should have been an improvement. The surprising part is that the administration of the insulin and glucose brought about no visible symptoms in the patient either for better or for worse. She passed into death, and the inference can only be that she did not die of these diseases of which she was either suspected or for which she was treated but of something else, which could not answer to the treatment given to her.

Dreisbach in his *Handbook on Poisons* at page 27 has stated that coma also results from the action of several poisons. Depressants, sedatives and hypnotics all cause death by coma (*ibid.* p. 201). The symptoms, according to the author, are sleepiness, mental confusion, unsteadiness rapidly followed by coma with slow, shallow respiration, flaccid muscles and absent deep reflexes. The difference between coma due to disease and coma as the result of poisons is stated by him in the following words:

> *Coma from poisoning presumably results from some interference with brain cell metabolism. In attempting to combat the effects of drugs which induce coma, remember that no agents are known which will specifically overcome the metabolic derangements of a drug-induced coma. The mechanism of action of cerebral stimulant drugs is also unknown, but these drugs presumably act by depressing some inhibiting function in the cell. There is no evidence that any stimulants specifically oppose the cellular metabolic depression induced by depressant drugs such as the barbiturates.*

No specific antidote is known for sedative and hypnotic drugs (*ibid.*, p. 202).

The condition of Laxmibai clearly indicated an impairment of the central nervous system. It is no doubt true that in some cases of coronary thrombosis, coma supervenes; but it is idle to suggest in the present case that Laxmibai was afflicted by this type of coma, because Dr. Jhala who performed the post-mortem examination and opened the coronary arteries found no evidence of thrombosis. According to Otto Saphir, a myocardial infarct is easily detected (*Autopsy*, p. 301-302). Coma in *Laxmibai's* case, as we have shown above, was not the result of acidosis, hypoglycemia, renal failure or meningeal irritation. Her liver, pancreas and kidneys were found to have no pathological lesions and it is significant that no question was even attempted to establish that the opinion of Dr. Jhala on this part of the case was incorrect. Learned counsel for the appellant suggested that the examination by Dr. Jhala might have been superficial, and might not have included a microscopical examination of sections of some of the vital organs normally affected by diabetes. This suggestion, in our opinion ought to have been put forward during the cross-examination of the witness, and it is unfair now to suggest that the opinion that no lesions were found was based on either improper or inadequate examination. We hold that Dr. Jhala performed the examination adequately, and he was also helped by his assistants.

Here, we pause to ask a question of why the appellant brought up the question of hysterical fits at all. He could have said that Laxmibai was a diabetic, and that it was likely she had coma by reasons of that disease. The suggested diagnosis given by the appellant was so unlikely that Dr. Ugale questioned it then and there. There is nothing in the Wanlesswadi T. B. Sanatorium papers or in Dr. Sathe's evidence to show that Laxmibai had hysterical fit after her hysterectomy operation. No suggestion was made to the doctors in court that Laxmibai might have had hysterical fits. The condition of the muscles and the absence of deep reflexes clearly show that this was just another piece the appellant gave the full particulars to Dr. Miss Aneeja. No suggestion was made to her or to Dr. Ugale that any information other than what was noted in the case papers was furnished. There is no case for holding that Laxmibai had a relapse of hysterical fits.

It would, therefore, appear that Laxmibai's condition was not due to any disease, because diseases inducing coma generally leave some trace behind, and also respond to medication. No doubt, in some cases the pathological findings after death from diabetic coma have been negative, but the question is, if this was such a case. We have, on the one hand, the fact that numerous poisons causing coma leave no identifiable trace in the victim after death, and, on the other, that sometimes the autopsy does not disclose any discoverable signs in a patient who dies after an attack of diabetic coma or disease. The appellant can be presumed to have had knowledge of these poisons. The appellant challenged the Advocate General to show from any standard book that the symptoms found by the doctors accorded with any known poison. Here, it must also be remembered that a man with knowledge may manipulate not one but more drugs to achieve his purpose, and the cardinal signs of poisoning on the victim may, as a result, be either obliterated or, at least significantly modified. We give one example on which a certain amount of knowledge is possessed even by laymen. A poison of which one of the symptoms would be the contracting of the pupils of the eyes may be sidetracked by putting into the eyes of the victim a drug like atropine, which by its local action dilates the pupils. We give this example, because most of us know the action of atropine on the eyes, and because the knowledge may confuse the symptoms by a simple trick. We are not suggesting that this is what has happened in this case; but when we have to deal with a case of crime versus natural death, we cannot overlook the possibility of some ingenious artifice having been used to screen the action.

If Laxmibai died in circumstances which *prima facie* admit of either disease or homicide by poisoning, we must look at the conduct of the appellant who brought her to the hospital, and consider to what conclusion that conduct unerringly points. If the appellant as an honest medical man had taken Laxmibai to the hospital and she had died by reason of disease, his conduct would have been entirely different. He would not have taken her to the hospital bereft of property with which she started from home; he would not have given a wrong history of her ailments; he would not have written a letter suggesting that she had a brother in Calcutta, which brother did not exist, he would not have abandoned the corpse to be dealt with by the hospital as an unclaimed body, he would not have attempted to convince the world that she was alive and happily married; he would not have obtained her property by forgeries, impersonation and other tricks indulged in both before and after her death; but he would have informed her relatives and done everything in his power to see that she was properly treated and stayed on to face whatever inquiry the hospital wished to make into the cause of death and not tried to avoid the post-mortem examination and would not have disappeared, never to reappear. His prevarications about where Laxmibai made a big and much varied list, and his forgeries cover scores of documents. In the words of Baron Parke in *Towell's* case.[11]

> *Circumstantial evidence is the only evidence which can in cases of this kind lead to discovery. There is no way of investigating them except by the use of circumstantial evidence: but it most frequently happens that great crimes committed in secret leave behind them some traces, or are accompanied by some circumstances which lead to the discovery and punishment of the offender.....Direct evidence of persons who saw the fact if that proof is offered upon the testimony of men whose veracity you have no reason to doubt is the best proof: but, on the other hand, it is equally true with regard to circumstantial evidence that the circumstances may often be so clearly proved, so closely connected with it, or leading to one result in conclusion. That the mind may be as well-convinced as if it were proved by eye-witnesses.*

The appellant in this case took some risk in taking Laxmibai to the hospital and in giving his name there; and these aspects were, in fact, stressed as arguments in the case. As regards the first part, the argument overlooks that what appears to us to be a risk might not have so appeared to the appellant, who might have been sure of his own ability to screen himself. To him, the death

11. (1854) 2 C and K 309.

of Laxmibai at the hospital without the discovery of poison would be the greatest argument in his favour that he had acted honestly. The second argument is equally unacceptable to us. The appellant could not take the risk of a false name and address if he was intending that the body should be disposed of as unclaimed. By giving his own address he could keep the strings in his own hands. If he gave an address and no reply came from that address, the hospital would suspect foul play. If he gave the address of Laxmibai, people in Poona would know of this mysterious death, and they would remember the death of Purshottam *alias* Arvind in 1954. At that time a post-mortem examination on the body of Arvind was held (*see*, evidence of Ramachandra (P.W. 1), and the explanation of the appellant given in writing on January 22, 1954, is set out below in his own words:

> *My name is Anant Chintaman Lagu, age.....years, residing at No. 431/5, Madiwale Colony, Poona, on being questioned by the state that I am the family doctor of Karve family in H. No. 94/95, Shukrawar. The deceased Purshottam Anant Karve belongs to that family. He came from Bombay to Poona on Saturday, the 16th January, 1954. He had come to me on Sunday the 17th January, 1954, for medicine for weakness. I treated him for 2 days, on 17th and 18th. He had neither told me that there was poisoning in his stomach, nor did I detect any even when I examined and treated him. He became unconscious 5 hours before his death. He was taken to the Sassoon Hospital at 9 P.M. on 18th January, 1954. He was taken to the Sasoon hospital because his disease increased in unconsciousness and also because his mother as also myself and Dr. Joshi were of the same opinion. He died there in about 30 to 45 minutes. The fact that there was deliberate poisoning by somebody, was neither revealed in my examination nor did Purshottam Karve speak to me anything about it during the time I treated him 2 days before. What exactly was the cause of death could not be revealed during my treatment. I do not know if somebody is on bad terms with him. There are rumours about suicide but there is no reason or any circumstance whatsoever for doing so.*

A false address would have started enquiries at the hospital end. Laxmibai's own address would have started speculation in Poona. It was for this reason that the appellant had to choose another place and to trim between fact and fiction, so that he might be able to deal with the matter himself. Of course, Laxmibai did have an address of her own which could have been given, and which did not cease to be her address because she had got an attack of coma, from which people are known to recover.

> ***These arguments, however, are of no avail, in view of the appellant's entire conduct now laid bare, which conduct has been proved to our satisfaction to have begun not after the death of Laxmibai but much earlier. This conduct is so knit together as to make a network of circumstances pointing only to his guilt. The case is one of extreme cunning and premeditation. The appellant, whose duty it was to care for this unfortunate lady as a friend and as her medical adviser, deliberately set about first to ingratiate himself in her good opinion, and becoming her confidante found out all about her affairs. All this time he was planning to get at her property after taking her life. He did not perpetrate his scheme at Poona, where the death might have brought a host of persons to the hospital. He devised a diabolical scheme of unparalleled cunning and committed an almost perfect murder. But murder though it hath no tongue, speaks out sometimes. His method was his own undoing; because even the long arm of coincidence cannot explain the multitude of circumstances against him, and they destroy the presumption of innocence with which law clothes him.***

In our judgment, the two courts below were perfectly correct in their conclusion that the death of Laxmibai was the result of the administration of some unrecognised poison or drug which would act as a poison, and that the appellant was the person who administered it. We accordingly confirm the conviction.

11.12.2 Proof of Poisoning[12]

11.12.2.1 Relevant Extracts Verbatim

The essential ingredients in a case of poisoning are no longer in doubt. The matter is concluded by a series of Supreme Court decisions. In *Anant Chintaman Lagu v State of Bombay*[13], their lordships pronounced that the prosecution establishes three propositions in a case of poisoning:

(i) Death took place by poisoning;

(ii) Accused had the poison in his possession; and

(iii) Accused had the opportunity to administer poison to the deceased.

In this case, Arundhati had the poison in her possession and in fact administered the same and death took place by poisoning Thus, the entire elements essential for a conviction are found.

In paragraph 59 their lordships laid down that though the three propositions must always be kept in mind, the sufficiency of the evidence, direct or circumstantial, to establish murder by poisoning will depend on the facts of each case. If the circumstantial evidence, in the absence of direct proof of the three elements, is so decisive that the court can unhesitatingly hold that the death was a result of administration of poison and that the poison must have been administered by the accused person, then the conviction can be rested on it.

The circumstantial chain in this case is complete. The moment oleander was administered, the deceased complained bitter taste, burning sensation and drying up of the tongue and throat. Soon after he died. There can be no escape from the conclusion that death was due to poisoning

It would be too much to expect the prosecution to establish that the accused knew that what was administered was poison. The answer to it is furnished in paragraph 65 of the aforesaid Supreme Court decision. Their Lordships observed thus:

> *A case of murder by administration of poison is almost always one of secrecy. The poisoner seldom takes another into his confidence, and his preparations for the commission of the offence are also secret. He watches his opportunity and administers the poison in a manner calculated to avoid its detection. The greater his knowledge of poisons, the greater the secrecy, and consequently the greater the difficulty of proving the case against him. What assistance a man of science can give, he gives; but it is too much to say that the guilt of the accused must, in all cases, be demonstrated by the isolation of the poison, though in a case where there is nothing else such a course would be incumbent upon the prosecution.*

In *Emperor v Shetya Timma*[14], the death was caused by Dhatura poisoning After review of conflicting decisions on the point, their lordships held that where the accused administered *Dhatura* poison to five men in order to facilitate commission of robbery and in consequence thereof three men died, the accused must be presumed to have knowledge that their act was so dangerous that it was likely to cause death. The acquittal of the charge under section 302, Indian Penal Code, was set aside. The same view was taken in *Emperor v Chattarpal,*[15] in that case a woman of middle age administered her husband with arsenic disguised in sugar and placed in his food. Their lordships said that she must accept the full responsibility of her action which resulted in death. Cases where such drugs are administered on the genuine impression that they would act as love philtres and would not cause the death of the person to whom they were administered were noticed and distinguished.

12. *Arundhati Keutuni v State of Orissa*, 34 Cut LT 60 : ILR 1967 Cut 951 : 1968 Cr LJ 848 (Ori).
13. AIR 1960 SC 500 : (1960) 2 SCR 460 : 1960 Cr LJ 682.
14. AIR 1926 Bom 518 : 27 Cr LJ 1134.
15. AIR 1930 Oudh 502.

On the principles enunciated in the aforesaid decisions we are clearly of opinion that Arundhati was guilty of the murder of the deceased by poisoning.

11.12.3 Identification of Poisoning[16]

Relevant Extracts Verbatim

The aforesaid three propositions are not the invariable criteria of proof by direct evidence. Reasons are apparent. If after the poisoning of the victim his body is destroyed, the first proposition is incapable of proof except by circumstantial evidence. Similarly if the accused gave the victim something to eat and the victim died immediately on the food being taken with symptoms of poisoning, and poison in fact was found in the viscera, the necessity of proving the second ingredient would fall as a matter of reasonable inference from the circumstance that the accused gave the victim something to eat. The element that the accused was in possession of poison need not be separately proved in such a case (see *Anant Chintaman Lagu v State of Bombay*,[17] paras 58 and 59; and *Mohan v State of Uttar Pradesh)*[18].

The quantum of circumstantial evidence must be such as to lead to the inference that the guilt of the accused is established beyond reasonable doubt and that the circumstances are wholly incompatible with the innocence of the accused.

* * * * *

The report of the chemical examiner (Ex. 4) is that the viscera and the *chatni* contained Oleander poison. The only point for consideration in this regard is whether both were properly preserved. The doctor (P.W. 6) preserved the viscera and sent it for chemical examination. It appears from Ex. 4 that alcohol as well as Oleander were detected in the viscera of the deceased. Mr. Ray relied on section 510, Cr.P.C., and contended that Ex. 4 was not admissible in evidence, it was not duly submitted for examination in the course of any proceeding under the Code. For proper appreciation the section may be quoted:

Section 510 *Report of chemical examiner.*—(1) Any document purporting to be a report under the hand of any Chemical Examiner or Assistant Chemical Examiner to Government or the Chief Inspector of Explosives or the Director of Finger Print Bureau or an officer of the Mint upon any matter or thing duly submitted to him for examination or analysis and report in the course of any proceeding under this Code, may be used as evidence in any enquiry, trial, or other proceeding under this Code.

(2) The court may, if it thinks fit, and shall on the application of the prosecution or the accused, summon and examine any such person as to the subject-matter of his report."

Ex. 4 shows that the doctor (P.W. 6) despatched the viscera for examination on 4-5-1962. Mr. Ray argued that the viscera was not duly submitted in the course of any proceeding under the Code. The F.I.R. was lodged on 13-3-1962 and the investigation started thereafter. There is absolutely no basis for the suggestion that the viscera was not submitted in the course of proceeding Much emphasis was laid on the words "duly submitted". Mr. Ray contended that the viscera should have been sent by investigating officer and not by the doctor (P.W. 6) to the chemical examiner. The word "duly" means "properly". This word only emphasises the fact that proof of identity of the article sent to the chemical examiner with articles examined by him must be established. There is no substance in this contention. Ex. 4 merely states that oleander was detected in the viscera. No reasons have been given as to how the chemical examiner came to this conclusion. By Central Act 26 of 1955, sub-section (2) has been inserted to section 510. It was open to the accused to summon and

16. *State of Orissa v Kaushalya Dei*, AIR 1965 Ori 38 : (1965) 1 Cr LJ 321 (Ori).
17. AIR 1960 SC 500 : (1960) 2 SCR 460 : 1960 Cr LJ 682.
18. Cri App No. 98 of 1958 (SC).

examine the chemical examiner. There is, therefore, no escape from the conclusion that the viscera was duly submitted for chemical examination in the course of investigation and Ex. 4 is admissible in evidence without the examination of the chemical examiner.

* * * * *

The doctor (P.W. 6) who conducted the post-mortem examination, reserved his opinion as to the cause of death until receipt of the report (Ex. 4). He gave a positive opinion that the cause of death was due to poisoning He found the brain and the membrane congested. The right side of the heart was full with dark thick blood and the left side was empty. The liver and the spleen were also congested. The gall-bladder was full. He also asserted that his post-mortem findings lead to the conclusion that death was the result of poisoning Thus, the doctor categorically asserted that the death was due to poisoning and his opinion was based on his post-mortem findings as well as on the report of the chemical examiner (Ex. 4).

Cross-examination of this witness was declined by the defense. Though alcohol was found in the viscera, not a single question was suggested that death was due to alcohol poisoning or that the symptoms were consistent with the alcohol poisoning Neither a question was put to the doctor that in the absence of a report by the chemical examiner regarding the quantity of oleander administered, no opinion could be given that death was due to poisoning by oleander. In the absence of such cross-examination and in the face of the unchallenged testimony of the doctor, the learned Sessions Judge was not justified in indulging in speculative argument on the basis of the existence of alcohol in the viscera and in the absence of a report regarding the quantity of the oleander. In this connection, it is instructive to refer to para 11, in *Mohan v State of Uttar Pradesh,*[1] where their Lordships observed:

> It is enough for us to say in regard to this contention that no question had been put to any witness to elicit what symptoms would appear in a case of arsenic poisoning The medical evidence is clear that death was due to arsenic poisoning
>
> * * * * *
>
> *To summarize, there is unimpeachable evidence that the viscera and the chatni contained oleander poison. The unchallenged testimony of the doctor (P.W. 6) is that death was due to oleander poisoning The statements made by the deceased at three different stages that the chatni served to him by the accused, tasted bitter received full corroboration from the findings on chemical tests and the medical opinion. The chain of circumstantial evidence is complete and no link is missing to come to a conclusion beyond reasonable doubt that the deceased died of poisoning arising out of the service of the chatni by the accused. The conduct of the accused in running away from the house next morning and her false explanation that she did not serve any food to her husband are consistent with the prosecution story.*

We are aware of our responsibility in setting aside the order of acquittal. The presumption of innocence of the accused has been reinforced by the factum of acquittal. The court has, however, plenary powers to go through the evidence and come to its own conclusion about the truth of the matter. After giving our anxious consideration of the materials on record and after closely examining the various reasons given by the learned Sessions Judge, we are satisfied that the view taken by the learned Sessions Judge is clearly an unreasonable one and cannot be sustained.

11.12.4 Proof of Possession of Poison[19]

Relevant Extracts Verbatim

The learned advocate for the appellant has first contended that the conviction is wrong in law in view of the decision of this court in *Dharambir v Punjab.*[2] That was a case of murder by poisoning. It was there said:

> *Three questions arise in all such cases,* viz.*,*
>
> firstly*, did the deceased die of the poison in question?*
>
> Secondly*, had the accused the poison in question in his possession? And,*
>
> thirdly*, had the accused an opportunity to administer the poison to the deceased? Therefore, along with the motive the prosecution has also to establish that the deceased died of a particular poison said to have been administered, that the accused was in possession of that poison and that he had the opportunity to administer the same to the deceased.....*

The learned advocate contended that in the present case, the second element stated in the above mentioned case, namely, proof of the possession of the poison by the appellant wanted we feel that this contention is wholly unfounded. The evidence in this case shows that the appellant gave Ram Bharosey the '*peras*' and within half an hour he became ill and died within two hours. It is also clear from the evidence that the food which Ram Bharosey had taken before noon did not contain arsenic or any other poison for chameli also took the same food and suffered no ill-effect whatever. There is further no evidence that in the field Ram Bharosey took any food apart from the '*peras*' given to him by the appellant. Lastly, of course, it is clear from the result of the chemical examination that he had died of arsenic poisoning The court below found from all this – a finding to which in our opinion no exception can be taken – that the arsenic was contained in the '*peras*' given by the appellant to Ram Bharosey.....

Now, it seems to us that if there was arsenic in the *peras* which the appellant gave to Ram Bharose, it inevitably follows that the appellant was in possession of arsenic before he gave them to Ram Bharosey.

> *The next point of the learned advocate is that there were no signs of corrosion in the stomach or of the nails having turned blue and no other symptoms indicative of arsenic poisoning It is enough for us to say in this regard that no question had been put to any witness to elicit what symptoms would appear in a case of arsenic poisoning The medical evidence is clear that death was due to arsenic poisoning.*

11.12.5 Oedema due to poisoning[20]

Relevant Extracts Verbatim

The two doctors have proceeded by the process of elimination. They noticed that all the organs of the deceased were healthy and there was no sign of any disease in any one of the organs such as brain, heart, lung and kidney. There could not, therefore, be any natural disease to any of these organs. That means that pulmonary oedema could not be the result of disease to any of these organs. So far as broncho-pneumonia is concerned, the two doctors maintained that broncho-pneumonia was secondary to pulmonary oedema. Had pneumonia been of Iobar origin, it may be possible to maintain that the pulmonary oedema was the result of pneumonia. *Having ruled out the possibility of death being due to any natural causes, the two doctors addressed themselves to the question as to what could be the possible cause of death. They concentrated their*

19. *Mohan v State of Uttar Pradesh*, AIR 1960 SC 659 : 1960 Cr LJ 1011.
20. Re *Palaniswamy Vaipuri,* 1963 Cr LJ 453 (Bom).

attention upon the presence of pulmonary oedema, which was primary and not consequence of disease to any of the vital organs which may lead to the appearance of pulmonary oedema. Therefore, they posed the question whether pulmonary oedema could be the result of administration of any foreign agent, and they were forced to the conclusion that it could only be the result of entry of a foreign agent in the body. How this entry was effected, of course could not be stated by the experts. The drug could be inhaled, could be orally administered and could be injected. The effects would be the same whatever the manner of the administration of the drug This then is the summary of the views expressed by the two doctors.

It would thus be seen that there are some poisons particularly vegetable poisons and also fungi and mushrooms for which there are no reliable tests of identification of poison, and there are some, which cannot be detected by any known method of isolation because of various factors such as absorption, evaporation and ejectment of urine, blood, It is settled law that merely because the poison has not been isolated in chemical examination, it does not follow that no poison was administered. *Once it is decided that pulmonary oedema, which made its appearance in the case of deceased, could not be due to the pathological condition prevailing in any of the organic tissues, it must follow that pulmonary oedema was the result of administration of an outside agent. Pulmonary oedema could be the effect or could be secondary to some primary cause such as, disease. But, when that primary cause is absent, it would be reasonable to assume that pulmonary oedema has been caused by the entry of a foreign agent which has exercised a catalytic influence on certain organs of the body particularly, the lungs in the present case.*

Before leaving this aspect of the matter, we may refer to one more argument that was advanced by Mr. Kode. Mr. Kode referred to the table on p 267 in *Snyder's Homicide Investigation* 1958, and pointed out that blood is one of the organs in which poison remains mixed and thus becomes amenable to deduction in the case of most of the poisons. In this connection he referred to the fact that according to Sub-Inspector Kumbhojkar, a sample of blood of the deceased was sent to the chemical analyser for chemical analysis. This assistant chemical analyser, D'Mello has stated that blood was sent for determining the blood group and that it was not suitable for analysis, because the blood had broken down, Mr. Kode complained that, as a matter of fact, the blood of the deceased should have been sent to the chemical analyser for detection of poison, if any, in the blood. No questions have been asked to Dr. Vaidya as to the purpose for which the blood was sent/for chemical analysis. It, however, appears from the evidence of D' Mello as also Exhibit 106 that the blood was sent for analysis for the purpose of determining the blood group. Whatever the purpose for which the blood was examined by the chemical analyser, it is clear that the blood had broken down and, therefore, was not/suitable for any kind of chemical analysis. *Prima facie*, therefore, it does not appear to us that any useful purpose would have been served by asking the chemical analyser to examine the blood for the purpose of finding out whether there was any element of poison therein. Incidentally, we may refer to pp 263 and 264 of *Snyder's Homicide Investigation*. On p 263 under the heading 'Medical Notes on Poisoning' the author has stated:

> *In attempting to isolate and identify poison in a dead body, two questions confront the lexicologist. These are:*
>
> *1. Is embalming likely to interfere with the analysis?*
>
> *2. What is the tendency for poison to disappear in the dead body? On p 264 under the heading 'Disappearance of Poison in the Dead Body' the author has stated:*
>
> *...Some poisons disappear rapidly after death, while others may be found after several years.*

11.12.6 Non-identification of Poison[21]

Relevant Extracts Verbatim

The trial court and the High Court in the light of the evidence on record were of the opinion that the death of Indira by morphine poisoning could not be ruled out. According to Taylor's *Principles and Practice of Medical Jurisprudence*, vol II, 12th Edn, p. 199, poison can be administered not only orally but also hypodermically or intravascularly with the help of a syringe. As there was no eyewitness of the occurrence, the court should not, in our opinion, insist upon evidence regarding the exact manner in which the death of Indira was caused. It has to be borne in mind in this context that Mahabir accused was responsible for the removal of the dead body immediately after the death of Indira and the same remained submerged in water for more than 24 hours. The above conduct of Mahabir accused prevented prompt post-mortem examination on the dead body of Indira. On the material it can be said that there were some features like the congestion of both the lungs, the kidney, the liver and the spleen of Indira which, according to Dr. Kamleshwar Singh were indicative of death by respiratory failure and the same could be caused by poisoning The fact that the heart of the deceased at the time of post-mortem examination was found to be empty would not rule out a physical death as a result of poisoning According to observations on page 125 of Modi's *Medical Jurisprudence and Toxicology*, Seventeenth Edition, in many cases of asphyxial deaths both the sides of the heart are found to be full if examined soon after death but after *rigor mortis* has set in, the heart is found contracted and empty. Reference has been made by Mr. Chari to report dated 23 December, 1963 of the chemical examiner, according to whom no poison could be detected in viscera of Indira deceased. This circumstance would not, in our opinion, militate against the conclusion that the death of the deceased was due to poisoning There are several poisons particularly of the synthetic hypnotics and vegetable alkaloid groups, which do not leave any characteristics signs as can be noticed on post-mortem examination. We may in this context refer to the following observations on page 477 of the above mentioned book by Modi:

> *It is quite possible that a person may die from the effects of a poison and yet none may be found in the body after death, if the whole of the poison has disappeared from the lungs by evaporation, or has been removed from the stomach and intestines by vomiting and purging, and after absorption has been detoxified, conjugated and eliminated from the system by the kidneys and other channels. Certain vegetable poisons may not be detected in the viscera, as they have no reliable tests, while some organic poisons, especially the alkaloids and glucosides, may by oxidation during life or by putrefaction after death, be split up into other substances which have no characteristic reactions sufficient for their identification.*

Similar view has been expressed by Lambert in his book "*The Medico Legal Post Mortem in India*". We may also in this context refer to the book "*Legal Medicine, Pathology and Toxicology*" by Gonzales and others. Second Edition, wherein it is stated on page 847:

> *The post-mortem appearances in cases of morphine poisoning are not particularly characteristic. There is a congestion of the viscera, cyanosis and abundant dark fluid blood. When crude opium is taken by mouth the stomach may contain fragments of poppy but nothing characteristic is found if morphine is ingested.*

The circumstances of the present case taken in their entirety clearly point to the conclusion that the death of Indira was not natural but was due to foul play. In a number of cases where the deceased dies as a result of poisoning, it is difficult to successfully isolate the poison and recognise it. Lack of positive evidence in this respect would not result in throwing out the entire prosecution case if the other circumstances clearly point to the guilt of the accused.

21. *Mahabir Mandal v State of Bihar*, AIR 1972 SC 1331 : 1972 Cr LJ 860 : 1972 Pat LJR 263.

Reference in this context may be made to the observations of Hidayatullah, J., (as he then was) who spoke for the majority in the case of *Anant Chintaman Lagu v State of Bombay*.[22]

* * * * *

Reliance in the above context was placed in the cited case on the books on medical jurisprudence by different authors wherein it has been stated that the pathologist's part in the diagnosis of poisoning is secondary and that several poisons particularly of the synthetic hypnotics and vegetable alkaloid groups do not leave any characteristic signs which can be noticed on post-mortem examination.

* * * * *

The case against Mahabir accused, in our opinion, is covered by the latter part of the above observation. We, therefore, find no cogent ground to interfere with the findings of the two courts that the death of the deceased was not natural but homicidal.[2]

11.12.7 Fatal Dose[23]

Relevant Extracts Verbatim

We are also of the opinion that the courts below were right in concluding that death resulted from poisoning. It is true that Dr. Patodia could not say what poison caused her death. But he could say that death was due to something that was an irritant, and it could be due to dhatura or belladonna or any other poison. The deceased, according to the Ghisaji, P.W. 3, was a healthy woman, and had not taken any other medicine before arriving at the clinic. She was at the clinic from 9 A.M. till she died. The only medicine she took, apart from antidotes, was what was administered, *i.e*., 24 drops of stramonium and a *dhatura* leaf. She started feeling restless and ill soon after taking these things. On these facts the conclusion of the courts below that death was the result of *dhatura* poison cannot be said to be erroneous.

Dr. Choudhary, P.W. 17, registered medical practitioner, in the course of his evidence, stated:

> *In the opinion of Dr. Modi, the writer of Medical Jurisprudence, a dose of 20 to 20.5 grains of* dhatura *is fatal and according to Dr. Taylor about 16 grains of it is a fatal dose. Therefore, I can say that if a fresh leaf of* dhatura *of 6 inches length and 4 inches breadth along with 24 drops of stramonium mother tincture of Homoeopathic preparation is given to any patient then the joint effect of both may be fatal and if it is kept in mind that the patient is allergic and idiosyncratic for stramonium then such a dose may be fatal.*

This is relied on by the learned Sessions Judge to determine what would be the fatal dose. We have, however, looked up Modi's *Medical Jurisprudence and Toxicology* (14th Edn); and Taylor's *Principles and Practice of Medical Jurisprudence* (11th Edn.); but they do not quite say what Dr. Choudhary had assumed. Modi writes at p 713 thus:

> Fatal Dose—*Uncertain—Four* dhatura *fruits pounded and mixed with flour were given to six men, four of whom died. A ripe fruit weighs, on an average, about a drachm, and contains the seeds which weigh about 1/2 drachm. One hundred dried* dhatura *seeds weigh 20 to 20.5 grains. A decoction of 125 seeds of* dhatura *stramonium has proved fatal to a woman.*

According to Taylor (p 551, Vol. II):

> Toxicity and Fatal Dose.—*The active principle, a mixture of hyoscine, atropine and hyoscyamine, is extremely toxic, and as the plant contains approximately 1/2 to 1 per cent. of alkaloids, it must be considered extremely dangerous. The seeds are highly poisonous, inasmuch*

22. AIR 1960 SC 500 : (1960) 2 SCR 460 : 1960 Cr LJ 682 (SC).
23. *Juggankhan v State of Madhya Pradesh*, AIR 1965 SC 831 : (1965) 1 SCWR 796 : (1965) 1 Cr LJ 763 (SC).

as they contain a larger proportion of alkaloids than other parts of the plant. Death may take place although the whole of the seeds are ejected.

A child of 2 years swallowed about 100 seeds stramonium weighing 16 grains. The usual symptoms were manifested in an hour, and the child died in 24 hours although twenty seeds had been ejected by vomiting and eighty by purging Sufficient alkaloid to destroy life had been absorbed from the entire seeds and carried into the blood.

In a case which became the subject of a trial at Osnabruck, a woman administered to her mother a decoction of the bruised seeds of the thorn-apple, of which it was supposed there were about 125. She very soon became delirious, threw her arms about and spoke incoherently; she died in 7 hours.

Dr. Patodia (P.W. 7) could not definitely say what dose of tincture stramonium should be sufficiently fatal to life. But he further opined that half an ounce of tincture stramonium, which is insufficient excess of the normal medicinal dose (which he put at 10 to 30 drops) will be sufficient to cause death.

On this material we cannot say that it has been established that what the appellant prescribed was necessarily a fatal dose. Further, the finding of the learned Sessions Judge that the leaf weighed 40 grains and the poison content would be 15 grains does not proceed on any sound basis. Ghisaji described the leaf as a big one but it was green and fresh. Laxminarayan Vaidya, P.W. 13 gave the dimensions of the biggest leaf as having a length of 7 inches and breadth of 3-½ inches grown on the land having the application of manure. Dr. Choudhary, P.W. 17, said that "on the basis of hypothesis that if a fresh leaf of dhatura is 6 inches in length and 4 inches in breadth and is 40 grains in weight, it would contain 27 grains moisture and 13 grains of solid stramonium, *i.e.*, poison." We think that this hypothetical evidence should not have been relied upon to determine the content of solid stramonium in the leaf alleged to have been administered to the deceased. It follows from this that poisonous contents of the leaf have not been satisfactorily established and if this is so, the prosecution has failed to prove that the dose given to the deceased was necessarily fatal. Further, Dr. Choudhary stated that it had not come to his notice that in any of the Homoeopathic systems of medicine stramonium mother tincture or stramonium in potentized form or a green leaf of dhatura is not given for treatment of guinea-worm. According to Dr. R.K. Singh, P.W. 16, mother tincture stramonium can be given for removing foreign bodies, though it is not specifically mentioned in *Materia Medica of Homoeopathy* that it can be used for treatment of guinea worm. But it will be remembered that in this system treatment is by symptoms.

11.12.8 Fatal Dose not Given[24]

Relevant Extracts Verbatim

One point argued by the learned counsel for the appellant was that motive not having been established, it was necessary for the prosecution to prove that in administering aconite to Sundar Singh the intention of the appellant was to kill him. According to the learned counsel such an intention had not been proved as there is nothing in the chemical examiner's report to show that the aconite found in the stomach contents of the deceased was of a fatal variety. He referred to the fact, mentioned in almost all the books on medical jurisprudence and toxicology, that a root of aconite is often used both externally and internally by '*Vaids*' and '*Hakims*' in this country, and that it is also sometimes added to country-made liquors to increase their intoxicating power.

He also argued that the poisoning may have been accidental. He further cited, '*In re Chinna Hanumakka,*[25] in connection with the question of intention. Motive having however been

24. *Findal v State of Himachal Pradesh*, 1953 Cr LJ 1900 (HP).
25. AIR 1943 Mad 396 : 44 Cr LJ 550 : ILR (1943) Mad 679.

established, no question of intention arises on the showing of the learned counsel for the appellant himself. It may, however, be stated that it is immaterial that the prosecution has adduced no evidence as to the particular variety of aconite used in the present case. And this for the reason that the nature of the variety used in the present case appears from the result produced by it. Sundar Singh died within three hours of the poisoning It is apparent, therefore, that the aconite used in the present case was sufficient both in quality and quantity to produce fatal results. There could, in the circumstance, be no doubt about the intention of the appellant, for a person who administers to another aconite producing fatal results within 3 hours cannot but have the intention of killing him.

The Madras ruling cited by the learned counsel for the appellant has no relevancy since in that case the accused pleaded that she gave aconite to her husband not with the intention of causing his death but with the intention of making him mad. The appellant in the present case did not plead that he had any other intention than of causing the death of Sundar Singh in mixing aconite powder with the tea. In any case, a person who administers aconite of such quality and in such quantity to another as results in his death within three hours must be taken to know that his act is so imminently dangerous that it must in all probability cause death or such bodily injury as is likely to cause death, and if death ensues, he is guilty of murder, notwithstanding that his intention may not have been to cause death. *See* para 4 of the definition of murder in section 300, Penal Code—*Emperor v Gauri Shankar*.[26] There could also be no question of accidental poisoning in this case since aconite was not administered by some quack in a drug, nor was it administered in liquor to increase its intoxicating power.[4]

11.12.9 Quantitation Essential[27]

Relevant Extracts Verbatim

The civil surgeon of Bareilly conducted the post-mortem examination of the dead body of Sudarshan Puri on 18th of April, 1953 at 9.55 in the morning He found the nails of thumbs and fingers blue. The skin at tips of fingers and thumbs was cyanosed. The membranes of the brain were hyperaemic. Both lungs were congested. Both sides of the heart contained blood and ecchymosis under the endocardium and in the muscles of the left ventricle. The liver, the spleen and the kidneys were congested.

Examination of the stomach revealed that the mucous membrane was swollen and softened and there were patches of congestion. The stomach had four ounces of brownish watery fluid with flakes of mucous and gritty whitish sandy particles which were also embedded in the mucous membrane. The small intestines showed that mucous membranes were swollen, flabby and congested.

The viscera was preserved by the civil surgeon for examination by the chemical examiner. In the opinion of the civil surgeon death was due to arsenic poisoning

The report of the chemical examiner indicated that arsenic was detected in portions of viscera of Sudarshan Puri and traces of arsenic were also discovered in the vomitus of Sudarshan Puri. Traces of opium were also discovered in portions of the viscera of Sudarshan Puri. Arsenic was also detected by the chemical examiner in two of the phials bearing the labels Liquor Arsenicalis P.B.I.M.S. Laboratory Ltd, Lucknow and Liquor Arsenicalis, P.B. Verma Medical Stores, Chandausi, and opium was detected in one of the phials marked as Tinct. Opii

Camphoreta B.P. 48, Bengal Chemical and Pharmaceutical Works Limited, Calcutta. The report of the chemical examiner did not disclose any result on the basis of a quantitative test.

As has been observed by Modi in his *Medical Jurisprudence*, Twelfth Edition (1955) at page 513, "When administered in a soluble form by the mouth arsenic gets absorbed into the blood almost in a few minutes, but when taken in solid lumps, it may not be absorbed by the stomach and sometimes passes out with the faeces without producing any poisonous symptoms. The report of the chemical examiner in our opinion is wholly insufficient to prove that the cause of death of Sudarshan Puri in this case was arsenic poisoning A very small and harmless quantity of arsenic can be detected by the Reinsch or Marsh Test.

As far back as 1930, a Bench of this court held, in *Emperor v Sikandar,*[28] that it is of the utmost importance in a case of arsenic poisoning that the prosecution should prove that a lethal dose of arsenic, that is two grains or upwards, had been administered. In India, arsenic is used as a medicine in all manner of diseases. It is therefore impossible to take the mere evidence that arsenic was detected as sufficient to prove conclusively that death was from arsenic poisoning

It is of the utmost importance before a court can find any individual guilty of murder by the administration of arsenic that a more complete analysis should be made than done in this case. That such analysis has been made in India in the past is clear from a reference to Dr. Cheyer's *Medical Jurisprudence* published in 1870, where he observed at page 116:

> *Dr. MacNamara discovered considerable quantities of arsenic in both stomachs.*

Given the necessary knowledge and the necessary instruments, modern science has no difficulty in coming to a conclusion as to the approximate quantity administered.

A similar question came up for consideration by another Bench in *Happu v Emperor*,[29] and there too it was observed that if the prosecution wishes to establish that the deceased died of arsenic poisoning by the report of chemical examiner, and weight is to be attached to his evidence, it must be proved that at least two grains of arsenic were administered to the deceased before death. He can do this by proving the discovery of this amount in the body of the deceased or by accounting for its absence in part. He may attribute the loss by vomiting, purging or the natural elimination of the poison from the body before death.

It was further observed in that case that where a man's life is in the balance and where the whole case depends upon an answer to the question whether a fatal dose was or was not administered to the deceased, it is a matter for consideration whether the Sessions Court should not whenever it is of opinion that such action is necessary for the ends of justice, exercise its right to call the chemical examiner so that he may be examined on oath and subjected to cross-examination; and that when a report is received from the chemical examiner containing a quantitative analysis it should be shown to the medical officer who conducted the post-mortem examination so that he will be in a position to state what are the medico-legal inferences to be drawn from the report. In the present case, there is a complete absence of evidence on the point.

11.12.10 Poisoning: Suicidal/homicidal/accidental?[30]

Relevant Extracts Verbatim

The prosecution case is that Sardar Jaspal was administered potassium cyanide poison by the appellant and Mohinderpal on the afternoon of 6-2-1950. The dead body was then put into a large trunk and kept in one of the rooms in the house in Ambala City. About ten days later, *i.e.*,

28. AIR 1930 All 532 : 31 Cr LJ 862.
29. AIR 1933 All 837 : (1933) 35 Cr LJ 280 : ILR 56 All 228.
30. *Palvinder Kaur v State of Punjab*, AIR 1952 SC 354 : 1953 SCR 94 : 1953 Cr LJ 154.

on 16-2-1950, Mohinderpal during the absence of the appellant, removed the trunk from the house in a jeep when he came there with Amrik Singh and Kartar Singh (P.Ws), two watermen of the Baldevnagar Camp. The trunk was then taken to Baldevnagar Camp and was kept in a store room there. Three days later, on 19-2-1950, Mohinderpal accompanied by Palvinder and a domestic servant, Trilok Chand (P.W. 27), took the trunk a few miles on the road leading to Rajpura, got on to a *katcha* road and in the vicinity of village Chapt took the jeep to a well on a mound and threw the box into it. The jeep was taken to a *gurdwara* where it was washed.

It held that though the body found from the well was not capable of identification, the clothes recovered from the trunk and found on the body proved that it was the body of Jaspal. It further held that the cause of death could not be ascertained from the medical evidence given in the case. The evidence on the question of the identity of the dead body consisted of the statement of constable Lachhman Singh, of the clothes and other articles recovered from inside the trunk and of alleged confession of the accused.

Whether Jaspal committed suicide or died of poison taken by mistake, or whether poison was administered to him by the appellant or by Mohinderpal or by both of them are questions the answers to which have been left very vague and indefinite by the circumstantial evidence in the case. In view of the situation of the parties and the belated investigation of the case and the sensation it created it was absolutely necessary for the courts below to safeguard themselves against the danger of basing their conclusions on suspicion howsoever strong. It seems to us that the trial court and to a certain extent the High Court fell into the same error against which warning was given by Baron Alderson in *Reg v Hodge,*[31] where he said as follows:

> *The mind was apt to take a pleasure in adapting circumstances to one another, and even in straining them a little, if need be, to force them to form parts of one connected whole, and the more ingenious the mind of the individual, the more likely was it, considering such matters, to over-reach and mislead itself, to supply some little link that is wanting, to take for granted some facts consistent with its previous theories and necessary to render them complete.*

We had recently occasion to emphasise this point in *Hanumant Govind Nargundkar v State of Madhya Pradesh.*[32]

In order to establish the charge under section 201, Penal Code, it is essential to prove that an offence had been committed, – mere suspicion that it has been committed and with the requisite knowledge and with the intent to screen the offender from legal punishment causes the evidence thereof to disappear or gives false information respecting such offences knowing or having reason to believe the same to be false. It was essential in these circumstances for the prosecution to establish affirmatively that the death of Jaspal was caused by the administration of potassium cyanide by some (the appellant having been acquitted of this charge) and that she had reason to believe that it was so caused and with that knowledge she took part in the concealment and disposal of the dead body. There is no evidence whatsoever on this point.

11.12.11 Morphine (Morphia) Poisoning and asphyxia[33]

Relevant Extracts Verbatim

The Kotwal then went to the house of Yashwant Rao, which was very near the maternity ward. In the meanwhile the accused absconded. The Kotwal and the police with the father

of the accused and other persons went inside the house. In the sleeping room of the accused, above his cot, there was a wooden plank fixed on which the basket was found and nearby in a corner were found the cow-dung cakes. Babu (P.W. 1) identified these as belonging to the deceased. On the left side of the room was a staircase, which was locked. The lock was broken and the party went to the roof. On the left side was a sort of verandah with three doors which were closed. The doors were opened, and after entering the Kotha they found a very small room which was also closed. Opening it the dead body of Mahila Dhanno was found in it. The body was lying on its back. The mouth was stuffed with a handkerchief and on it was tied a langot; eyes were closed; private parts and breast were uncovered and there were many marks of abrasions on both side of the breast. Dr. V.R. Sapkal (P.W, 2) who performed the autopsy on 6 February 1950 was of opinion that there were nearly ten abrasions on the right side of the breast and a big abrasion with a diameter of it, 1.25" on the nipple, left side. This was most probably due to human bite. No scratches or wounds could be detected near the private parts; hymen being old ruptured. The stomach and small intestines and oesophagus were inflamed; lungs, liver, spleen, kidneys being congested. The right side of the heart was full of blood and the left empty. According to him, the cause of death was asphyxia and irritant poison. The viscera were sent for chemical examination; and opium was found in them. Examined as a witness Mr. Shankar Rao (P.W. 8), the chief chemist, deposed that he was unable to say whether the morphia which he found was the result of partaking of opium in the form in which it is usually taken or of partaking of some preparation containing morphia. He could not tell the quantity of opium taken or the time before death at which it could have been taken. The fatal dose being one grain of morphia or four grains of opium, it is difficult to say whether so much opium or morphia was in fact administered. The police failed to discover any morphia or opium in the house. It is possible that the fatal dose may not have been given but some preparation may have been given in order to break the resistance, if any. The slides containing vaginal discharge were negative for semen and no spermatozoa could be traced. The examination of the *lehenga* and *dhoti* of the deceased also indicate the same result.

From the above, it is evident that attempts were made to have sexual intercourse with the unfortunate female forcibly and deceased continued to resist. Then, in order to silence her, a handkerchief was stuffed into the deceased's mouth and *langot* was tied over it. It appears that the female died due to suffocation before the offender could commence sexual intercourse.

11.12.12 Acid Burns[34]

Dr. V.K. Jain, who treated Maya Devi in the city clinic has stated in his evidence that the injuries suffered by Maya Devi were sufficient collectively, in the ordinary course of nature, to cause death. The opinion of Dr. Jain is corroborated by the evidence of Dr. K.S. Raj Kumar. He said that the burns were to the extent of 35 per cent of the body that if the burn exceeded 30 per cent, the same would be dangerous to life and that the injuries on Maya Devi were dangerous to life. Dr. S.S. Kaushal who conducted the post-mortem examination was of the view that death was due to toxaemia and septicemia from absorption of toxins on account of the extensive superficial ulceration of the body caused by some corrosive material. The evidence of these doctors would show that the injuries caused to Maya Devi were of a dangerous character. The fact that Maya Devi lingered for about 12 days would not show that the death was not the direct result of the act of the appellant in throwing acid on her. The medical evidence is

34. *Sudarshan Kumar v The State of Delhi*, 1974 AIR 2328 : 1975 SCR (2) 520 : 1975 Cr LJ 14 (SC).

clear that 35% of the surface of the body of Maya Devi was burnt as a result of the injuries received by her.

> The involvement of one-third to one-half of the superficial surface of the body is likely to end fatally". (*See* Modi's *Medical Jurisprudence and Toxicology*, 17th Edn., p. 196).
>
> *"..... .In suppurative cases, death may occur after five or six weeks or even longer" (ibid. p 198).*
>
> Taylor says:—
>
> *That after the fourth day of injury, "the chief danger to life is the occurrence of sepsis in the burned areas".*
>
> (See Taylor's "*Principles and Practice of Medical Jurisprudence*", 12th Ed., Vol. I, p. 331)

It was contended for the appellant that death of Maya Devi was not the direct result of the injuries caused by the acid burns but was on account of some supervening circumstances not resulting from the injuries and therefore, the appellant could not be held guilty of murder. He relied on the evidence of Dr. (Miss) Nirmala Lakshmi Narain who had stated, on her cross-examination that the cause of death of Maya Devi was melaena and respiratory failure. Malaena, according to Dr. Jain is nothing but passing of old blood in the stools. The evidence of Dr. S.S Kaushal who performed the post-mortem examination of the dead body is definite. He says:

> *Death, in my opinion, was due to toxaemia and septisemia from absorption of toxins from extensive superficial ulceration of the body caused by some corrosive material.*

As already stated the evidence of Dr. Jain and Dr. Raj Kumar is also to the effect that the injuries caused on Maya Devi were sufficient in the ordinary course of nature to cause death. The fact that Maya Devi developed symptoms of malaena and respiratory failure and they also contributed to her death cannot in any way affect our conclusion that the injuries caused by the acid burns were the direct cause of her death.

Since Curling first drew attention to the occurrence of duodenal ulcers after burns numerous cases have been recorded both *in vivo* and post-mortem after burns. Petechiae of the stomach and duodenum, often with erosions, occasionally acute ulcers, is a more common post-mortem findings: The condition is due to anoxia from hypertension and stasis. The large bowel may also be involved" (See *Taylor's Principles and Practice of Medical Jurisprudence*, 12th Edn, vol I, p 331).

Modi, in his *Medical Jurisprudence*, has stated that burns would cause:

> *Inflammation of serious membranes and internal organs, such as, meningitis, peritonitis, oedema glottidis, pleurisy bronchitis, bronchopneumonia, pneumonia, enteritis and perforating ulcer of the duodenum (17th Ed., p. 197).*

11.12.13 Diminished Responsibility[35]

As indicated earlier, medical opinion gave no certain guide as to the cause of death. While death as the result of violence is not ruled out by that evidence it showed that cyanide poison might as well have been the cause. The learned judge, therefore, rightly held that the person who caused violence could not be held to be liable for anything more than causing hurt. The question as to whether that hurt was one which could be designated as 'grievous' naturally came up for discussion by the judge after fixing the offender. The doubt as to the cause of death was caused by the presence of traces of cyanide in the stomach contents detected by the chemical examiner. As to how those traces happened to be present is a mystery to all those who had something to do with the case and it will be futile to attempt to unravel it.

35. *Joseph Cheriyan v State of Travancore-Cochin*, AIR 1953 Trav-Co 129 : 1952 Ker LT 656 : 1953 Cr LJ 706 (TC).

12.1 INTRODUCTION

The word "Narcotic" has been derived from Greek word *Narkotikos* meaning a state of lethargy, sluggishness or sleep. However, Narcotic drugs convey a common meaning for all those drugs and substances, which induce an altered state of consciousness in an individual and have high abuse potential.

Narcotic drugs are addictive *drugs* that reduce the user's perception of pain and induce euphoria (a feeling of exaggerated and unrealistic well-being).

A drug, which has a deteriorative effect on the human mind and body, is called a narcotic or a narcotic drug. The outwardly effect may be just the opposite. The drug abuser may show signs of stimulation to start with. He may feel relieved of pain, fatigue or worry. It may make him more active but ultimately, the drug will deteriorate the body functioning.

Different types of drugs have different types of initial effects. For example, opioids sedate, stimulants stimulate and hallucinogens hallucinate. Thus, these drugs have different effects on the body and mind of the abuser, yet all of these are termed as narcotics in common parlance.

In law, narcotics are simply those drugs, which the government through the Narcotic Drugs and Psychotropic Substances Act, 1985 prohibits/controls/regulates their production/sale/purchase. The Act provides the legal framework to handle their menace. It is amended from time to time to keep it updated.

The names of the narcotic drugs are given in the Schs I and II, appended to the Act.

12.1.1 Medical Definitions of narcotics

1. A drug (such as codeine, methadone, or morphine) that in moderate doses dulls the senses, relieves pain and induces profound sleep but in excessive doses causes stupor, coma, or convulsions.
2. An agent that produces insensibility or stupor, applied especially to the opioids, i.e., to any natural or synthetic drug that has actions like those of morphine.

12.1.2 Legal Definitions

Narcotic Drugs and Psychotropic Substances Act, 1985 has not defined the term 'narcotic' in general terms. It has however defined various narcotic drugs and related terms in section 2. Relevant sub-sections, defining the various drugs read as under:

(iii) "cannabis (hemp)" means:

(a) *charas*, that is, separated resin in whatever form whether crude or purified obtained from cannabis plant and also include concentrated preparation and resin known as *Hashish* or Liquid *Hashish*;

(b) *ganja*, that is, the flowering/fruiting tops of the cannabis plant (excluding the seeds and leaves when not accompanied by the tops), by whatever name may be known as designated; and

(c) any mixture, with or without the neutral material of any of the above forms of cannabis or any drink prepared therefrom;

(v) "coca derivatives" means:

(a) crude cocaine, that is, any extract from the 'coca leaves' which can be used directly or indirectly for the manufacture of cocaine;

(b) ecgonine and all the derivatives from which it can be recovered;

(c) cocaine that is methyl ester of benzoyl ecgonine and its salts; and

(d) all preparations containing more than 0.1% of cocaine;

(vi) "coca leaf" means:

(a) the leaf of coca plant except a leaf from which all ecgonine, cocaine and any other ecgonine alkaloids have been removed;

(b) any mixture thereof with or without neutral material but does not include any preparation containing not more than 0.1% of cocaine;

(vii) "coca plant" means the plant of any species of the genus Erythroxylon;

(viia) "commercial quantity" in relation to narcotic drugs and psychotropic substances, means any quantity greater than the quantity specified by the Central Government by notification in the Official Gazette;

(viid) "controlled substances" means:

Any substance which the Central Government may, having regard to the available information as to the use in the production or manufacture of Narcotic Drug or psychotropic substances or to the provisions of any international convention by notification in the Official Gazette, declare to be a controlled substance.

(x) "manufacture", in relation to narcotic drugs or psychotropic substances includes—

(1) all processes other than production by which such drugs or substances may be obtained;

(2) refining of such drugs or substances;

(3) transformation of such drugs or substances; and

(4) making of preparation (otherwise than in a pharmacy on prescription) with or containing such drugs or substances;

(xi) "manufactured drug" means—

(a) All coca derivatives, medicinal cannabis, opium derivatives, and poppy straw concentrate;

(b) Any other narcotic substance or preparation which the Central Government may, having regard to the available information as to its nature or to a decision if any, under any International Convention, by notification in the Official Gazette declare to be a Manufactured Drug, but does not include any narcotic substance or preparation which the Central Government may, having regard to available information as to its nature or to a decision, if any, under any International Convention, by notification in the Official Gazette, declare not to be a manufactured drug;

(xii) "medicinal cannabis" that is medicinal hemp means any extract or tincture of cannabis (hemp).

(xiv) "Narcotic drug" means coca leafs, cannabis (hemp), opium and poppy straw and includes all manufactured drugs.

(xv) "Opium" means:

(a) The coagulated juice of opium poppy; and

(b) Any mixture with or without neutral material, of the coagulated juice of opium poppy,

but does not include any preparation containing not more than 0.2% of morphine.

(xvi) "Opium derivative" means:

(a) medicinal opium, that is opium which has undergone the process necessary to adapt it for the medicinal use in accordance with the requirements of the Indian Pharmacopoeia or any other pharmacopoeia notified in this behalf by the Central Government whether in powder form or granules or otherwise mixed with neutral material;

(b) prepared opium, that is, any product of opium obtained by any series of operations designed to transform opium into an extract suitable for smoking and the dross and other residue remaining after opium is smoked;

(c) phenanthrene alkaloids, namely, morphine, codeine, thebaine and their salts;

(d) diacetylmorphine, that is, alkaloid also known as diamorphine or heroin and its salts; and

(e) all preparations containing more than 0.2% morphine or containing any diacetylmorphine.

(xvii) "Opium poppy" means:

(a) The plant of the species *Papaver somniferum.*

(b) The plant of any other species of *papaver* and from which opium or any phenanthrene alkaloid can be extracted and which the Central Government may by notification in the Official Gazette, declare to be opium poppy for the purpose of this Act.

(xviii) "Poppy straw" means all parts (except seeds) of the opium poppy after harvesting, whether in their original form or cut, crushed or powdered and whether or not juice has been extracted therefrom.

(xix) "Poppy straw concentrate" means the material arising when poppy straw has entered into a process for the concentration of its alkaloids.

(xx) "preparation", in relation to narcotic drug or psychotropic substance, means any one or more such drugs or substances in dosage form or any solution or mixture, in physical state, containing one or more such drugs or substances;

(xxii) "production" means the separation of opium, coca leaves or cannabis from the plants from which they are obtained:

(xxiii) 'Psychotropic substance' means any substance, natural or synthetic or any natural material or any salt or preparation of such substance or material included in the list of **Psychotropic substance** specified in the schedule.

(xxiiia) "small quantity" in relation to narcotic drugs and psychotropic substances, means any quantity lesser than the quantity specified by the Central Government by notification in the Official Gazette;

12.1.3 Deterrents

Narcotics have acquired tremendous notoriety in recent years. Human nature often wants to run away from reality. Formerly, religion provided the vent. The success or failure was all attributed to God. With the change to materialism, the very existence of God is questioned.

> **'If there is no God, let us create one'**
>
> **Voltaire**

The escapist, the person who wants to escape from reality, finds refuge in drugs. Their abuse is increasing at a frightening rate among all sections of society. The greatest menace of the invasion is among the youth. If they become lotus-eaters, the nations will go down. Each nation, therefore, views the abuse of drugs with concern and provides stringent measures against the same. The person who contravenes laws in relation to production, manufacture, possession, sale, purchase, transport, storage, import, export or uses it himself, is punished with rigorous imprisonment and/or a heavy fine of Rs 1-2 lakhs in respect of the following items:

1. poppy straw;
2. cocoa plant and leaves;
3. prepared opium and opium;
4. embezzlement of opium by its cultivators;
5. cannabis (hemp) *Charas*/*Hashish* (Punishment for *Ganja* is rigorous imprisonment up to 5 years and a fine up to Rs 50,000);
6. manufactured drugs; and
7. psychotropic substances.

Even attempts to commit any of the offences relating to the above drugs and psychotropic substances carry the same punishments. Recidivism invites enhanced punishments, 50% enhancements for most of the offences. Amendments tend to reduce the quantum of punishment.

There is a general belief that the drugs provide the criminal with the courage to commit crime. This does not appear to be so in most of cases. The physiological action of the narcotics on the human body is mostly not conducive for the commission of crimes. However, drug addiction does provide a strong motive for the crime.

1. The drug addict needs the drug, which he can get mostly from illegal sources, as narcotic drugs are banned.
2. The drug addict needs money for the purchase, which in most of the cases, is obtained by illegal means: theft, bribery, embezzlement, robbery, forgery, cheating, extortion, abduction, prostitution, drug peddling.

Certain narcotics do inhibit the power of discrimination and judgment. The baser tendencies of the criminal come out, which promote the commission of a crime. For example, alcohol and cannabis make a person insensitive and he may commit a crime, which he would not commit if he were not under the influence of the drug. It is believed that these drugs may promote criminal activities, especially in those who have inherent criminal tendencies that had been dormant due to social influence.

Some of the drugs like LSD and PCP give hallucinations to the addict and he loses sense or judgment of time, of space and of human values. He commits crime conforming to the general perception that drugs promoting the crime.

A 19 years-old boy was apprehended, while completely nude, in an apparent burglary-rape attempt. He was found under the influence of LSD. The boy revealed that after taking LSD he felt a strong urge to commit rape. He drove in his vehicle for about a kilometre when he observed light in a house. He disrobed in the car and went to the house and attacked the girl. He failed to do any damage, as the girl was able to get help of her neighbour through telephone. The boy mentioned that he has taken LSD previously also and felt the same desire and entered at least three houses. He did not remember what he did on those occasions. (CH)

12.2 ADDICTION

12.2.1 Nature

Psychologically drug addiction is a state of mind and body in which a person has lost self-control depending on the drug to which he is addicted. He consumes the drug repeatedly without caring about social/cultural/humane values. A drug addict will resort to any crime to satisfy his repetitive craving for the drug.

Medically, addiction is a mental disease. The main feature of the disease is that the victim wants to take the drug repeatedly, knowing fully that the drug is harmful. However, the physiological (mental) urge is so strong that the victim is not able to control/resist the urge to take the drug. Addiction due to its repeated intake becomes a biological necessity. Unfortunately, most of the addicts deceive themselves that the drug is inherently useful, desirable, and pleasurable.

The effects of addiction are mainly deteriorative personality changes. They include insomnia, instability, and lack of self-confidence, especially when not under the influence of the drug. The addict cannot concentrate on any work. He avoids social contacts. Slowly, he becomes a mental, physical and moral wreck and a burden to the society.

12.2.2 Signs/Symptoms of Addiction

One or more of the following signs/symptoms indicate drug addiction:

1. Uncontrollable Craving: the addict feels an overpowering craving to take the drug repeatedly and tries to procure the same by any means.

2. Psychological Dependence: the drug addict feels that he cannot do without the drug. Consequently, if he does not take the drug his mental processes are affected. He is unable to concentrate on his work and cannot carry out his work efficiently. Psychological syndromes appear in the form of restlessness, uneasiness, anxiety, panic, aggressive behaviour, depression, delirium and suicidal tendencies.

3. Physical Dependence: certain drugs like morphine, when taken repeatedly by a person, can alter his physiological body functions. The drug becomes part of the physiology. The body becomes sick, inactive and incapable of carrying out any useful activity in the absence of the drug. Such dependence on drug is called *physical dependence*. In acute cases withdrawal of the drug causes serious physical and mental illness-also called withdrawal or abstinence syndrome. Physiological syndromes appear in the form of nausea, vomiting, sweating, pain in the abdomen, muscular cramps, convulsions, and sometimes even in death.

4. Tolerance: when a drug is taken repeatedly, the body becomes used to the drug. It needs increasing amounts of the drug to have the same effect. This tendency of the body, to require increasing amounts of drug for corresponding intoxication, is called tolerance developed by the body. It has also been defined as *body-tolerance* to a drug when the same amount of the drug causes less and less intoxication effect on the body.

In fact, the distinction between habit-forming drugs and addictive drugs is not well defined. Some persons base it on tolerance. The habit-forming drugs (tea, coffee, cigarette or even cannabis) do not develop tolerance. Addictive drugs (opioids) develop tolerance. The habit-forming drugs usually do not produce most of the detrimental effects on the individual on withdrawal, though drug deprivation affect psychologically and he/she is not able to function normally. Addictive drugs, however, develop withdrawal syndrome.

12.2.3 Causes of Drug Addiction

Drug addiction is habituation to consume drugs (usually contraband drugs). The addicts take them for any of the reasons, real or imagined, given below:

1. Reduce tension
2. Relieve fatigue
3. Reduce pain
4. Improve feeling of well-being
5. Stimulate body
6. Reduce sleep
7. Facilitate social contact
8. Enrich sexual experience
9. Curiosity
10. Revolt against old values
11. Fashion

Medical practitioners do not prescribe narcotics as medicines.

The familial/social reasons for taking drugs are:

1. Broken families
2. Wrong company
3. Ambitious families
4. Defective weak personality
5. Double standards by parents: one for themselves and one for the youngsters
6. Low education
7. Unearned money
8. Over indulgence in money expenditure
9. Emotional upset
10. Failure/frustration

12.3 THE ADDICT

Only those persons become addicts who have flawed personalities. They cannot face the competition from their colleagues. They run away from the world of reality to that of the world of make-belief happiness, achieved through drugs. The drugs provide them temporary shelter from life's hardship and failures. But the relief from the shelter is short-lived. He has to acquire the drug repeatedly. It needs money, more money, still more money. His legal resources are soon exhausted. He enters the world of crime losing all self-respect, decency, society and even family.

An addict is an unpleasant sight. He is tormented by the ever-impending need and insatiable desire for drug, which ultimately takes his life prematurely. Yet it is difficult to sympathise with him. He is himself responsible for the wreckage. He has himself renounced the normal world. Or is it nature/nurture which has brought the calamity?

The addict, ordinarily, starts taking the drug as an experiment with the drug, to start with. He believes he cannot become an addict. Therefore, experimentation cannot harm him. The first experience of addiction-prone person is usually euphoria, which inculcates the desire to experiment a second time, third time and so on. Initially the interval between the intakes is long but it gradually shortens and ultimately it comes to an addiction stage, where the requirement he needs the drug at regular intervals and cannot resist its intake.

The dose of the drug also increases with the passage of time. Consequently, the cost of being in the twilight zone also increases and upsets the addict financially and ultimately socially. In order to get the maximum advantage of the drug, he injects the drug in the blood stream and thus becomes **main liner**.

12.3.1 Identification of the Addict

The following evidence identifies the addict:

1. Presence of drug on the person/ in his (her) baggage/ vehicles/ book/residence; he often hides the drug at the dirtiest places like a lavatory.
2. Presence of drug ingestion paraphernalia: equipment for smoking/drinking/ injection on his person/his premises.
3. Presence of needle pricks.
4. Scars on the body caused by older needle pricks. Sometimes the scars at sites are covered with tattoo marks. Needle pricks also create tattoo marks. If the needle or the cotton filter used is dirty, it also deposits the dirt under the skin.
5. Presence of abscess, ulceration, scab and pinkish swelling over the injection sites.
6. Presence of drug in the body.
7. Drug intoxication in the absence of alcoholic smell; It is indicated by:
    - Contraction of the pupils in opiate addicts. The contraction is substantial (3 mm from 6 mm). The movement of the eyelid is also sluggish.
    - Dilation of the pupils of those who have taken stimulants, which dilate pupils.
    - Unsteady gate.
    - Incoherent slurred speech.
    - Loose mental processes.
    - Vacant look
    - Drowsiness, droopy eyes
    - The tendency to laugh (or weep) at trivials
    - Dry mouth
    - Pale skin
    - Pale brittle nails
8. Cyanosis
    - Slow breathing
    - Reduced urination
    - Low blood pressure

- Anoxia
- Voice changes
- Slow heart beats

9. Changes in behaviour
   - Moody
   - Drug culture
   - The vocabulary of the drug addicts
   - Absence from school or college
   - Powdery contents on the person, from cigarette stubs
   - Remains alone in a room or bathroom for long intervals of time
   - Rushes to bathroom or go outdoors in the morning.
10. Nalline test indicates the opiate addicts. The test is carried out as under:

    A small dose (3 mg) of Nalline is injected into the body of the suspect. The size of the pupil of the suspect is measured before and after the injection. An addict will show appreciable dilation of the pupil. The drug has practically no effect on non-addicts.

    Nalline in this dose does not produce withdrawal syndrome.
11. Urine test. The drugs are often eliminated through urine wholly or partially. A chemical test, therefore, reveals the drug.
12. The individual changes his work mode.
13. Drug addiction changes an honest and decent person into a cheat, a forger, a thief, a pimp or a prostitute. They are his associates now.
14. Withdrawal symptoms, when kept away from drug.
15. The visible apparent addict pointers are:
    - Long-sleeved shirt, to hide needle marks
    - Dark glasses, to hide mitosis (eye contraction)
    - Flushed face, shifting eyes
    - Dry mouth, thirst, craving for sweets
    - Rickety body, pale skin
    - Mental confusion, slow reflexes
    - Disorderly

The majority of the addicts show the above *portrait parle*. There are exceptions. The rich addict may hide his addiction with money.

12.3.2 Withdrawal Syndrome

The addict becomes nervous and restless when the effect of the drug wears off. He starts sweating. His nose and eyes start running, and continue doing so increasingly for a long time. Twitching of skin, dilation of pupils and recurring goose flesh is observed next. It is followed by vomiting, diarrhoea, loss of appetite and sleep. Respiration, blood pressure and body temperature also changes. The withdrawal syndrome is acute for several days, after which the trouble starts subsiding. Complete recovery may take three to six months, or even more time.

The withdrawal syndrome can be roughly put into the following stages:

12.3.2.1 Stage I (8–24 hours)

This stage is mostly governed by fear psychosis of the non-availability of the drug. Nothing happens for the first 8 hours or until the next dose time; except that the subject feels discomfort and fears the onslaught of the abstinence.

The next 8 hours, is the restlessness time:

- Body perspires.
- Nose and eyes runs.
- Yawning, sneezing and other common cold symptoms appear.

In the next 8 hours the addict suffers:

- Loss of appetite
- Body shivering
- Cold turkey flesh (recurring goose flesh) appears

He is in trouble.

Stage II (24 – 48 hours)

This stage heralds real troubles: insomnia, diarrhoea, vomiting, weakness and depression. It continues for a day.

Stage III (48 – 72 hours)

Stage II symptoms intensify and reach the peak. Cramps and twitching increases manifold.

Stage IV

After about three days, the symptoms start subsiding but nervousness and insomnia continue for months together, in some cases. Net result is: weight loss, personality loss, physical dependence is finished. However, the psychological dependence continues. It can lead the addict to relapse, if proper supervision is not exercised.

12.4 NARCOTICS AND CRIMES

12.4.1 Non-violent Crimes

Drug addiction involves a large variety of criminal activities. In fact, a drug addict, as he takes illegal drugs, is a criminal. He continues to indulge in criminal activity. He cannot continue as drug addict otherwise, ordinarily. The habit causes him to lose his job, alienate his family, destroys his health and character. He is left with one craving: drug consumption! For its procurement, he adopts all sorts of criminal activities if he has no legitimate financial resources.

1. The addict steals money from home, from friends and from strangers, from everyone.
2. He acts as a prostitute or pimp.
3. He becomes a police informer.
4. He commits forgery.
5. He embezzles money.

6. He sells drugs. He becomes a drug peddler.
7. He blackmails and extorts.
8. He smuggles drugs, arms and explosives.
9. He manufactures illicit drugs.
10. He joins crime syndicates.
11. He induces others to take drugs.

12.4.2 Violent Crimes

Drug intake, ordinarily, does not appear to induce criminality. However, certain drugs reduce social inhibitions. They bring to surface the inherent criminality of the individual, which had been dormant due to education/family/societal pressures. Drugs open up the individual. Liquor and cannabis are some such drugs. Hallucinogens can lead to violent crimes. With such drugs, the addict loses the sense of time, space and of human values and commits the crime without understanding or bothering about the consequences of crimes.

Stimulants, like cocaine and amphetamines, invigorate the physiological activities. They can certainly promote violent crimes, mainly in those persons who have inherent criminality in them.

Opioids, barbiturates and other tranquilizers, generally, tend to inhibit tendencies towards violent crime. In fact, these drugs decrease violent crime.

Drugs induced criminality is conditioned by other factors also. The personality of the drug addict, the surroundings, the nature and the frequency of intake of the abused drugs are important determinants.

12.4.3 Drug Problem in India

The main drug-related problems in India include:

1. Wild growth/cultivation of cannabis.[1]
2. Cultivation of poppy plant.
3. Growth of addiction/drug abuse.
4. India is sand-witched between Golden Triangle and Golden Crescent. The countries produce large amounts of opium and its derivatives and use India as a conduit/route for smuggling out the opiates. Punjab and the six sister states in the East are badly affected.
5. The *charas* from Nepal is smuggled out through India. Even the Pakistan *charas* smugglers use Indian route to smuggle out the drug to western countries.
6. Narco-terrorism.

12.5 COMMON NARCOTICS

The common narcotics used in India and elsewhere are:

1. Cannabis
2. Opioids
3. Cocaine

1. There is a relatively recent thinking (via research) that cannabis cultivation should be allowed for its great medical potential.

4. Amphetamines
5. Methamphetamine
6. LSD
7. PCP (Phencyclidine, also known as Angel Dust, Rocket Fuel)
8. DMT (N-dimethyltryptamine)
9. Solvents
10. Designer's drugs (waiting to invade India on a mass scale)

Alcoholic drinks are also narcotics. However, they are perhaps mild and universal. Common person perhaps does not know that they are narcotics. Besides, governments have not put alcoholic drinks on the list of narcotics.

Most commonly abused narcotics are cannabis and opioids.

Cannabis grows wildly in all parts of India. It is also cultivated in some parts of the country. Originally, the cultivation was done for its fibres and seeds but now the cultivation is done more for narcotic entities: *Charas, Ganja, and Bhang* than for the traditional items.

Charas of Kullu valley of Himachal Pradesh is rated very high in quality. It is being smuggled out of the country.

Cultivation of poppy plant (*Papaver Somniferum*) is done, under Government control, in some parts of India (Utter Pradesh, Madhya Pradesh and Rajasthan). Part of the produce goes to the illegal market, where morphine is extracted from the opium and converted into **heroin**. Heroin is the real top heroine in the drug world.

Some of the opium or morphine released by the Government to authorised dealers for legal use also goes to the illegal market. However, the quantity of the drug in the illegal market is limited.

Illegal cultivation of the poppy plants is also prevalent in some secluded parts of the country.

The major producers of heroin in the world are the countries, which fall in the territories nicknamed as the Golden Crescent and the Golden Triangle. The former includes Pakistan, Afghanistan and Iran. The Golden Triangle includes Myanmar, Thailand and Laos. India has long borders, parts of which are highly inhospitable. The smugglers, however, utilise them to their advantage for smuggling heroin. Not only India acts as the pipeline for the drug smugglers but a fair part of the drug also trickles out on the route. The people of some of these border states use the drug to become drug addicts. The worst affected states are Punjab and Manipur where it is believed that 20% of the population has become a drug addict. Punjab has gone even worse. A recent guess is that about 50% of the population takes drugs. Perhaps it is due to being sandwiched and the route effect!

In addition to the cultivation, manufacture, trade and smuggling of drugs, which are serious problems in themselves, the sharply rising incidences of addiction have intensified the drug problem manifold.

Narco-terrorism is being used to finance terrorist activity. It has further promoted the terrorist activities in recent years in India. The terrorists need money for their activities. They smuggle and trade in narcotics and use the money to promote terrorism.

12.6 CLASSIFICATION

Narcotic drugs are divided into three main categories:

1. Sedatives
2. Stimulants
3. Hallucinogens

12.6.1 Sedatives

Sedative drugs have a depressant effect upon the body and make it less sensitive to pain/worry/emotions. They relieve the drug user from their evil effects. Examples of common and potent sedatives are: Opium, Morphine, Heroin, Codeine, Demerol, Methadone,

12.6.2 Effects

The opioids depress certain parts and stimulate (in neuro-physiological sense) other parts of the nervous system. The central nervous system is affected. The main manifestations of the effect are:

1. Reduce metabolic rate,
2. Lower blood pressure,
3. slow down respiration,
4. reduce hunger,
5. cause weight loss, overtime,
6. reduce sexual desire/activity in both males and females,
7. induce euphoria in addiction-prone individuals who derive pleasure from the drug. The degree of pleasure sensation depends upon the individual, the extent of his neurotic or psycho pathetic condition. It may be maximum when the individual is a beginner. This sensation weakens with the passage of time,
8. induces nauseating experience to a stable personality,
9. cause sickness in those persons who are allergic to opioids. Some even die.

Physiological and psychological effects vary somewhat with the varied techniques of administration.

12.6.3 Drug Dependence

Opioids create drug dependence, which has the following elements:

1. **Psychological Dependence:** the addict develops psychological dependence: He craves to take the drug repeatedly at the interval.
2. **Tolerance:** the body gets used to the drug and the subject needs an increasing dose to have the equivalent effect. The phenomenon is called “Drug Tolerance”.
3. **Physical Dependence:** body physiology changes. It needs the drug to ward off certain physiological problems. If the addict does not take the drug, he suffers from withdrawal syndrome and is unable to act and behave normally.

12.6.4 Non-Opiate Opioids

Barbiturates are another important group of substances (which are increasingly being used sedatives. They are also being used as drugs of addiction.

Barbiturates are important in medicine as sedatives and analgesics in cases of a nervous breakdown, emotional upsets and in certain ailments (asthma, insomnia, menstrual irregularities) especially along with other medicines. They do not leave any undesirable effects in medicinal doses.

Barbiturates, if taken in excess, produce intoxication, often with severe withdrawal syndromes. The alcoholic or opiate addicts often take barbiturates when they do not get alcohol or opiates. They also enhance or modify the effects of certain drugs of addiction. For example, emotional tension developed by cocaine or amphetamine addicts is controlled, with barbiturates. Likewise, intoxication of alcohol is prolonged if a barbiturate is taken along with.

Drug addiction of barbiturates has the following features:

1. The addict has the tendency to increase the dose, overtime
2. The addict suffers from withdrawal syndrome when he is not under its influence (not intoxicated).
3. The addict develops psychological dependence, characterised by a strong desire to take the drug repeatedly.
4. Barbiturate withdrawal syndrome is characterised by anxiety, twitching of muscles, tremors in hands and fingers, weakness, giddiness, nausea, vomiting, insomnia, lowering of blood pressure and delirium.
5. The symptoms start appearing in about a day and are intense for about three days. They slowly subside in about 10 days.

12.6.5 Miscellaneous

Other important non-opiate sedative drugs (opioids) are chloral hydrate (knockout drops) paraldehyde and bromides.

Tranquilisers (non-opiate non-barbiturates) have also invaded the field. They develop drug addiction similar to those of barbiturates.

12.6.6 Stimulants

The stimulant drugs stimulate various body functions. The important stimulants are:

1. Cocaine: snorted/smoked/injected
2. Amphetamines: swallowed/snorted/smoked/injected
3. Methamphetamine: swallowed/snorted/smoked/injected

They are used/misused to:

1. Counteract the effect of sedatives.
2. Keep awake during examination days or on long and night drives.
3. Pep up, to face the world better.

Addiction follows the usual pattern. Necessity or curiosity leads to experimentation. Frequency of desire to take the trip increases with the passage of time until the person becomes a slave to the drug, *i.e.*, an addict. Cocaine/Amphetamines affect the central nervous system. Usually, the person has the feeling of euphoria, well-being, increased self-confidence, heightening of alertness and initiative.

12.6.7 Hallucinogens

Hallucinogens are drugs, which affect the mental process of the human being, especially his perception, consciousness and his understanding. They are also known as psychedelic or psychotomimetic drugs.

Human beings have been taking hallucinogens from early times. They were taken by the mystics and the recluse who thought the drugs would enable them to detach themselves from the world and establish a union with the divine power.

To start with, hallucinogens were of plant origin. For example, peyote is a small cactus. It contains mescaline, which is a hallucinogen. *Charas* (a pseudo hallucinogen) is obtained from cannabis (*Bhang*). Lysergic acid, the starting material required to prepare LSD, was obtained from a fungus growth on rye grains.

Synthetic hallucinogens have ultimately come up replacing the original sources. For example:

1. LSD is now obtained from a synthetic source.
2. PCP (Phencyclidine, also known as Angel Dust, Rocket Fuel) and
3. DMT (N-dimethyltryptamine).

The synthetic drugs are similar in properties and their effects on LSD. Mescaline, the important alkaloid of the peyote cactus, can also now be prepared synthetically.

Hallucinogens are usually non-addictive. That is, these drugs do not induce drug dependence or drug tolerance, nor do they cause withdrawal syndrome. However, with these drugs, especially with LSD, the personality changes are so drastic that they are far more dangerous to society than even the addictive drugs.

Medical researchers are using these drugs for research purposes for mental ailments, and for exploring the hidden world of mental processes and feelings.

12.6.8 Solvents

New classes of substances, which are not included in the drug schedules, are solvents. The younger generations are taking up to their sniffing increasingly. The solvents being sniffed are:

1. Petrol
2. Paint Thinners
3. Others

All these materials are easily available. The solvent is poured on a handkerchief or taken in a plastic pouch and sniffed. They create the desired intoxication in the body of the sniffer.

The solvents are a serious menace to the health of the sniffers. They affect the windpipe, the lungs and the liver and are precursors to many ailments. They damage larynx; the air passage may be choked to cause suffocation.

12.6.9 Synthetic Narcotics

New synthetic drugs like Pethidine, methadone, LAAM, propoxyphene and buprenorphine have invaded the drug addicts' world and gradually drug menace. They possess better pain killing properties or have a long-lasting effect. For example, the Methadone effect lasts for about 24 hours.

12.6.10 Designer Drugs

Drug trade is highly lucrative. Alternative drugs to the prohibited drugs under the Act are being designed to evade the law, enhance potency and produce drugs which keep the addict intoxicated for longer duration.

Analogs of already existing drugs are called as designer drugs prepared. Analogues are the drugs, which have similar electronic structures but can have different molecular formulae. Many analogs of controlled drugs have entered the market of the illicit drug trade, which is a thousand times more potent than the traditional drugs.

Fentanyl (also known as fentanil) is an addictive drug with effects similar to morphine. However, it is about 100 times more potent than morphine. It is a synthetic drug and possesses a typical structure. Minor modifications in the molecule can produce numerous analogs, of which some are many times more potent than the fentanyl. For example, 3-Methylfentanyl is highly potent narcotic analgesic, its one gram can produce one million doses. Further, one gram of Carfentanil can produce 1.2 million doses, which is 10000 times more potent than morphine.

Another narcotic synthetic drug is Pethidine. Its major analog is MPPP, which is about 25 times more potent than Pethidine.

Among the stimulants, cocaine is starting material to prepare better stimulants. Two compounds, 2-Carbomethoxy-3 (4-fluorophenyl) tropane and 2-Carbomethoxy-3-Phenyln-ortropane are 60 times more potent than Cocaine.

A concoction of Fentanyl mixed with Halothane was supposed to have been used by Russia to control terrorists holding about 1000 hostages including theatre artists in a Moscow theatre. (CH)

12.7 EVIDENTIARY CLUES

Abuse of narcotic drugs is a serious world problem. It is increasing in all countries. The law enforcement agencies are, therefore, worried increasingly to control, contain and investigate drug-abuse crimes. Ordinarily, the following sources provide evidentiary clues in drug-abuse crimes:

1. The addict
2. The crime scene
3. The clandestine laboratories
4. The distributer
5. The peddler
6. The drug joints

The evidence relating to drug addiction include the drug addict, the drug, the containers of the drug, smoking paraphernalia, the syringe or the improvised injection devices, utensils used to heat, dissolve and modify drugs, are the clues found with the drug addicts. Needle prick scars, urine, blood, stomach wash, perspiration and hair are other useful clues. Manufacturing paraphernalia, associative chemicals, solvents, heating and distillation devices are met with at drug manufacturing sites. Special cavities, secret chambers and modified recesses in transport vehicles, where the drug on a bulk scale is stored are found on transport vehicles.

In a case of drug smuggling, the drug was carried in the belly of a camel. The belly of the camel had been opened and heroin in a plastic pouch was placed in the belly. Then the wound was stitched. (CH)

The following are the main sources of evidentiary clues:

12.7.1 Drug Addict

The addict is the most important source of clue materials. If he has consumed a drug, his blood, urine, hair, stomach-wash or stomach contents will have the drug.

If he injects the drug regularly, he creates needle marks on his body. The injection marks would be on the hands, arms, feet or legs. If the drug is injected subcutaneously, the marks will be seen on buttocks, thighs, legs or upper parts of the arms.

The drug may be found on his person. Cigarettes, smelling salt, handkerchiefs and purse are possible carriers. They are taken into possession. Any medicine, sweetmeats and smoking paraphernalia (pipe, tobacco, pouch, cigarette lighter) should receive thorough scrutiny.

Gum, glues, adhesives, books, notebooks, pen and pencils are checked for concealed drugs. Powder, cream and other cosmetic items are given a thorough check for drugs.

12.7.2 Addict's Residence

Residence of an addict usually yields a rich harvest of evidentiary clues. If the drug addict is living with his family, he is likely to hide the drug at secret places. The hiding place may be in the lavatory, bathroom discarded store, garage or vehicle. The usual clues are:

1. **The drugs;** open or concealed, pure or mixed
2. **The intake paraphernalia;** to consume the drug, if the drug is smoked, smoking pipe, will be located. If the addict is the main liner, injection needle – clinical or improvised, will be found. If the drug is 'cooked', heated or boiled, separate utensils will be found for the purpose.
3. **The drug residuals;** may be found at the site. These may be the packing material. These may be bottles or other containers. These may be even residues of smoked items. Or, the residual drug sticking to its receptacle may be found.
4. **Modification equipment;** if the addict prepares or modifies the product, equipment for such modification are found at site.
5. **Hiding sites;** arrangement for hiding the drug such as secret chambers/almirahs/boxes are found in some cases; especially where the drug consumption is organised on a commercial scale at the site. That is, if it is a drug den.

12.7.3 Clandestine Laboratories

In drug world, clandestine laboratories are places where narcotic drugs are prepared secretly, with improvised materials/tools/techniques. They usually manufacture popular narcotic drugs like, PCP, heroin, methamphetamine or extract/purify narcotic drugs of plant origin, all potent illegal drugs.

The drug mafia owns these laboratories most of the times. They locate the laboratories at a place away from the public gaze.

The handling of these laboratories needs knowledge of the drugs. Usually forensic experts are associated in the process to avoid accidents.

12.7.4 Drug Distributor/Peddler

Drug trade is a highly organised crime. Aeroplane, ships, cars (with special secret chambers) have been used for transport of the drugs. There are specified drug distributors/peddlers, who are usually drug addict s and they have joined the 'trade' to meet the cost of the drug they consume.

Quack doctors or drug peddlers retail narcotic drug. Their thievish/furtive/surreptitious behaviour indicates them. The drug they carry on their person or in their paraphernalia identifies them.

12.7.5 Drug Joints

Fig. 12.2

Cannabis cigarettes are often smoked by youngsters

Drug joint is usually a dirty/cheap/disreputable place of entertainment, usually a nightclub or restaurant where narcotic drugs are purchased/consumed by addict clients, often in company with other addicts. The youths often hold rave parties at these places. The drug joint owners locate the secret places (like underground secret rooms!). They often continue their clandestine activities for long periods, usually with the connivance of the local police. They are exposed when some serious crime occurs at the joint. Sting operation or surveillance also reveals them.

12.7.6 Collection of Evidentiary clues

In the collection of the evidentiary clues, the investigating officer must observe the following precautions, in addition to the usual ones:

1. Examine a suspected site for the manufacture or modification of the drug along with an expert from a Forensic Science Laboratory.
2. Do not smell, taste or smoke any substance suspected to be a drug.
3. Handling, packing and forwarding of chemicals need special care. Get the advice/help of the expert whenever possible.
4. Never depend upon the field tests alone. The suspected drug must be identified by a qualified person.

12.8 DRUG PROBLEMS/POSSIBILITIES

Drug addiction, as already seen, is a serious international problem for the law enforcing agencies including a forensic science laboratory, of all countries. The important questions raised by the problem include:

1. Is the suspect recovered material a narcotic or not? If it is, what is it? To establish the identity of the suspect material as a particular drug is the most important problem.

2. Has the suspect ingested/injected/taken a narcotic drug? if so, what is it? Search of the narcotic in urine/blood/stomach wash indicates the identity of the drug. Analytical techniques permit quantitation of the drug. If no drug is not found in body of the suspect subject, he is not subjected to additional investigations.

   The determinations of the dose also help the delivery of real justice in cases in which diminished responsibility is claimed for a serious criminal act under the plea that it happened under the influence of the drug.

   Further, a life insurance company may like to check whether a person is a drug addict or not before issuing insurance coverage. A will executed by a person is contested on the plea that the individual was under the influence of the drug. In some cases of alleged suicide, the actual cause may be drug addiction. In cases of sudden deaths, the real cause may be an overdose of a narcotic drug or a dose of an impure drug. The determination provides the correct picture.
3. Is the drug in question pure/diluted/impure/fake substitute?
4. Is the questioned drug licit or licit sources? Forensic analysis can give correct answers in most of the cases.
5. Where has the drug come from? The place of origin/laboratory where it was produced can be given with fair certainty. The question often acquires importance. The determinations can indicate if:
   - The drug is local or smuggled from outside.
   - In the latter case, it is possible to determine the country of origin. This helps to prevent smuggling of the drug into the country.
6. A witness in a criminal trial may be a drug addict. Naturally, his credit will thus be seriously affected. He may like to clear himself; or, the court may like to check in cases where it is challenged. A forensic analysis can establish addiction or otherwise of the individual.

12.9 SEDATIVES

12.9.1 Opium and Opium Derivatives

Fig. 12.3

Proud farmer of opium with opium plant flower and pods

All old civilisations were opium users. They used it both as medicine and for pleasure. In India, it was known much before the advent of Christianity in India, known at least seven centuries BC. It is believed that its use had spread from India to China and then to other countries like Egypt, Persia, Syria and later to Europe and then to America.

The scientific study, however, started only in the 19th century. The British were the first to isolate morphine from opium. The drug was used for de-addiction of opium. However, it was discovered soon that morphine was more potent as a drug of addiction than opium itself.

Opium was used extensively in India as a medicine and in religious ceremonies especially on the birth of a child. It still forms parts of its pharmacopoeia. However, the abuse of the drug caught up and continued to increase. Today heroin, a product based on morphine, is No. 1 narcotic in the world, embracing and destroying many a young person with its charms.

Opium to morphine, to heroin (diacetylmorphine), was a natural development. Like morphine, heroin was also believed to be a drug for de-addiction. In fact, it was marketed so in the initial stages by a German firm. Unfortunately, the results belied the hopes and it has proved a far greater danger — in fact, the most dangerous addictive and the most abused drug today.

The era of synthetic narcotic drugs started in the 20th century (1920–1940) and today it has reached the zenith (Or has it?). Yet there is no stopping. New drugs and the drug abuse continue spreading like a wildfire, the USA being the leader in its abuse in the world. Heroin menace rules the world, though it is a banned drug – no legal manufacture is allowed anywhere. The clandestine factories continue to churn out the drug in ever-increasing amounts to meet the ever-increasing demand.

Heroin production is morphine/opium based. The menace could be controlled if the production of opium is controlled/stopped. However, its three alkaloids, morphine, codeine and thebaine, have great medicinal value and legal production of opium continues. The part of the production of opium goes to the illicit market, where it ends up in the production of heroin.

Morphine is an extremely important drug used extensively the world over to relieve pain, control diarrhoea, reduce anxiety and to depress heart functions in heart problems. It is usually administered through injection.

Opium — morphine — Heroin are obtained from a poppy plant known *papaver somniferum,* which grows practically in all parts of the world, in all climates and regions, from the tip of South Africa to Moscow and from the Far East to the USA. However, notorious places for its production are:

- Golden Triangle: (Myanmar, Thailand, and Laos)
- Golden Crescent: (Iran, Afghanistan, Pakistan)
- Mexico
- Egypt and Turkey

The plant grows to a height of above 1 metre. It gives beautiful flowers, colours ranging from white to purple, mainly red and orange. Its fruit is the source of opium. When the petals fall off, the fruit grows to give opium fruit. The harvester gives an incision to the pod's skin. White milky fluid-like latex oozes out. On drying, it becomes gum-like material, which the harvester collects. The yield of opium is about five kg/acre.

There are many alkaloids in opium but the most important one is Morphine. It is separated from dissolved opium in water by adding lime followed by ammonium chloride. White powdery material appears on the surface, which is separated from the solution by filtration. The powder is converted into small bricks/blocks, usually of 250 /500 grams.

The Government of India has made stringent legal provisions to control and regulate the production, processing and sale of opium and its constituents/products. Narcotic Drugs and

Psychotropic Substances Act, 1985 and the Narcotic Drugs and Psychotropic Substances Rules, 1985, specifies for the purpose. The salient features of the same are:

- All cultivation of opium will be for the Central Government in specified areas only.
- The cultivation, collection of opium from the plants will be under strict supervision.
- The opium produced will be sold to Central Government authorities only.
- The Central Government will fix/pay a fair price to the cultivators.
- The Central Government would classify the quality of the opium for payment.
- The central Government views adulteration very seriously and inflict severe punishments.
- The Central Government alone does the manufacture/purification of opium in its opium laboratories.
- The Central Government deals alone with import/export/sale of opium.
- The State Government will, however, have the authority to regulate the manufacture, sale, purchase of medicinal opium and its constituents in the mixture form.
- Price of the various products will be fixed by the Central Government.

12.9.2 Opium

Opium is a mixture of about 35 alkaloids, the most important out of them being morphine. Opium contains about 10% morphine. Other important alkaloids are Narcotine, Codeine, Papaverine and Thebaine in order of decreasing percentage.

Table 12.1

Important Alkaloids of Opium

Morphine	9.5 to 14.2%
Narcotine	3.9 to 7.6%
Codeine	1.8 to 4%
Papaverin	1%
Thebaine	0.5 to 1%

Opium has been used as a drug, for its narcotic effects, for centuries, all over the world. Most governments have tried to limit its use for medicinal purposes only. However, illegal trade for the narcotic drug continues to flourish in most parts of the world. Opium is smoked, eaten or drunk. Its abuse through the hypodermic needle is dangerous.

Opium is a drug of addiction. Addiction-prone individuals feel great pleasure, when introduced to the drug. An intense desire to repeat the sensation is born after each dose until the individual becomes an addict. This phenomenon is accompanied by the need of ever-increasing dose (develops tolerance) and the increased frequency of intake. He reaches a stage when he cannot function without the drug (acquires dependence). If he does not take the drug, the body develops withdrawal syndrome. Ultimately, the addict is mental, physical and social wreck. He cannot live without continued presence/effect of the drug in the body. Opium reduces physical activity by depressing the central nervous system. It reduces the metabolic rate, blood pressure and respiration. Appetite is lost. Formation of digestive juices is reduced which often results in constipation.

Secretions of reproductive system organs decrease, reducing thereby the desire for sex. There are exceptions to this general rule, however.

Non-addiction prone individuals (stable personalities) do not get the intense pleasure sensation from opioids. Rather, the experience is nauseating to a few. A rare individual may even be allergic to opium. The mode of administration also affects the effects.

Opium can be identified by its characteristic smell, chemical tests and by thin layer chromatography,in which the presence of the constituent alkaloids is indicated by spray reagents and their $\mathbf{R_f}$ values.

12.9.3 Morphine

Morphine being the most important constituents of opium, is principally responsible for most of its qualities as sedative, pain killer and narcotic. In fact, it has replaced the use of opium for these purposes.

Morphine is extracted from opium. It is used in the form of its salts, usually as Morphine sulphate. Morphine is an alkaloid.

12.9.3.1 Administration

Morphine is taken usually by injection, though sometimes it is also taken by mouth. Medicinal dose of morphine sulphate is about 10-15 mg. 75 mg is the fatal dose. In the case of addicted persons, the fatal doses would be upward. Average addict takes 30 to 150 mg. of the drug every day in four or five shots.

Morphine is sometimes combined with atropine to counteract the depressant effect of morphine.

12.9.3.2 Physiological Effects

Morphine has the same physiological effect as those described for opium. Briefly, it may show excitement followed by a soporific effect, narcosis and coma.

12.9.3.3 Metabolism

Morphine is eliminated through urine. About 50% morphine is eliminated in about 8 hours. About 90% in one day. Traces are noticeable even after 48 hours.

12.9.3.4 Addiction

The drug is a very strong addictive drug. Continued use makes a person drug addict.

12.9.3.5 Identification

It is identified from the following:

1. **Melting Point.** Morphine (anhydrous) has a melting point of 250°-256° C, with decomposition.
2. **Marquis Test.** Formaldehyde and sulphuric acid give purple colour.
3. **Ammonium-molybdate Test.** Purple colour which changes to blue and then to light green.
4. Potassium calcium iodide gives fine needle crystals.
5. Paper or thin layer chromatography give characteristic R_f' values, which depend upon the system. In gas chromatography, morphine shows characteristic retention time.
6. UV and IR absorption spectra are characteristic. The former is also used to estimate morphine.

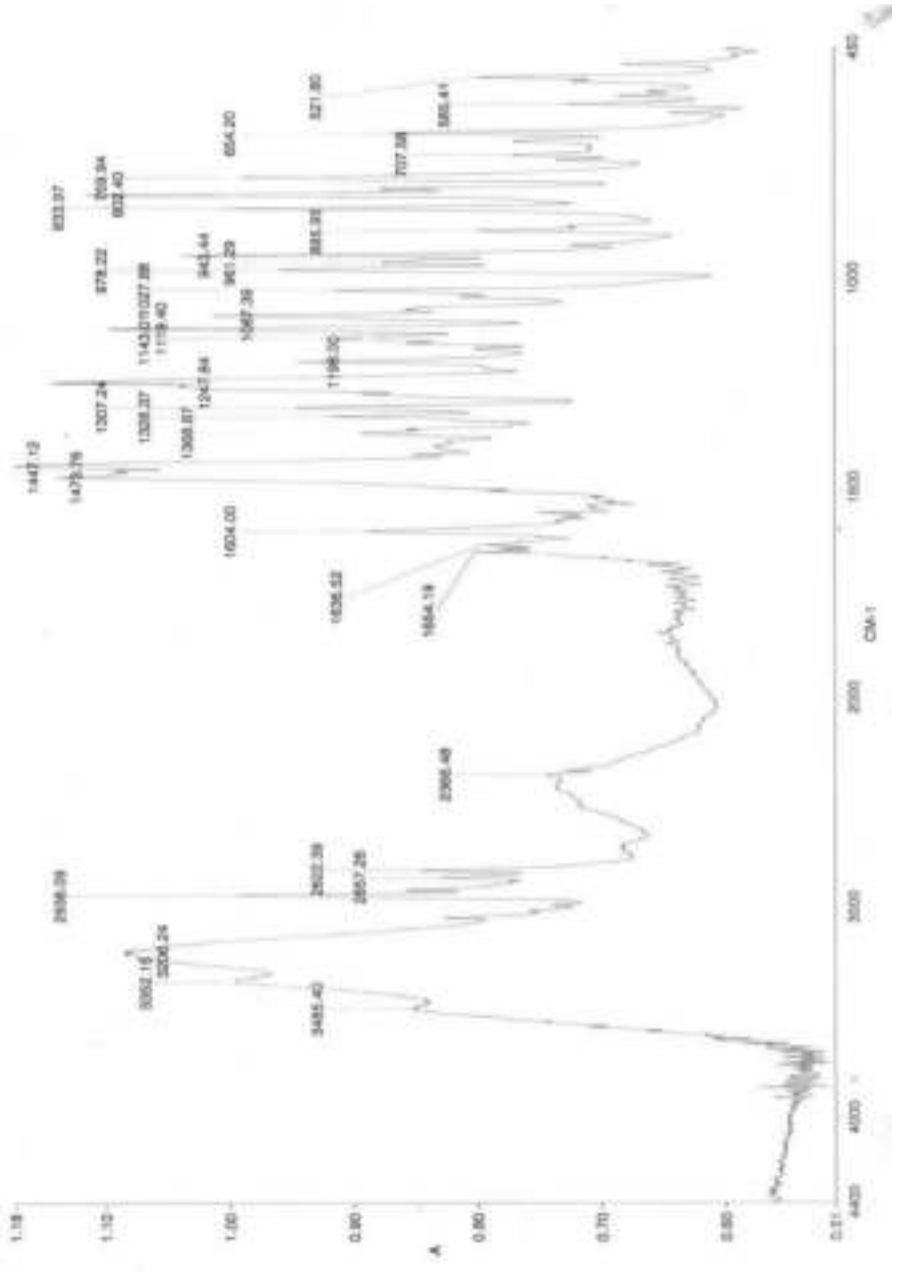

Fig. 12.4
IR spectrum of morphine

12.9.4 Heroin

Conversion of morphine to heroin needs more elaborate chemical operation. It, however, does not need extensive equipment. Morphine is refluxed with acetic anhydride for about 5 hours. Diacetyl morphine, *i.e.*, heroin, is formed. It is separated from the solution by neutralising the solution with sodium carbonate (washing soda). Heroin is separated as a precipitate, which is treated with hydrochloric acid. Heroin hydrochloride salt thus obtained is used/abused as a narcotic.

Heroin is white in colour. But heroin from Mexico is usually brown (hence the name 'brown sugar'). Its colour varies from white to almost black. The refining process creates the difference. Mexican process does not eliminate completely some gums and pigments from the crude, which create brownish colour. Golden Triangle, Golden Crescent and the Middle East countries products are usually white. Heroin content also is lower in Mexican products.

Heroin is not marketed in pure form. It is always diluted (cut). The usual street samples contain 1 to 5% heroin. Usually two types of (cutting) agents are used:

- **Diluents;** commonly used diluent is milk sugar; but other diluents like other sugars/carbohydrates are also used. Some may even mix baking powder.
- **Toxic Excipients;** commonly used excipients are quinine, procaine and lidocaine.
- **Speed Ball;** a mixture of heroin hydrochloride (or morphine sulphate) and cocaine is called speedball. It is administered either by injection or through insufflations (through body orifices). The combo has a synergic effect. It is not abused is in India to any extent.

12.9.4.1 Abuse

Heroin is abused in all modes: Smoking, inhalation, eating, drinking or injection. The usual and economical mode is by injecting. The drug is injected in the blood stream directly by the main liners.

A main (direct) liner prepares the injection by cooking heroin in a 'cooker' (spoon). He takes the required dose in a 'cooker' or any other small receptacle. He dissolves it in a small quantity of water and heats it. Matchstick heating is adequate to dissolve the drug. He draws it in a syringe (usually commercial, but in emergency eyedropper also serves) and injects it into the arm, starting from the middle of the biceps and then use the arm from the position toward the wrist and then to the back of the hand. Deterioration of the skin on the sites of pricks and stiffening of the veins necessitate this downward movement. Later he shifts to feet and then goes upward injecting the drug. Some choose odd places: neck, below the tongue, under the breasts (ladies!)

In case of a dirty solution, cotton plug is used to filter the drug at the site of the injection itself.

12.9.4.2 Physiological Effects

Heroin and other opioids affect the Central Nervous System (CNS). It is one of the strongest sedatives, depressing all body functions, free the subject from any pain, worry, immediately and the addict feels happy and relaxed. The intensity and the length of time for which the effect

lasts, depends mainly upon the quantity of the heroin injected and the extent of addiction of the addict. It slows down all physiological activities. The common symptoms of drug addiction are:

- Slower breathing, heartbeat
- Lower blood pressure
- Constipation
- Pale body colour, less oxygen intake
- Drowsiness
- Slurred speech
- Impaired mental-physical co-ordination
- Depressed reflexes
- Withdrawal Syndrome (table 2, below):

Table 12.2

Stage	Hours After intake	Symptoms
I	8-12	Nervous, anxious, irritable, fidgety, restless and belligerent
II	12-24	Yawns, sweats, running nose/eyes, goose-flesh waves, panic, confusion and depression
III	24-48	Tremors, twitching, cramps, diarrhea
IV	48-72	Symptoms peak: diarrhea and vomiting, unconsciousness and death, if neglected.

12.9.4.3 Identification

Heroin is usually identified by the following tests:

1. **Colour tests:** Marquis' reagent gives a purple colour. Frohde's reagent gives purple colour, which changes to olive green colour on standing.
2. **Micro-crystal test:** Platinum chloride and mercuric chloride give characteristic crystals.
3. **TLC:** Chromatogram visualised with iodoplatinate solution gives characteristic $\mathbf{R_f}$ value.
4. **Instrumental Modes:** IR spectophotometry, HPLC and GC-MS are confirmatory modes for heroin.

   Heroin is usually recovered in small amounts. Therefore, only non-destructive methods are used for its identifications. TLC, micro crystal test and IR Spectrophotometry are the favourite identification tests.

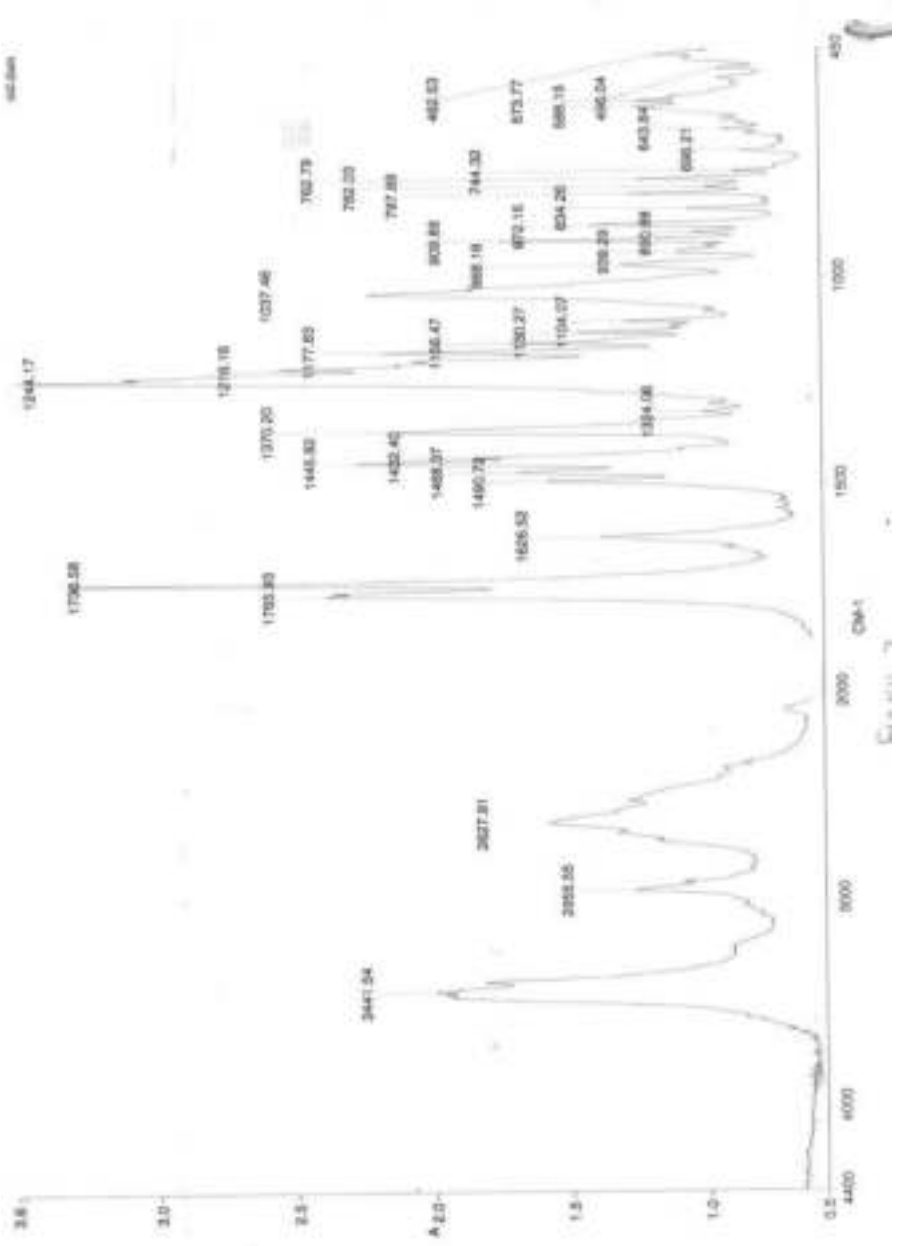

Fig. 12.5
IR trace of standard heroin

12.9.5 Barbiturates

Barbiturates are central nervous system depressants/sedatives. They are sedating and sleep-inducing and give hypnotic feeling to the users. They are used as anaesthetics or to treat epilepsy, insomnia, anxiety, or severe headaches.

Barbiturates have been used extensively in medicine as hypnotics to induce sleep and relieve pain and suffering. However, in recent years their medicinal use has declined because of their side effects and tendency to cause addiction. A new class of drugs Benzodiazepines is used in their place. Diazepam (valium) is one such drug, which is used to reduce pain/anxiety/emotional distress.

Barbiturates have been abused for suicide and murders. They account for 50% of the poisoning cases in the United Kingdom.

Barbiturates have been/are being used by the drug addicts as narcotics. They are comparatively more easily available, less costly and are considered less dangerous.

The addicts use barbiturates as substitutes for opiates. Likewise, alcoholics also sometimes take them as a substitute for liquors. The intoxication caused by barbiturates may not be so obvious as they have no smell.

Barbiturates are used as "truth serum"; for example, Pentobarbital sodium (Nembutal). Their administration creates a state of semi-consciousness in the subject. This state is conducive to get truthful answers from the subject — hence, the name "truth serum".

There are a variety of barbiturates available in the market. The common ones are:

1. Amytal (amobarbital)
2. Nembutal (pentobarbital)
3. Seconal (secobarbital)
4. Phenobarbital
5. Donnatal Butisol (butabarbital)
6. belladonna

12.9.5.1 Nature

All barbiturates are derivative of barbituric acid.

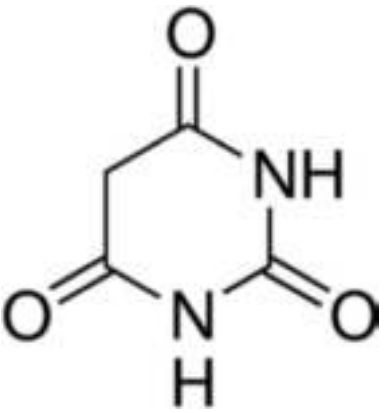

Fig. 12.6
Barbituric acid ($C_4H_4N_2O_3$)

The variations are due to substitution of hydrogen atoms by alkyl, aryl or other groups. In some, sulphur replaces the oxygen atom in between the two nitrogen atoms.

Barbiturates are known as barbitones or barbitals, the names ending in 'al' or 'one'.

The barbiturates may be long acting, intermediate acting or short acting. The barbiturates which induce sleep from 8 to 24 hours are long acting. Those of less duration (4 to 10 hours) are intermediate acting. The short acting barbiturates produce effect up to three to four hours. However, the effect varies with individuals and doses.

12.9.5.2 Administration

Barbiturates are frequently administered orally; sometimes by injection. They are usually taken alone; sometimes with other drugs especially with liquors (or cocaine).

12.9.5.3 Fatal Dose

Fatal dose of barbiturates is comparatively large, though it varies with the compound. For example, a minimum estimated lethal dose is two grams of barbiturate.

12.9.5.4 Addiction

Barbiturate addiction has the following characteristics:

1. A strong desire to continue taking the drug
2. A tendency to increase the dose
3. Both physical and psychological dependence develops.
4. Characteristic withdrawal syndrome appears within 24 hours and reaches maximum effect in 50 to 70 hours. The syndrome pattern is:

   Anxiety twitching of muscles weakening/dizziness nausea loss in blood pressure.

5. Barbiturates retard mental processes – the addict feels confused and loses control and judgment.
6. The physical vitality also diminishes.
7. Barbiturates in small doses cause sleep but in larger doses they cause insomnia.
8. An addict gets intoxicated even with a small dose because of the cumulative effect. Addiction to barbiturates resembles alcoholic intoxication. The addict loses control on motor centres, emotional control and suffers from delusions.

12.9.5.5 Metabolism

Barbiturates are metabolised in four ways:

1. The alkyl or aryl substituent gets oxidised.
2. N-alkyl group is de-alkylated.
3. Fission of the ring takes place but only to a small extent.
4. Thiobarbiturates lose sulphur.

12.9.5.6 Identification

1. Barbiturates produce blue colour with 1% solution of cobalt nitrate in alcohol and a pellet of sodium hydroxide.

2. Thin layer and gas chromatography identify and individualise barbiturates. Infrared absorption spectra are characteristic.
3. Quantitative estimation is done by U.V. absorption spectrophotometer.

12.9.6 Other Non-opiate Sedatives

Chloral hydrate, paraldehyde, bromides are other non-opiate sedatives. Out of these chloral hydrate is criminals often use it as a 'knock out' drug to knock out the victim. Half a gram is sufficient to induce sleep in a man. The drug-alcohol combo has a synergetic narcotic effect.

12.10 STIMULANTS

Stimulants activate the central nervous system. Thus, their effects are opposite to the sedatives. But this increased activity is achieved at a cost. Ultimately, this increased activity deteriorates the body functionaries due to their excessive activities. Consequently' these drugs are also narcotics. Important members are Cocaine, Benzedrine, Dexedrine, and Methedrine.

12.10.1 Cocaine

Cocaine is obtained from the leaves of Coca bush, commercially. It is white crystalline slightly volatile alkaloid. It's melting point is 96°-98° C.

12.10.1.1 Origin

Cocaine is of vegetable origin. The cocoa plant (Erythroxylon Coca L) is a bush. It is native of South America. However, it grows elsewhere also on mountain slopes. Humid climate and rich soil at temperature 20° to 30° C are ideal conditions. It grows in India also.

The useful life of the bush is 30-40 years. It may go up to up to 100 years under favourable conditions. It grows to a height of 2 to 3 metres It gives 4 crops of leaves in a year. The average yield of cocaine from dry cocoa leaves is 0.5 to 1%. A number of factors including drying process influence the yield.

The cocaine drug mafia has developed a new strain of coca plant, which is taller and has about four time cocaine than the traditional plant.

Cocaine is extracted from cocoa leaves by a number of processes. The basic nature of the alkaloid is exploited for extraction and purification. Ultimately, its hydrochloride salt in purified form is sold as the narcotic.

12.10.1.2 Use

Cocaine is a drug of choice for local anaesthesia. However, Novocain and xylocaine (Lidocaine), both synthetic drugs, are used for local anaesthesia.

12.10.1.3 Abuse as Narcotic

Cocaine is somewhat volatile. It evaporates with the passage of time. The process is hastened by the diluents, which are often used in the commercial cocaine. Cocaine is sold in three forms.

1. Wholesale dealers sell it in a rock-like solid form.
2. The rich use it in pure flake form.
3. The street form is powder, usually mixed with diluents.

Ordinarily, the dilution does not go beyond 40%. Often it is less.

The diluents commonly used are:

1. Procaine—a synthetic local anaesthetic drug
2. Milk sugar or other simple or complex sugars
3. Methamphetamine, synthetic stimulant

In fact, any chemical or food material, which is soluble in water and is not harmful to the body, can be used as diluents for cocaine.

The addict has to depend upon the word of the peddler as to the real strength of the drug (or diluent) though intelligent addict can guess the strength through inhaling or by tasting the drug.

12.10.1.4 Administration/Intake

Cocaine is taken by mouth in capsules, mixed with food or with drink, by inhaling, by application on the gums, by placing it under the tongue or by injection. The injection method gives maximum satisfaction to the user though inhaling is also considered quite satisfactory. In fact, cocaine inhaling is the most frequently utilised method. The inhaling is done in a number of ways.

1. Carrying it in a paper and inhaling it through the nostril.
2. Nose drops. It is sprayed in the nostril.
3. Sniffing from a pouch, handkerchief.
4. Taking a pinch of it like a snuff – snorting.
5. Mix it with Vaseline and rub it in the nostrils.
6. Taking it in a tiny spoon (made for the purpose), which can contain about 50 mg. of cocaine and snort the content off the spoon, placed in the nostril.
7. Pick up the dose in a straw, used for cold drinks, and snort it.

12.10.1.5 Effects of Cocaine

The effect of cocaine on an individual is immediate. The subject experiences euphoria/intense pleasure. The drug is claimed to:

1. Stimulate the central nervous system (CNS), mental and physical processes and the person is hyperactive.
2. Make the addict feel that he is capable of doing anything. He may indulge in anti-social activities.
3. Reduce inhibitions.
4. Act as a sexual stimulant.

12.10.1.6 Physiological Effects

1. Cocaine is known to:
2. Increase physiological activity: blood pressure, pulse rate, respiration
3. Reduce appetite, hence used to reduce obesity.
4. Reduce sleep.
5. Cause constipation.

6. Weaken sense of time and distance perception.
7. Cause thirst.
8. Create local anaesthetic effect on the tongue/throat, when taken orally.
9. Produce sore noses to some snorters.
10. Induce psychological stress syndrome in addicts.
11. Cause blood poisoning, anaemia in habitual users.
12. Cause infection.
13. Create toxic reaction in some cases.
14. Reduce hunger. Less food intake ultimately affects health and immune system.
15. Cause headache, nausea, cramps, delirium, and even unconsciousness in some persons.
16. Over doses makes a person aggressive, sometimes.
17. Fatal dose varies from 2.5 mg. to 1.5 g.

12.10.1.7 Addiction

Cocaine addiction indicators are:

1. Intense desire to take the drug
2. Psychological dependence
3. No appreciable tolerance
4. No physical dependence
5. No abstinence syndrome
6. Health deterioration: due to less food intake, less sleep and excessive exertion

12.10.1.8 Metabolism

Cocaine suffers extensive changes in the body. But a part of it (1 to 12%) is eliminated as such in the urine unchanged in about 24 hours. The maximum excretion is in the first six hours. It is identified from unchanged cocaine in the urine.

12.10.1.9 Identification

The following determinations help to identify cocaine:

1. **MP.** The melting points of the alkaloid and its hydrochloride are determined. They are 96° C and 197° C respectively.
2. **Scott Test.** Cobalt thiocyanate solution gives an intense blue coloured precipitate.
3. **Gold chloride Reagent.** It gives serrated needles (crystals).
4. **Thin layer and gas chromatography.** They are utilized to identify the drug.
5. **G.C/M.S.** The analysis distinguishes its different stereoisomers.
6. **UV and IR absorption spectra.** They are characteristic of the alkaloid.
7. **UV spectrophotometry.** It is used for the estimation of the drug.
8. **NMR.** It has also been used to characterise cocaine.

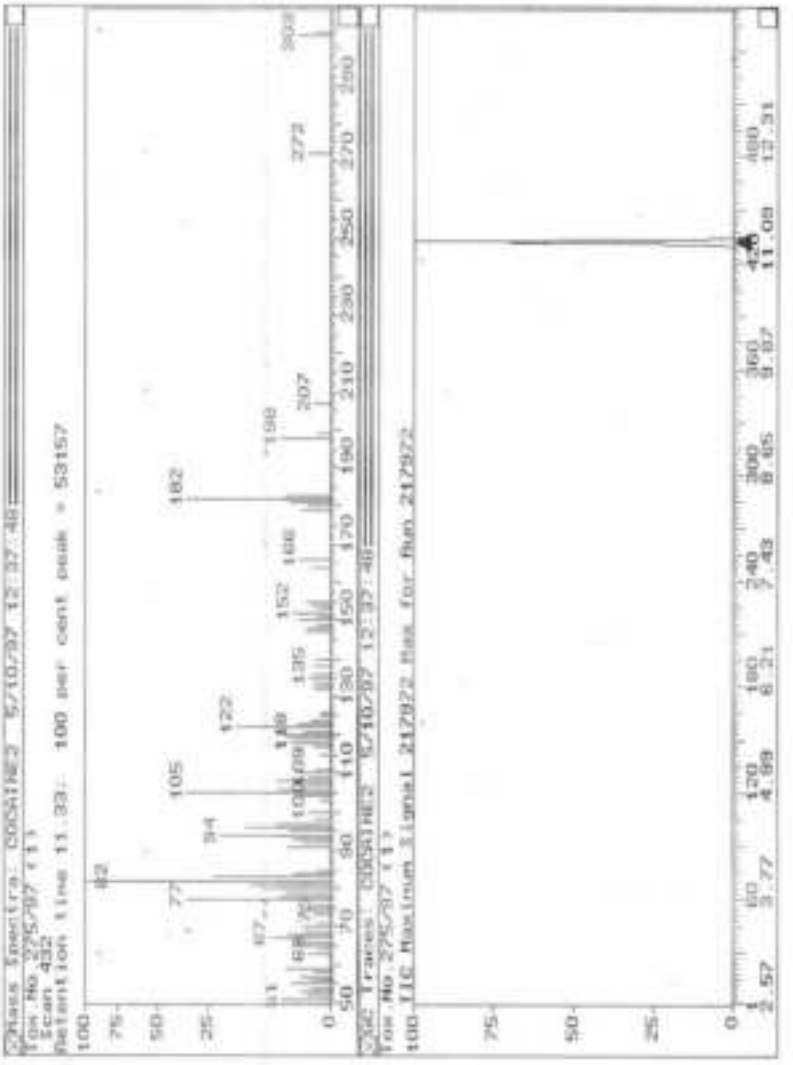

Fig. 12.7
Top: Mass spectrum of Cocaine
Bottom: GC trace of Cocaine

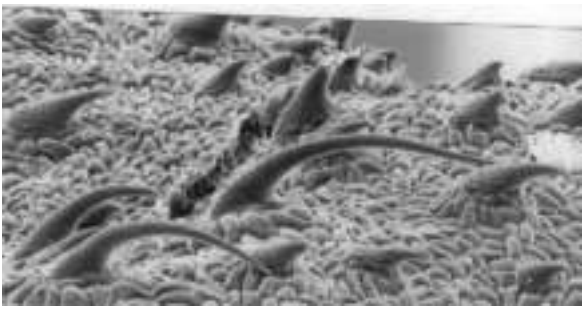

Fig. 12.8

SEM photograph of cystolic hairs on the leaf of cannabis

12.10.2 Amphetamines

The collective group of amphetamines includes amphetamine, dextroamphetamine, and methamphetamine. Medications containing amphetamines are prescribed for narcolepsy, obesity, and attention deficit/hyperactivity disorder.

Amphetamines are a group of synthetic stimulants, which are prepared from â-phenethylamine. Amphetamine has stimulant effect, similar to that of cocaine.

12.10.2.1 Administration

Amphetamine/methamphetamine, in the form of a pill, is usually taken orally. The other modes are:

1. Snorting it
2. Inhaling after vapourising it
3. Injection, after dissolving it in water
4. Placing it in contact (or rubbing it) on the body part.
5. Smoking

12.10.2.2 Effects

The drug has similar effects to those of cocaine on the human bodies.

1. The drug stimulates the central nervous system. Consequently, the sensation of pleasure, alertness and initiative are created.
2. It prevents sleep and reduces fatigue.
3. It reduces appetite and has been used as such by an obese person to reduce weight.
4. Psychomotor functions and mental processes are affected.

12.10.2.3 Addiction

Amphetamines addiction has the following characteristics:

1. Desire to take the drug repeatedly
2. Development of tolerance
3. Psychological dependence
4. Absence of physical dependence

12.10.2.4 Metabolism

Only a small amount of amphetamine is metabolised when the pH is low. At high pH, a fair percentage of the drug is metabolised to a large number of products. Unchanged amphetamine is excreted through urine in considerable amounts. It can be utilized for detection of addiction. Most of the drug (90%) is excreted within three days but small amounts of the drug can be detected even after a week of the oral administration. It is not excreted through faeces.

12.10.2.5 Identification

The following tests are common to identify the drug:

1. **Marquis Test:** Amphetamines change the orange colour of the reagent to brown.
2. **TLC/GC.** The drug gives a characteristic thin layer and gas chromatograms.
3. **UV and IR spectra.** *They* are useful modes to establish the identity/quantity of the drug.

Other Amphetamine-type stimulants (ATS) have the same general structure, similar effects and similar methods of analysis.

12.11 HALLUCINOGENS

Fig. 12.9

Psilocybin Mushroom: the source of powerful Hallucinogen Psilocybin

Hallucinogen drugs alter perception, state of consciousness and may create imaginary scenes, sounds and scents to the person who is under their influence. The origin of the drugs to start with was from the natural source like a mushroom, cactus, However, synthetic hallucinogens have since entered the field.

Important hallucinogens are cannabis (THC), peyote cactus (mescaline), mushrooms (psilocybin and psilocin), L.S.D., P.C.P., D.M.T., P.C.P.,

12.11.1 Cannabis (Bhang)

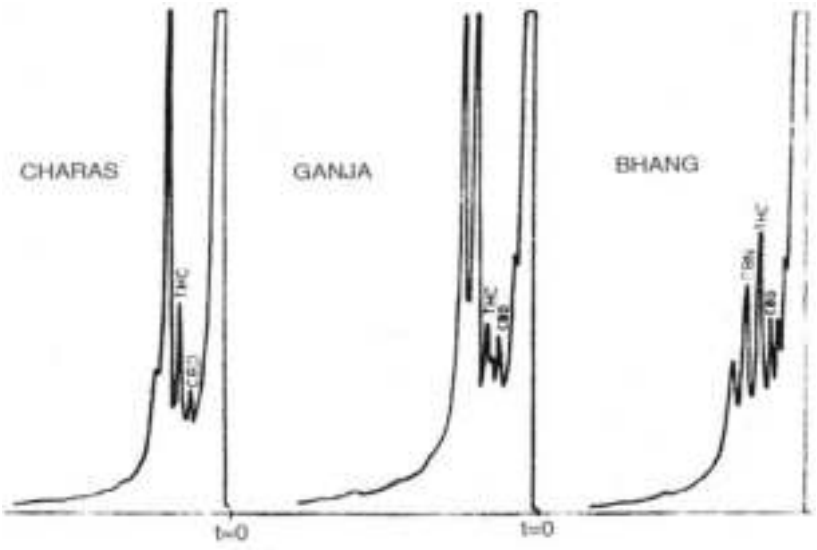

Fig. 12.10
IR spectra of cannabis

Bhang, marijuana or cannabis is synonyms with the botanical names of the plant *cannabis sativa L*. It is an annual dioecious shrub. It is usually 2 to 3 metres tall. But under favourable growth conditions the height may go up to 5 metres. The resinous contents, especially the Psych-active component, the **T**etra-**H**ydro-**C**annabinol (THC) vary in the various parts of plant. The resin is about 5% in flowering tops of the female plant and about 1% in the leaves. Even the fruit contains traces of the resin. The drug is used in three forms in India:

1. **Bhang; i**t is the flowering top and the leaves in nascent or dried form
2. **Ganja; i**t is the crude resin along with some leaves/flower residues
3. **Charas/Hashish.** WHO has defined *Charas* as: "the separated resin, whether crude or purified, obtained from the cannabis plant". The resin contains cannabinoids including tetrahydrocannabinol (THC).

   Charas may be solid or paste, depending on the method of preparation and temperature. Its colour varies from light to dark brown, to yellow, black or red. These characteristics depend mostly on the process of manufacture.
4. **Hashish oil**

   Hashish oil is also called Marijuana oil or honey oil. It is about 3-4 times stronger than *charas* and about 30-40 times stronger than *Bhang* (marijuana). It has generally a brown black colour. Its THC content is about 20 to 60%. It is a very strong hallucinogen.

   The active ingredient of all cannabis products is the same compound, the THC. Only its quantities vary. They, therefore, do not warrant separate treatment. The following points are noteworthy.

   1) In the Narcotic Drugs and Psychotropic Substances Act, 1985, the term cannabis includes practically all parts of the plants except mature stalks, fibres, seed, seed oil or cake.

2) The main psychoactive ingredient of the *Bhang, Ganja, Charas* and *hashish* oil is THC. It has been synthesised and is known as Dronabinol. However, it is not used as a drug because of its prohibitive cost of production. THC from natural source is far cheaper.
3) Cannabis (*Bhang*) has been described variously as depressant, stimulant or hallucinogen. In fact, the drug is believed to affect various individuals differently. In term of volume, it is the most abused drug in the world today.
4) Cannabis grows all over the world. The narcotic resin is obtained from the flowering tops/leaves. Fibre is obtained from its bark. Its seeds are useful food.
5) The resinous product varies in quality and quantity with the place of origin and the part of the plant.
6) The euphoria and the narcotic properties of cannabis are mainly due to THC.

Cannabis is used in three forms in India.

1) **Bhang;** it is mostly leaves.
2) **Ganja;** it *is* leaves and flowering tops of the plant.
3) **Charas;** it is mostly resinous product of cannabis, obtained from the flowering tops and leaves of the plant. It is also known as *Hashish*.

The resinous mass, contain many chemicals (More than 450 compounds have been identified). They include THC, and more than 60 cannabinoids. The resin also containscystolithic hair, glandular hair, resin glands, chlorophyll, proteins, oils, fibres, fragments of leaves, About 60 cannabinoids and 140 terpenes of the identified compounds are unique to Cannabis Sativa L.

12.11.1.1 Administration

1. Cannabis, in the most part of the world, is often smoked in cigarettes, in pipes, in *hookas*.
2. It is eaten, mixed in sweetmeats.
3. It is taken in the form of soft drinks *(sharbat)*.
4. It is administered in the form of medicinal concoction.

12.11.1.2 Effects

The effects of cannabis are confusing. As already mentioned, it is described as sedative, stimulant and hallucinogen. The major effects described are:

1. It relieves fatigue.
2. It removes inhibition.
3. It excites hunger in some and reduces hunger in others.
4. It affects perception with respect to time, space and understanding.
5. Some persons feel that they enjoy art and music better under its influence and that their creative powers are enhanced.
6. Some people suffer from hallucination. They start weeping, laughing, abusing or quarrelling. Some under its influence create a public nuisance. Some commit crime.
7. some persons suffer instability and confusion.

It is believed that excessive abuse overtime deteriorates the intelligence/memory/judgment,

12.11.1.3 Addiction

Cannabis is not addictive like opium. Ordinarily, people start with this drug and pass on to harder drugs. However, the main feature of cannabis abuse are:

1. It creates repeated craving, desire to take the drug repeatedly, perhaps in the belief that the drug will improve capabilities.
2. It does not develop tolerance.
3. It does not leave withdrawal syndrome.
4. It does not develop physical dependence.
5. It develops psychological dependence.

12.11.1.4 Metabolism

The metabolism of the important constituent, tetrahydrocannabinol (THC), has been studied. THC first changes to hydroxytetrahydrocannabinol which gets further degraded. It is excreted, along with its degradation products, through faeces (50%) and through urine (30%). Urine also excretes unchanged THC in a small amount (less than 1%). The excretion is slow and takes over a week for the elimination of most of the drugs.

Both the original compound and hydroxyl-compound are useful for identification and estimation purposes. They continue in the bodies of the regular abusers for many days.

Table 12.3

Cannabis Detection Limit Chart

S. No.	1	2	3	4	5
Intake count frequency	1	2-4/m	2-4/Week	5-6/week	Daily
Detection Limit In days	5-8	11-18	23-35	33-48	49-63

12.11.1.5 Identification

Commonly used tests for cannabis identification are:

1. **Fast Blue B reagent;** it gives violet colour with alkaline.
2. **TLC and GLC chromatograms;** they are characteristic.
3. **UV/IR spectra;** they are characteristic for identification purposes.
4. Other modes of identifications are:—
    1) **From leaves**
        - Characteristic veins and secretions.
        - Green colour even on drying. Rot may spot it brown.
        - Horn like cystolith transparent hair on the upper surface, with thick base and pointed tips
        - Microscopic bulbs can be observed under slide cover, which reacts with hydrochloric acid.

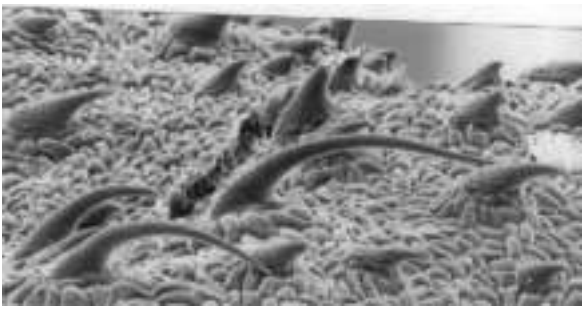

Fig. 12.11

2) **Seeds**
   - Ovoid in shape
   - Greenish yellow to brown colour
   - Whitish flesh in the kernel
   - Ridge around the circumference
   - Presence of characteristic reticulate pattern on the surface

12.11.2 LSD[2] (Lysergic Acid Diethylamide)

Lysergic acid diethylamide (LSD) is a psychedelic drug. Its psychological effects include altered awareness of the surroundings, perceptions, and feelings as well as sensations and images that seem real though they are not.

The drug is tasteless and odourless white powder with MP 80°– 85° C.

12.11.2.1 Administration

It is often sold on blotter paper, a sugar cube, or gelatin.

1. LSD is swallowed.
2. It is placed under the tongue.
3. It is taken orally, often placed in sugar cubes, blotting paper or gelatin.
4. It is injected.

LSD is a highly potent psychedelic drug. The normal dose for going on a trip is about 1 to 2 microgram per kilogram of body weight, though addiction-prone individual may tolerate up to 4 microgram (per Kg body weight) of the drug. On many individual a dose as little as 20–30 micrograms can produce a hallucinogen effect.

Quantities in milligram may prove fatal.

2. It is an acronym of its German name "Lyserg-Säure-Diäthylamid".

12.11.2.2 Effects

LSD is one of the most powerful psychedelic drugs. The drug affects the entire human mechanism, which may result in complete disorganisation of the individual and cause chaos. The effect is pronounced upon psychologically weak personalities. The main features of the experiences described are:

1. The subject experiences vivid hallucination perceiving non-existing sound, colour and visual distortions.
2. The subject loses the sense of time and space.
3. The subject is unable to discriminate between right and wrong.
4. The subject loses sense of cause and effect.

   Once, a subject started clawing out his own eyes. He described his state as being dead and under water and that when he found his vision did not work well, he wanted to pullout the eyes for better focus, to see better. (CH)
5. The effect of the drug appears in about half an hour and lasts for several hours. In some cases it creates permanent defect in the personality of the subject.

It is used mainly as a recreational drug and for spiritual reasons. However, many individuals suffer adverse reactions such as anxiety, paranoia, and delusions,

12.11.2.3 Addiction

The drug is not addictive. However, it is too drastic. A single dose has, in some cases, caused disturbance for over a year. The exact nature of its action on the human body and mind is not yet fully understood. It is possible that it may be causing damage to some organs, possibly to the brain parts. The drug, therefore, needs strict control and preventive measure against its abuse.

12.11.2.4 Metabolism

L.S.D. is metabolised in the liver to three or four different metabolic products. 60-80% is excreted into the bile.

12.11.2.5 Identification

1. ***Colour Tests;*** it gives grey colour with sulphuric acid and formaldehyde. It gives grey green colour with ammonium molybdate and brown colour with ammonium vanadate.
2. ***TLC and GLC chromatograms;*** they are characteristic.

12.12 RECENT TRENDS

The abuse of illegal drugs has gone sky-high in recent times. It can be seen from the following figures of yearly drug abuse in the USA, average of years 2002, 2003 and 2004:

Table 12.4

Yearly Drug Abuse in USA

S. No.	Drug abused	Abusers in lakhs
1.	Marijuana	255
2.	Pain Relievers	113
3.	Cocaine	58
4.	Tranquilizers	50
5.	Stimulants	30
6.	Ecstasy	14
8.	Crack(cocanine)	14
9.	Sedatives	9
10.	LSD	7
11.	Heroin	4

The extent of drug abuse is frightening and, unfortunately, it is increasing. The employers and others are highly worried about their staff's drug status. Scientists have come up with numerous tests, invasive and non-invasive, to provide a necessary check on the employees. The test is used by some employers to recruit, retain and promote drug-free workers.

The usual test materials used to check drug addiction of the persons are:

1. Blood
2. Urine
3. Oral fluid (saliva)
4. Hair

Methods have been standardised for the detection of drugs from these clue materials. for varying periods. The retention of the drug and hence detection thereof, in the clue materials, depend upon a number of factors including the nature of the drug, the health of the abuser, mode and quantity of the ingestion, However, a rough idea can be had from the following table:

Table 12.5

Approximate Retention (Detection) Time

S. No.	Substance	Urine	Hair	Blood/Oral Fluid	Remark
1	Ethanol (alcohol)	6–24 hours	up to 2 days	12–24 hrs	As Ethyl glyceride: 80 hrs in urine
2	Amphetamines	1 to 4 days	up to 90 days	12 hrs	except methamphetamine
3	Methamphetamines	3 to 5 days	up to 90 days	1–3 days	
4	Ecstasy	72 - 96 hours	up to 90 days	72 - 96 hrs	
5	Barbiturates	1 day	up to 90 days	1 to 2 days	except Phenobarbital
6	Phenobarbital	2 to 3 weeks	up to 90 days	4 to 7 days	
7	Benzodiazepines (Therapeutic use)	up to 7 days	up to 90 days	6 to 48 hrs	Chronic use: 4 to 6 weeks
8	Cocaine	2-5 days	up to 90 days	2-5 days	Kidney disorders interfere
9	Codeine	2-3 days			
10	Cotinine	2-4 days	up to 90 days	2-4 days	Nicotine Metabolite
11	Morphine	2-4 days	up to 90 days	1-3 days	
12	TCA	7-10 days	undetectable	Only detectable	Tricyclic Antidepressant
13	LSD	12-24 hrs	undetectable	2-4 days	
14	Methadone	7-30 days	up to 90 days	24 hrs	
15	Steroids	3-30 days			
16	PCP	3-7 days; used once	up to 90 days	1-3 days	up to 30 days in regular user

The testing methods for the drugs in the clues (Blood, urine, oral fluids, hair) have undergone a sea change *vis-à-vis* their sensitivity and specificity.

Table 12.6

COMMON NARCOTICS

Drug	Normal Use	Abuse	Dose	Mode of Intake	Effects	Withdrawal Symptoms	Availability/ Remarks
DEPRESSANTS							
1. Opium	Sedative	To escape reality	Variable	Smoked/ eaten/ injected	Euphoria, sleep, physical dependence. Develops tolerance	Pain, cramps, nervousness, perspiration. In acute cases death.	From poppy heads.
2. Morphine	Sedative, pain killer in acute cases	— do —	15mg	injection	— do —	— do —	One of opium alkaloids
3. Heroin	Nil, illegal manufacture	— do —	5 mg. onward	— do —	— do —	— do —	From morphine
4. Methadone-pthedin	Sedative	— do —	10 mg.	Injection/ eaten	— do —	— do —	Synthetic compound
5. Barbiturates	Sedative, pain killer, relaxant	— do —	50 mg. to 100 mg.	Swallowed/ injected	Drowsiness, sleep. No Physical dependence. Tolerance develops	Depression, incoherence, prespiration,	Synthetic derivatives of Barbituric acid.
STIMULANTS							
1. Cocaine	1. Antidote for depressant 2. To keep awake. 3. To reduce obesity	1. – do – 2. For dutch courage.	variable	Eaten/ sniffed/ injected.	Excitation: LocquaiousnessAlertness, activities increases. Nophysical depen-dence or tolerance.	Irritation, confusion, aggressiveness	1. From cocoa leaves. 2. Synthetic.

Drug	Normal Use	Abuse	Dose	Mode of Intake	Effects	Withdrawal Symptoms	Availability/ Remarks
2. Amphetamines	Antidote for depressant. To keep awake To reduce obesity	1. To escape reality. 2. For dutch courage.	2.5 mg.	Swallowed/ snuffed	Excitation: Locquaciosness Alertness, Activity increases. Nophysical depen-dence or tolerance	Irritation, confusion, aggressiveness	synthetic
HALLUCINOGENS 1. Mescaline	Nil	To escape reality	variable	oral	Illusion and hallucination	No physical dependence. Only psychological urge.	1. Peyote cactus 2. Synthetic
2. L.S.D.	Nil	— do —	50 to 250 ug.	— do —	Changes mood andbehaviour hallucina-tion, panic, extreme anxiety and mental depression	— do —	Semi synthetic. Hallucination can rear up with the same does after intervals
3. D.M.T.	Nil	— do —	variable	Smoked/ injection	Produce illusions and hallucinations	— do —	Synthetic
Cannabis	Mild Sedative, relaxant, intoxicant Hallucinogen	— do —	— do —	Smoked/ eaten	Relaxation, Euphoria Sleep in moderate doses.	— do —	Plant origin
Solvent Vapours	Variable	— do —	— do —	Sniffing	Excitation, confusion, tremors	— do —	From legitimatesources, Gasoline, nailpolish remover, lighter fluid, lacquer

12.13 CASE LAW

Supreme Court Cases (21st Century)

12.13.1 Contraband Quantity in Mixtures[3]

Author's Summary

It is a landmark judgment on Narcotics. The Amendment of the NDPS Act has drastically changed the punishment pattern. Now it is based on the quantity of the drug recovered. Law specified 3 categories small quantity (5 g), commercial quantity, (250 g) and the intermediate quantities (5-250 g).

The Narcotics are handled in mixtures. There was confusion whether the weight of the mixture or of the drug in the mixture should be considered for punishment. The SC decided in favour of the latter.

Highlights italicised

Relevant Extracts (Verbatim)

The relevant facts of the case are that on 5 March 2001, the Intelligence Officer was informed by an informant that two persons with certain drugs would be arriving by a Tamil Nadu Transport Corporation Bus at Thiruvananthapuram Bus Stand. The Officer along with other persons and the informant went to the bus stand and waited for the bus. At about 9.00 am, the two accused alighted from the Tamil Nadu Transport Corporation bus. They were identified by the informant. They were intercepted by the officials. The officials disclosed their identity and the accused were searched. When asked about possession of narcotic drugs, it was admitted by the accused that they were carrying 4 kg. of heroin and they handed over the bag to the Officer. The bag contained two packets wrapped in Tamil newspapers secured with brown adhesive tape in which light grey powder was found. Two samples of 5 gms. each from both the drug packets was packed, sealed and sent for testing to the Laboratory. The accused were arrested, but the second accused escaped while on the way to produce them before the Magistrate. On 26 March 2001, the Customs House Laboratory, Cochin sent a report confirming the samples as answering to the test of crude heroin, a narcotic drug covered under the N.D.P.S. Act. The report further said that the Laboratory was not equipped to conduct a quantitative test. Thus, the samples were sent for quantitative test. On 22 February 2002, a quantitative test was done in the Customs Laboratory, Chennai where the purity was tested and the quantitative test report indicated as follows:

S. No.	Marking on the cover	Lab No.	Wt. of the sample received with plastic cover	Wt. of the remnant received with plastic cover
1.	Section 1	235	5.6 g	5.0 g Purity 1.4%
2.	Section 3	236	4.9 g	4.6g Purity 1.6%

3. The accused-appellant was charged with the offence committed under section 8(c) read with sections 21 and 29 of the N.D.P.S. Act by the Intelligence Officer, Narcotic Control Bureau. The Special Judge for Trial of Cases under the N.D.P.S. Act found that the substance found

3. *Micheal Raj v Intelligence Officer, Narcotic Control Bureau,* AIR 2008 SC 1720 : 2008 Cr LJ 2250.

in possession of the accused was an opium derivative which has been defined under section 2(xvi), and under section 2(xvi)(e) a preparation, containing more than 0.2% of morphine or diacetylmorphine, is an opium derivative; and that since this contraband article contained 1.4% and 1.6% heroin it is an opium derivative, and punishable under section 21 of the N.D.P.S. Act. Since the manufactured drug being carried weighed 4.07 kg., it would come under section 21(c) being a commercial quantity, but since the accused is only a carrier and is not the beneficiary of the transaction, he would not be awarded the maximum sentence and would be awarded the minimum sentence of 10 years' rigorous imprisonment and a fine of Rs 1 lakh, in default of payment of fine rigorous imprisonment for one more year. On an appeal being preferred, the High Court found the accused guilty. The High Court said that section 21 of the N.D.P.S. Act when read with section 2(xi) which defines manufactured drug, makes it evident that the packet seized from the appellant is a manufactured drug. The offence can be in respect of the manufactured drug as well as preparation of manufacture drug. Preparation has been defined in section 2(xx). Again, any mixture of narcotic drug with other substances will also come within section 21 of the N.D.P.S. Act, so the rate of purity becomes irrelevant. The purity test does not advance the case of the accused. As per the High Court, it is the whole quantity of mixture which has to be taken into consideration for imposing the punishment under section 21 of the N.D.P.S. Act. The High Court maintained the conviction and sentence awarded by the Special Judge.

4. The only submission made by Shri K.V. Viswanathan, learned counsel for the appellant is confined to the limited issue relating to the sentence of the appellant under section 21 of the N.D.P.S. Act. As per the learned counsel, the conviction and sentence of the appellant are contrary to law because the total quantity of contraband seized from him was 4.07 kg. Since the purity of heroin is 1.4% and 1.6% respectively in two samples, therefore the quantity of heroin in possession is only 60 g. [(1.4+1.6)/2 = 1.5% of 4.07 kg. = 60 gs.). Thus, the total quantity of heroin seized is below 250 g., *i.e.,* below the commercial quantity. It is submitted that it is not the total weight of the substance allegedly recovered that is material, but the percentage content of heroin translated into weight that is relevant.

5. On the other hand, Shri Vikas Sharma, learned counsel appearing for the respondent urged that it is only the weight of the substance found in possession of the appellant and recovered from him ought to be seen, and once the substance tested positive for heroin, its percentage content in the substance was irrelevant, the entire substance would be viewed as a narcotic drug and consequently the total weight of the substance ought to be taken into consideration for determining whether it was a small quantity or a commercial quantity.

6. The provisions of the N.D.P.S. Act were amended by the Narcotic Drugs and Psychotropic Substances (Amendment) Act, 2001 (Act 9 of 2001) (w.e.f 2 October 2001), which rationalized the punishment structure under the N.D.P.S. Act by providing graded sentences linked to the quantity of narcotic drugs or psychotropic substances carried. Thus, by the Amending Act, the sentence structure changed drastically. Small quantity and commercial quantity were defined under section 2(xxiiia) and section 2(viia) respectively. New section 21 also provides for proportionate sentence for possessing small, intermediate and commercial quantities of offending material. As per Entry 56 of the Notification dated 19 October 2001 issued by the Central Government which deals with heroin, small quantity has been mentioned as 5 g. and commercial quantity has been mentioned as 250 g. So, the basic question for decision is whether the contravention involved in this case is small, intermediate or commercial quantity under section 21 of the N.D.P.S. Act, and whether the total weight of the substance is relevant or percentage of heroin content translated into weight is relevant for ascertaining the quantity recovered from the accused.

7. To appreciate the arguments of the parties, the relevant sections of the N.D.P.S. Act have to be looked into, which are as under: section 2(viia) (inserted by Amending Act 9 of 2001 w.e.f. 2 October 2001).

'Commercial quantity', in relation to narcotic drugs and psychotropic substances, means any quantity greater than the quantity specified by the Central Government by notification in the Official Gazette; section 2(xxiiia) (inserted by Amending Act 9 of 2001 w.e.f. 2 October 2001).

'Small quantity', in relation to narcotic drugs and psychotropic substances, means any quantity lesser than the quantity specified by the Central Government by notification in the Official Gazette; section

Section 2(xvi).

'Opium derivative' means—

(a) **Medicinal opium,** that is, opium which has undergone the processes necessary to adapt it for medicinal use in accordance with the requirements of the Indian Pharmacopoeia or any other Pharmacopoeia notified in this behalf by the Central Government, whether in powder form or granulated or otherwise or mixed with neutral materials;

(b) **Prepared opium,** that is, any product of opium by any series of operations designed to transform opium into an extract suitable for smoking and the dross or other residue remaining after opium is smoked;

(c) **Phenanthrene alkaloids,** namely, morphine, codeine, thebaine and their salts;

(d) **Diacetylmorphine,** that is, the alkaloid also known as diamorphine or heroin and its salts; and

(e) **All preparations** containing more than 0.2% of morphine or containing any diacetylmorphine;

Section 2 (xi)

'Manufactured drug' means—(a) All coca derivatives, medicinal cannabis, opium derivatives and poppy straw concentrate;

(b) Any other narcotic substance or preparation which the Central Government may, having regard to the available information as to its nature or to a decision, if any, under any International Convention, by notification in the Official Gazette, declare to be a manufactured drug; but does not include any narcotic substance or preparation which the Central Government may, having regard to the available information as to its nature or to a decision, if any, under any International Convention, by notification in the Official Gazette, declare not to be a manufactured drugs.

Section 21. *Punishment for contravention in relation to manufactured drugs and preparations [substituted by the Amending Act 9 of 2001, w.e.f. 2 October 2001]: Whoever, in contravention of any provision of this Act or any rule or order made or condition of licence granted thereunder, manufactures, possesses, sells, purchases, transports, imports inter-State, exports inter-State or uses any manufactured drug or any preparation containing any manufactured drug shall be punishable,—*

(a) where the contravention involves small quantity, with rigorous imprisonment for a term which may extend to six months, or with fine which may extend to Rs 10,000, or with both;

(b) where the contravention involves quantity, lesser than commercial quantity but greater than small quantity, with rigorous imprisonment for a term which may extend to ten years, and with fine which may extend to one lakh rupees;

(c) where the contravention involves commercial quantity, with rigorous imprisonment for a term which shall not be less than ten years but which may extend to twenty years and

shall also be liable to fine which shall not be less than one lakh rupees but which may extend to two lakh rupees:

Provided that the court may, for reasons to be recorded in the judgment, impose a fine exceeding two lakh rupees.

8. The Statement of Objects and Reasons concerning the Amending Act of 2001 is as follows:

Narcotic Drugs and Psychotropic Substances Act, 1985 provides deterrent punishment for various offences relating to illicit trafficking in narcotic drugs and psychotropic substances. Most of the offences invite uniform punishment of minimum ten years' rigorous imprisonment which may extend up to twenty years. While the Act envisages severe punishments for drug traffickers, it envisages reformative approach towards addicts. In view of the general delay in trial it has been found that the addicts prefer not to invoke the provisions of the Act. The strict bail provisions under the Act add to their misery.

Therefore, it is proposed to rationalise the sentence structure so as to ensure that while drug traffickers who traffic in significant quantities of drugs are punished with deterrent sentences, the addicts and those who commit less serious offences are sentenced to less severe punishment. This requires rationalisation of the sentence structure provided under the Act. It is also proposed to restrict the application of strict bail provisions to those offenders who indulge in serious offences.

9. The entry of the Notification under which the substance found in possession of the appellant falls is Entry 56 or Entry 239. The relevant portion of the Notification dated 19 October 2001 issued by the Central Government reads as under:

S.O. 1055(E), dated 19 October 2001. In exercise of the powers conferred by clauses (viia) and (xxiiia) of section 2 of the Narcotic Drugs and Psychotropic Substances Act, 1985 (61 of 1985) and in supersession of Ministry of Finance, Department of Revenue Notification S.O. 527(E), dated 16 July 1996, except as respects things done or omitted to be done before such supersession, the Central Government hereby specifies the quantity mentioned in columns 5 and 6 of the Table below, in relation to the narcotic drug and psychotropic substance mentioned in the corresponding entry in columns 2 to 4 of the said Table, as the small quantity and commercial quantity respectively for the purposes of the said clauses of that section.

Sl. No	Name of Narcotic Drug[4] Heroin	Small Quantity (in gm)	Commercial Quantity (in g./kg.).
56	Diacetylmorphine	5	250 g

Any mixture or preparation that of with or without a neutral material, of any of the above drugs.

* Lesser of the small quantity between the quantities given against the respective narcotic drugs or psychotropic substances mentioned above forming part of the mixture.

** Lesser of the commercial quantity between the quantities given against the respective narcotic drugs or psychotropic substances mentioned above forming part of the mixture.

10. The possession of offending substance would be considered an offence punishable under the N.D.P.S. Act, as heroin is an opium derivative as per section 2(xvi)(e) which says that all preparations containing more than 0.2% of morphine or containing any diacetylmorphine is an opium derivative. Further, according to section 2(xi), all opium derivatives fall under the category of manufactured drug.

4. Non-proprietary/chemical names.

Thus, we conclude that the offending substance is an opium derivative and hence a manufactured drug, the possession of which is in contravention of the provisions of section 8 of the N.D.P.S. Act which prohibits certain operations to the effect that no person shall produce, manufacture, possess, sell, purchase, transport, warehouse, use, consume, import inter-State, export inter-State, import into India, export from India or tranship any narcotic drug or psychotropic substance.

11. *In the present case, the opium derivative which has been found in possession of the accused-appellant is prohibited under section 8 of the N.D.P.S. Act and thus punishable under section 21 thereof. The question is only with regard to the quantum of punishment.*

12. As a consequence of the Amending Act, the sentence structure underwent a drastic change. The Amending Act for the first time introduced the concept of commercial quantity in relation to narcotic drugs or psychotropic substances by adding clause (viia) in section 2, which defines this term as any quantity greater than a quantity specified by the Central Government by notification in the Official Gazette. Further, the term 'small quantity' is defined in section *2,* clause (xxiiia), as any quantity lesser than the quantity specified by the Central Government by notification in the Official Gazette. Under the rationalised sentence structure, the punishment would vary depending upon whether the quantity of offending material is 'small quantity', 'commercial quantity' or something in-between.

13. It appears from the Statement of Objects and Reasons of the Amending Act of 2001 that the intention of the legislature was to rationalize the sentence structure so as to ensure that while drug traffickers who traffic in significant quantities of drugs are punished with deterrent sentence, the addicts and those who commit less serious offences are sentenced to less severe punishment. Under the rationalised sentence structure, the punishment would vary depending upon the quantity of offending material. Thus, we find it difficult to accept the argument advanced on behalf of the respondent that the rate of purity is irrelevant since any preparation which is more than the commercial quantity of 250 gms. and contains 0.2% of heroin or more would be punishable under section 21(c) of the N.D.P.S. Act, because the intention of the legislature as it appears to us is to levy punishment based on the content of the offending drug in the mixture and not on the weight of the mixture as such. This may be tested on the following rationale. Supposing 4 gms. of heroin is recovered from an accused, it would amount to a small quantity, but when the same 4 gms. is mixed with 50 kgs. of the powdered sugar, it would be quantified as a commercial quantity. In the mixture of a narcotic drug or a psychotropic substance with one or more neutral substance, the quantity of the neutral substance/s is not to be taken into consideration while determining the small quantity or commercial quantity of a narcotic drug or psychotropic substance. It is only the actual content by weight of the narcotic drug which is relevant for the purposes of determining whether it would constitute small quantity or commercial quantity. The intention of the legislature for introduction of the amendment as it appears to us is to punish the people who commit less serious offences with less severe punishment and those who commit grave crimes, such as trafficking in significant quantities, with more severe punishment.

14. In the case of *Ouseph* alias *Thankachan v State of Kerala*, (2004) 4 SCC 446, this Court in para 8 has held as under:

The question to be considered by us is whether the psychotropic substance was in a small quantity and if so, whether it was intended for personal consumption. The words small quantity have been specified by the Central Government by the notification dated 23 July 1996. Learned counsel for the State has brought to our notice that as per the said notification small quantity has been specified as 1 gram. If so, the quantity recovered from the appellant is far below the limit of small quantity specified in the notification issued by the Central Government. It is admitted that each ampoule contained only 2 ml and each ml contains only .3 mg. This means the total quantity found in the possession of the appellant was only 66 mg. This is less than 1/10th of the limit of small quantity specified under the notification.

From the aforesaid decision, we find that the Court has taken the quantity of the narcotic drug or psychotropic substance found in the mixture, relevant for the purpose of imposition of punishment.

15. The learned counsel for the respondent placed reliance on the decision of this Court in *Amarsingh Ramjibhai Barot v State of Gujarat*, (2005) 7 SCC 550 : AIR 2005 SC 4248 : 2005 Cr LJ 4521, in support of his contention that the entire material found in possession irrespective of the content of the offending material has to be taken into consideration while imposing the punishment. In *Amarsingh* case (*supra*), two persons, namely, Amarsingh and Danabhai were apprehended. Amarsingh was found carrying a plastic bag which contained a black-coloured liquid substance weighing 920 gms. Similarly, 4.250 kg. of grey-coloured substance was recovered from Danabhai. Samples were sent to the Forensic Science Laboratory (FSL). The FSL report indicated that the sample from Amarsingh was opium as described in the N.D.P.S. Act containing 2.8% anhydride morphine apart from pieces of poppy flowers and the sample relating to Danabhai was reported to be opium as described in the N.D.P.S. Act having 1.2% anhydride morphine and also containing pieces of poppy flowers. Both the accused were charged and tried under sections 15, 17 and 18 read with section 29 of the N.D.P.S. Act. The High Court found that the conviction under sections 17 and 18 read with section 29 of the N.D.P.S. Act was not correct, but convicted Amarsingh under section 21(c) and also under section 21(c) read with section 29 of the N.D.P.S. Act, for individually being in possession of opium and for being jointly, in conspiracy with the other accused. The High Court found the accused possessed of commercial quantity and convicted and sentenced him for 10 years rigorous imprisonment plus fine of Rs 1 lakh. Being aggrieved, Amarsingh approached this Court. This Court has held in para 14 of the judgment as under:

> *There does not appear to be any acceptable evidence that the black substance found with the appellant was coagulated juice of the opium poppy and any mixture, with or without any neutral material, of the coagulated juice of the opium poppy. FSL has given its opinion that it is opium as described in the N.D.P.S. Act. That is not binding on the court.*

The Court further held that the evidence also does not indicate that the substance recovered from the appellant would fall within the meaning of sub-clauses (a), (b), (c) or (d) of section 2(xvi), but residuary clause (e) would apply and consequently it would amount to opium derivative as all opium derivatives fall within the expression 'manufactured drugs' Thus, the Court arrived at the conclusion that what was recovered from the appellant was manufactured drug and the offence proved against the appellant fell clearly within section 21 of the N.D.P.S. Act for illicit possession of manufactured drug. The Court concluded and held in para 17 as under:

> *In respect of opium derivatives (at S.I. No. 93) in the said notification, 5 grams is specified as small quantity and 250 grams as commercial quantity. The High Court was, therefore, right in finding that the appellant was guilty of unlawful possession of commercial quantity of a manufactured drug. Consequently, his case would be covered by clause (c) and not clause (a) or (b) of section 21 of the N.D.P.S. Act.*

This court has, therefore, upheld the imposition of minimum punishment under section 21(c) of 10 years rigorous imprisonment with fine of Rs 1 lakh.

16. On going through *Amarsingh* case (*supra*), we do not find that the Court was considering the question of mixture of a narcotic drug or psychotropic substance with one or more neutral substance. In fact that was not the issue before the Court. The black-coloured liquid substance was taken as an opium derivative and the FSL report to the effect that it contained 2.8% anhydride morphine was considered only for the purposes of bringing the substance within the sweep of section 2(xvi) (e) as 'opium derivative which requires a minimum 0.2% morphine. The content found of 2.8% anhydride morphine was not at all considered for the purposes of deciding whether the substance recovered was a small or commercial quantity and the Court took into consideration the entire substance as an opium derivative which was not mixed with one or more neutral substance/s.

Thus, Amarsingh case (supra) cannot be taken to be an authority for advancing the proposition made by the learned counsel for the respondent that the entire substance recovered and seized irrespective of the content of the narcotic drug or psychotropic substance in it would be considered for application of section 21 of the N.D.P.S. Act for the purpose of imposition of punishment. We are of the view that when any narcotic drug or psychotropic substance is found mixed with one or more neutral substance/s, for the purpose of imposition of punishment it is the content of the narcotic drug or psychotropic substance which shall be taken into consideration.

17. *In the present case, the narcotic drug which was found in possession of the appellant as per the analyst's report is 60 g. which is more than 5 g., i.e. small quantity, but less than 250 g, i.e., commercial quantity. The quantity of 60 g is lesser than the commercial quantity, but greater than the small quantity and, thus, the appellant would be punishable under section 21(b) of the N.D.P.S. Act. Further, it is evident that the appellant is merely a carrier and is not a kingpin.*

18. In these circumstances, the ends of justice would be subserved if we reduce the sentence of the accused-appellant to 6 years rigorous imprisonment with a fine of Rs 20,000 and in default of payment of fine rigorous imprisonment for six months. We order accordingly.

12.13.2 Commercial or Small Quantity of Contraband[5]

Author's Summary

Two persons, travelling in a bus, were searched. 2 Kg of contraband was recovered from them. They said they were just the carrier of the drug for another person. He was arrest and later freed on bail. When the contraband was examined, it contained 2.5 % of the drug. The authorities got the bail cancelled. The accused approached the Supreme Court for bail. The court after scrutiny of the Law/case law found that the case is not bailable as the net quantity of the drug was far more than 5 g. They dismissed the bail application.

Highlights italicised

Relevant Extracts (Verbatim)

2. Whether an order of bail granted in favour of the appellant herein could have been directed to be cancelled on the basis of a report of analysis of the articles recovered from him containing 'heroin' is the core question involved herein.

3. Before, however, we advert to the said question, we may notice the factual matrix involved in the matter.

On or about 14 August 2004, the luggage of two persons, *viz.*, Abdul Munaf and Zahid Hussain, who were travelling in a bus were searched and allegedly contraband weighing 2 kg. was recovered. A purported statement was made by the said accused persons that the said contraband (heroin) was meant to be delivered to the appellant. Nothing was recovered from him. Apart from the said statements of the said accused persons, no other material is available on record to sustain a charge against him. On the basis of the said statement, the appellant was arrested on 15 August 2004. Allegedly, a statement was made by him in terms of section 67 of the Narcotic Drugs and Psychotropic Substances Act, 1985 (for short "the Act"). Appellant contends that he was tortured and the statement was obtained forcibly from him on some blank documents. He later on retracted therefrom.

Indisputably, the seized articles were sent for chemical examination to the Government Opium and Alkaloid Works, Neemuch. A report was sent to the investigating officer on 23 September 2004 stating that the sample did not contain any contraband substance. Appellant

5. *Sami Ullaha v Superintendent, Narcotic Central Bureau,* AIR 2009 SC 1357 : 2009 Cr LJ 1306.

thereafter filed an application for discharge. The prosecution moved the court for sending the substance allegedly recovered from the co-accused persons for its examination by the Central Revenue Control Laboratory, New Delhi. It was rejected by the court opining that there was no provision in the Act for sending the sample to another laboratory. The court, however, did not pass an order of discharge in favour of the appellant but released him on bail, stating:

> *Accordingly, as mentioned above, there is no ground that by accepting the application of the complainant and order be passed for sending the second sample for examination to another laboratory. If the investigating officer so desires, then in accordance with the ruling expounded as above, he is free to send the second sample to any of the laboratories for its examination at his own level. On the basis of the above mentioned observations, the application of the complainant is rejected.*

4. The prosecution, however, sent another sample to the Central Revenue Control Laboratory, New Delhi. A report dated 6 January 2005 was sent opining that the sample under reference was tested positive for Diacetyl-morphine (Heroin), which according to the said report was found to be 2.6% of the sample tested.

5. Thereafter, an application for cancellation of bail was filed on 4 February 2005. By an order dated 15 March 2005, the bail granted to the appellant was cancelled relying on or on the basis of the second report obtained by the respondent from the Central Revenue Control Laboratory, New Delhi stating:

> *While receiving guidance from the abovementioned citations, I arrive at the conclusion that under the present facts, the second sample which was sent for examination and according to its receipt the seized substance was heroin, and on the basis of which charges have been levelled against the accused persons, and the prosecution has right to send second sample for chemical examination, and as such there are charges of serious nature against the accused persons in which there provisions (sic) to award punishment of imprisonment of the term of at least ten years and fine of Rs 1 lakh, as well as under section 37 of the Act, in case of recovery of psychotropic substances in the quantity of commerce and trade, bail cannot be granted until the court does not arrive at the conclusion to the effect that the accused is not guilty of such an offence, and in case of granting him bail such an offence will not be committed by him during the course of his remaining free on bail.*

12. However, a distinction even is made as regards grant of bail in relation to a commercial quantity and a small quantity. The commercial quantity has been defined in section 2(viia) of the Act to mean "any quantity greater than the quantity specified by the Central Government by notification in the Official Gazette".

13. We will advert to the question of the definition of "Chemical Examiner" a little later. The question, however, as to whether the contraband found came within the purview of the commercial quantity within the meaning of section 2(vii a) or not is one of the factors which should be taken into consideration by the courts in the matter of grant or refusal to grant bail. Even, according to the Central Revenue Control Laboratory, New Delhi, only 2.6% of the sample sent was found to be containing heroin. Small quantity in terms of the notification issued under sections 2(vii a) and 2(xxiii a) is as under:

S No.	(Narcotic Drug/Psychotropic Substance		Small Quantity	Commercial Quantity
	(International Name	Non-proprietary Name (NN)	5 g	250 g
	Morphine	Morphine		

The quantity, thus, alleged to have been recovered from the co-accused persons could be said to be the intermediate quantity and, thus, the rigours of the provisions of section 37 of the Act relating to grant of bail may not be justified.

In *Ouseph* alias *Thankachan v State of Kerala*, (2004) 4 SCC 446, this Court held:

> *"8. The question to be considered by us is whether the psychotropic substance was in a small quantity and if so, whether it was intended for personal consumption. The words 'small quantity' have been specified by the Central Government by the notification dated 23 July 1996. Learned Counsel for the State has brought to our notice that as per the said notification small quantity has been specified as 1 gram. If so, the quantity recovered from the appellant is far below the limit of small quantity specified in the notification issued by the Central Government. It is admitted that each ampoule contained only 2 ml and each ml contains only 3 mg. This means the total quantity found in the possession of the appellant was only 66 mg. This is less than 1/10th of the limit of small quantity specified under the notification.*
>
> *** *** ***

11. On account of the aforesaid fact situation, we are inclined to believe that the small quantity of buprenorphine (Tidigesic) was in the possession of the appellant for his personal consumption and, therefore, the offence committed by him would fall under section 27 of the N.D.P.S. Act."

So the basic question for decision is whether the contravention involved in this case is small, intermediate or commercial quantity under section 21 of the N.D.P.S. Act, and whether the total weight of the substance is relevant or percentage of heroin content translated into weight is relevant for ascertaining the quantity recovered from the accused.

5. It was held that the percentage of heroin content translated into weight is relevant. Reference was made to an earlier judgment and observed in para 16 as follows:

"16. In *Ouseph v State of Kerala*, (2004) 4 SCC 446, this Court in para 8 has held as under: (SCC p 447)

> *8. The question to be considered by us is whether the psychotropic substance was in a small quantity and if so, whether it was intended for personal consumption. The words 'small quantity' have been specified by the Central Government by the Notification dated 23 July 1996. Learned counsel for the State has brought to our notice that as per the said notification small quantity has been specified as 1 gram. If so, the quantity recovered from the appellant is far below the limit of small quantity specified in the notification issued by the Central Government. It is admitted that each sample contained only 2 ml and each ml contains only 3 mg. This means the total quantity found in the possession of the appellant was only 66 mg. This is less than l/10th of the limit of small quantity specified under the notification.*

From the aforesaid decision, we find that the Court has taken the quantity of the narcotic drug or psychotropic substance found in the mixture, relevant for the purpose of imposition of punishment."

6. In view of what has been stated in the said case the appeal deserves to be dismissed which we direct.

12.13.3 Identified Opium: morphine content Immaterial[6]

Author's Summary

It is a case of seizure of opium. The SC in this case ruled that If opium is identified , the NDPS law does not need its analysis for morphine, etc. for conviction/punishment. If it were a derivative /preparation from opium, the analysis was needed.

The SC, therefore, decided that the appellant has no *locus standi.*

6. In the Supreme Court of India, Criminal Appeal No. 816 of 2011: *Harjit Singh of Punjab,* [Judgment: Dr. B.S. Chauhan, J. date of decision 30 March 2011.].

Relevant Extracts (Verbatim)

Facts and circumstances giving rise to this appeal are that on 4 July 2003, a police party was proceeding from Focal Point, Mandi Gobindgarh to G.T. Road on patrol duty in a government vehicle. When the police party reached near the culvert of minor in the area of village Ambe Majra, the police party spotted the appellant who was coming on foot, from the side of Ambe Majra carrying a plastic bag in his right hand. On seeing the police, the appellant turned to the left side of the road. The police party apprehended the appellant, being suspicious of him. In the meantime, Ashok Kumar, an independent witness also came to the spot and joined the police party. The appellant was apprised of his right of being searched in the presence of a Gazetted Officer and in that respect his statement was recorded.

Shri Dinesh Partap Singh, Assistant Superintendent of Police, was summoned to the spot by the Investigating Officer and in his presence, Amarjit Singh, Inspector (PW-3) searched the plastic bag of the appellant and the substance contained therein was found to be opium. Two samples of 10 g each of the opium were taken. The remaining opium was found to be 7.10 Kgs. The samples and the remaining opium were sealed and taken into possession by the police party.

14. Opium is essentially derived from the opium poppy plant. The opium poppy gives out a juice which is opium. The secreted juice contains several alkaloid substances like morphine, codeine, thebaine Morphine is the primary alkaloid in opium.

15. Opium is a substance which once seen and smelt can never be forgotten because opium possesses a characteristic appearance and a very strong and characteristic scent. Thus, it can be identified without subjecting it to any chemical analysis. It is only when opium is in a mixture so diluted that its essential characteristics are not easily visible or capable of being apprehended by the senses that a chemical analysis may be necessary. In case opium is not mixed up with any other material, its chemical analysis is not required at all. "Of course, an analysis will always be necessary if there is a mixture and the quantity of morphine contained in mixture has to be established for the purpose of definition (of opium under the Opium Act)." (Vide: *Baidyanath Mishra v State of Orissa*, 1968 (34) CLT 1 (SC); *State of Andhra Pradesh v Madiga Boosenna*, AIR 1967 SC 1550 : 1967 Cr LJ 1398 : (1967) 3 SCR 871).

16. However, the aforesaid cases have been decided under the Opium Act and cannot be the authority so far as deciding the cases under the N.D.P.S. Act. Thus, chemical analysis of the contraband material is essential to prove a case against the accused under the N.D.P.S. Act.

17. The N.D.P.S. Act defines "opium" under section 2(xv) as under:

(a) the coagulated juice of the opium poppy; and

(b) *any mixture, with or without any neutral material, of the coagulated juice of the opium poppy, but does not include any preparation containing not more than 0.2% of morphine.*

18. Coagulated means solidified, clotted, curdled – something which has commenced in curdled/solid form.

In case the offending material falls in clause (a) then the proviso to section 2(xv) would not apply. The proviso would apply only in case the contraband recovered is in the form of a mixture which falls in clause (b) thereof.

19. Relevant part of the chemical analysis made by the Forensic Science Laboratory, Punjab, Chandigarh in the instant case, reads as under:

> *On analysis of the substance kept in the bundle under reference, it is established that the substance is opium and percentage of morphine is 0.8%* (Emphasis added).

21. In the instant case, the material recovered from the appellant was opium. It was of a commercial quantity and could not have been for personal consumption of the appellant. Thus, the appellant being in possession of the contraband substance had violated the provisions of section 8 of the N.D.P.S. Act and was rightly convicted under section 18(b) of the N.D.P.S. Act. The instant case squarely falls under clause (a) of section 2(xv) of the N.D.P.S. Act and clause (b) thereof is not attracted for the simple reason that the substance recovered was opium in the form of the coagulated juice of the opium poppy. It was not a mixture of opium with any other neutral substance. There was no preparation to produce any new substance from the said coagulated juice. For the purpose of imposition of punishment if the quantity of morphine in opium is taken as a decisive factor, Entry No. 92 becomes totally redundant. Thus, as the case falls under clause (a) of section 2(xv), no further consideration is required on the issue. More so, opium derivatives have to be dealt with under Entry No. 93, so in case of pure opium falling under clause (a) of section 2(xv), determination of the quantity of morphine is not required. Entry No. 92 is exclusively applicable for ascertaining whether the quantity of opium falls within the category of small quantity or commercial quantity.

25. Thus, the aforesaid judgment in *E. Micheal Raj* (Supra) has no application in the instant case as it does not relate to a mixture of narcotic drugs or psychotropic substances with one or more substances.

> *The material so recovered from the appellant is opium in terms of section 2(xv) of the N.D.P.S. Act. In such a fact-situation, determination of the contents of morphine in the opium becomes totally irrelevant for the purpose of deciding whether the substance would be a small or commercial quantity. The entire substance has to be considered to be opium as the material recovered was not a mixture and the case falls squarely under Entry 92.*

Undoubtedly, the FSL Report provided for the potency of the opium giving particulars of morphine contents. It goes without saying that opium would contain some morphine which should be not less than the prescribed quantity, however, the percentage of morphine is not a decisive factor for determination of quantum of punishment, as the opium is to be dealt with under a distinct and separate entry from that of morphine.

26. In view of the above, we do not find any substance in the appeal. It is devoid of any merit and, accordingly, dismissed.

12.13.4 Personal Search[7]

Author's Summary

The police, in this case, seized a bag containing 1.75 kg opium. The trial court convicted/sentenced the culprit. The convict appealed first to HC and then to SC on the plea that law for personal search was not observed. Both courts dismissed the appeal as the seizing the bag was not personal search. SC quoted law and precedences.

Highlights italicised

Relevant Extracts (Verbatim)

The prosecution story is that on 23 September 1994 at around 2.30 pm, Inspector Ram Pal Singh (PW-4) along with SI Gurdeep Singh, ASI Satpal Singh (PW-5) and other officials were on duty and coming from village Hassanpur to village Mirzapur. After reaching near the bridge of canal minor while going on *kacha* path, the police party noticed the appellant coming from the bank of canal. On seeing the police party, the appellant tried to run away but on suspicion, he was

7. *Jarnail Singh v State of Punjab,* AIR 2011 SC 964 : 2011 Cr L J 1738.

apprehended. On enquiry, he informed the police about his name, parentage, address At that time, he was carrying a bag (*thaili*) in his right hand. PW-4 suspected that the appellant was carrying some incriminating articles in his bag. The search was conducted and the police party recovered 1 Kg and 750 gram opium from his custody.

3. Ten grams of opium was put into a tin container as a sample. It was duly sealed. The entire case property was taken into possession *vide* memo Ex. PD attested by SI Gurdeep Singh and ASI Satpal Singh. The seal after use was handed over to ASI Satpal Singh (PW-5). The appellant could not produce any valid licence or permit for possession of the said opium. On personal search, currency notes amounting to Rs 25 was also recovered from the accused and the same was taken into possession *vide* memo Ex. p 1 signed by the appellant. Ruqa Ex. PF was sent to the police station and subsequently the FIR was registered. Inspector, Ram Pal (PW-4) recorded the statements of the witnesses and arrested the appellant.

* * *

5. The Addl. Sessions Judge *vide* its final order and judgment dated 19 May 1999 convicted and sentenced the appellant under section 18 of the N.D.P.S. Act, as noticed above. The High Court, in an appeal, *vide* judgment dated 12 May 2008 affirmed the findings of the Sessions Court and dismissed the appeal filed by the appellant. Hence the appeal before this Court.

* * *

12. .. … it is accepted that the narcotic/opium, *i.e.,* 1 kg. and 750 grams was recovered from the bag (*thaili*) which was being carried by the appellant.

> *In such circumstances, section 50 would not be applicable. The aforesaid section can be invoked only in cases where the drug/narcotic/N.D.P.S. substance is recovered as a consequence of the body search of the accused. In case, the recovery of the narcotic is made from a container being carried by the individual, the provisions of section 50 would not be attracted.*

This Court in the case of *Kalema Tumba v State of Maharashtra,*[8] discussed the provisions pertaining to "personal search" under section 50 of the N.D.P.S. Act and held as follows:

> *…… ……..if a person is carrying a bag or some other article with him and narcotic drug or psychotropic substance is found from it, it cannot be said that it was found from his person.*

Similarly, in the case of *Megh Singh v State of Punjab*[9], this Court observed that:

> *A bare reading of section 50 shows that it applies in case of personal search of a person. It does not extend to a search of a vehicle or container or a bag or premise.*

The scope and ambit of section 50 was also examined by this Court in the case of *State of Himachal Prades v Pawan Kumar,* Appeal (crl.) 222 of 1997, decided on 8 April 2005 (SC).[10] In paragraph, 10 and 11, this Court observed as follows:—

> *10. We are not concerned here with the wide definition of the word "person", which in the legal world includes corporations, associations or body of individuals as factually in these type of cases search of their premises can be done and not of their person. Having regard to the scheme of the Act and the context in which it has been used in the section it naturally means a human being or a living individual unit and not an artificial person. The word has to be understood in a broad common-sense manner and, therefore, not a naked or nude body of a human being but the manner in which a normal human being will move about in a civilised society. Therefore, the most appropriate meaning of the word "person" appears to be — "the body of a human being as presented to public view usually with its appropriate coverings and clothing". In a civilised society appropriate coverings and clothings are considered absolutely essential and no sane human*

8. (1999) 8 SCC 257 : AIR 2000 SC 402 : 1999.
9. (2003) 8 SCC 666 : AIR 2003 SC 3184.
10. (2005) 4 SCC 350 : AIR 2005 SC 2265
also see: *Ganga Kumar Srivastava v State of Bihar*, AIR 2005 SC 3123 : (2005) 6 SCC 211; *Balbir Kaur v State of Punjab,* AIR 2009 SC 3036 : (2009) 15 SCC 795.

being comes in the gaze of others without appropriate coverings and clothings. The appropriate coverings will include footwear also as normally it is considered an essential article to be worn while moving outside one's home. Such appropriate coverings or clothings or footwear, after being worn, move along with the human body without any appreciable or extra effort. Once worn, they would not normally get detached from the body of the human being unless some specific effort in that direction is made. For interpreting the provision, rare cases of some religious monks and sages, who, according to the tenets of their religious belief do not cover their body with clothings, are not to be taken notice of. Therefore, the word "person" would mean a human being with appropriate coverings and clothings and also footwear.

***11.** A bag, briefcase or any such article or containtc., can, under no circumstances, be treated as body of a human being. They are given a separate name and are identifiable as such. They cannot even remotely be treated to be part of the body of a human being. Depending upon the physical capacity of a person, he may carry any number of items like a bag, a briefcase, a suitcase, a tin box, a thaila, a jhola, a gathri, a holdall, a carttc., of varying size, dimension or weight. However, while carrying or moving along with them, some extra effort or energy would be required. They would have to be carried either by the hand or hung on the shoulder or back or placed on the head. In common parlance it would be said that a person is carrying a particular article, specifying the manner in which it was carried like hand, shoulder, back or hetc. Therefore, it is not possible to include these articles within the ambit of the word "person" occurring in section 50 of the Act." It has come in evidence that although the body search of the appellant was conducted but no recovery of any narcotic was made. The body search only led to the recovery ofRs. 25 from his pocket.*

* * *

Having considered the entire material on the record, the trial court as well as the High Court have concurrently found the appellant guilty. We are unable to find any perversity or any miscarriage of justice in the findings so recorded. Finding no merit, we dismiss the appeal.

12.14 ADDITIONAL CASE LAW

12.14.1 Bhang not a Narcotic[11] under NDPS Act

2. As per the prosecution version, 15½ kgs. of hemp (*bhang*) was recovered from the possession of the appellant when he was travelling in a train. For that recovery, the appellant was charged for the offence punishable under section 20B of the Act and after the trial, he was punished under the aforesaid section.

3. Counsel for the appellant at the very outset raised the contention that the hemp (*bhang*) is not a narcotic or psychotropic drug as defined under the Act and hence its possession is not an offence. He submitted that cannabis plant and cannabis hemp are two different contrabands under the Act. Cannabis (hemp) has been defined under section 2(iii) of the Act which includes *Charas*, *Ganja* and also any mixture with or without any neutral material of any of the above forms of cannabis or any drink prepared. He submitted that according to the definition of '*Ganja*' given in clause (b) of section 2(iii) of the Act, *Ganja* is the flowering or fruiting tops of the cannabis plant which excludes the seeds and leaves when not accompanied by the tops. He submitted that the *bhang* is the leaves of the cannabis plant and it has not been included in the definition cannabis (hemp) as defined under section 2(iii) of the Act. He further submitted that in the Act, the possession of the cannabis plant has not been made punishable and only its cultivation has been prohibited and made punishable under section 8 of the Act. He submitted that *bhang* as such has not been included in the definition of cannabis (hemp) and its sale, import or export and possession has not been made punishable under the Act. However, under the provisions of the Punjab Excise Act (hereinafter referred

11. *Arjun Singh v State of Haryana,* 2005 Cr LJ 253 (P&H).

to as 'the Excise Act'), the possession of *Bhang* has been made punishable in the definition of 'Intoxicating drugs' as under section 3(13) of the Excise Act, *bhang* has been included in the definition of the intoxicating drug. Therefore, learned counsel for the appellant contended that conviction and sentence of the appellant under section 20B of the Act is wholly illegal and without jurisdiction. In support of his contention, learned counsel for the appellant has relied upon three judgments of different High Courts, including this Court *viz., Sam v State of Uttar Pradesh,* 1995 (3) Rec Cri R (Cri) 44 : 1995 All LJ 1108; *Mane v State of Rajasthan*, 1996 (2) Rec Cri R (Cri) 2 : 1996 Cr LJ 37 : 1997 (1) Crimes 164; and *Gurdial Sgh v State of Punjab,* 2002 (3) Rec Cr R (Cri) 334.

4. *Per contra*, learned counsel for the respondent though submitted that bhang falls under the definition of cannabis (hemp) as defined under section 2(iii) of the Act but he could not cite any contrary judgment in support of his contention.

5. After hearing the arguments of the learned counsel for the parties, I am of the opinion that this appeal deserves to be allowed and the conviction and sentence of the appellant are liable to be set aside. In all the aforesaid three judgments, it has been held by different High Courts, including this Court, that *bhang* (hemp) does not fall under the definition of cannabis (hemp) as defined under section 2(iii) of the Act. Thus, its possession does not constitute an offence punishable under the Act.

6. In *Samid's* case, 1995 All LJ 1108 : 1995 (3) Rec Cri R (Cri) 449 (supra), the Allahabad High Court summoned the officers dealing with the narcotic drugs and cases relating thereto to explain the Court whether *bhang* is a narcotic or psychotropic drug and the possession of which is punishable under the Act or not. In response to that, the letter given by the Assistant Director, Narcotics Control Bureau, Varanasi was placed before the Court in which it was clearly stated that so far as the question of inclusion of '*bhang*' under the Act is concerned, it is explicit in the Act itself that '*bhang*' is not covered under the Act. Section 8 of the Act lays down prohibition of certain operations and prohibits the transaction in regard to *Ganja* only and not the *bhang*. After considering the said letter and the definition of cannabis (hemp) as given under section 2(iii) of the Act and the 'cannabis plant', as given in section 2(iv) of the Act, the Court came to the conclusion that '*bhang*' is not covered under the Act. Therefore, no person can be punished for its possession under the Act. However, it was held that under the Excise Act, the possession of *bhang* is punishable but not under the Act.

7. Similarly in *Manjee's* case, 1996 Cr LJ 3787 (supra), the Rajasthan High Court has elaborated and analysed the various definitions given under the Act and then came to the conclusion that *bhang* does not fall under the definition of cannabis (hemp) as defined under section 2(iii) of the Act by observing as under:—

> *13. It is apparent from aforesaid two enactments that under Act No. 2 of 1950 Charas, Ganja and Bhang are included within the definition of cannabis (hemp) whereas under N.D.P.S. Act bhang is excluded. Bhang does not fall within the definition of cannabis (hemp) as defined under section 2(iii) of the N.D.P.S. Act. It is also to be noticed that under Act No. 2 of 1950 cultivation of only cannabis (hemp) plant i.e. Charas, Ganja and Bhang is an offence under section 54(b) and punishable under section 54(g) of the said Act whereas under N.D.P.S. Act cultivation of any cannabis plant which means any plant of the genus cannabis as defined under section 2(iv) of N.D.P.S. Act is punishable under section 20(a) read with section 20(b)(1) of the said Act. In my humble opinion although bhang is excluded from the definition of cannabis (hemp) under the N.D.P.S. Act yet it does fall within the definition of cannabis plant and as such its cultivation is punishable under section 20(a) read with section 20(b)(i) of the said Act. I am also of the opinion that cannabis (hemp) is one of the species of cannabis plant, therefore, it cannot be held that since 'Bhang' is excluded from the definition of cannabis (hemp) under the N.D.P.S. Act one of the species of cannabis plant, therefore, its cultivation is not an offence and it is not punishable under section 20(b)(i) of the said Act.*

14. In my considered opinion cultivation of '*Bhang*' is punishable under N.D.P.S. Act although it is not included within the definition of cannabis (hemp) and not Act No. 2 of 1950 within the meaning of Article 254 of the Constitution of India. As regards cultivation of *Bhang* is concerned, the N.D.P.S. Act would prevail over Act No. 2 of 1950 and later enactment passed by the Legislature of State shall be deemed to be repugnant and void to the extent of its inconsistency to the former enactment passed by Parliament.

15. However, it is made clear that personal use and sale of *Bhang* is not an offence under rule 24 of Rajasthan Narcotic Drug and Psychotropic Rules, 1984, since in the present case the question of possession and sale of *Bhang* is not involved, therefore, it is left open to be decided in an appropriate case." In *Gurdial Singh's* case, 2002 (3) Rec Cr R (Cri) 334 (*supra*) this Court also came to the aforesaid conclusion while observing as under:—

> *13. It is apparent from aforesaid two enactments that under Act No. 2 of 1950 Charas, Ganja and Bhang are included within the definition of cannabis (hemp) whereas under N.D.P.S. Act bhang is excluded. Bhang does not fall within the definition of cannabis (hemp) as defined under section 2(iii) of the N.D.P.S. Act. It is also to be noticed that under Act No. 2 of 1950, cultivation of only cannabis (hemp) plant i.e., Charas, Ganja and Bhang is an offence under section 54(b) and punishable under section 54(g) of the said Act whereas under N.D.P.S. Act cultivation of any cannabis plant which means any plant of the genus cannabis as defined under section 2(iv) of N.D.P.S. Act is punishable under section 20(a) read with section 20(b)(i) of the said Act. I am also of the opinion that cannabis (hemp) is one of the species of cannabis plant, therefore, it cannot be held that since Bhang is excluded from the definition of cannabis (hemp) under the N.D.P.S. Act one of the species of cannabis plant, therefore, its 27 July 1992 passed by the learned Additional Sessions Judge convicting the appellant under section 20B of the Act is set aside and the appellant is acquitted of the charge framed against him.*

12.14.2 Cannabis is contraband[12]

The answer to the query that whether *ganja* seized in the instant case is contraband or not, is the evidence of the Deputy Director, FSL, Guwahati. The FSL received a parcel sent to the Director of the FSL consisting of 28 exhibits, enclosed in a sealed carton, with paper cover. He described the articles as follows:- "28 sealed envelopes marked from Sl. No. 1 to Sl. No. 28 having twenty eight closed polythene packets containing 24 gram dry plant materials in each. Marked here as DN-107/2011(1) to DN-107/2011(28) respectively" and the result of his examination is "The Ext.DN107/2011(1) to DN-107/2011(28) gave positive tests for cannabis (*ganja*)". This witness has not been subjected to cross-examination by the defensedefence and there is no evidence on record to discard his evidence. Therefore, the Court accepts his evidence. As the samples, examined by the Deputy Director, FSL, Guwahati, gave a positive test for cannabis (*ganja*), in the absence of evidence to impeach the evidence led by him, there is no doubt that the seized suspected *ganja* was a contraband.[12]

12. *Emdadul Hoque v State of Assam,* 2018 Cr LJ (NOC) 642 (GAU.) : Criminal Appeal (J) No. 47 of 2012, Decided on 10 July /2017 (Gau HC).

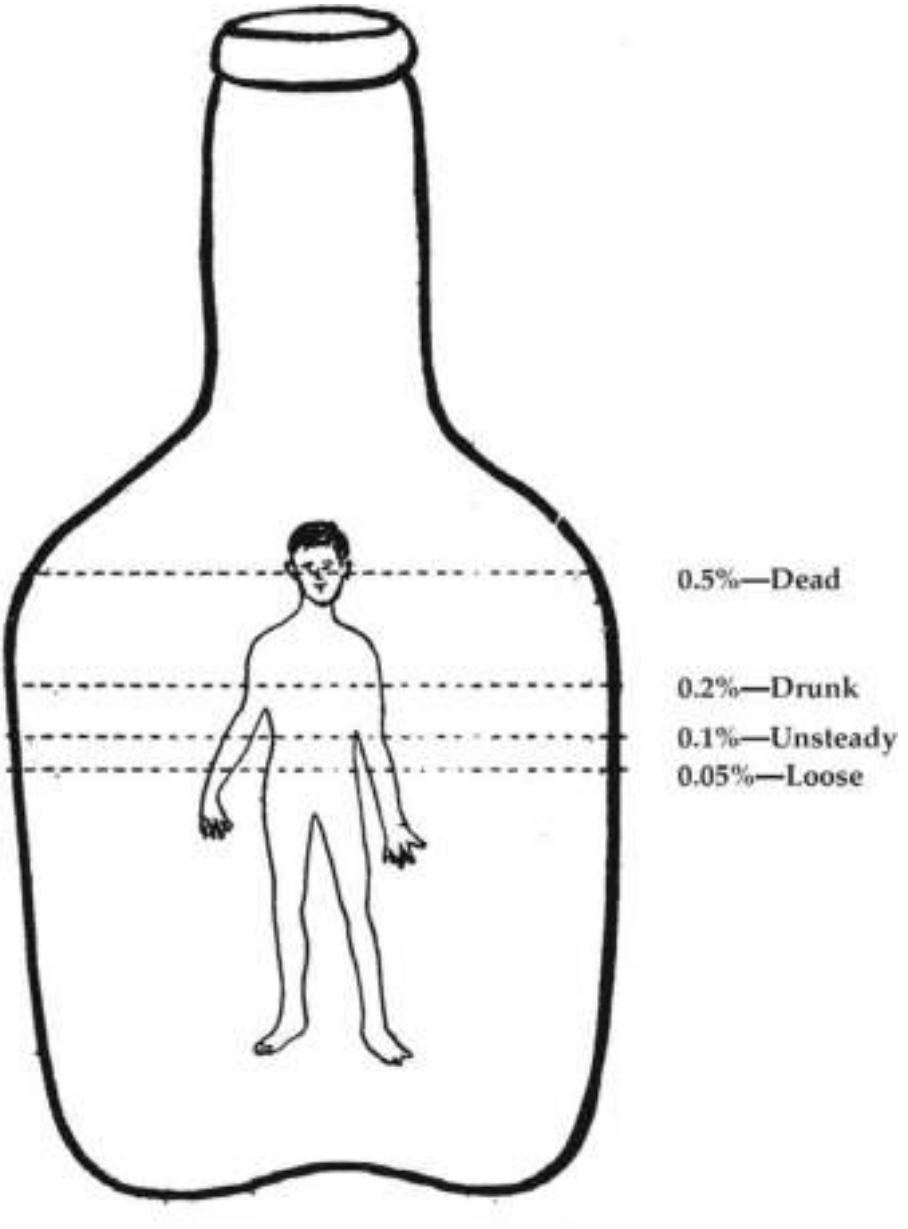

Fig. 13.1
Drinks, drinking, drunk, dead: Blood alcohol

13.1 GENERAL

The Quantity of alcohol intake determines whether the drink is a Poison…or a Remedy

An alcoholic drink or alcoholic beverage is a drink that contains alcohol (ethyl alcohol/ethanol). It is a depressant. In low doses, it causes euphoria, reduces anxiety, and enhances sociability. In higher doses, it causes intoxication (drunkenness). In still higher doses, it causes stupor, unconsciousness, coma and death.

Long-term abuse of alcohol is alcoholism. It leads the victim to physical dependence and makes him a physical/mental/social wreck.

Drinking in common parlance is intake of alcoholic beverages. It plays an important social role in many cultures. Most countries have regulated their production, sale, and consumption. In some countries there is prohibition, ban on drinking. However, alcoholic drinks are legal in most parts of the world. The global alcoholic drink industry exceeded one trillion dollars in 2014.

It appears that drinking was known even in prehistoric times among most of the old civilisations. They prepared the drinks through the fermentation process, which is also the current process for the manufacture of alcoholic drinks

Alcohol is one of the oldest intoxicants known to mankind. Its use or misuse was known in India even before it was known in most other countries. It has been described in Indian literature long before the birth of Christ. Ever since there have been continuous efforts to control its consumption because of its devastating effects on human life. Many countries, including India, have tried prohibition but with little success. In some states (Gujarat, Bihar and Nagaland; as well as in the Union Territory of Lakshadweep) of India there is prohibition.

In the U.S.A., roughly 50% of all the persons involved in cases of assault are under the influence of alcohol. Likewise, 40% of the victims of assaults too are under the influence of alcohol.

Alcohol has adversely influenced the rate of road accidents. In the United States of America, every year 20,000 persons die, and another one million persons are injured in road accidents. Intoxicated drivers cause the majority of these accidents! The chances of an intoxicated driver causing an accident are about fifty times more than that of a sober driver.

In India, we do not have reliable figures of death due to a drunken driver. The National Crime Record Bureau (NCRB) has given data for the years 2008 to 2012 (chart below) but these figures are apparently wrong[1]:

1. The Apex Court had commented on the data stating:
   In regard to the figures of death or injury due to drunken driving there is a tendency to under estimate or under-report in order not to impede the right of victims and/or their legal heirs to receive compensation.
   The remark indicates that the actual figures would be significantly higher.

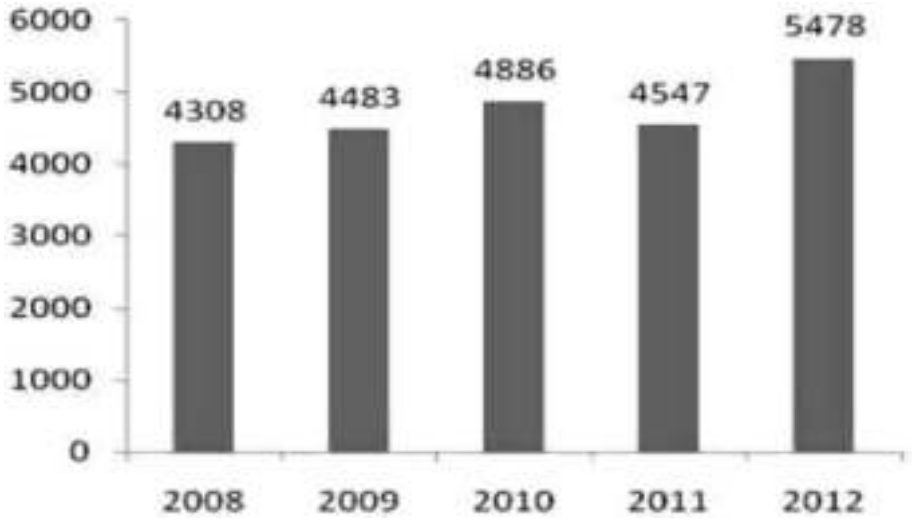

Fig. 13.1
Number of alcohol-related deaths in Road Accident (NCRB)

Table 13.1

Percent increase year-on-year

Year	2007	2008	2009	2010	2011	2012
Total number of deaths	4042	4308	4483	4658	4833	5008
Y-o-Y increase (%)		6.60%	4.1	9.00%	–6.90%	20.50%

The report suggests that about 1.5% of all the total 4.64 lakh road accidents were caused by drunken driving or driving under influence of drug or alcohol, resulting in injuries to 6,295 people. The Ministry of Road Transport and Highways puts Road Accidents in 2015, caused by drivers under the influence of alcohol as well as the fatalities much higher — 3.3% of all road accidents and 4.6% of all fatalities from road accidents.

Of the two official analyses of road accidents, the National Crime Records Bureau's report suggests that about 1.5% of all the total 4.64 lakh road accidents were caused by drunken driving or driving under influence of drug or alcohol, resulting in injuries to 6,295 people. The offence, however, according to the report, resulted in 2,988 deaths, accounting for just over 2% of all fatalities in road accidents.

Numbers would suggest drunken driving is only a drop in the ocean of road accidents, which resulted in 1.48 lakh deaths in 2015, though the Supreme Court called it one of the major causes of road accidents.

The number of accidents and deaths that alcohol causes on the road is clearly a matter of contention and likely higher than any of these reports suggest.

In 2011, the Ministry had admitted that drunken driving was one of the leading causes of road accidents and attributed as many as 27,152 accidents to it. In comparison, its 2015 report attributes 16,298 accidents to alcohol and the NCRB attributes only 6,970 accidents to it.

The truth seems to be far more serious.

Alcohol-related problems have been classified in the following categories:

1. Mental and behavioural disorders
2. Nervous system degeneration
3. Heart diseases onset
4. Pancreatic problems
5. Liver fibrosis and cirrhosis and liver failure
6. Neurotic problems
7. Gastritis problems
8. Accidental alcoholic poisoning
9. Drunken driver road accidents
10. Factory accidents due to drinking
11. Suicidal drinking

Prohibition laws add new dimensions to the problem. Illegal imports, smuggling, illicit manufacture, consumption of dangerous substitutes like methylated spirit, production and consumption of cheap and dangerous imitations and forgery of liquor permits are some of the consequent problems of prohibitions.

A few years ago, in Haryana, some illicit 'liquor' was consumed on a joyful event. The unauthorised 'vendor' sold them a methyl alcohol solution instead of an alcoholic drink. The incident resulted in deaths on a large scale. (CH)

One of the greatest tragedies of drinking spurious drinks, of recent times, occurred in Kerala[2]*. The tragic toll of the tragedy was:*

Dead, 31;

Blinded, 6;

Seriously injured, 500. (CH)

Crime involving alcohol, directly or indirectly, is increasing at a significant rate. The police, the prosecution, and the judiciary must, therefore, know the various facets of alcohol-related crime: its nature, effects, detection, and process to deal effectively with such crimes.

Alcohol: Mother of Crimes

(USA statistics)

1. 15% of robberies in America (about 197,000) were committed by liquor drinkers.
2. The average number of violent victimizations each year totals to about 11.1 million, (128,790 incidents were by liquor drinking offenders.
3. 37% of rapes and sexual assaults (about 149,000) were committed by liquor drinkers.
4. 27% of aggravated assaults (about 509,859) were by liquor drinking offenders.

2. *Chandran v State of Kerala,* Appeal No. 1528 of 2005 decided on 4 April 2011(SC).

5. 25% of simple assaults (about 1,445,304) were committed who were drinkers
6. 57% of intimate violence on female victims was committed by offenders while drinking.
7. 3 out of 4 incidents in spousal abuse were by liquor drinking offenders.
8. Federal research shows that 40% of convicted murderers used alcohol before or during the homicide.

13.2 NATURE

The active ingredient of all liquors is alcohol, also known as ethyl alcohol or ethanol. It is present in different amounts in different liquors[3].

13.2.1 Classification

The classification of alcoholic beverages is based on alcoholic content[4]:

1. **Beers;** they are un-distilled fermented products, mainly from barley. The alcoholic content is about 5% by volume. Range: 3 to 15%. Examples are beer, ale and stout.
2. **Wines;** they are also mainly un-distilled products, usually from fruits (Grapes, Apple,). The normal alcohol content is about 12%. Range: 8 to 17%. Examples are: Champagne, hock, burgundy, claret,
3. **Spirits;** they are distilled alcoholic drinks. The alcohol content is over 40% usually. Range varies from 15 to 80 % or more. Examples are whiskey, brandy, rum, gin, vodka and a host of other drinks.

The manufacturers perform two main acts to make their drinks healthy and popular. Firstly, they remove the undesirable unwanted products of fermentation, called undesirable congeners. Secondly, they add ingredients to their product, for pleasing colour, specific taste and aroma at the fermentation stage itself. The sum-total of these changes determine the quality of the liquor.

Other materials contained in fermented liquors are cereals, sugars, juices, spices, salts, colouring matter, aldehydes, ketones, higher alcohol, essential oils, esters and acids. These ingredients are important in the identification of illicit, adulterated or imitation liquors. They confer individuality to the liquor.

13.2.2 Properties

Alcohol in the pure state is a colourless, transparent liquid. It boils at 78.4°C. It is miscible with water in all proportions. It has a pleasant odour and a burning taste. It causes irritation when tender body tissues are exposed to it.

Alcohol is a good solvent. It is used extensively in industry, especially in the pharmaceutical industry. On burning, it gives carbon dioxide, water and no particulate residue. Alcohol is being used increasingly as a clean motor fuel. Usually, as motor fuel, it is used as a mixture with petrol.

3. Liquor is the common name for all alcoholic drinks/beverages
4. The concentration of alcohol in a beverage is usually given as the percentage of alcohol by volume: the number of milliliters (ml) of pure ethanol in 100 ml of beverage.

13.2.3 Production

There are many methods, both chemical and biological for the production of alcohol on commercial scale. In chemical methods, ethene, aldehydes, ketones, esters, halides, are used as base materials. Even cellulose fibre is used for its production. However, alcohol for beverages is prepared by the fermentation of sugars, molasses, grains, fruit juices and starches.

Fermentation is a complex enzymatic process. The enzymes are obtained from yeast. It is carried out under controlled conditions. The final fermented mass contains about 10% alcohol. It is concentrated/purified by distillation for the production of spirits. Wines/bears are not distilled. They are handled differently to produce potable liquor.

13.2.4 Absorption

When an alcoholic drink is taken, it immediately starts getting absorbed in the body through the stomach membrane and small intestine. About 20% alcohol is absorbed almost immediately while the rest is absorbed in about half an hour to two hours. Body tissues of certain persons absorb alcohol more easily than those of others. Many factors affect absorption including:

1. **Rate of Consumption;** the faster a person consumes drinks, the quicker the BAC will rise
2. **Concentration/strength;** the concentration/strength of alcohol in the liquor affects absorption: greater the concentration, quicker is the absorption.
3. **Health;** healthy person takes more time to absorb the alcohol absorption is quicker in physically weak person. Perhaps the difference is due to fat deposition in the body tissues.
4. **Food;** if the stomach is empty, the absorption of alcohol is facilitated and is quicker than when the stomach is full. Proteinous and fatty food delays absorption.
5. **Tolerance:** Habitual drinkers absorb alcohol quickly. They can take more alcohol without being the worse for it. The mechanism of tolerance has not been fully understood.
6. **Person's preconceived expectations** of alcohol; it determines the effect more than the amount of alcohol. For example, people who set out to get "drunk" tend to get drunk even on look-alike drink.
7. **Sex of the subject;** females absorb alcohol slowly.

Other factors affecting absorption are:

8. **Mood**
9. **Illness**
10. **Fatigue**

Alcohol, on absorption, enters the bloodstream and is distributed uniformly in all the body fluids. Bones, hairs, nails and fat of the body do not absorb it to any significant extent. The equilibrium is reached in about half an hour to two hours, depending upon the factors mentioned above. However, if the drinking is continued, the equilibrium is not reached.

Alcohol concentration during the drinking period is higher in the arteries than in the veins.

The uniform distribution of alcohol in the body makes it possible to use any of the following fluids for determining Blood Alcohol Concentrations (BAC):

1. Blood
2. Urine
3. Breath
4. Saliva
5. Perspiration
6. Spinal cord fluid
7. Brain fluid

Ordinarily, blood, urine and breath are employed to test the quantity of alcohol consumed. Due to variations in water content in various body fluids, the alcohol concentrations vary. However, the concentration in the fluid is converted/expressed in terms of Blood Alcohol Concentrations **(BAC)**.

13.2.5 Elimination

Immediately after absorption, the system starts the elimination of alcohol. Most of it (about 90%) is metabolized by the system mainly by the liver. The enzyme alcohol dehydrogenase converts alcohol first to acetaldehyde and another enzyme convert it to acetic acid and finally to water and carbon dioxide. The rate of metabolism is constant. It is slightly less than 0.015% of the blood alcohol concentration per hour. The rest of the alcohol (~ 10%) is eliminated by the lung (exhaled), sweat pores and through urine as such. This alcohol is utilised for test purposes by taking appropriate sample of the body fluid.

The rate of elimination varies with individuals. Different research workers give varying estimates for the rate of elimination. However, the commonly accepted rate of elimination is about 10 millilitres of absolute alcohol per hour. In terms of whisky, a large peg is eliminated in about three hours.

Some scientists are of the opinion that the rate of elimination varies with the concentration of alcohol in the system but the consensus is that the rate is constant. It appears that whereas the elimination of alcohol by metabolism is constant but the rate of elimination through breath, urine and perspiration varies. Overall, rate of elimination is about 0.015% of the concentration of alcohol in the blood. Thus, greater the concentration of alcohol in the blood, greater is the overall elimination.

13.2.6 Effects

Alcohol affects the central nervous system in all amounts. Some persons are easily affected even by the low intakes. Other can tolerate large amounts before they show outward signs/symptoms. Alcohol affects the whole body, vision, hearing, speech are all affected. Speech becomes slurred, double vision occurs. Deterioration of judgment and self-control are the first/initial causalities.

Alcohol is a narcotic. That is, it depresses the body system. There is no minimum quantity, which does not affect the system adversely.

13.2.6.1 Euphoria

The observations of common people are different. They observe that when a person has taken a glass or two of beer, a glass of wine or one or two pegs of whisky, the subject exhibits euphoria. They, therefore, consider that a drink/alcohol is a stimulant. Extensive experiments

have proved that alcohol is never a stimulant. The euphoria shown after a moderate dose of liquor is due to the inhibitory cells of the brain (centres regulating conduct, judgment and self-criticism/control) are the first to be dulled by the narcotic, to reduce sensitivity and self-control. The effect is that the person feels:

1. Temporary relief from fatigue, pain or depression
2. A sense of well-being
3. Increased confidence
4. Less restricted speech
5. Carefree attitude

13.2.6.2 Muscular In-co-ordination

Muscular in-coordination (ataxia) due to alcohol intoxication results in jerky, un-coordinated movements of the limbs. There is postural instability, manifested by irregular wide-based gait.

Ataxia gait is dubbed as the drunken person's gait. It is clumsy, sway back and forth, and the subject falls down now and then. It is due to alcohol's effect on the brain's part controlling the movement.

Continued drinking causes affects the parts of the brain controlling inhibitions adversely and depresses the motor centres further. The results are apparent when a person has taken about two large pegs of whisky or four bottles of beer. The changes observed in the individual are:

1. **Inherent tendencies** of the individual become apparent. He may become hilarious, morose, irritable or excitable without proper cause.
2. **Neuromuscular** in-coordination occurs.
3. **Slurred speech** is common
4. **Staggering gait** (drunken person's gait: ataxia).

13.2.6.3 Respiratory Paralysis

If more liquor is consumed the paralysis of the respiratory centers sets in. The amount of alcohol to cause the effect varies with different individuals, depending upon the factors already mentioned. The effects observed are:

1. Complete in-coordination of muscles.
2. Stertorous breathing
3. Sleep
4. Coma; and
5. Death

13.2.7 Fatal Dose

Usually when the alcohol concentration in the body reaches the level of 0.40% or above it proves fatal. It has been found that 50% of the persons who have that level die. If alcohol causes vomiting, the latter may cause asphyxiation due to food going into the air passage. If asphyxiation does not occur, the expulsion of alcohol may save the individual.

The fatal dose of liquor for an ordinary adult person varies. In terms of alcohol, it is about 200 to 500 ml of absolute alcohol and about 50 ml onward for children under the age of twelve years. It means consumption of about three quarters of a bottle of whisky or about seven

bottles of beer onwards is fatal for an adult. The other factors, not already mentioned, which determine the effects of alcohol on a system, are:

1. The concentration of alcohol in the drink;
2. The time taken for taking a given quantity of alcohol
3. Mixing other narcotics in the drink
4. Habituation

If the drinking is spread over a number of hours and the drink has a small percentage of alcohol, the rate of intake and elimination is so adjusted that the body system does not attain the offensive concentrations. Consequently, the usual effects of heavy drinking will not be apparent.

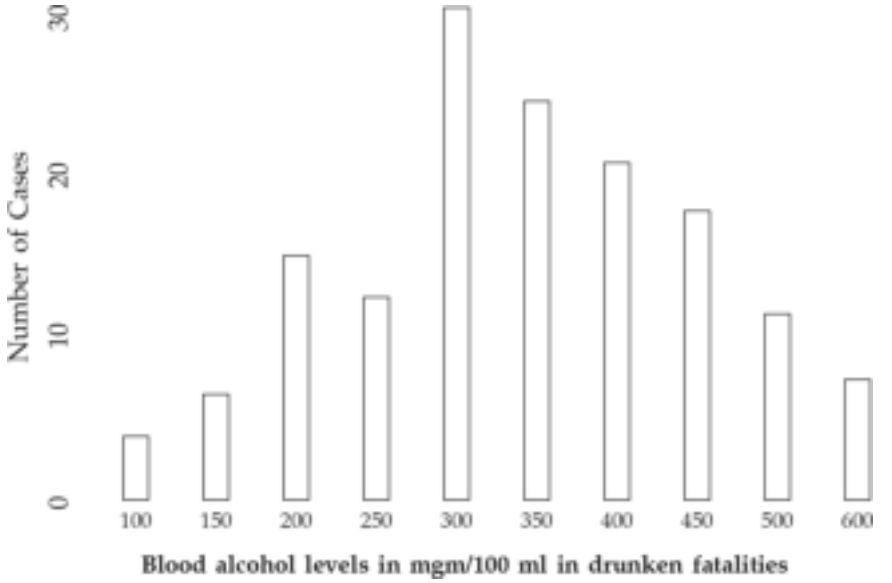

Fig. 13.2

13.2.8 Fatal Period

The fatal effects of alcohol may appear within 10 to 24 hours. However, in some cases, death may take place immediately or even after a number of days.

13.2.9 Alcoholic Allergy

Some persons are allergic to alcoholic drinks. The drinks madden them and they behave like maniacs under its influence.

13.2.10 Abnormal Tolerance

Alcoholic drinks affect all normal persons, though the tolerance varies from one individual to another. In rare cases, however, the drink does not affect a person appreciably. It is due to some either peculiar body tissues or sheer will power.

A very senior officer, who was a teetotaller, once related a personal experience. His friends asked him to drink half a bottle of whisky (about 375 ml) and drive a vehicle for about 25 km. He did it!

At another occasion, he was administered anaesthesia to carry out some operation, after an accident. The anaesthesia had no effect upon him. (CH)

13.2.11 Normal Use

In addition to alcoholic drinks, alcohol is used extensively as a solvent in industry and fuel in motor vehicles. It is an important solvent in most of the medical system in pharmaceutical preparations.

13.3 LOCATION AND COLLECTION

13.3.1 Illicit Liquor

Illicit manufacture is a flourishing industry in India, especially in states where prohibition prevails. Liquor stills are located at secret places. Covert observation and talks with the persons close to the suspected culprit reveal the locations. The paraphernalia and the products of manufacture are also secreted. The IO, therefore, searches all likely/unlikely places to locate the unauthorised stills and stores. In addition, he utilises the services of shadows and informers to locate them. Specially trained dogs also help to locate the stills/stores of illicit liquors.

Collection of the evidence includes the collection of the paraphernalia, fingerprints and tool marks in addition to the liquor and manufacturing ingredients.

13.3.2 Evidence of Intoxication

Intoxication may have to be established in cases of sudden deaths, in offences against the person, in motor vehicular accidents and in cases where diminished responsibility is claimed as a defence. The alcohol actually present in the brain causes intoxication as it is the alcohol, which affects the normal functions of a person. The blood alcohol is in equilibrium with that in the brain fluid. Therefore, the blood alcohol concentration is a fair index of the alcohol present in the brain. It is the material of choice for alcohol concentration determination. However, for practical reasons, breath, urine and saliva are also used. Breath, of course, has become the most convenient material as high precision instruments have come up in the field for breath alcohol analysis, which is sensitive, specific and rapid. The alcohol concentrations in all the body fluids at equilibrium are co-related to Blood Alcohol Concentration (BAC). The degree of drunkenness is expressed in terms of BAC. There are conversion factors, which convert the concentration of alcohol in a particular fluid into BAC.

BAC is the criterion used to determine drunkenness, all over the world. BAC is determined by chemical/instrumental tests for alcohol. It involves the following steps:

13.3.2.1 Collection Blood Samples

There are minor variations in alcohol concentration in the samples collected from various parts of the body. They are ignored. There is no prohibition, therefore, of taking blood from any part of the body, but usually, blood is collected from the ante-cubital vein of the arm. In the case of a dead person, venous blood from the leg can also be collected. The blood from the chest cavity is usually not collected as it is often contaminated by other body fluids.

While collecting blood samples, the medico-legal expert observes precautions and takes care to:

1. Allow only the qualified medical personnel to take blood samples in the presence of the investigating officer and witnesses.
2. Take two samples of blood, 5 ml each.
3. Preserve the samples with 100 mg. of sodium fluoride (1%) each.

4. Disinfect the skin (and the syringe needle) with non-alcoholic disinfectant, (mercury chloride solution) before taking the samples.
5. Use blood alcohol kits for the collection of the sample. The kit consists of:
   - Sterile disposable syringe
   - Blood collection tubes
   - Preservative; usual one is sodium fluoride
   - Mercury salts
   - Anti-coagulant (citrate, oxalate!). It obviates the need for homogenization
6. Use standard packing kit to pack the tubes after they have been labelled, sealed and witnessed.
7. Dispatch the blood sample to the laboratory at the earliest, observing legal formalities.
8. Store the blood it in a refrigerator at about 4° C if it has to be stored. 1% sodium fluoride or oxalate can keep the sample useable for about 6 months. The preservative and the anticoagulant do not interfere with the analysis.

Blood collection kits are convenient. They are being used routinely in blood testing laboratories. The kits are organised by the departments where blood sample collection is extensive.

13.3.2.2 Post-Mortem Blood Samples

Post-mortem blood from dead persons is collected at the earliest; in any case, before the putrefaction sets in or before the body is embalmed. If the body has started putrefying or is putrefied, the blood also suffers changes and the results of the analysis may be misleading. In such cases, cerebrospinal fluid or vitreous humour are collected as they are better test materials. Types of samples:

13.3.2.3 Urine Samples

The urine sample is easy to collect. However, it may not give true index of blood alcohol at the time of arrest as the urine may be accumulating for a long time in the bladder. Therefore, the bladder is emptied soon after the arrest. The sample urine is collected about half an hour thereafter. A second sample after another half an hour should suffice.

Whenever possible, a collection kit, on the pattern of blood collection kit is used. The urine is collected in disposable beakers and stored in screw type bottle instead of sample tubes.

The sample is sent to the laboratory at the earliest. If the sample has to be stored, 0.2% fluoride is used as preservative.

In case of female culprits, the urine sample is collected through female police official or another reliable female. The latter should witness the sample.

Urine sample is used only when blood samples cannot be obtained or the urine is used as an additional test material.

13.3.2.4 Saliva Samples

Saliva samples are not used many cases. They do not offer any advantage over blood, urine or breath samples. There are more or less of theoretical interest only. The subject is given paraffin for chewing. It causes salivation. The saliva is collected in a sterile tube. If it has to be preserved fluoride is used as in blood/urine samples.

13.3.2.5 Breath Sample

For accurate blood alcohol estimation from breath, only alveolar air[5] (alveolar gas) is taken into consideration. Alveolar air is the one, which is in immediate contact with alveoli of the lungs. It is in equilibrium with blood alcohol and contains amounts of alcohol, which correspond to blood alcohol. The breath also contains air, which is not in contact with the alveoli and hence dilutes it. The breath is, therefore, collected as given below:

1) Collect total exhaled gases. Assume that it is two-third alveolar air.
2) Or, assume exhaled gases contain 5.5% carbon dioxide and calculated the alveolar air on its basis.
3) Collect the last portion of the forced exhaled gases; assume it to be alveolar air.

The storage and collection of breath is done in many ways. The amount collected varies from less than one ml to about 200 mi of exhaled gases and vapours.

The collected sample is taken to the departmental laboratory at the earliest. If they are sent over long distances, the packing is properly done to avoid breakage or contamination.

Any one of the fluids can be used for analysis. However, in important cases, two fluids/ samples are collected. The fluids in the order of preference are blood, urine, saliva and breath.

If the samples are to be stored, they are kept under lock and key, preferably, in a refrigerator.

If a breath analyser is available, a preliminary test is made on the spot. Some modern instruments give directly accurate blood alcohol. One set of the samples is preserved in a refrigerator until the disposal of the case, as the defence may desire to get the same analysed from a chemist of their choice. In case the samples are to be examined at more than one place, an additional set of samples is collected for each place.

13.4 PROBLEMS

In crimes involving alcohol, the following types of questions need answer:

1. Does the given sample contain alcohol?
2. Is it illicit liquor?
3. What is the alcoholic strength of the liquor?
4. Does the liquor conform to the given specifications? Or, is it an imitation or a substitution of a given brand?
5. Were the drivers involved in an accident, under the influence of alcohol?
6. Did the person die of alcoholic poisoning?
7. Did the dead person consume alcohol before his death?
8. Was the person who claims diminished responsibility actually under the influence of alcohol?

Four persons consumed some alcoholic drink. Two of them were found dead in the hut, while the other two complained of pain in the stomach. They were taken to hospital. They also died after admission in the hospital. Ethyl alcohol and methyl alcohol were detected in viscera of all the four deceased and in the unconsumed portion of the liquor. (CH)

5. It is the gas in the pulmonary alveoli where exchange of oxygen or carbon dioxide occurs.

13.5 EVALUATION

The questioned sample of liquor is identified/and individualised by comparing its analytical data of with that of the standard data of the corresponding liquor. The following data is usually compared:

13.5.1 Identification of Liquor

Sometimes it is necessary to establish whether a given drink is liquor or not; i.e., whether it contains alcohol or not. This is established by identifying alcohol in the liquor. The following tests are employed for the purpose:

1. Iodoform test gives a characteristic smell.
2. Ester formation gives a fruity smell.
3. Determination of the boiling point, specific gravity and refractive index after purification identify alcohol.
4. Gas chromatography has become a very popular identification technique for alcohol.

13.5.2 Liquor Content

It is important to know the type of liquor it is. For this following determinations are carried out.

13.5.2.1 Alcoholic content

To find out the alcoholic content, The liquor is distilled in a specified manner and the distillate is collected. The specific gravity and refractive index of the distillate are determined. The concentration of alcohol is found from specific gravity or refractive index tables. Sometimes both determinations are used to arrive at the correct identification.

Other methods for the determination of alcoholic content have come up. The most convenient and efficient method is gas chromatography. Peak area relevant to alcohol gives the quantity of alcohol. Direct reading instruments, with integrators have also come in the field.

13.5.2.2 Specific Gravity

The specific gravity of liquor is affected not only by the alcoholic content but also by other ingredients of the liquor, especially sugars, unfermented cereals and spices.

The specific gravity is determined through hydrometers, pyknometer or with the help of a Westphal balance or with specific gravity bottles.

13.5.2.3 Refractive Index

The dipping type of refractometer is used to determine the refractive indices of liquors.

13.5.2.4 Total Solids

The total solids of liquor, notably of beers and wines, vary considerably depending upon the ingredients and the manner in which the liquor has been prepared. If the solids are more than 5%, they are estimated indirectly from the specific gravity. A given volume (say, 50 ml.) is distilled after determining its specific gravity. The distillate is then made up to the original volume and its specific gravity is determined. The total solids are given by:

$$\frac{S1 - S2}{0.00386}$$

Section 1 and section 2 are specific gravities of the liquor before and after distillation respectively.

When total solids are less than 5%, they are determined by evaporating 50 ml. of alcohol in a flat-bottomed dish. Final drying is carried out in a steam-heated oven at 100°C for two hours.

13.5.2.5 Acidity

Total acidity of wine is determined by direct titration of the liquor with alkalis. Usually barium hydroxide solution (0.1 N) is used.

The presence of carbon dioxide creates some difficulty in the estimation.

Volatile acidity is determined by distillation of the liquor and titration of the distillate. Usually tannin is added to the liquor before it is distilled.

Volatile acidity and total acidity are expressed in terms of acetic acid while fixed acidity is expressed in terms of tartaric acid.

13.5.2.6 Sugars

Sugars are detected and estimated by Benedict's methods. They may also be tested and estimated by polarimetry.

The determination of sugar content in wine is of great importance as it a significant constituent in the quality/taste of wine. It is now estimated through enzymatic analysis or through high performance liquid chromatography (HPLC).

13.5.2.7 Ash

The ash content of liquor is estimated by evaporating a given sample and ashing it in the usual way.

13.5.2.8 Miscellaneous

1. **Essential oils;** they are separated by diluting the liquor and extracting it with petroleum ether. They are identified by their smell, colour,
2. **Methyl alcohol** is detected by oxidation and estimated from the colour produced with Schiffs reagent. It is oxidized The products give the colour. Gas chromatography is however, is the preferred mode.
3. **Isopropyl alcohol** is estimated by its oxidation to acetone, which gives colour reaction with nitrobenzaldehyde.
4. **Glycerol, furfural, sulphate, sulphite, lead and arsenic** are also sometimes detected and identified. They are tested through chemical/physical tests.

Instrumental methods have made most of the traditional chemical/physical techniques obsolete. For example, gas chromatography can analyse both qualitatively and quantitatively all the volatile constituents of liquors; methanol, ethanol, higher alcohols, esters, acids, ketones, aldehydes, essential oils and furfural. Likewise, spectrography, atomic absorption spectrophotometry and other techniques can analyse metallic constituents.

Complete analysis of a liquor can, thus, lead to its identification and prove whether it is illicit/licit/standard/spurious. It also permits identification of individual liquors and their sources.

13.6 INTOXICATION

Alcohol intoxication (or drunkenness) is a physiological state in which a person's normal capacity to act or reason is inhibited by alcohol.

Alcohol on ingestion enters the bloodstream at a faster rate than it is eliminated through various routes. It affects the human brain (and other part of the body), his psychology, reasoning, consciousness and control over body functions. The effects represent intoxication. An **intoxicated** person is incapable of acting, as an ordinary prudent and cautious person, not drunk, would act under similar conditions. He is incapable of properly executing the occupation in which he is engaged at the material time.

Intoxication is an important factor in many criminal/civil cases.

Alcohol intoxication is identified by medical examination, physical tests and blood alcohol analysis. The last includes chemical, biological and instrumental techniques of the body fluids.

13.6.1 Medical examination

In medical examination, the examiner checks the symptoms of drunkenness and also makes the subject to perform certain actions. The doctor or a police officer checks the following symptoms:

1. **Breath smell;** it is a good guide in some cases. Certain liquors, though taken only in small amounts, emit a strong smell, while other liquors, though consumed in large amounts, may not give the characteristic odour.
2. **State of clothing;** a person under the influence of alcohol is careless about his dress and it is dishevelled.
3. **General demeanour;** an intoxicated person may show flushed face, reddened eyes, reduced inhibition, disorderly behaviour in talk and action,
4. **Speech;** slurred speech is an indication of intoxication. It is difficult for an intoxicated person to pronounce certain words. Certain drugs also cause slurring of speech.
5. **Clean tongue**/excessive salivation indicate intoxication.
6. **Eyes;** the pupils of an intoxicated person are often dilated. The reaction to strong light is slow. The eyes are red and have a glassy vacant look.
7. **Walk;** an intoxicated person has a staggering gait. It is more prominent when he is turning at sharp corners.
8. **Memory;** an intoxicated person has a short memory, especially of recent events. The time taken by him to recall an event is long. He may also show some confusion. He loses sense of time.
9. **Breathing:** The subject may show hiccups in some cases.
10. **Tremors;** hands, arms, feet and legs may develop tremors.
11. **Coma.** Heavily drunk person may go into a coma. Most of the persons go into coma when they have imbibed alcohol to give Blood Alcohol Concentration (BAC) 0.35% or above.

It may be noted that:

1) Reliance is not placed on a single observation.
2) The pathological condition of the subject is also checked. The subject may be suffering from some disease. Thus, red eyes, dilated or contracted pupils, tremors or rapid pulse may be due to some disease.
3) Some persons are capable of consuming large amounts of alcohol without showing any outward sign of drunkenness. They may be able to repeat certain words and phrases or to write neatly. They may be able to walk in a straight line.

Thus, elimination of drunkenness is not based on such tests. BAC, beyond the legal limits, is the sole sure test of drunkenness or otherwise.

13.6.2 Physical Tests

The Investigating officer himself carries out the physical tests. They are good preliminary indicator tests when it is not possible to get a medical examination done or to determine BAC. Physical efficiency check of the subject includes the following tests:

1. Walk in a zigzag path.
2. Pick up small items fallen on the ground.
3. Perform simple mental mathematical calculations.
4. Write quickly.

The habitual drinkers can do these activities even after drinks.

13.6.3 Blood Alcohol Analysis

The presence of alcohol in the blood of a person affects the Central Nervous system (CNS) to create a state of intoxication. The greater the amount of alcohol, the greater is the intoxication. It is, therefore, ideal if intoxication and the BAC in the body are co-related. The importance of the relationship was recognised in the far end of the last century.

A lot of research on the subject has given a clear picture of the relationship of alcohol concentration in the body and intoxication. Consequently, the estimation of BAC in body fluids has acquired tremendous importance. Excellent techniques are available now, by which the alcohol level in body fluids can be determined. These techniques are classified as:

1. Chemical Techniques
2. Bio-chemical Methods
3. Instrumental Methods
4. Miscellaneous Techniques

The detailed discussion of these techniques is beyond the scope of this book but a brief description is given below. Those who need details may refer to the easily accessible Forensics literature in books/journals/Internet.

13.6.4 Chemical test

In all chemical tests, the advantage is taken of the fact that an oxidising agent easily oxidises alcohol to give acetic acid. Commonly used oxidisers are potassium dichromate and sulphuric acid, potassium permanganate solution or osmic acid. The commonest oxidising agent used is potassium dichromate. A measured amount of oxidising agent is added to the measured amount of liquor. Part of the oxidising agent is used to oxidise the alcohol. The agent left unused by alcohol is found out. The used oxidising agent gives the amount of alcohol present in the sample.

The first person to suggest this technique for the estimation of alcohol was Nicloux. Others have since modified it. Notable modifications are due to:

1. Widmark
2. Cavett
3. Southgate and Carter, and
4. Kozelka and Hine

These modifications give fairly accurate and reproducible results. Out of these techniques, Cavett's modified method and Kozelka and Hine's methods are still used in India in some laboratories[6].

Tests for adventitious materials such as acetone, albumin, salicylates, phenols, sugars and preservatives are also carried out. The above technique for alcohol determination is modified to avoid interference by these materials.

The chemical methods are non-specific because other reducing agents (other alcohols, aldehydes, Ketones), if present are also oxidised, corrupting the result unless they are taken into consideration. The methods, therefore, are giving way to other methods, notably to instrumental methods.

13.6.5 Gas Chromatography

Gas chromatography technique for the determination of alcohol in body fluid is extremely simple both in principle and operation. Yet it is highly sensitive, rapid and specific. It needs only small quantities. The analysis is not interfered by the common materials present in the sample. Gas chromatography, consequently, is being used extensively and increasingly for the body fluid alcohol determinations in almost all laboratories. The set up of the process is shown in the diagram below:

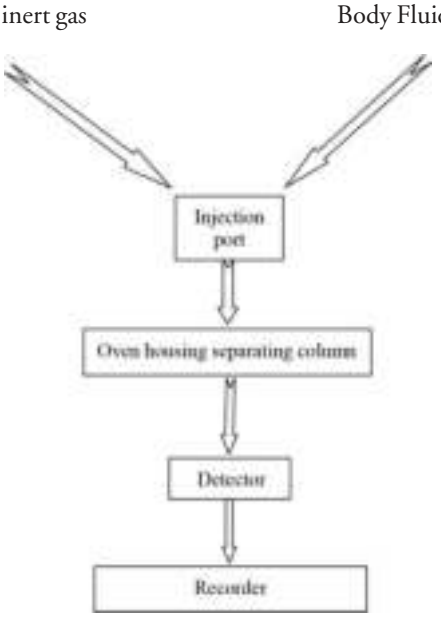

Fig. 13.3

Flow-chart: Gas Chromatography

6. In Cavett's modified method about 2 ml. of blood or urine are taken in a petri dish. It is placed over 10 ml. of potassium dichromate solution (4.9 g of dichromate in 1 litre of 50% sulphuric acid) over a triangular glass stand, in a wide mouthed 500 ml. jar. The jar is closed with a ground glass plate and a screw-on cap. It is left for about 20 hours at room temperature or incubated at about 37° C for 8 hours.

   The alcohol in the sample is distilled over by hygroscopic action of sulphuric acid. It gets oxidized on coming in contact with the solution. An excess of potassium iodide is added to unused dichromate solution. The solution is titrated with sodium thiosulphate solution using starch as the indicator. The quantity used for alcohol is thus found out.

   Often, it is preferable to use Kozelka and Hine method when interference by reducing agents is suspected. The main features of the Kozelka and Hine technique are:
   1. The distillation and oxidation are carried out in separate steps.
   2. Foaming is avoided in the distillation by precipitating proteins with the addition of sodium tungstate, to the blood sample. A trap is also employed to prevent froth being carried over to the distillate.
   3. Reducing agents are retained in mercuric chloride and sodium hydroxide solutions.

A measured sample containing alcohol is put into the head of the column (injection port) kept in a heated chamber where it is changed into vapours. The vapours are carried by carrier gas through a column packed with a suitable material. Due to differential adsorption, various constituents of the sample are separated. They are detected through a sensitive detector. The time intervals at which they pass through the detector are recorded on a chart (chromatogram of the sample) which gives qualitative and quantitative analysis. Blood, urine or other body fluids are diluted with isopropyl alcohol before analysis.

Head space procedure for the analysis of alcohol is becoming popular. In this technique body fluid liquid is mixed with an internal standard (say Dioxane) and allowed to attain equilibrium in a rubber bunked closed tube, when one ml. sample of the vapours is drawn with a syringe and injected into the injection port and the sample undergoes chromatography. A typical instrumental set up is:

1. Column: Stainless Steel, 2 mm x 3 m. Coated with Carbowax.
2. Temperature:
   - Injection port 175° C
   - Oven 80° C
   - Dilutor 225° C
3. Carrier Gas Helium
4. Detector FID/TCD

Other alcohols, esters, aldehydes, ethers, acids and essential oils appear at different intervals and have separate peaks. They, therefore, not only do not interfere in the analysis but they are also identified and estimated.

13.6.6 Biological Method

This method utilizes the action of an enzyme, alcohol dehydrogenase (ADH) which changes alcohol into acetaldehyde by removing a molecule of hydrogen. Acetaldehyde is then estimated spectrophotometrically (340 nm).

The enzymic reaction is carried out in a buffer solution of about 9 pH in the presence of semi carbazide. The coenzyme gets reduced and changes the absorption quantitatively. Alcohol is transferred to the solution by suction. The enzyme reacts only with alcohol and does not react with acetone or methanol.

The technique is sensitive, specific and micro in nature.

13.6.7 Breath Analysers

A large number of instruments are available for the analysis of breath alcohol in the market under various trade names, namely drunkometer, breath analyser, alcometer, intoximeter and, the latest (A.L.E.R.T.) Alco Testor, They are extensively used in United States of America. They are not so popular in other countries. However, their portability, simplicity and the instantaneous results they produce have made them very popular especially in checking drunken driver. They are becoming indispensable where the intoxicated driver is a serious problem. Research and experience have brought in tremendous improvements in these instruments.

Most of the instruments work on the principle that the alcohol contained in breath is oxidised by an oxidising agent and produces change in its colour, which is measured visually, colourimetrically or spectrophotometrically. The change in colour is proportional to the amount of alcohol. The latter, therefore, can be determined from the former.

Newer instruments are also using other estimation technologies. The important technologies are:

Semi-conductor oxide-based testers; these breath analysers are relatively new and cheap. An ethanol-specific sensor is used to measure the subject's BAC.

Semiconductor oxide sensors are cheap, power consumption is low and they are of small size, hence portable. Semiconductor oxide testers require frequent calibration (yearly or after about every 300 tests). For low-volume work, they give accurate and satisfactory performance.

Fuel cell testers; they are high accurate and sensitive. Being of small size, they are portable. They need re-calibration after about 1000 tests or yearly.

In a fuel cell alcohol is oxidises (a chemical reaction). The reaction creates an electrical current. The strength of the current is proportional to the amount of alcohol. The measure of the current determines the subject's BAC.

Spectrophotometer technology; It is used in tabletop breath analysers. Spectrophotometers identify alcohol through absorption of infrared light. The absorption level is measured in the singled out alcohol sample and measured, The level gives the subject's alcohol level.

Some breath analysers are used only to screen drivers. They indicate whether the person is legally sober, drunk, It is indicated usually by various types of light or word 'PASS', 'FAIL' or 'WARN' which appear upon the instrument. Some instruments give BAC on a print out.

13.7 SIGNIFICANCE OF BLOOD ALCOHOL CONCENTRATION

13.7.1 Legal Drunkenness

As alcohol in blood in all concentrations adversely affects the human brain, mind and body, there is no safe lower limit. However, some countries have arbitrarily fixed blood alcohol concentration limit to identify drunkenness. The prescribed limits in some countries are:

Table 13.2

S. No.	Country	Limit
1	United Arab Emirate and Romania	0.0%
2	Australia, South Africa and Germany	0.05%
3	The United Kingdom, United States of America and New Zealand	0.08%
4	**India**	0.03%

The medical tests are often unreliable to determine intoxication, the determination of BAC in body fluids is therefore, the sure indicator of drunkenness is used. Most of the countries use it for legal purposes.

13.7.2 Estimation of ingested alcohol

The estimation of alcohol consumed by a person is useful to determine if the person is legally drunk or not. There are numerous formulae. The one given below is simple and good indicator.

Q = C.W.B.

Q = Total quantity of alcohol consumed.

C = Concentration of alcohol in the blood.

W = Weight of the body, and

B = The body factor.

The use of body factor is necessary to account for the non-absorbing part of the body, mainly the bones and the fat. B is roughly 0.7. The body factor for males has been found to be about .68 and for females .55, in U.S.A. It will vary with the geography of the lands and their inhabitants.

Thus, a person weighing 70 kilograms and having an alcoholic concentration of 0.1%, have consumed alcohol:

$$Q = \frac{0.1 \times 70 \times 1000 \times 7.0}{100}$$

$$= \frac{700 \times 7}{100}$$

$$= 49 \text{ g}$$

$$= 62 \text{ ml (SG = .7893)}$$

In terms of whiskey, the person has consumed about 150 ml. of whiskey or over two large pegs of whiskey. In terms of beer, the person has taken two to four bottles of beer.

As discussed earlier, the elimination of alcohol starts as soon as it is absorbed. The correct amount of alcohol in the body will be less and it can be found out. For example, in the above case if the total time taken for drinking and delay in taking the sample is three hours, then:

$$\text{Alcohol eliminated} = 3 \times 0.015$$

$$= 0.045$$

Imbibed alcohol = 0.10 (from the above calculations)

$$\text{Residual alcohol in the body} = 0.10 - 0.045$$

$$= 0.055$$

13.7.3 Concentration of Alcohol in body fluids

As estimation of alcohol in the body is determined not only from blood but from other fluids also, it is essential to know the concentration relationship in the fluids *inter se*. The table below shows the interrelationship of concentrations.

Table 13.3

Co-Relation of Alcohol in Blood and Body Fluids	
1. Blood : Urine	= 1: 1.33
2. Blood : Perspiration	= 1: 1.1
3. Blood : Saliva	= 1: 1.1
4. Blood : Breath	= 2100:1
5. Blood : Brain Fluid	= 1: 0.85
6. Blood : Liver	= 1: 0.77
7. Blood : Plasma	= 1: 16

Other body fluids do not give consistent results.

The ratios will vary somewhat with the technique of sampling. For example, if the breath is not exhaled properly from the lungs, the concentration of alcohol in breath is found less. Likewise, if the mouth contains some alcohol, the concentration of alcohol in breath is more.

Similarly, if urine is not sampled properly, the concentration of alcohol in urine will not be a true index of blood alcohol level at the time of taking the sample, if there was urine in bladder when he started drinking.

13.8 PRESENTATION

The reports of chemical examiners who carry out blood alcohol analysis are tendered in the Trial Court under section 293 of the Code of Criminal Procedure, 1973. Thus, attendance of the examiner in a court is not compulsory.

The evidence is highly technical and is not likely to be understood by the courts. It is therefore, necessary that the expert should explain the nature of evidence in person whenever possible. It is recommended that the following chart should accompany each analysis report concerning intoxication.

Table 13.4

Alcohol Effects

	Liquor	Taken	Concentration %		Effects
Beer Bottle (5%)	Whisky (ml)	Alcohol (ml)	Blood	Urine	Signs/symptoms
Half- 1 bottle	35 70	15 30	0.025 0.050	0.033 0.07	Outwardly no effect Inhibitory centres affected Mild euphoria.
2-4 bottles	140-280	60-120	0.10 to 0.20	0.133-0.236	Muscular in-coordination. Subject talkative, social, happy. Judgement impaired. Efficiency decreases. In some confusion.
4-6 bottles	280-450	120-180	0.2-0.3	0.267-0.400	Emotional breakdown, Mental physical incoordination. Muscular in-coordination increases slurred speech, staggering gait, loss of pain perception and other sensation (complete confusion).
6-8 bottles	420-560	180-240	0.3-0.4	0.4-0.533	Loss of muscular control complete. No response to stimulations, Loss of consciousness. Stertorous breathing, sleepiness, Coma, Stupor, Death.
Above	>560	>240	>0.400	>0.533	Coma, Sleep, Paralysis, Death.

The elimination of alcohol starts immediately after the start of drinking, at the rate of 10 ml. of pure alcohol per hour. If a person has taken two bottles of beer in 3 hours, 30 ml. of alcohol is eliminated during the drinking and at the end effective concentration is only 0.05% instead of 0.10%.

There are numerous techniques for BAC determinations. Besides they are being changed/modified continuously. It is therefore imperative that the technique employed is mentioned in the report. The technical details should be given only in brief but reference to detailed method should be given, so that if the court so desires, can verify the dependability of the procedure.

13.9 CASE LAW

Supreme Court Cases – 21st Century

13.9.1 Spurious Liquor Deaths[7]

Author's Summary

The lust for liquor and poverty push the weaker section of the society to the money sharks who, to make fast buck, sell spurious killer substitutes.

The present case is such a tragedy on a vast canvass in Kerala. **31** persons lost their lives, **6** persons suffered total blindness whereas more than **500** persons suffered serious injuries on account of the drinking of the spurious liquor.

Supreme Court

"…we must note some very disturbing facts which have been revealed from the voluminous evidence by the prosecution. Here was a person who was unabashedly running his empire of spurious liquor trade and for that purpose had purchased politicians including the public representatives, police officers and other officers belonging to the Excise Department."

Highlights italicised

Relevant Extracts (Verbatim)

4. Alcohol has already proved itself to be one of the major enemies of the human beings. However, its grip is not loosened in spite of the realisation of the evil effects of alcohol on the human life. On the other hand, the unholy grip is being tightened day by day. Therefore, when the standard and healthy alcohol in the form of liquor is not available or is too costly for a common man, the poor section of the society goes for illicitly distilled liquor which is sold by the bootleggers. The conscienceless bootleggers—thanks to their avarice for money—take full vantage of this human weakness and without any compunction or qualms of conscience, distil illicit liquor and then to increase the sale and to gain astronomical profits make their product more potent at least in taste so as to attract the poor customers. Such poor customers invariably become the prey of such unholy avarice on the part of the bootleggers and in the process even lose their lives at times or suffer such injuries which are irreparable like total blindness, and that is precisely what has happened in this case.

5. On 22 October 2000, in the wee hours, Sub-Inspector of Police, Parippally received information that one Raghunatha Kurup of Kulathoorkonam and seven others were admitted in the Medical College Hospital Thiruvananthapuram for treatment on account of illness caused by consumption of illicit liquor. He reached the hospital and recorded the first information statement of Raghunatha Kurup at 2 am. By that time, one Sasidharan who had consumed the illicit liquor had died and two others were lying in unconscious condition. On that basis, Sub-Inspector registered Crime No. 268 of 2000 under sections 302, 307, IPC read with section 34, IPC and under section 57A of the Abkari Act. Little did he know the exact ramifications or vastness of the grim tragedy which was about to take place. Three other similar crimes were registered at Kottarakkara police station and this was followed by further crimes registered in the same police station being Crime No. 809 of 2000, Crime No. 810 of 2000, Crime No. 811 of 2000 and Crime No. 817 of 2000. All these crimes were consolidated with crime No. 268 of 2000 of Parippally police station and the information started trickling regarding the consumption of spurious liquor by poor persons and their admittance to the hospital from within Anchal and Parippally police station limits. Similar incidents had taken

7. *Chandran @ Manichan @ Maniyan v State of Kerala*, AIR 2011 SC 1594 : (2011) 5 SCC 161.

place within the limits of Mangalapuram police station and the crime was registered there also. Investigation machinery quickly responded to the happenings and

a Special Investigation Team (SIT) was constituted as per the directions of Director General of Police, Kerala, Thiruvananthapuram on 25 October 2000 which was to be headed by Shri Sibi Mathews, IPS who was the Inspector-General of Police. He was to head the team of seven persons, six other persons being the police officers of the level of Inspectors and above. All these earlier mentioned crimes were taken over for investigation by SIT. They started investigation in all the concerned police stations where the crimes were reported. It was realized that as many as 31 persons had lost their lives, six persons had suffered total blindness in Kollam District whereas more than 500 persons suffered serious injuries on account of the drinking of the illicit liquor.

6. Unfortunately, all this was going on in God's own country, Kerala which was turned into hell by the liquor mafia. Eventually, an investigation by the SIT was completed and

> *the final report was filed before the Judicial Magistrate, 1st Class, Paravoor on 21 January 2001 against 47 persons. After the charge-sheet was filed, accused No. 48 was also added by a supplementary charge-sheet. However, as many as four accused persons, they being accused Nos. 34, 36, 39 and 45 died on account of consumption of their own medicine, the spurious liquor. Accused No. 3 had lost his eye sight completely. Few accused were absconding, their cases were split up. Rest of the accused were sent for trial before the Sessions Judge before whom a marathon trial took place wherein 271 witnesses were examined, as many as 1105 documents were proved and relied upon and over 291 material objects were produced. The defence also examined as many as 17 witnesses and relied on 110 documents being Exhibits D-1 to D-111.*

7. The prosecution alleged that methyl alcohol which is a poisonous substance used to be brought from Karnataka and mixed with Ethyl alcohol. At times, this concoction was mixed with toddy and other essences resulting in a drink called Kalapani. The methyl alcohol used to be mixed with ethyl alcohol which was also illegally and illicitly procured in order to add potency to the drink so that more and more people would purchase the same. These sales were made from the regularly licensed toddy shops and from other places. There was well-oiled machinery, huge in proportion, the main component of which was Chandran (accused No. 7) who was a toddy contractor. His brothers, Manikantan (accused No. 4) and Vinod Kumar (accused No. 8) were deputies helping him. This group had servants like Balachandran (A-15), the Manager. Even their wives did not lag behind. There were laboratories, assistants and labourers. There were drivers and a fleet of vehicles which were used for importing methyl alcohol from Karnataka and then it used to be brought to the laboratories maintained by Chandran (A-7), Manikantan (A-4) and Vinod Kumar (A-8) where the mixing used to take place. Accused Nos. A-4 (Manikantan @ Kochani), A-7 (Chandran @ Manichan), A-8 (Vinod Kumar), A-15 (Balachandran), A-18 (Usha), A-19 (Sugathan), A-20 (Vijayan), A-21 (Rassuludeen), A-22 (Suresh @ Sankaran) and A-23 (Binu @ Monukuttan) were active in firstly procuring the methyl alcohol and then mixing the same in the laboratories and then distributing the same in the whole district, more particularly, to the various outlets for sale of toddy.

Chandran (A-7) used to control these shops which were either in his name or some other names. It was alleged by the prosecution that all these accused persons hatched a criminal conspiracy in or about March, 2000 prior to the auction of toddy shops for the period between 2000–01 and well-oiled machinery was created for importing methyl alcohol from a place called Arihant Chemicals, Bangalore. Chandran (A-7) controlled toddy shop Nos. 1 to 26 of Chirayinkil Panchayat so that there were easy outlets available for the sale of spurious liquor. Once methyl alcohol was imported, it used to be brought to the huge laboratories constructed for that purpose and carefully concealed which was located at Pandakasala.

It was alleged by the prosecution that Gunasekharan (A-17) purchased two barrels of methyl alcohol as part of the criminal conspiracy from Arihant Chemicals, Bangalore and the same was

entrusted to Anil Kumar (A-16) for import to Kerala for the purpose of its mixing with the spirit ethyl alcohol and for sale by Manikantan @ Kochani (A-4), Chandran @ Manichan (A-7), Vinod Kumar (A-8), Balachandran (A-15), Usha (A-18), Sugathan (A-19), Vijayan (A-20), Rassuludeen (A-21), Suresh @ Sankaran (A-22), Binu @ Monkuttan (A-23). It was brought by Anil Kumar (A-16) in a Fiat car which had a fake registration number. This Fiat car was fitted with a secret tank and thus the poisonous methyl alcohol was imported and was mixed with 56,200 litres of spirit which was also imported to Kerala by Mahesh (A-12), Salil Raj (A-13), Ashraf (A-14) and Sakthi (A-48). All the mixing was done at Pandakasala and then it was given for distribution to Manikantan (A-4) who transported it through Anil Kumar (A-5), Shibu (A-6), Santhosh @ Kochu Santhosh (A-9), Santhosh @ Valiya Santhosh (A-10), Mohammed Shaji @ Shabu (A-11), knowing it to be injurious to health, through various other vehicles.

8. The said methyl alcohol which was mixed in the Pandakasala godown meant for toddy shop Nos. l to 26 of Chirayinkil Panchayat and then got distributed by the above accused persons who all knew very well that it was injurious to health and was fatal. For this purpose, cars bearing registration No. PY01M-6582 and TN-1-rule 9283 and a Van bearing registration No. KLOQ-2787 were used.

9. It was further the case of the prosecution that from this poisonous spirit, 35 litres were taken in a car bearing registration No. TN-1-rule 9283 on 20 October 2000 at about 3.30 pm with the assistance of Anil Kumar (A-5) and Shibu (A-6) and was given to Herunnesa (A-1), Rajan (A-2) and Raju @ Mathilakom Raju (A-3) in the house of A-1 and A-2 at Kalluvathukkal. It was alleged that accused Nos. 1, 2 and 3 diluted the spirit by adding water and sold it through their outlets because of which 18 persons died due to consumption of spurious liquor. It was pointed out that two persons lost their eyesight and number of others sustained grievous injuries. It was further alleged in the charge that Manikantan (A-4) with the help of Anil Kumar (A-5) and Santhosh (A-10) transported 10 Kannas full of spurious liquor having a capacity of 35 litres in the car bearing fake registration No. KL 01M 7444 on 20 October 2000 night to Charuvila Puthen Veedu, Anthamon Muri and Kalyanpuram village at Kottarakkara and there the said liquor was sold by A-30 with the assistance of A-31 who earlier diluted the spurious liquor by adding water at the house of A-30 and packed liquor in polythene covers containing 100 ml each. The said pouches were also sealed with the help of sealing machine. Then the pouches were loaded in one Maruti car on the same day and the same was entrusted to A-39, Latha Kumari. Even these accused knew the spurious nature of the liquor and its lethal effects. Some liquor out of this was sold to one Soman Pillai and CWs. 630 to 634 and on that account Latha Kumari and Soman Pillai died while others suffered serious injuries.

18. Section 2(6A) of the Act defines "arrack". It means any potable liquor other than toddy, beer, spirits of wine, wine, Indian made spirit, foreign liquor and any medicinal preparation containing alcohol. Section 2(8) defines "toddy" to mean fermented or unfermented juice drawn from a coconut, palmyra, date or any other kind of palm tree. Section 2(9) speaks about the "spirits' meaning any liquor containing alcohol and obtained by distillation. Sub-section (10) provides the definition of "liquor" which includes spirits of wine, arrack, spirits, wine, toddy, beer and all liquid consisting of or containing alcohol. Section 2(12) defines country liquor which means toddy or arrack while section 2(13) defines foreign liquor which includes all liquor other than country liquor. Thus, it will be seen that "liquor" is the broadest concept and engulfs all the intoxicating drinks … … …

A new section was added by Amendment Act No. 21 of 1984 being section 57A which is the most relevant section for our purpose. The section reads as under:—

"57A. For adulteration of liquor or intoxicating drug with noxious substances,—(1) whoever mixes or permits to be mixed any noxious substance or any substance which is likely to endanger human life or to cause grievous hurt to human beings, with any liquor or intoxicating drug shall, on conviction, be punishable.

(i) if, as a result of such act, grievous hurt is caused to any person, with imprisonment for a term which shall not be less than two years but which may extend to imprisonment for life, and with fine which may extend to Rs 50,000;

(ii) if, as a result of such act, death is caused to any person, with death or imprisonment for a term which shall not be less than three years but which may extend to imprisonment for life, and with fine which may extend to Rs 50,000;

(iii) in any other case, with imprisonment for a term which shall not be less than one year, but which may extend to ten years, and with fine which may extend to Rs 25,000.

Explanation.—For the purpose of this section and section 57B the expression 'grievous hurt' shall have the same meaning as in section 320 of the Indian Penal Code, 1860 (Central Act 45 of 1860).

(2) whoever omits to take reasonable precautions to prevent the mixing of any noxious substance or any substance which is likely to endanger human life or to cause grievous hurt to human beings, with any liquor or intoxicating drug shall, on conviction, punishable—

(i) if as a result of such omission, grievous hurt is caused to any person, with imprisonment for a term which shall not be less than two years but which may extend to imprisonment for life, and with fine which may extend to Rs 50,000;

(ii) if as a result of such omission, death is caused to any person, with imprisonment for a term which shall not be less than three years but which may extend to imprisonment for life, and with the fine which may extend to Rs 50,000;

(iii) in any other case, with imprisonment for a term which shall not be less than one year but which may extend to ten years, and with fine which may extend to Rs 25,000.

(3) whoever possesses any liquor or intoxicating drug in which any substance referred to in sub-section (1) is mixed, knowing that such substance is mixed with such liquor or intoxicating drug shall, on conviction, be punishable with imprisonment for a term which shall not be less than one year but may extend to ten years, and with fine which may extend to Rs 25,000.

(4) notwithstanding anything contained in the Code of Criminal Procedure, 1973 (Central Act 2 of 1974), no person accused or convicted of an offence under sub-section (1) or sub-section (3) shall, if in custody, be released on bail or on his own bond, unless—

(a) the prosecution has been given an opportunity to oppose the application for such release, and

(b) where the prosecution opposes the application, the Court is satisfied that there are reasonable grounds for believing that he is not guilty of such offence.

(5) Notwithstanding anything contained in the Indian Evidence Act, 1872 (1 of 1872)—

(a) where a person is prosecuted for an offence under sub-section (1) or sub-section (2) the burden of proving that he has not mixed or permitted to be mixed or, as the case may be, omitted to take reasonable precautions to prevent the mixing of, any substance referred to in that sub-section with any liquor or intoxicating drug shall be on him;

(b) where a person is prosecuted for an offence under sub-section (3) for being in possession of any liquor or intoxicating drug in which any substance referred to in sub-section (1) is mixed, the burden of proving that he did not know that such substance was mixed with such liquor or intoxicating drug shall be on him."

30. *The reason why accused No. 7 had to mix the methyl alcohol and/or methanol is not far to see. It is clarified from the evidence of PW-96, V. Ajith Kumar that A-7 had put the bid of Rs 4 crores for the 26 toddy shops and even if all the toddy shops had worked in their full capacity he could not*

have recovered even half the amount and it was, therefore, that this idea of bringing ethyl alcohol, mixing it with methyl alcohol and creating various drinks like Kalapani, was mooted. The result thereof was for all to see which resulted in death of 31 persons.

The High Court has correctly observed that the basic reason for bidding for 26 shops for toddy was to get the legitimate godown for toddy. It is proved that those godowns, instead, were used not for storing toddy but for storing ethyl alcohol and mixing it with methyl alcohol for making enormous profits. It is not as if A-7 was selling only toddy. In addition to that he was creating various drinks preferably by mixing ethyl alcohol with methyl alcohol. Thus, there was a full liquor industry going on under his captainship.

31. *The last nail in the coffin is the evidence of PW-53, Sunil. We have very carefully gone through his evidence and the High Court has also extensively dealt with his evidence. PW-53 is a close relative of A-7 and worked in the godown from March, 2000. Before that he was supplying spirit to A-7 from various places. He has graphically described in his evidence as to how the spirit business was being done inasmuch as he deposed that the spirit used to be brought from the tankers and used to be collected in the syntex tanks and was filled in 35 litres cans.*

This spirit was used for making a drink called Kalapani by mixing with essence and some toddy. It was then filled in the cans and dispatched in the vehicles. The evidence of this witness further goes on to show the position of godown which was used for the storage of ethyl alcohol and methyl alcohol. He referred to methyl alcohol as 'essence'. He described that the spirit was brought from Karnataka and essence used to come on Thursdays in a white Fiat car. The Fiat car had a secret chamber. That car was identified as M.O. 24. The tank and the platform were built in the back seat and the front seat of the car. There were three valves attached to the same and 35 litres of methyl alcohol *i.e.,* the essence could be carried in the said car. He gave a graphic description of mixture with the spirit which ultimately was sold. He specifically named A-20, A-22, A-23 and A-21 who were supervising the mixing. In his evidence he has also specifically referred that he had seen M.O.-24, the car, importing the essence *i.e.,* the methyl alcohol precisely two days prior to the liquor tragedy. He has also named A-16 and another boy who were the occupants of the said car. He also suggested that he and the other employees were filling up the essence in 10 cans. The High Court has referred to the further evidence on the part of this witness that in the night at about 10.30 pm the tanker lorry came with spirit and the said spirit was filled in the syntex tank and cans. Those half-filled cans were then filled with the methyl alcohol meaning thereby it was mixed. He then went on to depose that the employees of A-4, namely, A-5, A-6, A-9 and A-10 came there with three vehicles and essence and they mixed up the essence with the spirit. He claimed that in all 60 cans were filled up and were dispatched in three cars for transporting to various places for sale. According to him he came to know about the Kalluvathaukkal tragedy on 21 October 2000. On that day at about 7.30 pm. A-7 and 15 came and slapped Vijayan for not properly mixing and A-7 then left the place telling them to destroy the evidence. According to him, thereafter, what was left in the syntex tank was poured in the river, un-used cans were removed and plastic covers were disposed of by setting fire. A-7 had also taken adequate care to send away the employees for some time and it was through him that the witness came to know that people had died by drinking the spirit supplied by A-4 and his employees due to a mistake in mixing by A-20 and A-22.

59. Before we part with this case, we must note some very disturbing facts which have been revealed from the voluminous evidence by the prosecution. Here was a person who was unabashedly running his empire of spurious liquor trade and for that purpose had purchased politicians including the public representatives, police officers and other officers belonging to the Excise Department.

The trade was going unabated. Unfortunately, it is the elite of the society or the "haves" of the society who never purchase this kind of spurious liquor for the obvious reasons. It is only the poor section of the society which becomes the prey of such obnoxious trade and ultimately suffers. As many as 31 persons have lost their lives, about 5 or more persons have lost their eye-site forever and several others have suffered in their health on account of the injuries caused to them. It is only by an accident that the mixing was not done properly on the fateful day in the sense that the liquor mixed did prove to be fatal or injurious. But that does not mean when it was mixed on other day for months together that it was not injurious.

The use of methanol was a dangerous proposition. It only shows that the human avarice could create hell in God's own country Kerala. We are not only perturbed by the enormousness of the tragedy but the enormousness of the liquor trade run by A-7 and that was under the so-called vigilant eyes of those who had a duty to stop it. The avarice is not only on the part of the accused persons, but also on the part of those who benefit from this horrible business. Though 10 years have passed, the reverberations of this grin tragedy have not become silent. We hope and expect that the Kerala Government takes up this issue and takes definite steps for overhauling the system. We are worried about the rotten system that allowed such trade not only to continue, but to thrive. It will be, therefore, for the administrators and the Government to take positive steps, firstly, to overhaul the system by weeding out the corrupts by punishing those who are responsible for the whole system looking sideways. We do not know as to whether such an exercise is taken up, but if it has not been taken up the government is directed to take such steps. We do not think that the things would come under control unless such exercise is taken, so as to save the poor man from such ghastly disaster.

13.9.2 Oral Evidence of Expert not Obligatory[8]

Author's Summary

In this case, the police seized 18 cartons of liquor. Representative samples were sent to Excise Laboratory. The sample were found alcoholic liquor. The culprits were convicted. The culprits ultimately appealed to SC. Their main contention was that as the expert did not submit the report in person, it was invalid.

The SC, quoting Section 293 of Cr C P that made the report valid as evidence, dismissed the appeal.

Highlights italicised

Relevant Extracts (Verbatim)

3. Background facts in a nutshell are as follows:

The appellants were alleged to have been indulging in smuggling of liquor from Haryana to Delhi. The prosecution alleged that upon receipt of information, SI Lalit Mohan, along with certain police officials, constituted a raiding party, assembled near a traffic intersection and on 8 April 1994 at about 1.45 am intercepted a Tata 407 vehicle in which the appellants were travelling. Despite being signalled to stop, the vehicle sped away. The police officials chased it, and stopped it and apprehended the appellants. Eighteen cartons containing 12 bottles of "Bonnie Scot" special malt whisky, each being a 750 ml bottle, were recovered. Two sample bottles were taken out separately as samples from each carton *i.e.,* 36 bottles. The heads of the sample bottles were enclosed in white *pullanda* and sealed with the letters "LMN". Form M-29 was also filled. The seal was handed over to Head Constable Satpal Singh. An FIR was lodged and a site plan was prepared. The appellants were arrayed as the accused and arrested.

8. *Rajesh Kumar v State (NCT of Delhi)*, (2008) 4 SCC 493.

The Excise Control Laboratory opined that the samples submitted tested positive as whisky. The appellants were charged with having committed offence under section 61 of the Punjab Excise Act, 1914 (in short "the Act"). They stood trial pleading not guilty.

4. The prosecution examined three witnesses. All of them testified as to recovery of the samples. The accused persons did not lead any evidence in their defence. They, however, denied the accusations through statements under section 313 of the Criminal Procedure Code, 1973 (in short "Cr PC").

5. The Metropolitan Magistrate *i.e.* the trial court by judgment and order dated 1 May 2001 found the appellants guilty and sentenced them to six months' simple imprisonment with fine of Rs 2000 and in default a further three months' simple imprisonment. The appeal preferred by the petitioners to the Additional Sessions Judge was dismissed by order dated 22 February 2006.

6. The only stand before the High Court was that there was delay in dispatch of the sample and none was examined to prove the reports. The High Court found that there was no substance in the plea. Referring to the evidence of SI PW-3 and PW-1 about the sealing and sending samples to the Excise Control Laboratory, it was noted that Form M-29 was filled up by PW-2 at the time of recovery. All the prosecution witnesses have testified that the same was filled up by PW-3. The seal after use was handed over to PW-1. These were tallied with the specimen seal of M-29 when the Excise Control Laboratory sealed them. It was noted that there was no necessity for examining any witness to prove the Excise Control Laboratory report as documents were marked in terms of section 293 Cr PC

7. Learned counsel for appellants reiterated the submissions made before the High Court. Learned counsel for the respondent, on the other hand, supported the judgment of the High Court. It is submitted that no question was put to either PW-1 or PW-3 on the aspect of alleged delay in sending the samples.

8. Section 293 Cr PC reads as follows:

> *293. Reports of certain Government scientific experts.—(1) Any document purporting to be a report under the hand of a Government scientific expert to whom this section applies, upon any matter or thing duly submitted to him for examination or analysis and report in the course of any proceeding under this Code, may be used as evidence in any inquiry, trial or other proceeding under this Code.*
>
> *(2) The court may, if it thinks fit, summon and examine any such expert as to the subject-matter of his report.*
>
> *(3) Where any such expert is summoned by a court and he is unable to attend personally, he may, unless the court has expressly directed him to appear personally, depute any responsible officer working with him to attend the court, if such officer is conversant with the facts of the case and can satisfactorily depose in court on his behalf.*
>
> *(4) This section applies to the following Government scientific experts, namely—*
>
> (a) any chemical examiner or assistant chemical examiner to Government;
>
> (b) the Chief Controller of Explosives;
>
> (c) the Director of the Finger Print Bureau;
>
> (d) the Director, Haffkeine Institute, Bombay;
>
> (e) the Director, Deputy Director or Assistant Director of a Central Forensic Science Laboratory or a State Forensic Science Laboratory;
>
> (f) the serologist to the Government;
>
> (g) any other Government scientific expert specified by notification, by the Central Government for this purpose.

9. A bare reading of sub-sections (1) and (2) of section 293 shows that it is not obligatory that an expert who furnishes his opinion on the scientific issue of the chemical examination of

substance, should be of necessity made to depose in proceedings before the court. This aspect has been highlighted by this Court in *Ukha Kolhe v State of Maharashtra,*[9] and *Bhupinder Singh v State of Punjab.*[10] Therefore, there is no substance in the revision petition so far as the conviction is concerned.

13.10 ADDITIONAL CASE LAW

13.10.1 Bona fide Expert[11]

Another question before us is whether the excise inspector, whose evidence was under consideration, had sufficient knowledge to be deemed to be an expert within the meaning of section 45 of the Evidence Act so that the tests adopted by him, together with all the attendant circumstances, could establish beyond doubt that the appellant was in possession of illicit liquor. We think that these are also essential questions of fact. If there is sufficient evidence led by the prosecution to establish its case it becomes the duty of the defence to rebut the evidence. In the case before us, the appellant's counsel cross-examined Shri C.D. Mishra, P.W. 1, excise inspector, at considerable length, but the whole of this cross-examination was directed at showing that the recoveries were not made from the possession of the appellant. No question was put to him in cross-examination to suggest that the appellant questioned the composition or strength of the liquid recovered as alcohol of prohibited strength or the competence of the excise inspector to give his conclusion on the strength of tests adopted by him. Again, no defence evidence was led to indicate that the liquid could be anything else. These considerations would be sufficient to dispose of the points raised on behalf of the appellant in the case before us. We may, however, observe that we agree with the High Court that the proposition contained in *Boosenna's* case,[12] must be confined to its own facts.

> ***We find that the excise inspector who had deposed, at the very outset of his evidence, that he had put in 21 years service as excise inspector and had tested lakhs of samples of liquor and illicit liquor. As already pointed out, the competence of C.D. Misra to test the composition and strength of the liquid under consideration was not questioned at all. We, therefore, think that this particular excise inspector could be treated as an expert within the meaning of section 45 of the Evidence Act. The excise inspector had, in addition, to employing the smelling test, used all the other tests he could reasonably adopt.***

If his competence to give his opinion or the sufficiency of the tests adopted by him had been questioned in the trial court, the prosecution would have been in a position to lead more evidence on these questions. We also find that the objects recovered from the possession of the appellant almost proclaim the nature of his activity and of the liquid which could be in his possession. On the facts and circumstances of this case, neither *Boosenna's* case, nor any other case would, we think help the appellant. Consequently, we dismiss this appeal and affirm the conviction and sentence of the appellant. The appellant should surrender to his bail and serve out the sentence.

13.10.2 Excise Inspector as Liquor Expert[13]

The prosecution admittedly did not send the sample from the contents of the bladder to the chemical examiner. In such cases the chemical analysis is always the surer test to declare

9. AIR 1963 SC 1531 : (1963) 2 Cr LJ 418 : (1964) 1 SCR 926.
10. AIR 1988 SC 1011 : (1988) 3 SCC 513 : 1988 SCC (Cri) 694.
11. *Srichand Batra v State of Uttar Pradesh*, AIR 1974 SC 639 : (1974) 4 SCC 247 : 1974 Cr LJ 590.
    Also see: *State of Andhra Pradesh v Madiga Boosenna*, AIR 1967 SC 1550 : (1967) 3 SCR 871 : 1967 Cr LJ 1398; *State v Madhukar Gopinath Lolge*, AIR 1967 Bom 61 : 1967 Cr LJ 167 : ILR 1965 Bom 257; *Pitamber v State of Uttar Pradesh*, 1975 Cr LJ 948 (HC); *Yerra Kanakarao v State of Andhra Pradesh*, 1974 Andh LT 437 : 1975 Cr LJ 953 (HC).
12. (1967) 3 SCR 871 : AIR 1967 SC 1550 : 1967 Cr LJ 1398.
13. *State of Haryana v Radhey Shyam*, 1977 Cr LJ 528.

as to what the commodity actually recovered from the accused is. In place of doing so the prosecution got the contents of the bladder examined from Shri D.K. Palta, excise inspector and projected him as an expert witness to say that whatever he had examined was liquor. Shri D.K. Palta did not put the contents of the bladder to any laboratory test. He applied two physical tests; the first was that of taste and smell and the second was with the help of a Hydrometer set. In order to style himself as an expert witness he gave his qualifications stating that he was distillery trained and he had put in 13.5 years service in the Department. On the basis of this evidence the learned counsel appearing on behalf of the state wants us to accept that the contents of the bladder were proved to be liquor of illicit origin.

> *So far as the experience of Shri D.K. Palta (P.W. 4) in testing is concerned his statement is extremely unsatisfactory. He did not spell out the training which he had received at the distillery. He did not state whether he was associated with the distillation of liquor, the chemical analysis of this commodity or any method of testing liquor. Unless the type of training received by Shri D.K. Palta at the distillery was stated by him specifically it is difficult for us to accept that he had received any such training which had given him sufficient proficiency to examine liquor and declare it to be so with definiteness. His contention to show experience of testing liquor by the length of his service is also equally unsatisfactory. It is not known from the record in what branch of the Excise Department he had put in service; whether he remained on office duty, field duty or in the branch of the Excise Department which is directly connected with the testing of liquor. Such a vague statement without any particulars of training or type of service does not make the person an expert witness. The prosecution has to prove that the training or length of service was directly connected with the test of liquor.*

13.10.3 Liquor Identification[14]

In support of this appeal it is contended that the evidence of the police inspector Pawar should have been accepted as the respondent was caught running away, keeping the bicycle there, after he was detected riding the bicycle. I do not see any compelling reasons to differ from the finding of the learned magistrate, who had an opportunity to see the witnesses in the witness-box that it may be unsafe to convict the respondent on the sole testimony of the police inspector, Pawar, in view of the circumstances of this case. But in my opinion there is a further infirmity in the prosecution evidence which goes to the root of the matter. There is no legal evidence, in my opinion, on which it could be held that the liquid, for the possession of which the respondent was charge-sheeted, is, in fact, established to be liquor or prohibited liquor by any legal evidence which can be accepted and acted upon. The testimony of Lalbhai is brief and is to the following effect:

> *I have undergone training in testing liquor by the Syke's test. I have brought today a hydrometer and a thermometer to test the contents of the two scaled rubber bladders now before the court. (Note: The seals on the two bladders are intact and they are removed in the presence of the court and the two accused and their pleader and the witness is asked to examine their contents). After taking the necessary tests I say that the liquid contained in each of the two rubber bladders is liquor containing 48.8 of alcohol and 51.2% of water.*

Relying on this testimony, it is urged by the learned assistant government pleader that the Syke's hydrometer test has been accepted as a reliable test to come to the conclusion whether a liquid claimed to be liquor is in fact liquor or not and, in view of the decisions of this court, the evidence of the witness should be accepted. The witness claims to have undergone training in testing liquor. But what is the nature of that training is not testified by the witness at all. In fact, he has given no information to qualify as an expert. Another serious infirmity in the testimony of this witness is that he has given no data from which he could come to the conclusion, even by applying the hydrometer test, that the liquid was liquor. He has not stated what was the specific gravity of the liquid which he tested, nor the temperature, nor has he disclosed the principle with reference to which he came to the conclusion that the liquid should be liquor.

14. *State v Madhukar Gopinath Lolge*, AIR 1967 Bom 61 : 1967 Cr LJ 167 : ILR 1965 Bom 257.

I felt some difficulty in accepting the evidence of the police head constable as evidence of an expert. It is not shown how he has qualified himself to be an expert in testing liquors. But even assuming that by his experience he may have attained some degree of knowledge, the reason he has given, *viz.,* the test carried out by hydrometer and thermometer to determine whether the liquid was liquor or not, is certainly far from satisfactory. If it is known or proved that a certain liquid is liquor or contains alcohol, then it is certainly possible, by means of Syke's hydrometer test and by use of thermometer, to determine the percentage of alcohol from that liquid; but if the basic question that has first to be proved is whether the liquid under test does or does not contain alcohol, it does not appear that hydrometer test alone could *i.e.,* sufficient to come to any such conclusion. An opportunity was, therefore, given to the learned assistant government pleader to call any expert in this subject who may have the necessary knowledge and experience in the matter of testing liquor or alcohol and liquids to find out whether Syke's hydrometer test would furnish a necessary test for determining whether a liquid does or does not contain alcohol. Accordingly, the case was adjourned for recording the evidence of such an expert and was taken up today, when Shri Harbhajan Singh Mahal was examined by the State as an expert. Shri Mahal entered the witness-box and has given his opinion regarding the Syke's hydrometer test and what can be determined by applying that test to a liquid. Shri Mahal is a director of a forensic science laboratory and the chemical analyser to the government of this State and, by his qualifications and experience, he seems to be a scientist of sufficiently wide knowledge and experience. He seems to have made a special study of estimation of alcohol in the blood and contributed papers in well-known American periodicals. He was specifically asked about the Syke's hydrometer test and what conclusions can be drawn from such test. What he has stated, in his own words, is as follows:

> *I know what is Syke's hydrometer test. It is a test for determining the density of liquids. The test is made with the help of an instrument called hydrometer. The instrument is allowed to be immersed in the liquid to be tested and is allowed to float. There are calibration marks on the stem of this instrument. These marks show the density of the particular liquid. When the hydrometer is immersed in the liquid to be tested and the level of the liquid reaches a particular mark on the stem it will mean that the liquid is of that particular density, calibrated at the place upto which the liquid reaches the stem. There is a standard chart or table by reference to which the reading on the calibrated stem can be interpreted to find out the density of that liquid..... If I am given a liquid and asked to test or find out its specific gravity by hydrometer test and it is found that the specific gravity is between and 0.7 it would not be possible to conclude from this much data alone that the liquid contains ethyl alcohol. This would be so even if readings were obtained at different temperatures.*

To court questions the witness has stated that a fairly reliable method to find out whether a liquid is ethyl alcohol or contains ethyl alcohol is by subjecting it to a chemical test and this test is known as iodoform test.

In view of this clear and unequivocal testimony of the expert witness, whose opinion one would always prefer to the opinion of Abubakar Lalbhai, who is a police head constable, claiming to have undergone training in testing liquor by the Syke's test, it is clear that the Syke's hydrometer test will furnish no data to determine whether a particular liquid is liquor or contains alcohol. It may be that once it is known that a particular liquid contains alcohol, the percentage of alcohol in that liquid may be found by the hydrometer test. But when the question to be determined is the primary question, namely, whether the liquid does or does not contain alcohol, the hydrometer test does not appear to be the proper test to come to any such determination.

In view of the testimony of Dr. Mahal, who is the director of forensic science laboratory in this State, there is hardly any room for canvassing that the evidence of the police head constable as to the liquid being liquor could be accepted as legal or sufficient evidence to come to the conclusion that the liquid was liquor or prohibited liquor.

13.10.4 Unchallenged Positive Report of Chemical Examiner Acceptable[15]

In the present case, the medical officer, Padra who had collected blood of the accused in a phial, had sent the same by registered post parcel with a forwarding letter containing facsimile of his seal. The parcel which was sealed in the presence of the medical officer, was received in the chemical analyser's office with seals intact. *The report of the chemical analyser, Ex. 16 clearly shows that seals were intact and it mentions serial number of the letter under which the said bottle was received. The chemical analyser's report was sent under his letter, dated 22 August 1968, addressed to the medical officer, Padra mentioning that letter No. 742, dated 30 September 1967 forwarding therewith a phial containing blood of Chandrasing Prabhatsing bearing serial number 238 received thereon 3 October 1967 by R.P.P. sealed and that seals were perfect as per copy sent. The result of the test of blood showed that it contained 0.1081 % w/v of ethyl alcohol. He had also annexed an extract of technique by which he had performed the test. Thus, when the phial containing blood of the accused was sent by registered post parcel, completely sealed by the medical officer, Padra and the said parcel with seals intact was received by the office of the chemical analyser, it was not necessary for the prosecution to examine some person from the chemical analyser's office to show that the very bottle which was sent by the medical officer, Padra, was received at his end. It is nobody's case that seals on that bottle were removed by some person from the chemical analyser's office before the same was given to him for analysis. On the contrary, the letter Ex. 16 referred to above clearly shows that seals on the bottle with the label were intact and that seals were as per the copy of the forwarding letter, Ex. 15. Under the circumstances, I do not agree with the learned advocate for the respondent that the prosecution should have examined the person who received the bottle and that merely because the person who received the bottle was not examined, the report of the chemical analyser was bad in law. In my opinion, there is no lacuna in the prosecution case and the prosecution had clearly satisfactorily established that the 5 c.c. blood of the accused which was taken by the medical officer, Padra was analysed by the chemical analyser and that on analysis, it was found to contain 0.1081% w/v alcohol.*

He was smelling of alcohol, his speech was incoherent and his pupils were dilated. Reading the evidence of the medical officer together with the evidence of Gunvantray Tribhovandas Dhabalia, assistant chemical analyser, I have no hesitation in holding that the very phial containing blood of the accused sent by the medical officer, Padra was received by the chemical analyser and that the same was analysed by him. In fact, the assistant chemical analyser who was examined by the prosecution was not cross-examined by the accused at all. His evidence has remained unchallenged.

* * * * *

Thus, if the report of the chemical analyser disclosed that the blood of the accused contained 0.1081% of ethyl alcohol, a presumption could be raised that the accused had consumed liquor. It was for the accused then to discharge the burden by showing that he had consumed a medicine or toilet preparation.

13.10.5 Prohibited Liquor[16]

The first contention may be put thus. Under section 66(2) of the Act all that an accused need prove is that he has consumed a medicinal preparation; if he established that, the burden of proving that the medicinal preparation is fit for use as an intoxicating liquor shifts to the prosecution. In the present case the accused has established that he had taken "tincture

15. *State of Gujarat v Chandrasing Prabhatsing Solanki,* 12 Guj LJ 663 : 1971 Cr LJ 1381 (HC).
16. *Vijay Singh v State of Maharashtra*, AIR 1966 SC 145 : (1965) 2 SCWR 538 : 1966 Cr LJ 168 (SC);
Also see: *State of Bombay v Nararandas Mangilal Agarwal*, AIR 1962 SC 579 : (1962) 1 Cr LJ 512 : 1962 Supp (1) SCR 15; *Palaniswami (in re:)*, (1965) 2 Cr LJ 370 (Mad).

Zingeberis", which is a medicinal preparation, but the prosecution failed to prove that it was fit for use as an intoxicating liquor.

To appreciate this contention it is necessary to notice the relevant provisions. Under section 66(1) of the Act, "whoever in contravention of the provisions of this Act, or of any rule, regulation of order made.....consumes..... any intoxicant shall, on conviction, be punished for a first offence with imprisonment for a term which may extend to six months and with fine which may extend to Rs 1,000."

"Intoxicant" is defined to mean, among other things, any liquor; and "liquor" is defined to include, among others, all liquids consisting of or containing alcohol.

But by reason of section 24A(2) of the Act, if it is established that the liquor consumed is contained in any medicinal preparation which is unfit for use as intoxicating liquor, the consumption of such liquor is not an offence under the Act for the Act itself does not apply to such medicinal preparation. We shall revert to the question of burden of proof a little later.

The facts found in this case may now be noticed. The accused says that he consumed "tincture Zingeberis" and produced before the police a sample bottle out of which he says he had consumed "tincture Zingeberis". A sample of the liquid was analysed by the chemical analyser. His report shows that the liquor was a weak Ginger Tincture B.P. 1958 (Tincture Zingeberis Mitis); absolute alcohol content was 89.1% V/V. The report further states as regards alcohol content of the liquid that the sample contains 90.0% of V/V of ethyl alcohol though the B.P. limits were 86 to 90%. V/V. "The analysis has also given the quantity of total solids as 0.62% weight per ml. at 20 degrees to be 0.825 g." In the opinion of the chemical analyser, the sample complied with pharmacopeial specifications. On the basis of the report, the High Court found that the accused consumed a medicinal preparation which was listed in the British Pharmacopia, 1958 edition and which had alcohol contents to the extent of 90% of ethyl alcohol. The chemical analyser to the government of Maharashtra examined the sample blood taken from the body of the accused by applying "modified Cavatte's method',' and gave his report to the effect that the sample blood of the accused contained 0.207 mg. per cent W/V of ethyl alcohol. The High Court also found on the expert evidence that blood alcohol concentration taking a normal dose of tincture Zingeberis Mitis would be about 0.007% W/V and the accused should have taken roughly about 125 c.c. of tincture Zingeberis to induce an alcohol content of 0.207% found in his blood by the chemical analyser. On the basis of the evidence of Dr. Deshmukh, the High Court also found that tincture Zingeberis Mitis was a preparation which might be consumed for intoxication and that intoxication would not be accompanied by any other harmful effects. On the other hand, the accused has not adduced any evidence that the said medicine is a medicinal preparation.

The question whether the prosecution has discharged its burden of proof in this case will have to be considered on the basis of the said facts found by the High Court. Section 66(2) of the Act which bears on the question of burden of proof reads thus:

> *Subject to the provisions of sub-section (3), where in any trial of an offence under clause (b) of sub-section (1) for the consumption of an intoxicant, it is alleged that the accused person consumed liquor, and it is proved that the concentration of alcohol in the blood of the accused person is not less than 0.05% weight in volume then the burden of proving that the liquor consumed was a medicinal or toilet preparation ..... containing alcohol, the consumption of which is not in contravention of the Act or any rules, regulations or orders made thereunder, shall be upon the accused person, and the court shall in the absence of such proof presume the contrary.*

It has been proved in this case that the accused person consumed liquor and that the concentration of alcohol in his blood was more than 0.05% weight in volume. So in terms sub-section (2) of section 66 of the Act the burden of proving that the liquor consumed was a medicinal preparation containing alcohol, the consumption of which was not contravention of the Act, or the rules made thereunder, shifted to the accused. He could have discharged

this burden by proving, *inter alia*, that the medicinal preparation containing alcohol which he had taken was unfit for use as an intoxicating liquor; if so much had been established, as under section 24A of the Act, the Act itself does not apply to such medicinal preparations, the accused would not have committed any offence under the Act. The High Court found that the accused had not placed any material to prove that tincture Zingeberis Mitis was unfit for use as an intoxicating liquor; indeed, it accepted the evidence adduced on behalf of the prosecution and held that it was fit for use as an intoxicating liquor. In this case not only the accused failed to discharge the burden so shifted to him by the statute, but the prosecution has also established that the said medicinal preparation was fit for use as an intoxicating liquor. Reliance is placed by the learned counsel for the appellant on the decision of this court in *State of Bombay (now Gujarat) v Narandas Mangilal Agarwal*[17] wherein it was held, in the circumstances of the case, that it was for the State to prove that the medicinal preparation was not unfit for use as intoxicating liquor. But that decision as given on the relevant provisions of the Act before it was amended by the Bombay Act XII of 1959. Section 66(2) was added by the said Act which in express terms states that in the circumstances mentioned in the sub-section the burden of proof shifts to the accused. The said decision cannot therefore, be invoked in the changed circumstances. The present case falls to be decided on the interpretation of section 66(2) of the Act. We, therefore, hold that the High Court came to the correct conclusion on the question of burden of proof and gave its finding on the evidence adduced before it.

13.10.6 Improper Collection[18]

Now it is clear that in order to establish the guilt of the accused for an offence under section 66(1)(b) of the Act, the prosecution mainly relies on a report received from the chemical examiner in respect of the blood of the accused taken by Dr. Talati on the date of the offence and then sent for examination to the chemical examiner at Junagadh through the police officer. When that is so, the point raised by Mr. Thakore assumes considerable importance as the guilt or otherwise of the accused will have to be determined on the strength of the report produced as Ex. 7 in the case. In that event, the presumption of his guilt arises under section 66(2) of the Act and since his explanation is disbelieved, he would be liable under section 66(1)(b) of the Act. We have, therefore, to turn to the Bombay Prohibition (Medical Examination and Blood Test) Rules, 1959, hereinafter to be referred to as "as Rules" and find out as to whether the requirements contemplated in rule 4 are of a mandatory character and a breach thereof would affect the evidence contained in the report produced by the chemical examiner. Such a point arose in the case of *Karansingh Balubha v State of Gujarat*[19], where it was held that if the prosecution relies solely on the report of the chemical analyser to prove the fact of concentration in blood which had been collected and sent to the chemical analyser in the course of an investigation of an offence under the Bombay Prohibition Act, such certificate could be evidence only if the certificate had been obtained in the prescribed manner as laid down in section 129A of the Act. Then it was held that section 129A, clause (2) of the Bombay Prohibition Act, 1949, casts duty on the registered medical practitioner before whom such a person was produced in the course of the investigation to examine such a person and collect and forward in the prescribed manner the blood of such person, and on the chemical analyser to certify the result of the test of the blood forwarded to him stating the percentage of alcohol and such other particulars. Rules 4 and 5 of the Bombay Prohibition (Medical Examination and Blood Test) Rules, 1959, which lay down the manner of collection and forwarding of

17. AIR 1967 SC 1550 : (1967) 3 SCR 871 : 1967 Cr LJ 1398.
18. *Dalsukhji Varvaji v State of Gujarat*, (1969) 10 Guj LR 553 : 1969 Cr LJ 695 (Guj HC). Also see *N.K. Marulkar v State of Bombay*, 1967 Cr LJ 858 (Bom); *Karansingh Balubha v State of Gujarat*, AIR 1967 Guj 219 : 8 Guj LR 31 : 1967 Cr LJ 1142 (Guj HC).
19. AIR 1967 Guj 219 : (1967) 8 Guj LR 31 : 1967 Cr LJ 1142 (Guj HC).

blood, are mandatory provisions. The legislature had advisedly required the despatch of the sample phial to be made by the doctor through post or a special messenger with his own forwarding letter so that there might not be any scope of tampering with the sample phial. If that safeguard was disregarded and the sample phial was handed over to the investigating officer himself, this salutary safeguard would be completely set at naught. In those circumstances, the court held in that case that the prosecution having not led any other evidence to prove that fact of concentration of the blood, no presumption could be drawn under section 66(2) of the Act and it was not for the accused to rebut the burden raised by the presumption. On the basis of this decision, it can be said that the rules 4 and 5 are of a mandatory character and in the present case since the phial containing blood of the accused was sent by Dr. Talati through the investigating officer himself, namely the complainant, head constable, the salutary safeguard providing for the despatch of the sample phial to be made by the doctor through post or a special messenger with his own forwarding letter has been completely disregarded.

13.10.7 Proper Submission of Samples to Chemical Examiner[20]

The Legislature of the State of Bombay being faced with this interpretation imposing a serious burden which the prosecution had to undertake in trials for offences of consumption or use of liquor contrary to the provisions of the Act, for due enforcement of the law and to prevent evasion, enacted certain additional provisions by Bombay Act 12 of 1959. By that Act, section 60 was renumbered as section 66(1) and sub-section (2) was added thereto in the following form:

Subject to the provisions of sub-section (3), wherein any trial of an offence under clause (b) of sub-section (1) for the consumption of an intoxicant, it is alleged that the accused person consumed liquor and it is proved that the concentration of alcohol in the blood of the accused person is not less than 0.05%, weight by volume, then the burden of proving that liquor consumed was a medicinal or toilet preparation, or an antiseptic preparation or solution, or a flavouring extract essence or syrup containing alcohol the consumption of which is not in contravention of the Act or any rules, regulations or orders made thereunder, shall be upon the accused person and the court shall in the absence of such proof presume the contrary.

By sub-section (3) the provisions of sub-section (2) are not to apply to consumption of liquor by indoor patients during the period they are being treated in any hospital, convalescent home, nursing home, or dispensary, maintained or supported by government or a local authority, or by charity, or by such other persons, in such other institutions, or in such circumstances as may be prescribed. The result of this amendment was to make, except in the cases expressly provided in clause (3), concentration of alcohol in excess of 0.05%, weight in volume in blood presumptive evidence of consumption of liquor in contravention of the provision of the Act and the burden of proving that the liquor consumed was a medical or toilet preparation or an antiseptic preparation or solution, or a flavouring extract, essence or syrup, lay upon the person charged with the offence.

The case of the prosecution in this case rested primarily upon the report of the chemical examiner certifying that alcohol concentration in the blood of the appellant which was extracted at 6 am on 3 April 1961 was in excess of the percentage prescribed by section 66(2). The prosecution had, therefore, to establish that the specimen examined by the chemical examiner was the specimen of blood collected from the body of the appellant and that the specimen disclosed concentration of alcohol in excess of the permissible limits. It is somewhat unfortunate that the trial magistrate did not appreciate that the only important piece of evidence on which the prosecution case against the appellant rested was contained in the report of the chemical examiner. There is no dispute that the appellant went to

20. *Ukha Kolhe v State of Maharashtra*, AIR 1963 SC 1531 : (1964) 1 SCR 926 : (1963) 2 Cr LJ 418.

the civil hospital early in the morning of 3 April 1961. He has admitted that fact in his statement before the court. Dr. Kulkarni has deposed that on being told about the death of Mohamad Yusuf the appellant fainted and was admitted to the hospital, and that he found that the appellant was smelling of alcohol. Dr. Kulkarni has stated that no treatment was given to the appellant. Dr. Rote was asked by Dr. Kulkarni to collect a specimen of blood from the body of the appellant, and a blood specimen was accordingly taken and the phial was sealed in his presence by a laboratory servant. Dr. Rote stated in cross-examination that no methyl spirit was applied before extracting blood. The certificate of Dr. Rote dated 13 April 1961 that he had collected blood from the body of the appellant on the morning of 3 April 1961 and that the bottle containing the blood was sealed in his presence corroborates the statement.

But there is no evidence on the record about the person in whose custody this phial remained till it was handed over to the sub-inspector of police on 13 April 1961 when demanded. There is also no evidence about the precaution taken to ensure against tampering with the contents of the phial when it was in the civil hospital and later in the custody of the police between 13 April 1961 and 18 April 1961. Even the special messenger with whom the phial was sent to the chemical examiner was not examined and Ext. 43 which was the acknowledgement signed by some person purporting to belong to the establishment of the chemical examiner does not bear the official designation of that person. The report of the chemical examiner mentions that a sealed phial was received from the police officer by letter No. C/010 of 1961 dated 18 April 1961, but there is no evidence that the seal was the one which was affixed by Dr. Rote on the phial. These undoubtedly were defects in the prosecution evidence which appear to have occurred on account of insufficient appreciation of the character of the burden which the prosecution undertakes in proving a case of an offence under section 66(1)(b) relying upon the presumption under section 66(2).

It was assumed by the trial magistrate that the phial containing blood collected by Dr. Rote was kept in a safe place and could not be tampered with, that it was kept in such a place that it was not liable to deteriorate, that thereafter this phial also remained with the police at a place where it could not be tampered with, and that the phial sealed by Dr. Rote was delivered by the special messenger to the establishment of the chemical examiner and that the same phial was examined by the chemical examiner, and that between 3 April 1961 and 19 April 1961 when the contents of the phial were subjected to chemical examination, they had not deteriorated. Both the prosecutor and counsel for the appellant appear to have contributed to the somewhat slipshod trial of the case. Dr. Kulkarni and Dr. Rote were examined as witnesses for the prosecution, but no examination or cross-examination of either was directed in respect of these important matters, and even to the investigating officer, no questions seeking to elicit information on these matters were asked. The report of the chemical examination of the blood specimen collected at 11 am on 3 April 1961 was also not tendered in evidence by the prosecution though the same was demanded.

Section 129A contemplates two classes of certificates—certificate of the results of the examination by a registered medical practitioner whether the person sent to him has consumed any intoxicant and the certificate of the chemical examiner of the examination of blood collected by a registered medical practitioner and sent to him for examination. These are made admissible by virtue of clause (a) of section 129B. Clause (b) of section 129B deals with the admissibility of reports in respect of the examination of persons or of matters or things submitted to the registered medical practitioner for examination or analysis and report. These are undoubtedly different from the certificates of examinations made under section 129A. The report of the registered medical practitioner under clause (b) of section 129B may be upon a "matter or thing" and so may be in respect of blood specimen submitted to him.

On an analysis of sections 129A and 129B, it is clear that the Legislature has provided in the first instance for compelling persons suspected of consuming intoxicants to be produced and to submit themselves for examination and extraction of blood which, under the law as it stood, could not be secured, but thereby the law did not provide for only one method of proving that a person had consumed illicit liquor within the meaning of section 66(2). The Legislature has made the certificate of the examination under section 129A, sub-sections (1) and (2) admissible without formal proof; but by sub-section (8) of section 129A, the adoption of any other method of collection of evidence for proving that a person accused has consumed an intoxicant is not precluded and a report of any registered medical practitioner which tends to establish that fact in respect of matters specified in clause (b) of section 129B is also made admissible. On that view of sections 129A and 129B, there is no warrant for assuming that it was intended thereby to exclude in trials for offences under section 66(1)(b) of the Act the operation of section 510 of the Code of Criminal Procedure. The Code makes a document purporting to be a report under the hand of a chemical examiner and certain other documents upon any matter or thing duly submitted to him for examination or analysis and report, admissible in any enquiry, trial or other proceeding under the Code. The terms of section 510 of the Code of Criminal Procedure are general; but on that account it cannot justifiably be assumed that by enacting sections 129A and 129B, the Legislature intended that the certificate of a competent officer in respect of matters not governed thereby shall become inadmissible. It is open to the prosecution to rely in corroboration of a charge of consumption of illicit liquor upon a certificate under clause (a) of section 129B if it is obtained in the manner prescribed by section 129A, and also to rely upon the report of a registered medical practitioner in respect of any person examined by him or upon any matter or thing duly submitted to him for examination or analysis and report. It is also open to the prosecution to rely upon the report of the chemical examiner in cases not covered by section 129A as provided under section 510 of the Code of Criminal Procedure (section 293 of the new Code).

It was urged before the Sessions Court that the report of the chemical examiner was submitted by that officer not to the court nor to the medical officer but to the police officer and it was by virtue of section 162 of the Code of Criminal Procedure inadmissible, except to the extent permitted within the strict limits prescribed by the section. But section 510 makes provision with regard to proof of documents by production thereof, and the application of section 162(1) is expressly made subject to what is provided in the Code of Criminal Procedure. Exclusion from the evidence of any part of a statement made to a police officer or a record from being used for any purpose at any enquiry or trial in respect of an offence under investigation at the time when such statement was made is "save as hereinafter provided". The word "hereinafter" is, in our judgment not restricted in its operation to section 162 alone but applies to the body of the Code: to hold otherwise would be to introduce a patent inconsistency between section 207A and section 162 of the Code, for by the former section in committal proceeding, statements recorded under section 162 are to be regarded as evidence. The contention raised that the report made to the police officer by the chemical examiner was inadmissible in evidence was rightly rejected.

Finally, it was urged that the blood specimen was not submitted in the manner prescribed by rules framed under the Bombay Prohibition Act, and therefore it could not be regarded as "duly submitted".

The government of Bombay has, by notification dated 1 April 1959, framed rules under clause (w) of section 143 of the Bombay Prohibition Act, called the Bombay Prohibition (Medical Examination and Blood Test) Rules. Rule 3 deals with the examination of a person by a registered medical practitioner before whom he is produced under sub-section (1) of section 129A. Rule 4 provides for the manner of collection and forwarding of blood specimen and rule

5 deals with certificates of tests of "sample blood". All these rules deal with medical examination of a person who is produced before a registered medical practitioner under sub-section (1) of section 129A. To an examination to which section 129A does not apply, the rules would have no application. The law not having prescribed a particular method of submitting specimen of blood collected from an accused person when blood has been collected before any investigation has started, it is unnecessary to consider the argument whether the expression "duly admitted" used in section 510 of the Code of Criminal Procedure means merely in the manner prescribed by rules in that behalf or as pointed out by the learned Sessions Judge, submitted after taking adequate precautions for ensuring its safety and for securing against tampering. In the present case, the blood specimen was collected by Dr. Rote and thereafter it was handed over to the police officer on demand by him and ultimately submitted to the chemical examiner for his examination, it would, in our judgment be regarded as "duly submitted".

13.10.8 Inadmissible Reports[21]

In the present case all that the report of the chemical examiner says is that the concentration of alcohol in the sample of the blood analysed by him was 0.191%. Now there are several methods for determination of alcohol in human blood. As pointed out in *Taylor's Principles and Practice of Medical Jurisprudence*, Vol II, p 446, the panel of the Royal Institute of Chemistry after considering many methods of investigation including the principal ones in use and as a result of collaborative work on the selected procedure by a group of experienced analysts, favours the following methods of testing:

1. A precisely described and amended Cavett (micro) method.
2. A detailed and slightly modified Kozelka and Hine (micro) method.

   According to the panel, these two methods should be recognised as the official methods for court work. In the present case the court is not told which method of testing was employed by the chemical examiner— whether it was one of the methods mentioned above or a different method altogether. If the method of testing employed by the chemical examiner was not one of the methods mentioned above, it would be a question for consideration how far the method employed by the chemical examiner was a reliable method and the result of his analysis could be depended upon for arriving at a particular conclusion. Even if the method of testing employed by the chemical examiner was one of the methods mentioned above, it is essential that the court should know which one of these methods it was that was employed by the chemical examiner. As observed in Taylor's book at p 447 "the Cavett method cannot be used if ketonic bodies are present and it is essential, therefore, that preliminary tests for these substances should be made according to certain methods, whereas the presence of ketonic bodies does not interfere with the procedure in the Kozelka and Hine method. If the Cavett method was used by the chemical examiner, it would have to be ascertained whether any preliminary tests for ketonic bodies were made and what was the result of those tests. The presence of ketonic bodies would interfere with the procedure followed in the Cavett method and affect the correctness of the result. Apart from this requirement, Taylor's book also lays down the following precautions which must be taken in the Cavett method.

---

21. *Suleman Usman Memon v State of Gujarat*, (1961) 2 Cr LJ 78 (Guj).
    Also see: *State v Bhausa Hanmantsa Pawar*, (1962) 2 Cr LJ 466 : AIR 1962 Bom 229 : ILR 1962 Bom 472; *State of Maharashtra v Ramsingh Desasingh*, AIR 1963 Bom 68 : ILR 1962 Bom 493 : (1963) 1 Cr LJ 567; *Mahadevayya Veerabhadrayya Hiremath v State of Mysore*, 1966 Cr LJ 270 : AIR 1966 Mys 75.

Note 1

It is essential to ensure that the small Erlenmeyer flask and stopper are thoroughly cleaned with hot chromic acid and rinsed at least six times with tap water and twice with distilled water. Dry both flask and stopper in an air oven. Grease must not be used on stoppers for lubrication merely damp the part of the stopper that fits in the top of the flask with distilled water and ensure that the water does not enter the flask.

Note 2

As this is a micro method, it is essential to take the special precautions that are common in such work. The laboratory itself must be clean, and free from dust, and exceptional care in such matters must be taken. It is essential that the distilled water should be freshly distilled into a clean glass vessel. Ordinary laboratory distilled water is likely to give falsely high results.

Again the court is not told whether the Kozelka and Hine method was employed by the chemical examiner and if so, whether these precautions were observed. The court is not even told as to what was the quantity of blood tested by the chemical examiner. The report of the chemical examiner is silent as to the reagents. Though the Cavett method as well as the Kozelka and Hine methods are elaborate as appears clearly from the description of these methods given in Taylor's book, the report does not say a word as regards the process actually carried out by the chemical examiner for arriving at the concentration of alcohol in the blood of the accused nor does it contain any factual data revealed as a result of the process employed by the chemical examiner. Brevity seems to be the only merit of the report. The report contains nothing more than the mere *ipse dixit* of the chemical examiner that the concentration of alcohol in the blood of the accused was 0.191%, there is no other evidence to show what was the concentration of alcohol in the blood of the accused and in that event the prosecution must be held to have failed to establish that the concentration of alcohol in the blood of the accused was not less than 0.05%. The prosecution cannot rely on the presumption under section 66(2) of the Act and without the aid of the presumption, the prosecution must obviously fail.

13.10.9 Reports Admissible[22]

It is most urged by the petitioner's counsel that Exhibit P-5 the chemical examiner's report, does not contain any data or particulars which are necessary to help the court in accepting the opinion; it merely states that the bottle contained alcoholic content 21.9% V/V at 60 F. The petitioner has relied on *Prabhu Babaji Navee v State of Bombay*[23]. In that decision their Lordships have held that it is the chemical examiner's duty to indicate the number and extent of bloodstains found on the clothes sent to him for examination. In my opinion, this decision is not of any assistance to the petitioner. That was a case of bloodstains found on the clothes of the accused person and not a case concerning the report sent by the chemical examiner of the analysis of percentage of alcohol contained in the article sent to him for examination. Further it may be noted that their lordships did not say that because of the defects pointed out by them, the chemical examiner's reports not giving a detailed description is inadmissible. In *Suleman Usman Memon v State of Gujarat*,[24] it has been held that the report of the chemical examiner must show the tests or experiments performed by him, the factual data revealed by such tests or experiments and the results leading to the formation of the opinion from such factual data; otherwise, the report would have no value as a piece of evidence. This judgment

24. AIR 1961 Guj 120 : (1961) 2 Cr LJ 78.

of a single judge has not been approved by a Bench decision in *State of Maharashtra v Ramsingh Desasingh*.[25] Chainai, C.J. speaking for the Bench has stated:

> *The court cannot refuse to consider the evidence furnished by a certificate of the chemical examiner or assistant chemical examiner issued under section 129A of the Bombay Prohibition Act, 1949, merely because it does not mention the data on the basis of which the chemical examiner arrived at the percentage of alcohol mentioned in his certificate or because he has not given the reasons for his conclusion. If the court feels that it should have more information in order to satisfy itself about the correctness or otherwise of the certificate, the court should summon the chemical analyser or ask the prosecution to summon and examine him. But without examining the chemical analyser, the court would not be justified in holding that the charge against the accused has not been proved, merely because the certificate issued by the chemical analyser only mentions the percentage of alcohol found in the blood of the accused and does not give any other particulars.*

Following, with respect, the decision reported in 64 Bom LR 451 : AIR 1963 Bom 68, I hold that the absence of data in Exhibit P-5 does not make it inadmissible in evidence. It was open to the petitioner if he wanted to have some more details or particulars about the report to request the court to summon the chemical examiner for cross-examination. The petitioner has not done so and he cannot now contend that the report has no evidentiary value.

With regard to the question of delay in the examination of the bottle, this is not a question of law which could be agitated before this court in a revision petition. The offence was committed on 14 July 1962 and the bottle was immediately seized and sealed in the presence of panchas. The same was sent to the chemical examiner on 27 July 1962. The fact that the report of the chemical examiner was received long after this, does not in any way affect the value of the report of the chemical examiner.

13.10.10 Intoxication[26]

In order, therefore, to arrest the accused, he must have been in a state of intoxication while he was in Nagercoil. Intoxication or state of intoxication is not defined in the Act; and so, we have to look to its meaning through authoritative English dictionaries. In the Encyclopaedia Britannica, "Intoxication" is defined to be as poisoning, whether by drug or liquor or other toxic substances, and hence, the condition of the nervous system produced by excessive drinking of alcohol. In the absence of any specific definition of this word in the statute in which the term is used, the word "intoxication" applies only to the excessive use of intoxicating liquors or drugs.

What is mentioned in the section is that, if anyone is seen 'in a state of intoxication' in a prohibition area, he is said to have committed an offence. The state of intoxication may be taken to be practically equivalent to a state of drunkenness, so that the person intoxicated was incapable of knowing the consequences of his action. By reason of intoxication, if a person is capable of knowing the nature of the act done, at the time he was under the influence of the alcohol his act is not considered to be an offence under the Penal Code (*vide* section 74 of the Travancore Penal Code).

So, what is necessary to be found out in this case is whether the accused was in a state of intoxication when he was said to have been taken into custody by P.W. 8. I shall refer later on to the extremely suspicious circumstances under which P.W. 8 himself, a head constable in mufti, came and took the accused into custody. P.W. 7, the inspector of police who investigated the case, had sworn in clear terms that his investigation revealed that the accused had taken brandy while he was in Trivandrum and before he got into the bus for Nagercoil. This bus started from Trivandrum at about 8 pm and it was an ordinary bus. It reached Mennakshipuram at

25. 64 Bom LR 451 : AIR 1963 Bom 68 : (1963) 1 Cr LJ 567.
26. *Narayanan Nair v State*, AIR 1952 Trav-Co 239 : 1952 Cr LJ 1095 : 1952 Ker LT 159 .
Also see: *Shanmugam (in re:)*, AIR 1954 Mad 376 : (1952) 2 Mad LJ 579 : 1954 Cr LJ 486 (Mad); *Connabatula Satya Rao v State of Andhra Pradesh*, 1954 Cr LJ 1529 (Andh); Re *Palaniswamy*, 1956 Cr LJ 370 (Mad).

11.15 pm that day. It was at 12.50 the same night that P.W. 8 was said to have seen the accused standing at the gate of the Raghuvilas Hotel smoking a cigarette. So, not less than five hours must have elapsed since he had taken brandy.

There was absolutely no case or suggestion that the accused had brought any brandy and took it in Nagercoil, just before he was taken into custody. There was no necessity to speculate on that point, as the prosecution had no such case. The poisoning by alcohol is dealt with exhaustively in *Taylor's Medical Jurisprudence*, Vol II, pp 535 and 536, 1948 Edn. The relevant portion is quoted below:

> *Ethyl alcohol is produced by the fermenting action of yeast on sugars, and is concentrated by distillation. The percentage of absolute alcohol in various beverages is approximately as under taking round figures without regard for precise accuracy:*
>
> *Spirits, such as whisky, brandy, gin and rum, contain about 40% of alcohol.*
>
> *Fortified wines, such as port and sherry, contain about 20% of alcohol.*
>
> *Natural wines, such as claret and burgundy, contain about 10% alcohol.*
>
> *Strong beer contains about 5% of alcohol.*
>
> *A "large whisky", which should be half a gill (2½ ounces), contains therefore 1 ounce, or 30 c.c., of absolute alcohol, and the same amount will be present in a pint of strong ale, half a pint of claret, or a quarter of a pint of port.*
>
> *The absorption of alcohol from the stomach and small intestine begins soon after ingestion. The rate of absorption is dependent upon a number of factors, the most important being the presence or absence of food in the stomach. Food delays absorption and the delay is most marked in the presence of fat and protein (Haggard and Greenberg, 1934: Mellanby, 1919). The concentration of alcohol is important, and generally the stronger the drink the more rapid is its effect. Absorption is usually complete within the first hour, so that after a single dose the maximum concentration in the blood is reached within the same period. After absorption, the alcohol is distributed more or less evenly throughout the tissues, with the exception of the bones and fat. Thus by estimating the amount of alcohol in the blood it is possible to calculate the approximate amount which must have been ingested.*
>
> *About 90% of the alcohol absorbed is oxidised and the remaining 10%. is excreted, mainly by the kidneys and the lungs. At no stage in its oxidation is alcohol stored in the tissues and its disappearance from the blood takes place at a fairly uniform rate, which for rough calculation may be placed at 10 c.c. per hour (0. 185 c.c. per kg. of body weight, Mellanby, 1919). It thus takes about three hours for the blood to be cleared of alcohol after the ingestion of a single large whisky. The excretion by the kidney is of importance in that at the time of secretion the urine has a similar concentration as that in the plasma at the same time, though higher than that in the blood as a whole, the ratio being approximately 1.3: 1.*
>
> *The concentration in the blood varies, however, increasing during absorption and then decreasing with oxidation. It follows, then that the concentration of alcohol in a given sample of urine will correspond with the average concentration in the blood during the time the urine has been collecting in the bladder (Smith and Stewart, 1932). If the concentrations in the urine and blood are estimated some time after ingestion, when the alcohol in the blood has fallen through oxidation, it may be found that the urine alcohol is at a higher level. Urine examination may, therefore, be used instead of blood examination and gives a reasonably accurate idea of the total alcohol in the body. A considerable number of investigations have been made in an endeavour to co-relate the alcoholic concentration in the blood with the behaviour of the individual.*
>
> *It is generally agreed that with concentrations below 0.05% there is little change to be observed on clinical examination: at 0.10% a number show mild symptoms and quite possibly some more decided symptoms. Between this level and 0.2% the number showing decided symptoms of intoxication increases, and at the latter figure it is to be expected that practically all will be diagnosed clinically. The critical concentration seems to lie at or about the 0.15 level and any person with this amount in his blood can be considered to have imbibed a dangerous amount of alcohol. With increasing concentration the symptoms become more intense and at concentrations beyond 0.2% up to 0.5% there is likely to be marked incoordination, coma and possibly death.*

Knowing that the concentration in the blood is the same as that in the tissues, we may translate these percentages into amounts drunk as follows. When the amount in the blood is equal to 0.15%, the person has ingested as a minimum within a few hours of the test 1.5 c.c. of absolute alcohol per kilogramme of body weight. In a man of ten stones this would amount to about 3-one-second ounces of absolute alcohol, or about 1-one-second gills of whisky at proof.

"Effects of Alcohol". The only acute effect of alcohol which is of any interest is its effect on the central nervous system. Its first effect appears to be a depression of the highest evolutionary centres, the centres regulating the conduct, judgment, and self-criticism. It passes progressively downwards through the centres of earlier evolutionary origin until the motor centres are reached and finally it depresses and paralyses the vital centres in the medulla.

There is first a feeling of well-being and a certain slight excitation. The actions, speech and emotions are less restrained, due to a lowering of the inhibition normally exercised by the higher centres of the brain. With this there is increased confidence and a certain carelessness of consequences. This implies a lack of self-control, which is one of the first things observed after alcohol, and which is a constant feature of alcoholic poisoning.

When the narcosis has penetrated more deeply the sense perceptions and skilled movement are affected. The increased loss of the inhibitory action of the higher centres causes an alteration in the conduct of the individual according to the dictates of his inherent desires and emotions.

This accounts for the fact that an individual may become morose, gay, irritable, excitable, pugnacious, sleepy, and so on, according to the dominant impulse which have been unleashed by the drug. The reaction times are somewhat lengthened, and there is a certain clumsiness and in-coordination in the finer and more skilled movements shown by slight alteration in speech and in the finer finger movements.

This passes into a third stage, where the motor and sensory cell are deeply affected; speech becomes thick and slurring; coordination is markedly affected, causing the patient to stagger and possibly to fall. Finally a stage is reached where the narcosis affects the whole nervous system, and the patient passes into a state of coma with stertorous breathing, indicating a commencing paralysis of the respiratory centre.

The coma gradually lightens into a deep sleep, and the patient if left alone, usually recovers in eight to ten hours, and wakes up with gastro-intestinal irritation, and usually nausea, vomiting and severe headache. If the coma continues for more than ten hours, the prognosis is bad.

The accused was not in any condition of coma when P.W. 8 saw him. According to the prosecution, it was also more than five hours since he had taken the liquor. He could not, therefore, have been in a state of intoxication at 12.50 am. P.W. 7 himself stated that the accused pleaded before him to let him free. That would not be the condition of a person who was in a state of intoxication. The tests, to find out whether a person is intoxicated or not, are given at pp 613 and 614 of Modi's Medical Jurisprudence and Toxicology. They are given below:

In order to ascertain whether a particular individual is drunk or not a medical practitioner should bear the following points in mind:

1. *The quantity taken is no guide.*
2. *An aggressive odour of alcohol in the breath, unsteady gait, vacant look, dry and sticky lips, congested eyes, sluggish and dilated pupils, unsteady and thick voice, talks at random and want of perception of the passage of time are the usual signs of drunkenness.*
3. *Drunkenness does not come within the cognizance of the police, unless the man is dangerous to himself or to his property or that he is annoying or dangerous to others.*

A special committee of the British Medical Association was appointed to consider the question of the definition and diagnosis of drunkenness. This committee arrived at the following conclusions and recommendations in regard to persons accused of being "drunk":

1. *That the word "drunk" should always be taken to mean that the person concerned was so under the influence of alcohol as to have lost control of his faculties to such an extent as to render him unable to execute safely the occupation on which he was engaged at the material time.*

2. *That it is desirable that a medical practitioner should base his opinion on the following considerations:*

   Whether the person concerned has recently consumed alcohol.

   Whether the person concerned is so much under the influence of alcohol as to have lost control of his faculties to such an extent as to render him unable to execute safely the occupation on which he was engaged at the material time.

   Whether his state is due, wholly or partially, to a pathological condition which causes symptoms similar to those of alcoholic intoxication, irrespective of the amount of alcohol consumed.

3. *That in the absence of any pathological conditions a person is definitely under the influence of alcohol if there is a smell of alcoholic liquor in the breath and or in the vomited matter (if any) provided there is a combination of all or most of the following groups of signs or symptoms:*

   A dry and furred tongue, or conversely, excessive salivation.

   Irregularities in behaviour, such as insolence, abusive language, loquacity, excitement or sullenness, and disorder of dress.

   Suffusion of the conjuctince and reaction of the pupils. The pupils may vary from a state of extreme dilatation to extreme contraction and may be equal or unequal.

   In the opinion of many police surgeons when alcohol in toxic quantity has been consumed, the pupil reflex to 'ordinary light' is absent, whereas the pupil will contract in 'bright light' and remain contracted for an abnormally long time, indicating the delayed reaction of the pupil.

   Loss or confusion of memory, particularly as regards recent events and appreciation of time.

   Hesitancy and thickness in speech and impaired articulation.

   Tremors and errors of coordination and orientation.

4. *That there is no single test by itself which would justify a medical practitioner in deciding that the amount of alcohol consumed had caused a person to lose control of his faculties to such an extent as to render him unable to execute safely the occupation on which he was engaged at the material time. A correct conclusion can only be arrived at by the result of the consideration of a combination of several tests or observations such as:*

   General demeanour;

   State of the clothing;

   Appearance of the conjuctince;

   State of the tongue;

   Smell of the breath;

   Character of the speech;

   Manner of walking, turning sharply, sitting down and arising, picking up a pencil or coin from the floor;

   Memory of incidents within the previous few hours and estimation of their time intervals;

   Reaction of the pupils;

   Character of the breathing, especially in regard to hiccup.

5. *That the following are the tests, upon which taken by themselves, little stress should be laid in deciding whether or not a person is under the influence of alcohol:*

   Presence of tachycardia (rapid pulse);

   Repetition of set words or phrases;

   Character of handwriting;

   Walking along a straight line;

   Failure of convergence of the eyes.

In this case P.W. 6 to whom the accused had been taken had, even if what he said was true, subjected the accused only to a very perfunctory examination. The certificate, Ex. B., given by P.W. 6, stated that the accused was in a state of drunkenness for the following reasons, viz., smell of brandy from nose, redness of his eyes, very rapid pulse and tremors of his hands. These findings are absolutely insufficient to hold that the accused was in a state of intoxication. Seeing the delicate position in which P.W. 7 (the inspector of police) and P.W. 6 (the medical officer) were put, they attempted to improve upon what they had stated in the earlier records. I do not think that it was proper on their part to resort to such methods, even though this was one of the earliest cases in the prohibition area.

13.10.11 Strong Smell of alcohol: Guide to licit/illicit Liquor[27]

He has strongly relied on the decision of the Supreme Court in *Behram Khurshid v State of Bombay*,[28] in which it has been observed as follows:

> *The bare circumstance that a citizen accused of an offence under section 66(b) is smelling of alcohol is compatible both with his innocence, as well as his guilt. It is a neutral circumstance. The smell of alcohol may be due to the fact that the accused had contravened the enforceable part of section 13(b) of the Prohibition Act. It may well be due also to the fact that he had taken alcohol which fell under the unenforceable and inoperative part of the section. That being so, it is the duty of the prosecution to prove that the alcohol of which he was smelling was such that it came within the category of prohibited alcohols and the onus was not discharged or shifted by merely proving a smell of alcohol.*

Relying on this passage, the learned counsel for the petitioner contends that the mere fact that the petitioner was smelling of alcohol does not carry the prosecution case any further. It is a neutral circumstance and it is compatible both with his innocence as well as his guilt. So, he contends that in this particular case, the prosecution has not made out a case against the petitioner that he was drunk.

It may be pointed out that in the very next paragraph of the said judgment quoted above, their lordships of the Supreme Court observes as follows:

> *The onus thus cast on the prosecution may be light or heavy according to the circumstances of each case. The intensity of the smell itself may be such that it may negative its being of a permissible variety. Expert evidence may prove that consumption in small doses of medicinal or other preparation permitted cannot produce the smell or a state of body or mind amounting to drunkenness.*

Their lordships have stated that the intensity of the smell itself may be such that it may negative its being of a permissible variety. Expert evidence may prove that consumption in small doses of medicinal or other preparations permitted cannot produce the smell or a state of body or mind amounting to drunkenness. So from this it is clear that where there is expert evidence which proves that the consumption is not due to medicinal or other preparations, their lordships pointed out, that it is permissible for the prosecution to rely upon it and in such a case the *onus* cast on the prosecution is duly discharged.

28. AIR 1955 SC 123 : 1955 Cr LJ 215 : 1955 SCR 613.; *Mahadevayya Veerabhadrayya Hiremath v State of Mysore*, 1966 Cr LJ 270 : AIR 1966 Mys 75.
Also see: *State of Maharashtra v Ramsingh Desasingh*, AIR 1963 Bom 68 : ILR 1962 Bom 493 : (1963) 1 Cr LJ 567.

The learned government pleader has argued that in the instant case the prosecution has proved the case against the petitioner and discharged the *onus* which lies on it. The case of the petitioner was that he had taken B.G. Phos and symptoms found on him were due to the fact that he had consumed that medicine. The learned government pleader argues that the evidence of the doctor P.W. 1 in this case definitely negatived the plea that the symptoms are due to his taking B.G. Phos. P.W. 1. Dr. Sangane Gowda when examined has stated that when the petitioner was produced before him he observed the following symptoms:

1. Breath smells of alcohol.
2. Pupils dilated and eyes are congested
3. Pulse 92 per minute.
4. Incoherent speech.
5. Staggering gait.

In the opinion of the doctor, the petitioner has taken alcohol and he was also intoxicated. He further stated that the petitioner was incapable of taking care of himself. In his cross-examination he has stated as follows:

> *..... I smelt only alcoholic smell. B.G. Phos. contains 17% of alcohol. If one takes in excess quantity he is not intoxicated. If the whole bottle is taken all the symptoms in a modified form exist. But he cannot have the smell of alcohol. Other symptoms will be there. A bottle of B.G. Phos contains 4 ounces of tonic. The intoxication lasts for 12 hours.*

It is clear from the evidence of the doctor that if a person takes the whole bottle of B.G. Phos, all the symptoms in a modified form will exist. He further states that if one takes in excess quantity of B.G. Phos he will not be intoxicated. There is therefore force in the contention of the learned High Court government pleader that the evidence of the doctor, definitely establishes that the symptoms found on the petitioner are not due to the fact that he had taken B.G. Phos. I am, therefore, of the opinion that the evidence of the doctor definitely disproves and negatives the case of the petitioner that he had taken B.G. Phos and the symptoms found on him were due to his taking excess dose of B.G. Phos. It follows from this that symptoms found on the petitioner were due to his taking alcohol and not B.G. Phos. I am, therefore, of the opinion that there is no merit in the contention urged by the learned counsel for the petitioner. The prosecution has established the charge against the petitioner.

13.10.12 BAC Test Rules/Procedure[29]

> *3. Mr. Bhatt next urged that if blood test rules are not properly followed, no presumption would be raised. He submitted that there is no evidence to show that the medical officer who extracted blood had used a sterilised syringe or that he had not applied alcohol or cleaned with sterilised water the skin of the accused before extracting blood. He urged that unless the medical officer categorically stated that he had followed all the rules scrupulously, no presumption could be made that he in fact had followed the rules. He, therefore, urged that these rules being mandatory, if they were not followed, no legal presumption could be made under section 66(2) of the Act. In support of his submission, Mr. Bhatt referred to the case of Vrajlal Damodar v State of Gujarat, (1971) 12 GLR 68 it was observed as under:*
>
> *It is, however, essential for the prosecution to prove two requirements prescribed by rule 4:*
>
> *1. viz., that no alcohol was allowed to touch the body of the person from whom the blood sample was collected; and*
>
> *2. that the phial in which the blood sample was transferred from the syringe contained anti-coagulant and preservative.*

29. *State of Gujarat v Ibrahim Mohmad*, 1975 Cr LJ 1089.

In my opinion, these two requirements constitute the essence of rule 4(1) and are mandatory having regard to the importance of complying with these directions and the nature and the purpose of such requirement. The next question that arises is as to how the prosecution can establish that the aforesaid requirements were conformed to. It would be sufficient for the doctor to say that he had complied with the requirements and followed the procedure prescribed by rule 4(1). General evidence of this character can be accepted as adequate to establish that the requirement was conformed to. Or, in the certificate issued by the doctor this fact of having complied with the requirement of rule 4(1) could be incorporated. These are two of the several possible ways of establishing that the rule was complied with. In the present case, the doctor has not been examined. For ought we know he may not have been conscious of the statutory requirement of rule 4(1). The certificate issued by the doctor, Ex. 5 also does not contain any statement that the requirement of rule 4(1) was present in the mind of the doctor who collected the blood sample or that he had complied with any such direction.

There can be no quarrel with the propositions laid down by my learned brother Thakkar, J., and with respect I am in entire agreement with his observations. But it should be remembered that in the case before him the doctor was not examined and the certificate did not disclose that the doctor had followed the provisions of rule 4(1). In the instant case, the doctor has been examined and the doctor has categorically stated that he extracted 5 c.c. of venous blood and collected it in a phial as per rules. My learned brother Thakkar, J., has stated that it would be sufficient for the doctor to say that he had complied with the requirements and followed the procedure prescribed by rule 4(1). I, therefore, fail to understand how this ruling would help the accused. In my opinion, it is not necessary for the doctor to repeat parrot like the provisions contained in rule 4(1). If the doctor is aware of the provisions contained in the Bombay Blood Test Rules and if the doctor in his evidence before the court says that he had extracted blood as per the rules and if there is no cross-examination to the contrary, it cannot be presumed that the doctor had not followed the mandatory provisions contained in Blood Test Rules particularly rule 4(1). Similarly the other case referred to by Mr. Bhatt would not help him. In the case of Madhavarao Bhagwandas Kharade v State of Gujarat, 1971 Cr LJ 1626 : (1971) GLR 956 it was observed that:

the presumption under section 66(2) of the Bombay Prohibition Act cannot be drawn unless the mandatory provisions of rules 4 and 5 of the rules have been scrupulously followed. The Legislature must have in its wisdom provided the period of seven days for the blood sample to reach the testing authority with a view to see that there may not be any tampering with the blood sample collected or that the alcohol contents of the sample of blood may not increase if it was kept in possession of the medical officer or his subordinate for an unduly long period.

With respect I agree with the observations made therein. In the instant case, as already observed earlier, the medical officer who extracted blood was examined and he has stated that he had extracted the blood and collected it in a phial as per rules. Therefore, whatever provisions are contained in these rules were followed by him. It is not necessary for him to enumerate the rules in seriatim in his examination before the court. So far as the second objection taken in the case of Malahavarao Bhagwandas Kharade would not be applicable in the present case because the blood sample was sent to the C.A. on the same day. There was no delay on the part of the medical officer in sending the phial to him. In my opinion, therefore, both the rulings referred by Mr. Bhatt cannot help him.

13.10.13 Proper/Improper Collection of Blood Sample[30]

As observed by this court in *State v Sheshappa Dudhappa Tambade*,[31] there is nothing brutal or offensive or shocking in taking blood sample under the protective eye of law. Modern community living requires modern scientific methods of crime detection lest the public goes unprotected. Such scientific tests are necessary for proving the guilt as well as innocence of the accused. This is one of the well-recognised methods adopted in the crime detection all over the

30. *State of Maharashtra v Sheshappa*, 1981 Cr LJ 133 (HC).
31. *State v Sheshappa Dudhappa Tambade*, AIR 1964 Bom 253 : (1964) 2 Cr LJ 523 : ILR 1964 Bom 404.

world. In this context a reference could usefully be made to the following observations in para 9 of the said judgment:

> *We have pointed out before that the section itself contains limitations with regard to the procedure for extracting blood. The question as to whether the conviction of a person based on the result of the involuntary blood-test taken after extracting blood deprived a person of his liberty without due process of law guaranteed by the Fourteenth Amendment of the American Constitution arose for consideration in Breithaupt v Abram, (1957) 352 US 432 : 1 L.Ed. 2nd 448. The petitioner in that case while driving a pickup truck was involved in a collision with a passenger car. Some of the passengers of the car were killed and the petitioner was seriously injured. A print whisky bottle almost empty, was found in the glove compartment of the truck. The petitioner was, therefore, taken to a hospital and while he was lying unconscious, the smell of liquor was detected on his breath. On a request by the patrolman, and attending physician, while the petitioner was unconscious, withdrew a sample of about 20 cubic centimetres of blood by use of a hypodermic needle. Subsequent laboratory analysis showed that the blood contained about 17% alcohol. The petitioner was thereafter charged with involuntary manslaughter and in the trial, testimony regarding the blood test and its result, was admitted into evidence, despite the petitioner's objection. This testimony included the evidence of an expert that a person with 17% alcohol in his blood, was under the influence of intoxicating liquor. Although he was convicted, the petitioner did not appeal, but later he sought release from his imprisonment by a petition for a writ of habeas corpus. It was contended that the conduct of the state officers offended the "sense of decency" and that it was "brutal" and "offensive" and was therefore "shocking" to the "conscience". It was also said that the conduct did not comport with traditional ideas of fair play and decency. This argument was not accepted by a majority of the Supreme Court of the U.S. Mr. Justice Clark who delivered the opinion of the majority observed as follows:*
>
> *There is nothing 'brutal' or 'offensive' in the taking of a sample of blood when done, as in this case, under the protective eye of a physician. To be sure, the driver here was unconscious when the blood was taken, but the absence of conscious consent, without more, does not necessarily render the taking a violation of a constitutional right; and certainly the test administered here would not be considered offensive by even the most delicate. Furthermore, due process is not measured by the yardstick of personal reaction or the sphygmogram of the most sensitive person, but by that whole community sense of "decency and fairness". That has been woven by common experience into the fabric of acceptable conduct. The blood test procedure has become routine in our everyday life. It is a ritual for those going into the military service as well as those applying for marriage licences. Many colleges require such tests before permitting entrance and literally millions of us have voluntarily gone through the same routine in becoming blood donors.*
>
> *The majority opinion, therefore, was that a blood test taken by a skilled technician is not such "conduct that shocks the conscience". The court also observed that this may not apply to cases where there is indiscriminate taking of blood under different conditions or by those not competent to do so. It was also observed:*
>
> *Modern community living requires modern scientific methods of crime detection lest the public go unprotected.*

Mr. Justice Clark in conclusion made the following very pertinent observations:

> *As against the right of an individual that his person be held inviolable, even against so slight an intrusion as is involved in applying a blood test of the kind to which millions of Americans submit as a matter of course everyday, must be set the interests of society in the scientific determination of intoxication, one of the great causes of the mortal hazards of the road. And the more so, since the test likewise may establish innocence, thus affording protection against the treachery of judgment based on one or more of the senses.*

This was the view taken by the Supreme Court of the U.S. even when the challenge was under the Due Process Clause. So far as our Constitution is concerned, the courts are not required to go so far and determine whether a certain procedure established by law was brutal or offensive or shocking to the conscience and was, therefore, unreasonable. Infringement of personal liberty or life, if in accordance with the procedure established

by law, is not justiciable. In the Prohibition Act, which, as we have pointed out earlier, is brought on the statute book to effectuate the policy of Prohibition, the taking of blood is empowered to be done only by a registered medical practitioner. It is thus under the protective eye of the law. It is intended to help the scientific determination of intoxication and the results of the test may as well prove innocence as the guilt of the person. We are, therefore, unable to accept the view taken by the learned magistrate that section 129A of the Act is *ultra vires* Article 21 of the Constitution.

13.10.14 Drunkenness not Proved without BAC[32]

5. Apart from the oral evidence given by the witness of their impression regarding the accused having been drunk at the time of the driving, the prosecution case in that connection rests on the certificate given by the medical officer. Obviously, no blood test was carried out, nor was any urine test taken. In such circumstances Mr. Gangal strongly relies upon the decision of the Supreme Court quoted above. In that case also, the appellant was convicted of rash and negligent driving mostly on the basis of the certificate from the medical officer. The certificate showed alcoholic smell, unsteady gait, dilation of pupils and incoherent speech. The finding of the High Court that the appellant was drunk, was not confirmed by the Supreme Court by making the observations as follows:

It seems to us that on this evidence it cannot be definitely held that the appellant was drunk at the time the accident occurred.

While arriving at this conclusion, the learned judges of the Supreme Court took into consideration that the symptoms of gait being unsteady could very well be if a person is in nervous strain. The Supreme Court also observed that mere smelling of alcohol would not show that a man is under the influence of drinking. Unfortunately the Supreme Court has not spoken about the competitive reasons for holding dilations of pupils or the incoherent speech as not necessarily due to a person being under the influence of drink. It appears that in the opinion of the Supreme Court, when urine test and the blood test were not done symptoms mentioned in the certificate were not conclusive of proving that the appellant was, under the influence of drink. I suppose Mr. Gangal can take benefit of this ruling although an unhappy feeling arises whether all the four symptoms taken together do or do not always amount to a person being under the influence of drink.

There is no reliable oral evidence in addition to the certificate of the medical officer for speaking of the behaviour or of the actions of the present revision petitioner for concluding that he was under the influence of drink. As the matter stands, in view of the ruling quoted above, it would be difficult to maintain the finding that the petitioner was driving under the influence of drink. Consequently, the conviction under section 117 of the Motor Vehicles Act, will have to be set aside.

13.10.15 Intoxication as Defence[33]

And even if one were to take it that the accused persons had taken some liquor the question will still be whether the case falls under section 86, Indian Penal Code, which provides:

86. In cases where an act done is not an offence unless done with a particular knowledge or intent, a person who does the act in a state of intoxication shall be liable to be dealt with as if he had the same knowledge as he would have had if he had not been intoxicated, unless the thing which intoxicated him was administered to him without his knowledge or against his will.

The facts found in the present case do not bring the case under section 86, Penal Code and the finding of the learned judge is opposed to the law as laid down in '1920 AC 479 (A)' which was

32. *Kishanbhai Jinubhai Gavit v State of Maharashtra*, 1978 Cr LJ 829 : (1977) 3 UCR (Bom) 422.
33. *Amar Singh v State of Punjab*, (1977) 3 UCR (Bom) 422 : 1955 Cr LJ 305 (PB).

approved of by the Lahore High Court in Sheru v Emperor, 2 where it was held that evidence on drunkenness falling short of a proved incapacity in the accused to form the intent necessary to constitute the crime, and merely establishing that his mind was affected by drink so that he more readily gave way to some violent passion, does not rebut the presumption that a man intends the natural consequence of his acts.

13.10.16 Murder after Drinking[34]

But there is one important factor in this case which we think may be taken as an extenuating circumstance for giving a lesser sentence. P.W. 9 says in his evidence that all the accused appeared to have been drunk. It is also in the evidence of other witnesses that the 1st accused was fully drunk and that he sat on a boulder by the side of the dead body and even taunted P.W. 1 when handing over the ring of the deceased to him.

If they primed themselves with drink for the purpose of committing the offence, that circumstance cannot obviously be proved for mitigating the punishment. But the accused were manufacturing toddy illicitly and they must have been getting drunk every day. One of the previous incidents, which is suggested to be the motive for the offence had taken place two months prior to the incident and another 10 days prior to that. There is no specific evidence that they had prepared themselves and taken a drink to strengthen their minds, to commit the murder. It is more likely that after they got drunk and when they saw the deceased going to the field the night, they got the idea of doing away with him in a drunken state of mind and pursued him with weapons, which they must have had in their garden and committed the murder.

13.10.17 Murder or Homicide[35]

Under section 86 of Penal Code, the court had together from the attending general circumstances of the case the intents or the intention, paying due regard to the degree of intoxication. If the man was beside his mind altogether for the time being, it would not be possible to fix him with the requisite intention. But if he had not gone so deep in drinking and from the facts it could be found that he knew what he was about to do, that rule that a man is presumed to intend the natural consequences of his act or acts will apply. Ordinary drunkenness makes no difference to the knowledge with which a man is credited. Intention in many cases in an inference from knowledge, but there may be cases in which a person by reason of intoxication may under certain circumstances be incapable of knowing the nature of a particular act he commits, or that it is either wrong or contrary to law although his state of intoxication may not be such as to render him incapable of knowing the nature of his acts. In such cases, in determining the quality of the offence, evidence may be necessary of a specific state of mind which must be found as a fact and not assumed.

Where in a case in which accused was charged under section 302, apart from the bold statement in her cross-examination by a prosecution witness that the accused was heavily intoxicated and the fact that there was no evidence either positive or circumstantial to support the inference that accused was beside his mind due to intoxication, the case came squarely under section 302 and not under section 304.

35. *State of Orissa v Matuba Barik*, 1978 Cr LJ 260.

13.10.18 Random Sampling[36]

In this appeal by the State of Gujarat it is contended that section 98 applies to the case. That section reads as follows:

> Whether any offence punishable under this Act has been committed,
>
> (a) any intoxicant, hemp, mhoma flowers, molasses, materials, still, utensil, implement or apparatus in respect of which the offence has been committed, shall be confiscated by the order of the court.
>
> * * * * *

The short question therefore is whether it can be said that in respect of the 1500 and old bottles, an offence punishable under the Prohibition Act had been committed. It is no doubt true that the person who was charged with committing an offence was found not guilty, but the question is not whether the accused has been successfully brought to book, but whether the offence in respect of the property has been committed or not. There is a distinction between the two. An offence may be demonstrated to be committed although the accused who committed it may not be successfully prosecuted. We may be given an example. Suppose in a house a vast quantity of contraband opium is found. The house-holder may get off because the opium was found from a place which was open and had access to strangers. He may get the benefit of doubt and be acquired, but it is clear that insofar as the opium is concerned, an offence must be deemed to have been committed, and if it is proved that the contraband article was opium, it would be remarkable that the order should be that the opium be returned to the householder. In these circumstances, on proof that the contraband article in respect of which an offence has been committed is proved to exist, the obvious course would be to confiscate it to the state. In the present case, the two bottles which were sent to the chemical examiner were said to contain alcohol although there was some doubt in the mind of the magistrate as to whether there was no chance of any malpractice. Be that as it may, here are the other bottles intact. There is some evidence to show that they were in the original packing and were a proprietary product. The manufacturer came as a witness and deposed that the liquids were bottled by him as a proprietary manufacture. In these circumstances, it would be fair to assume that all of them were of the same kind as the ones which were sent for chemical examination. However, an examination of random samples can be made and if they satisfy the court that the bottles contain contraband stuff the bottles can be confiscated. The order of the High Court is thus set aside, but instead of restoring the order of confiscation we order that a few bottles at random should be analysed and if contraband stuff against the Prohibition Act is found the whole stock shall be confiscated.

13.10.19 Correct Sampling[37]

If three separate samples were taken from three different bottles and one sample was sent to the public analyst, which was taken from one bottle and another sample was kept for the court, which was taken from another bottle and another sample given to the accused was taken from another bottle and if the public analyst comes to the conclusion that the sample is adulterated, there is every possibility that the *3rd sample which is with the accused or the second one which is sent to the court need not be* adulterated. Therefore, it is proper that the three samples have got to be taken from one container and one to be sent to the public analyst and one to be kept for the court and the third one to be given to the accused.

14.1 GENERAL

14.1.1 Explosives

For a common person, an explosive is a material that, on initiation, causes a sudden, almost instantaneous, release of gases, heat, light, and pressure, accompanied by the loud noise. The explosive material(s) may be a single entity or a mixture of two or more entities. It undergoes transformations. In the process, it releases a large amount of its potential energy, devastating/damaging the surroundings.

The government of India, in *Explosive Act, 1884 as amended in 1978*, has given the meaning of "explosive" materials fairly elaborately[1] in the following words:

> *Explosive means gunpowder, nitroglycerin, nitroglycol, gun cotton, di-nitro-toluene, tri-nitro-toluene, picric acid, di-nitro-phenol, tri-nitro-resorcinol (styphnic acid), cyclo-trimethylene-trinitramine, penta-erythritol tetra-mine, nitro-guanidine, lead azide, lead styphnate, fulminate of mercury or any other metal, diazo-di-nitro-phenol, coloured fires or any other substance whether a single chemical compound or a mixture of substances, whether solid or liquid or gaseous used or manufactured with a view to produce a practical effect by explosion or pyrotechnic effect, and includes fog signals, fireworks, fuses, rockets, percussion caps, detonators, cartridges, ammunition of all descriptions and every adaptation and preparation of an explosive as defined in this clause.*

14.1.2 Uses of Explosives

Explosives have many legitimate uses, both for civil and military purposes. In civil works, they are mostly used for:

1. Fireworks; on festivals and marriages and inauguration of mega events like Olympic Games, for coloured lights display, sound signals.
2. Mining of minerals.
3. Blasting obstructing rocks/earth; for the construct roads, railway lines, dams, tunnels, pipelines, buildings, and the like.
4. Spacecraft and satellite propulsion.
5. Oil explorations.
6. Extinguishing oil wells' fires.

1. Section 4 of the Explosive Act, 1884 as substituted by Act 32 of 1978, operative with effect from 2-3-1983.

A few years ago one of the oil wells caught fire. The firefighters struggled for 42 days to put down the fire but to no avail. Ultimately, the fire was put down by exploding 200 Kg of high explosive at the site. The explosion extinguished the fire. (CH)

7. Demolition of old derelict structures.
8. Ammunition for small arms: for hunting, self-defence or in armed conflicts.
9. Miscellaneous uses: for heating food, lifting loads, welding, drain blockage testing, tear gas shells to control mobs, and the like.

Defence forces of all countries use explosives in large quantities in their defence (and offence) systems, mainly for:

1. Ammunition for their small arms and artillery
2. Grenades, bombs
3. Smoke screens

14.1.3 Abuse of Explosives

The abuse of explosives is extensive. The terrorists misuse them to inflict heavy losses of life and property. They are exploited in sabotage, communal and political wrangling. They are abused for murders, dacoities/robberies, revenge killing, and burglaries.

A very rich person could spend lots of money on the wife of one of his friends, a military officer, when the latter was away on duty. The wife was so enamoured by the person that she abandoned the officer and started living with the businessman. The officer was cut to the quick. He wanted to take revenge. He allegedly sent a parcel bomb to the paramour. It exploded when he was opening it and killed him. The officer was prosecuted and the lower courts convicted him or murder but the apex court ultimately acquitted him of the charge. (CH)

The abuse of explosives, in India, was not common up to the late eighties of the twentieth century. They were used to open safes and money chests, sometimes. They were also used, but rarely, to derail the train to loot the passengers. The criminal usually used low explosives for the purpose. However, terrorists have completely changed the scenario.

The explosions by terrorists have become too common, killing and maiming scores of persons, destroying cars and buses and other property worth crores of rupees! The Mumbai blast (1993), Twin Tower blasts of New York (2001) and the continuing spate of suicide bombings in Pakistan and elsewhere (2017) are sad and painful examples.

Table 14.1

New York Twin Tower Blast Holocaust
(11 September 2001)

Persons killed	~ 3000
Repercussions	Started a limited War in Iraq/Afghanistan
Property Damaged/destroyed (Approx.)	$ 3 trillion
culprits	19 Al-Quida terrorist: all killed
Mastermind	Osama Bin Laden; killed in May,2011
Main Fall out	Iraq war
Type of Attack	Suicidal plane crash

What could be achieved by a non-explosive explosion? It was dramatically revealed in the twin Tower destruction on 11 September 2001:

1. *4 passenger aeroplanes were hijacked by 19 al-Qaeda terrorists on 11th September, 2001. Two of the planes, were crashed into the North and South towers, of the World Trade Center complex in New York. Within 2 hours, both 110-story towers collapsed, causing partial or complete collapse of all other buildings in the neighbourhood, including the 47-story 7 World Trade Center tower.*
2. *Brought USA to a grinding halt for days together*
3. *Pulled down the stock markets of the world*
4. *Brought in serious racial/religious conflicts*
5. *USA took about 11 years to hunt mastermind: Osama Bin Laden*
6. *The motives given were:*
    - *U.S. support of Israel*
    - *the presence of U.S. troops in Saudi Arabia*
    - *sanctions against Iraq*

Fig. 14.3

September 11, 2001 attack on World Trade Center: burning

Table 14.2

Mumbai Blast
(13 March 1993)

Criminal	Dawood Ibrahim's D company
Mode	13 car Bombs
Explosive	RDX with Sharpnels
Persons killed	257
Person injured	713
Property destroyed	27 Crores
Person accused	204
Time taken for investigation/trial	>20 years

Terrorists are abusing explosives increasingly for sabotage, political and communal vendetta. The latest terrorism wave in Pakistan is a stern reminder to all about the shape of things to come.

Table 14.3

October, 2009 Explosions in Pakistan

Date (attacks)	5	9	11	12	15: 3	16	20	23	26	28
Place	Islamabad	Peshawar	Army GHQ	Shangl	Lahore Police	Peshawar CIA	Islamabad Islamic University	Kamra Aeronauti-calcomplex		Pesha-war
Dead	5	54	19	41	27+11+ 1 = 39	15	7	9	2	117

The terrorist is using all means of transport to carry explosives to the targeted site. Human bomb was used to murder Rajiv Gandhi. Cycles, Scooters/motorcycles, cars, buses, trucks even aeroplanes (Kanishka of Air India!) have been used.

The main targets are usually trains, buses, hotels, government buildings, police stations and public places, army installations.

The reasons for the extensive abuse of explosives are:

1. **Easy availability;** of the explosives or their ingredients/components
2. **Easy improvisation;** of the explosives from common materials available in the markets; for example, ammonium nitrate, an important fertiliser, has been extensively exploited to manufacture Indigenous Explosive Devices (IEDs).
3. **Massive illegal supplies;** of high safe explosives (mostly RDX, TNT) to terrorists by the hostile neighbouring countries
4. **Cost-effective explosives**; the common active ingredients of the indigenous explosive devices are ammonium nitrate (a fertiliser), potassium chlorate. They are both cheap and easily available. Besides, the assembling of Improvised Explosive Devices (IEDs) does not involve high technical expertise.
5. **Easy to carry and hide**; common items are used as containers to hoodwink the observer. Ordinary suitcases, bags, transistor radio frames, postal parcels, cycles, cars and even trucks are used to carry, hide and explode bombs at the chosen sites.
6. **Sophistication in initiation;** has gone very high. Remote or delayed time initiations are quite common.

   An IED was placed in a waste paper basket in the office of a district police chief (an SSP). The device was exploded through a remote control gadget from a safe distance, outside the room, when the officer came to the office. The explosion killed the officer. (CH)

   Suicide bombing is the latest trend in the abuse of explosives. The new concept of the exploding human is quite abnormal, yet very effective. Suicide bombers (***Fidayeen***[2]), the human-initiator, have taken over the big job. What is the cost of the human-initiator is not known. But in term of grief to the members of the blown-off *Fidayeen* must be heart rending. The number of human-initiators is increasing, especially in Pakistan.
7. **Little residual evidence;** is left after the explosion, and that too is hidden and contaminated in heaps of debris that are left after the explosion.
8. **Create panic and fear;** among the victims and onlookers, which is the main objective of the terrorists.

2. Persons who have been motivated to die for a (misconceived) cause on conviction that they will go to heaven.

9. **Choice of time; and place**; the culprit chooses the time and place which are unpredictable and thus defy preventive measures. They create fear psychosis among a large section of the society. It affects public morale and efficiency.
10. **Effective in all crimes**; the explosives can be used and are effective in all sorts of crime. The terrorists have therefore, adopted them on a large scale
11. **Explosives are safe** to handle, store and use.

The abuse of explosives is a serious offence. The law provides stern punishments if the perpetrators are identified, apprehended and tried. However, very few terrorists live to face the trials. They die in the explosions, commit suicide if caught or their gang members kill them.

14.2 NATURE

An explosive is a substance, which on receiving an impulse undergoes rapid changes — decomposition or transformation to other forms, almost instantaneously. The process releases tremendous energy in the form of high-speed gases, light, heat and imparts kinetic energy to entities which come in contact with the expanding gases and other decomposition products. The decomposition and conversion of the explosive to other substance(s) are extremely rapid and self-sustained.

The explosive may be an element (Uranium), a compound (TNT, RDX) or a mixture (black powder, chlorate or nitrate mixtures).

The explosive substances, commonly encountered in the criminal investigation, are chemical compounds or their mixtures, ordinarily.

14.2.1 Characteristic Features

The main characteristic features of the explosives are:

1. **Chemical instability: a**n explosive substance is internally unstable. The instability of the substance leads to rapid decomposition or transformation on receiving an impulse.
2. **Self-sustenance: a**n explosive undergoes a self-sustained chemical/physical changes. It is usually rapid burning of the combustible component of the explosive compound or mixtures. Carbon, hydrogen and other elements in the explosive substance or mixtures provide fuel (combustible material) for the explosive charge. Likewise, the explosive has sufficient oxygen to support the combustion. They form part of the unstable compound or of a constituent of the explosive mixture, in combined form. On initiation, the oxygen supports the self-sustained chemical change. They create gaseous products and energy in various forms.

   In mixtures, like gunpowder, potassium nitrate provides oxygen to the combustion of the fuel components. Other oxidants can also be used. Nitrates, chlorates, perchlorates, nitrites, permanganates, chromates, and dichromates are other oxygen suppliers in explosive mixtures.

Certain explosives, like azides of metals (for example Lead Azide), do not contain oxygen. The decomposition of the molecules provides sufficient gas (nitrogen) and heat to give the explosive effect. The usual combustion does not take place.

Additional characteristics of common explosives are:

1. They are sensitive to one or more of the following energy impulses:
   - Friction
   - Impact

- Electric Charge
- Heat

2. Most of the common explosives have nitrogen as a component of the molecule. Nitrogen confers instability to the explosive substance.
3. Most of the explosives, after the explosion, leave very small amounts of residues.
4. Explosives can be improvised easily. The raw materials for their manufacture are easily available.
5. Explosives, on explosion, release gases and other products. The volume of the products is many times the volume of the explosive used.
6. Some explosive decomposes at a very high speed. They are said to detonate[3]. Other explosives burn at comparatively slow speed. They are said to deflagrate[4]
7. Nuclear explosions depend upon annihilation of matter for their explosive action. They occur with unstable atoms, which undergo decomposition in a chain reaction, producing intense heat, light and radiation. The surrounding gases expand suddenly and cause an explosion.
8. In a thermonuclear reaction, hydrogen gas atoms (or other substance) 'fuse' to form helium atoms (or other substance). This happens at very high temperatures, generated by nuclear decomposition. The fusion reaction also results in the annihilation of matter, which is converted into heat, light and other radiation energy to cause an explosion.
9. Aerosol explosions occur when combustible gas (from gas cylinders or other sources), vapours of inflammable liquids (like petrol), other combustible gases and organic dust (like flour) form explosive mixtures with air under certain conditions.

The explosion of the twin towers of the World Trade Centre, in New York, on 11 September 2001, is a revelation. No normal explosives were used. The fuel of the two passenger aircraft, which struck the buildings, exploded and destroyed not only the second tallest buildings of the world and killed thousands of persons, but also created the great panic among the people.

14.3 CLASSIFICATION

14.3.1 Legal Classification

The explosives have been classified in *The Explosives Rules, 1983, Sch I* as under:

Table 14.4
Classification of Explosives

1. Class 1	Gunpowder
2. Class 2	Nitrate Mixture
3. Class 3	Nitro Compound
4. Class 4	Chlorate Mixture
5. Class 5	Fulminate

3. **Detonation** is burning of high explosives at supersonic velocities (up to 2,000 m/s)and very high pressure (up to 20 bars).
4. Deflagration propagation velocity is about 199 m/s. The pressure developed is also low: about 0.5 bars.

6. Class 6	Ammunition
7. Class 7	Fireworks
8. Class 8	Liquid Oxygen Explosives (LOX)

The classification is rather loose but convenient from the legal point of view. Other classifications are based upon various features of explosives as under:

14.3.2 Speed Based Explosion

Speed of explosion divides explosives into two classes:

1. **Low or deflagrating explosives; their** burning speed is 200 to 900 m/s. It may go up to 2000 m/s.
2. **High or Detonating Explosives;** their detonating speed is 2000 to 9000 m/s.

14.3.2.1 Low/Deflagrating Explosives

Strictly speaking, low explosive burn rather than explode. The burning process is rapid (200 to 900 m/s). They produce gases rapidly, which increase pressure on the surroundings in confined spaces. Common deflagrating explosives are:

1. Gunpowder
2. Nitrocellulose and
3. Cracker compositions are usually low explosives.

The low explosives are utilised to manufacture propellants for small arms, fireworks. They are safe if properly manufactured, handled and controlled.

Low explosive, however, can behave like high explosive under certain conditions. For example, gunpowder initiated in closed containers can act as a high explosive.

14.3.2.2 High/Detonating Explosives

High explosives explode at very high speed: 2000 to 9000 m/s. They shatter the container and have a shattering effect on the surroundings. The explosive wave is directional. It takes the direction least resistance.

Common high explosives and their detonation speeds are in the table below:

Table 14.5
Detonation Speed of Explosives

Explosive	Detonation Speed (m/s)
1. TNT,	8250
2. RDX,	8180
3. PETN,	8300
4. Tetryl	7850
5. Amatol	6430

14.3.3 Sensitivity Based Explosives

On the basis of sensitivity, the explosives are divided into two classes:

1. **Primary Explosives**
2. **Secondary Explosives**

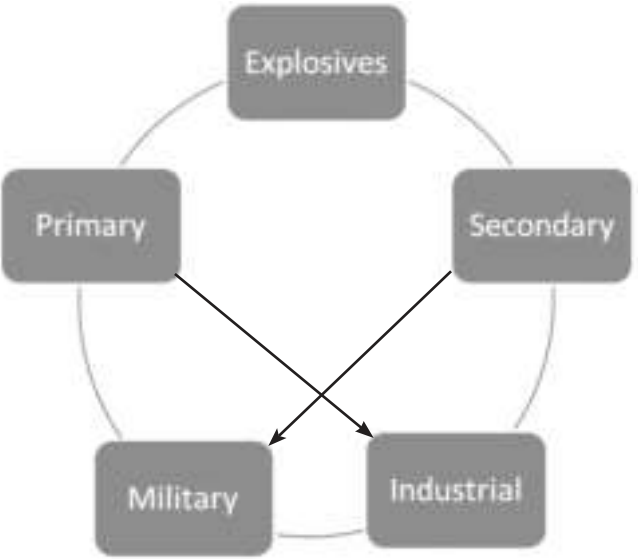

Fig. 14.4

Explosives and their applications

14.3.3.1 Primary explosives

Primary explosives are highly sensitive to various stimuli: impact, heat and friction, and are easily initiated with an electric spark or direct flame. They detonate; they do not deflagrate. They are used in small amounts as initiators in firearm ammunition, blasting caps and detonators or to initiate, sensitise and explode the secondary explosives. The latter form the main charge of powerful explosive devices. The primary explosives are initiated by impact by an electric spark or by stabbing the primary charge.

Working with primary explosives in substantial quantities is hazardous because of their high sensitivity.

The important common primary explosives are:

1. Mercury fulminate
2. Lead/Silver azide
3. Lead styphnate
4. Tetracene (tetrazene)
5. Dinol (Diazo-dinitro-phenol)

14.3.3.2 Secondary Explosives

Secondary explosives are comparatively insensitive. They are safer to manufacture, transport and work with *vis-à-vis* the primary explosives. They normally require a small charge of primary explosive as a detonator to explode.

The common secondary explosives are TNT, RDX, HMX, PETN.

14.3.3.3 Tertiary Explosives

Tertiary explosives (blasting agents,) are, insensitive to shock. They need booster (secondary explosives) for their explosion. They are safe to work with and are comparatively very cheap. Therefore, they are used extensively, especially in mining and construction activities. ANFO is a tertiary explosive which is used almost exclusively in these two activities.

14.3.4 Use-Based Classification

The third classification of explosives is based on their use, abuse:

1. Industrial Explosives
2. Military Explosives
3. Pyrotechnics
4. Propellants
5. Non-explosive Explosive mixture
6. Nuclear Explosive
7. Miscellaneous

14.3.4.1 Industrial Explosive

14.3.4.1.1 Dynamites; industrial explosives were loosely termed as **dynamites**. They are modifications of the original dynamite, which, Alfred Nobel prepared from nitroglycerin, a highly sensitive powerful and cheap liquid explosive. The sensitivity of the explosive is so high that it does not permit safe handling during its use. Nobel reduced its sensitivity in a very simple way; simply by adding Kieselguhr earth (diatomaceous earth) to nitroglycerin. He found that a mixture consisting of 25 parts of nitroglycerin and 75 parts of the earth gave the best results. The results brought in lots of money with which he created a trust, which has been awarding Nobel prizes for the globally best contributions in various fields of activity.

A number of formulations with or without nitroglycerin have come up and 'dynamites' are being manufactured according to those formulations. Common formulation are given in the table XVIII-6.

Table 14.6
Dynamites

Name of Dynamite	Composition
1. Straight Dynamite	NC (Nitrocellulose) + EGDN (Ethylene Glycol Di-Nitirite)
2. Gelatine Dynamite	NG (Nitroglycerin) + EGDN + NC

14.3.4.1.2 ANFO (Nitrate Mixtures) Dynamites are no longer the favourite industrial explosives because of their accidental potential. ANFO explosives have replaced them. They contain ammonium nitrate as the main active explosive ingredient. They are commercially available emulsions, slurries or gels.

ANFO contains Ammonium Nitrate (94%) and Fuel Oil (6%). It is the most popular and widely used commercial explosive. It is cheap, safe, and easy to handle, yet powerful. A number of formulations have come up for ANFO explosives.

14.3.4.1.3 Gel Explosives; they occupy a predominant position among industrial explosives. They are used as blasting agents.

Gel explosives have a jelly-like consistency and they are packed in plastic tubes, like sausage. Both the ends of the tube are closed.

Gel explosives are made from ammonium nitrate, calcium nitrate, aluminium, ethylene glycol and TNT. The proportions of these components vary depending on the desired explosiveness of the water gel. They are often sensitised by a number of materials like Aluminum powder, TNT, PETN, RDX. Gel explosives have many advantages over the traditional explosives collectively called dynamites, including the following:

- They are less hazardous to manufacture, store, transport and use.
- They are less toxic.
- They are cheaper.

They are known by a number of names, most frequently used names are:

- Water Gel Explosives
- Slurry explosives
- *Explosive Emulsions.*

The water gel explosives do not contain NG. They are solution of nitrates containing water (15%). The following are the main ingredients of water gel explosives.

- Ammonium Nitrate
- Calcium Nitrate
- Sodium Nitrate

In addition, they contain stabilisers and gel forming agent. Some water explosives also contain Aluminum (for energy), TNT or aliphatic amine nitrate (for sensitization).

Slurry explosives are essentially ammonium nitrate explosives turned into slurry by the addition of water and a gelling agent. Sometimes sensitising agents are also added.

Explosive emulsions are usually made of inorganic nitrate, Ammonium or Sodium Nitrate (AN or SN) mixed with fuel oil, wax and emulsifier. The mixture is made sensitive with air bubbles (through tiny plastic bubbles). In some preparations Nitrocellulose (NC) and Ethylene Glycol Dinitrate (EGDN) are also added for sensitisation. Two typical formulations are:

1. **Nipak:** Ammonium Nitrate + Sodium Nitrate + Tetrachloride+ polyurethane + Aliphatic amine nitrate with plastic bubbles.
2. **Emulex:** AN+SN+AL + oil with emulsifier + microbubbles.

Industrial explosives are mainly used for blasting, mining. Important members are dynamites of various compositions (and strengths). Examples are Gelatins, Gelignite and ANFO.

Emulsion explosives are popular for blasting purposes. They have high speed because of their particle size. They can be used in wet or water-filled holes, as they are also available in waterproof form.

14.3.4.2 Military Explosives

Military explosives are mainly TNT, RDX, PETN, Tetryl, HMX. The first three are the most popular. Military explosives are usually used in mixtures.

Table 14.7
Military Explosives

Name		Composition
1. A-3	=	RDX + Wax
2. B	=	RDX + TNT + Wax
3. C-1	=	RDX + Plasticiser[1]
4. Cyclotol	=	RDX + TNT
5. PTX-1	=	RDX + TNT +Tetryl.
6. PTX-2	=	RDX + TNT + PETN
7. Pentilite	=	PETN + TNT
8. Terytol	=	TNT + Tetryl
9. Tritnol	=	TNT + AL
10. Picratol	=	TNT + Am. Picrate
11. Octol	=	HMX +TNT
12. Delta sheet	=	PETN + Platiciser

The variety of military explosives is legion. The number is increasing. The compositions and formulations also vary, not only with different brand names but also with various batches of the same explosive mixtures. Most formulations are secret.

14.3.4.3 Pyrotechnics

Pyrotechnics are an explosive mixture to create fireworks display. The main ingredients used are mainly gunpowder, aluminium powder, barium nitrate, magnesium powder, nitrate mixtures. A large variety of pyrotechnic items is available in the market and new products come up continuously. Only licensed persons can manufacture them. However illegal manufacture goes on.

Before pyrotechnic products go to the market the authorities inspect the products. Each product has to conform to the specifications laid down by the Chief Controller of Explosives *vis-à-vis* its composition and structure. The nature of the explosive as well as the quantity of the explosive used has to conform to the directions of the authorities. In fact, the pyrotechnics item of a firework product leaves the premises only after the approval of the Inspector of Explosives.

The use of chlorates mixtures is prohibited in fireworks.

The pyrotechnics are supposed to be innocent items for fireworks display on festivals, birthdays, marriages and other celebrations. However, the manufacturers frequently cross the safety limits in order to increase the popularity of their brands.-p

Unlicensed manufacturers are often negligent. They do not hesitate to produce dangerous accident-prone fireworks. They sometimes cause serious accidents. Further, the users are usually children. Most of them have a "could not-care-less" attitude. They worsen the situation still more serious. Hundreds of children suffer injuries every year. A stringent control on the manufacturer and vigilance on the part of parents is essential.

> *In a case of accident while playing with fireworks, a child of ten years lost both his eyes. He was playing with a legally manufactured, hence authorised, cracker.*
>
> *An examination of a number of crackers of the same make and model revealed that clay was used to plug the two ends of the paper tube forming the body of the cracker. A series of experiments with the crackers showed that due to excessive use of gum in the clay (not specified in law), it had hardened. Further, it was partially baked by the heat of the explosion.*
>
> *Experiments with the crackers showed that the pieces of the hard clay plugs flew to long distances, even to 15 metres; and in all directions. If these pieces hit any person in the eyes, they could cause serious damage to the eyes, as had happened to the boy.*
>
> *It appears that the hardening of the clay plug due to excessive use of gum-was responsible for the serious accident. (CH)*

14.3.4.4 Propellants

Propellants are used in ammunition and have been discussed in some detail elsewhere in this book.[5]

14.3.4.5 Aerosol Explosive Mixtures

Non-explosive and explosive mixture is formed by combustible gases like NG (Natural Gas), LPG (Liquefied Petroleum Gas), volatile inflammable liquids and combustible organic dust, when they are dispersed in the air in a confined space and a spark or flame is applied to the aerosol. Household gas (LPG) cylinders explosions are on the increase.

14.4 INDIVIDUAL EXPLOSIVES

14.4.1 Gunpowder

Gunpowder is perhaps the oldest explosive known to man. Its details are given elsewhere in the book[6]. In addition to its use as propellant in homemade cartridges and muzzle-loading guns, it is used in mining for blasting, in safety fuses or fuse cords, in crackers and fireworks. It is also used in IEDs.

Gunpowder is an intimate mechanical mixture of potassium nitrate (or sodium nitrate), sulphur and charcoal. It can be identified by identifying its constituents. When it is treated with water, nitrate is dissolved and can thus be separated and identified from the solution.

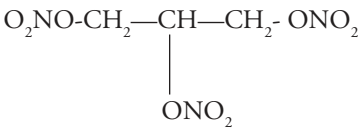
Potassium nitrate is identified from the colour of its flame (orange-purple) or by instrumental methods.

Residue after removal of potassium nitrate is stirred in pyridine, Sulphur is dissolved in the solvent. Filtration removes the charcoal from the sulphur solution. Evaporation of the solution gives sulphur It is identified from its colour, crystals and burning which gives sulphur dioxide. With sodium hydroxide solution, the filtrate gives tan-brown colour to indicate the presence of sulphur.

Charcoal is identified from its colour, non-reactivity and burning.

5. See Chapter 9. May also see chapter 3 of my book: ***Firearms in criminal Investigation and trials;*** 2017 Edn (V), LexisNexis.
6. *Ibid.*

14.4.2 Nitroglycerin [$C_3H_5(NO_3)_3$]



It is a pale yellow liquid. It is an extremely dangerous explosive in its pure form. It is not used as such. Its common modified forms used are:

- Cordite, a propellant. Its use reduces the life of the firearm's barrel.
- Dynamite
- Gelignite
- Gelatin
- Plastic Gelatin

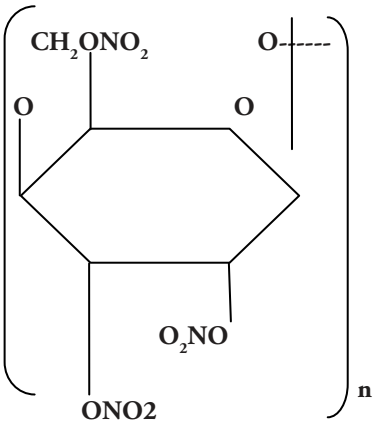
Modified nitroglycerin explosives are sold under a host of other trade names also.

Nitroglycerin is also used as medicine for heart and Angina Pectoris patients. It relieves the pain by reducing the blood pressure almost at once.

Nitroglycerin, when heated with sulphuric acid and mercury, gives nitrogen dioxide - a brown gas with a pungent odour.

Thin layer chromatography (TLC), using a silica plate with ether solvent, is used to confirm nitroglycerin. Sodium hydroxide spray followed by the spray of Greiss agent gives yellow to red colour spots.

14.4.3 Nitrocellulose (trinitrate)



Nitrocellulose, also known as gun cotton, is prepared from cotton or other cellulose by nitration. It has found extensive use in the manufacture of ammunition singly or in combination with nitroglycerin. As the latter has a tendency to corrode and damage the firearms, nitrocellulose is used alone in many propellant formulations.

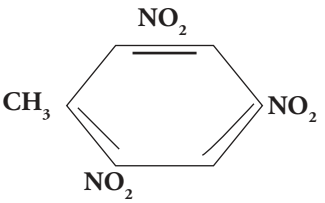
The maximum theoretical intake of nitrogen (in nitrate form) is 14.5%. However, explosive nitrocellulose contains slightly less than 13% nitrogen. Nitrocellulose with fewer quantities of nitrogen (~ 11%) is used for films, varnishes, lacquers.

Explosive nitrocellulose behaves both like a high or low explosive. When the quantities are large or it is exploded in a confined place, it explodes like a high explosive. In open

spaces and when the amount of the nitrocellulose is not large, it burns and behaves like a low explosive.

Nitrocellulose is identified through its solubility. It is insoluble in water, sparingly soluble in alcohol and easily soluble in acetone and certain esters. It is identified through TLC. The plate is coated with silica gel and acetone is used as a solvent. Water elutes the nitrocellulose. Sodium hydroxide spray followed by Greiss Reagent gives red spots.

14.4.4 Trinitrotoluene (TNT)



Trinitrotoluene is a high explosive. It is obtained by the nitration of toluene - a product obtained from coal tar or from petroleum.

It forms the major part of the bursting charge in many military explosives or explosive devices; either singly or in combinations with other explosives. Some of its combinations are:

- **Amonal**—it is a mixture of TNT, ammonium nitrate, aluminium and carbon.
- **Amatal** - It is a mixture of TNT and Ammonium Nitrate.

TNT is identified from its light brown colour. On identification of other substances, both explosive and non-explosive, formulation of the explosive mixture is ascertained.

TLC, with ether as solvent and silica gel as TLC plate coating (stationary phase) is used to identify the explosive.

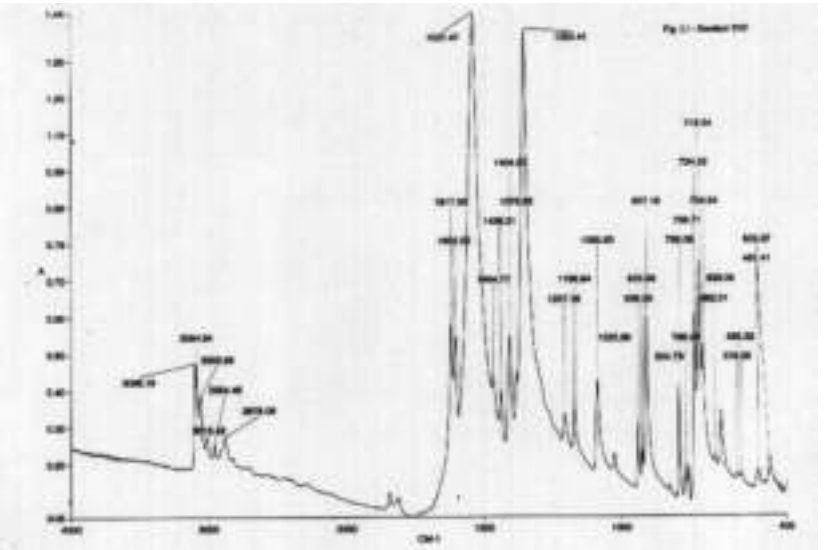


Fig. 14.5
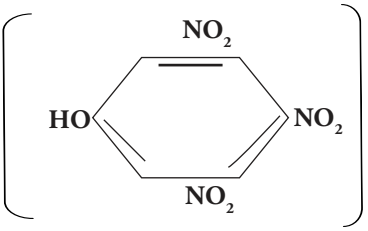
TNT IR Spectrum

14.4.5 Picric Acid and Picrates

Picric Acid



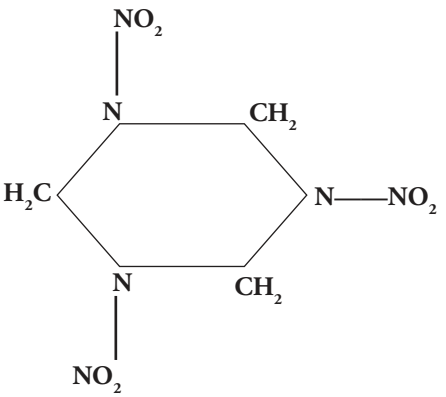
Picric acid is obtained by the nitration of phenol. It is yellow in colour. Its solution is used as a tincture. Picrates are derivatives of picric acid. The acid is ordinarily stored under water.

Picric acid and picrates are frequently encountered in homemade bombs. The explosion's products leave characteristic yellow stains on the objects around.

Picric acid and picrates are identified from their colour, melting points and derivatives with characteristic melting points.

Instrumental methods, TLC, IR, HPLC, XRD are particularly useful to identify/estimate picric acid and its explosives.

14.4.6 RDX (Research Department Explosive)



RDX or cyclonite is cyclo-1,3,5 trimethylene 2,4,6, trinitramine. It is one of the most important military explosives today. It is a highly stable high explosive. It is susceptible to shock.

RDX is used as a component of many formulations with TNT and PETN. Semtex is a plastic explosive created from RDX and PETN.

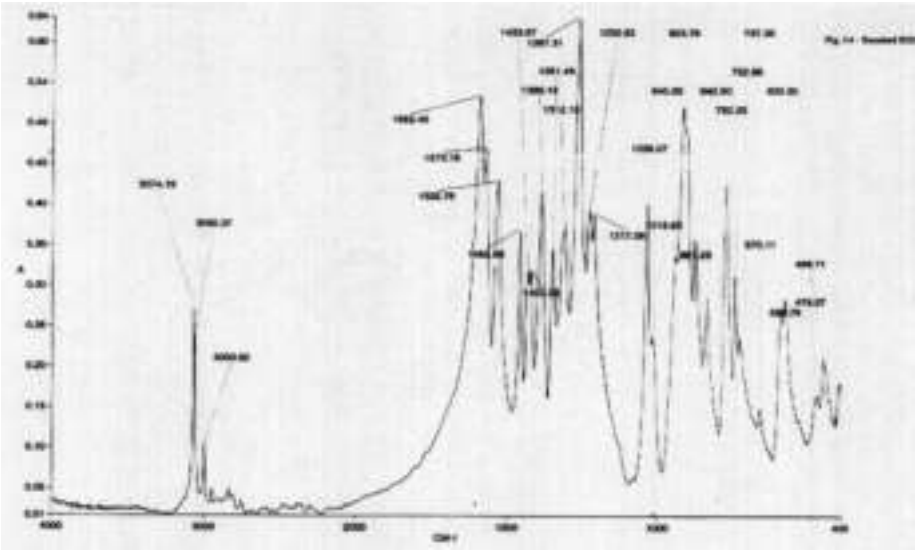


Fig. 14.6

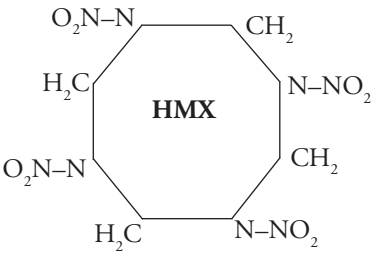
RDX IR spectrum

RDX in its various avatars has been used as military explosive now for a long time. Its abuse by the terrorists is comparatively recent, especially since rogue governments have started supplying it to their favourite terrorist groups. It has become popular with the terrorists. They are now using it routinely on a large scale.

RDX is identified easily:

- Spot test: 6-amino-I-naphthol and sulphuric acid gives yellow colour. Addition of ethanol changes it to blue, and then blue changes to grey.
- TLC, with acetone and silica gel used as the moving and stationary phases identifies RDX.
- IR spectroscopy identifies RDX. Its acetone solution or potassium bromide pellets (FTIR) give characteristic trace.
- X-ray diffraction, GC-HPLC, GC-MS are other techniques used for its identification.

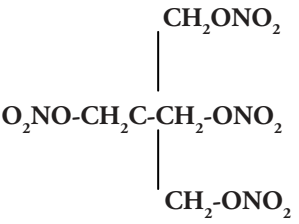
14.4.7 HMX



HMX is similar to RDX. Chemically it is *tetra*-methylene *tetra*-nitramine. The explosive is used as rocket fuel and also as a booster charge in artillery shells.

Its identification follows the RDX pattern: Spot test, TLC, IR, XRD are the method of choice. GC, HPLC, GC-MS techniques have also been used.

14.4.8 PETN ($C_5H_8N_4O_{12}$)



PETN

PETN is chemically *penta*-erythritol *tetra*-nitrate. It is a basic explosive charge for blasting caps and detonators. It is also used as an ingredient of booster charges, plastic explosives and detonating cord. It is also used in place of nitroglycerin for angina pectoris though mono-nitrate of glycerin is replacing the two.

PETN is highly stable. It is, however, highly sensitive to impact.

PETN does not give any good spot test. It is not easy to identify it through TLC either. The methods of choice are infrared spectroscopy or X-ray diffraction.

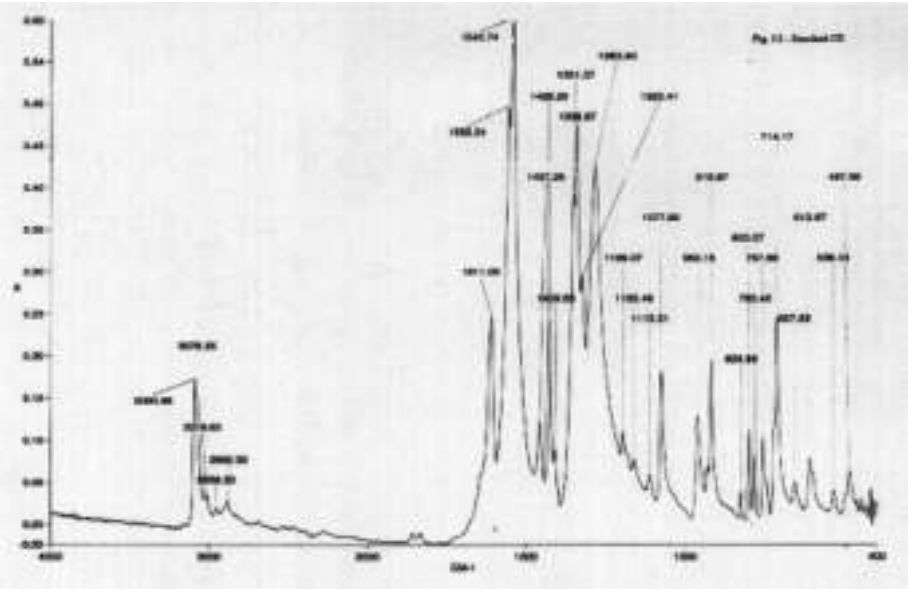


Fig. 14.7
PETN IR spectrum

14.4.9 Ammonium Nitrate (AN)

The main use of ammonium nitrate is as a fertiliser. However, it is an important component of many explosive formulations, especially in dynamites used for blasting purposes.

Ammonium nitrate is highly stable. It has low sensitivity to friction and impact. It is an explosive of choice for industrial purposes. It is a good oxidiser, provided the other components of the mixture do not react and change its characteristics. It is highly hygroscopic.

Ammonium nitrate alone can explode at about 20° C, if heated in airtight containers.

Ammonium nitrate is easily identified from the characteristic reaction of its ions.

14.4.10 Fulminates

Fulminates are primary explosives. They are highly sensitive to friction and impact. Consequently, they are very dangerous to handle.

Fulminate of mercury [Hg $(ONC)_2$] is used as an initiator in many explosive devices, firearm ammunition and in other primers.

14.4.11 Lead or Silver Azide

Lead and silver azides are high explosives. They are sensitive to pressure. Lead azide [$Pb(N_3)_2$] is used in percussion caps and other primers to initiate the main charge. The substance is not used as an explosive as such.

Lead and silver azides are comparatively more stable to heat and storage and less sensitive to impact than fulminates. They are compatible with most of the explosives.

Silver azide (AgN_3) is more sensitive than lead azide.

14.4.12 Lead Styphnate ($C_6HN_3O_8Pb$) H_2O

Lead styphnate is used as a primer in initiator compositions in various explosive devices and in percussion caps of firearm ammunition.

The explosive properties of styphnates are similar to those of lead azide or fulminates. Lead styphnate is non-hygroscopic and non-corrosive. It is, however, very sensitive to electric impulse or direct heating.

14.4.13 Tetracene (Tetrazene) $C_2H_6N_{10}$ (H_2O)

Tetracene is a highly sensitive explosive. It is stable to heat up to 75° C. It is used to sensitise primer compositions.

14.4.14 Dinol (DDNP) $C_6H_2N_4O_5$

The chemical name of dinol is Diazo dinitrophenol. The compound is less sensitive to impact, friction and electrostatic charge as compared to other primary explosives. It is the primer charge of choice for industrial explosives, blasting, caps.

14.4.15 Dynamites

Dynamites are frequently put to unlawful use. The culprits procure them from construction project contractors.

The dynamites have different compositions, which help to identify the source of dynamites. The usual tests (TLC, IR, GC and HPLC) are used to identify the organic constituents.

The constituents, which are used in the manufacture of dynamites include:

1. Nitroglycerin
2. Nitrocellulose
3. Ammonium Nitrate
4. Sodium Nitrate
5. Sulphur
6. Filler, which may be saw dust.
7. Oils

14.5 EXPLOSIVES DEVICES

There are too many explosives devices to permit their detailed discussion. Here only those devices are discussed which are sometimes involved in the criminal justice system.

14.5.1 Safety Fuses

Safety fuse is a train of black powder, like the lead of a pencil, enclosed and covered with cotton or jute threads or tape. There are ordinarily three layers of covering, but the number of layers and type of material used vary with different manufacturers. The outer layer is impregnated with moisture proof material varying from wax or coal tar to modern plastics. The powder is also enclosed in a rubber or plastic hose.

The burning speed of a safety fuse is controlled by the nature, grain structure, quantity and packing of the black powder. Usually it takes about seven seconds for the impulse to travel through one metre of a safety fuse.

Fig. 14.8
Cross-sectional view

Fig. 14.9

Longitudinal sectional view of a safety fuse

14.5.2 Detonating Cord

Detonating cord is also called Fuse Cord. It has a somewhat similar function and structure to that of a safety fuse. But instead of gunpowder PETN is used as the impulse carrier and the cover is usually a plastic hose. It is used to connect and initiate a number of explosive devices and charges simultaneously. It is also used in non-electrical detonators. It is shockproof.

PETN is a high explosive. It detonates at a high speed of about 5000 m/s. It produces burns mark on the surfaces where the cord was placed. The marks remain identifiable for a long time. The mark also indicates the site where the detonating cord was placed to cause the explosion.

14.5.3 Primers

Primers are essential initiating devices used in small arms and artillery ammunition. The initiating charge in the primers of small arm consists of:

1. A sensitive primary explosive: Mercury fulminate, lead azide or lead styphnate; the last being the favourite.
2. An oxidising agent (potassium chlorate), and
3. A combustible material (antimony sulphide).

The initiating charge is placed in a percussion cap and covered with waterproof lacquer in small arms ammunition.

The artillery primers are bigger in size. In addition to the initiating charge, they contain black powder to boost the initiation of the main explosive charge.

14.5.4 Military Detonators

Military detonators initiate and explode larger charges. Ordinarily, a detonator consists of a metal tube closed at one end. It is about 25 mm (one inch) long and about 6 mm (a quarter of an inch) in diameter. The detonating charge is placed first in the tube and covered by primary explosive. A high explosive (tetryl) tops the two.

Military detonators are also known as blasting caps.

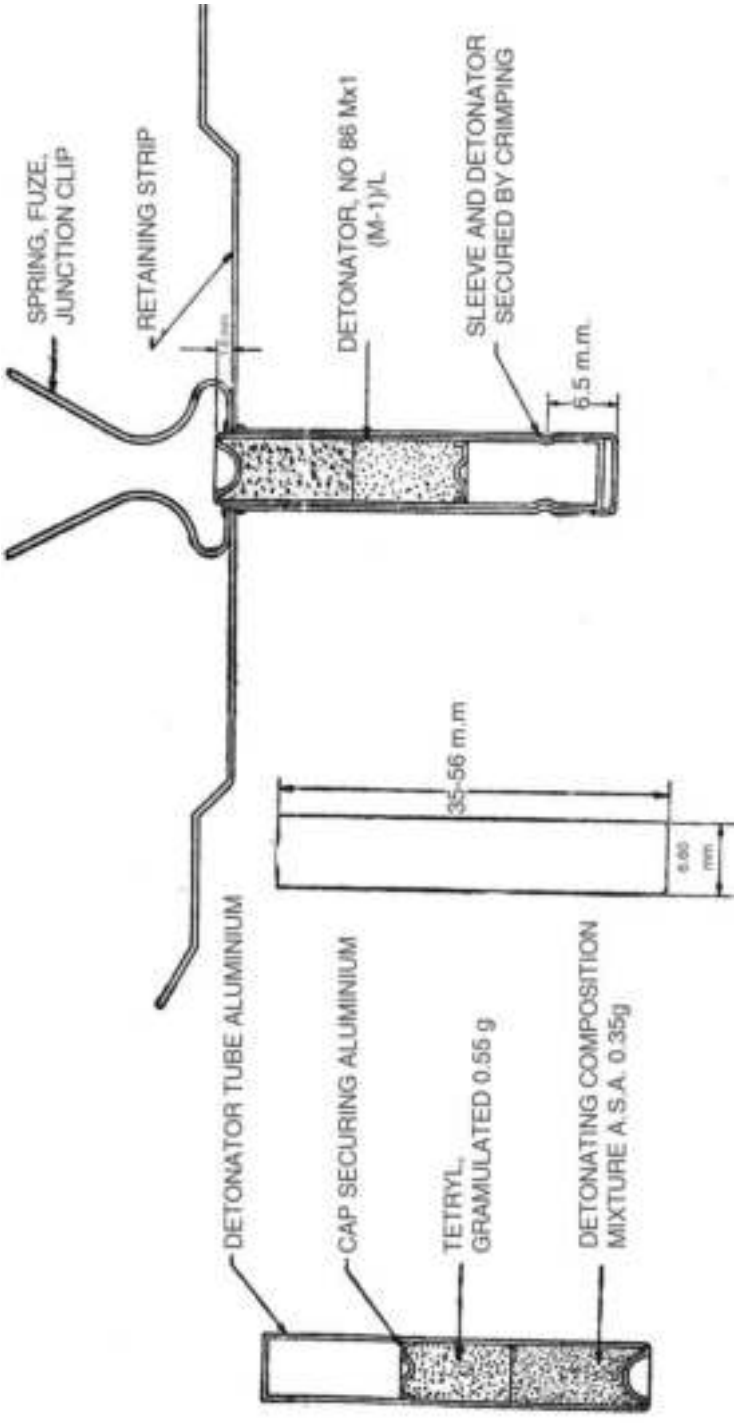

Fig. 14.10
Disruptive Detonators

14.5.5 Commercial Detonators

Commercial detonators are also known as blasting caps. They are similar to the military detonators with the following components:

1. Usual initiating charge is lead azide.
2. Common detonating charge PETN.
3. Container tube is of aluminium, brass or copper.
4. The detonating cord or electric lead wires are crimped into the container.
5. A small electrical heating element, placed in the initiating charge in the detonator tube. On switching on the current, the heated element ignites the initiating charge, which in turn detonates the main charge.
6. Alternatively, one end of a fuse cord placed in the initiating charge. The other end is set on fire. It ignites the charge, which in turn detonates the bursting charge.

The blasting cap is shattered in the explosion. Bits of the container tube and the marks of the burnt fuse are found at the site.

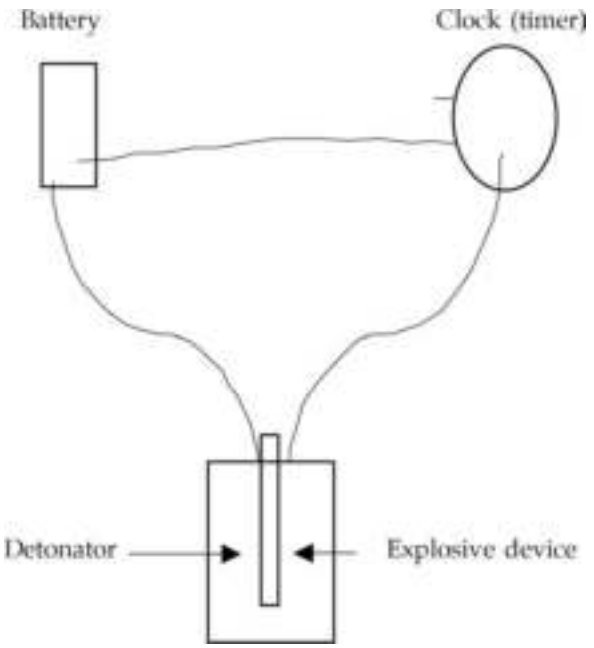

Fig. 14.11

Delayed Explosion setup

14.5.6 Explosive Train

An explosive train is an arrangement of different explosives of varying sensitivity and power to achieve proper initiation and detonation of the main charge to achieve the maximal explosive effect of the given explosive with maximum safety.

The train has essentially three parts:

a. The firing device.

b. The detonator and the booster charge.

c. The main bursting charge is contained in a shell of specific design.

The arrangements, however, vary tremendously in accordance with the nature of the explosive device.

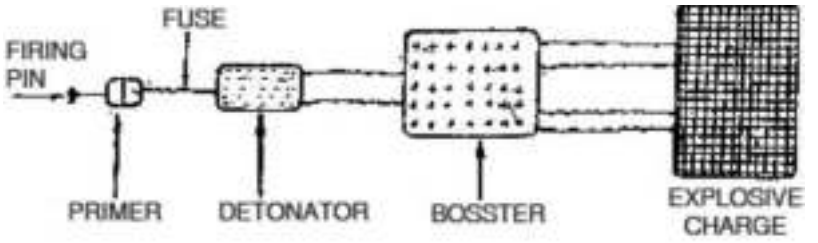

Fig. 14.12

Explosive Train Arrangement in High Power Bombs and other Explosive Devices

14.5.7 Grenade

A grenade has an explosive charge, an initiating charge, and an initiation device, all contained within a case of cast iron. On explosion, the case shatters into splinters and fragments. The splinters act as missiles and injure persons around the area (of a circle about 20 m in radius) where the grenade explodes.

The initiating device is a primer cap. The trigger is in the form of a lever, which is held along the case with a pin. When the grenade is to be used, the lever is released. It is actuated by a spring. The lever flies upward and the hammer thereon strikes the cap. The primer mixture gives out a flame, which ignites a safety fuse, kept in the cap. The other end of the fuse initiates a detonator kept in the main explosive charge (usually TNT or Baratol). The charge explodes and bursts the grenade.

The safety fuse has a specific length to delay the explosion. Usually two lengths are used. One delays the explosion by about 4 seconds and the other by 7 seconds.

A grenade can be thrown to a range of about twenty metres. It is dangerous in an area of a circle of about the same radius (20 metres).

The complete initiating device is one separate piece. The piece is kept away from the grenade during storage. The grenade is safe if the initiating device is not fitted in the body of the grenade.

To make the grenade functional, the initiating device is screwed to the main body of the grenade with the base plug. The grenade is ready for use.

Grenade is an anti-personnel device, generally hurled manually. However, it can be fired from a rifle (say 7.62 mm) specially adapted to fire grenades.

The manual hurling range of a grenade is about 20 m (23 to 27 m). The range is about 180 metres when fired from a rifle. It explodes into 40 to 60 fragments, killing and maiming the enemy within an effective radius of 27.5 meters.

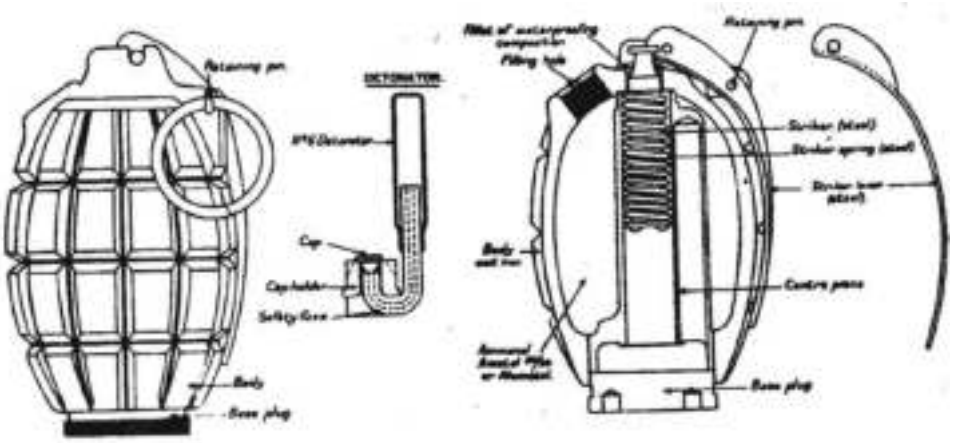

Fig. 14.13

Sketch of a Grenade. The Various Parts are Indicated in the Figure

The Indian grenade has the following specifications:

1. Body: round cast iron segmented
2. Main explosive charge: TNT
3. Detonator time lag: 4 seconds for hand grenade; 7 seconds for rifle grenades
4. Weight 680 grams

14.5.8 Military Bombs and Shells

The variety of military bombs and shells is very large. It is increasing every year. They are made to rigid specifications. In general, they are structured on the basic principle of the explosive train. Excluding hand grenade and mines military explosive devices are rarely encountered in police work.

Military bombs and explosive devices are easily distinguished from homemade bombs (IEDs) the following characteristics help:

a. All military bombs have good finish.

b. They bear identification marks: make, year of manufacture. The marks may be letters, logo figures or monograms on various parts of the device.

c. They have an appreciable size, except for the anti-personnel mines and detonators.

14.6 IMPROVISED EXPLOSIVE DEVICES

There is an infinite variety of crude improvised explosive devices (IEDs). They do not conform to any pattern or design. In fact, the nature of the contraption depends upon the ingenuity of the culprit and on the availability of materials which form components of the device.

14.6.1 Basic Components of IEDs

The essential components of an IED (homemade bomb) are:

1. A container
2. An explosive

3. An initiation device
4. Missiles
5. A timer in time bombs

14.6.1.1 Containers

The containers of crude bombs vary tremendously. Strings, paper, cloth, bottles, bulbs, tins, torch covers, bamboo poles, coconut shells, earthen pots and pipes have been used. They are used, usually, for bombs of small size, weighing less than a kilogram.

The terrorists have brought in new types of containers for IEDs. Some of them are:

1. **Transistor Bombs; i**n these bombs, the casing of a transistor radio, its electrical circuits and switches are used as essential components. These bombs are planted at busy places. They are supposedly left by some careless owner.

   When a person picks up and fiddles with such a device, the explosive inside explodes and kills the handler and other persons who happen to be nearby.
2. **Suitcase bombs; i**n suitcase bombs, suitcase forms the container. They house the explosives, the missiles, the initiating gadget and the timing device, usually a clock mechanism. They are placed at the intended targets, like cars, buses, trains, aeroplanes, buildings. The infernal device explodes at the set time and takes a toll of life and property. In the meanwhile, the terrorist vanishes from the scene. The power of these time bombs has varied, depending on the maker's ingenuity/intention.
3. **Human Bomb; h**uman bomb are also called suicide bombers. They were initially used to kill important leaders. A human bomb killed Rajiv Gandhi, a former prime minister of India on May 21, 1991, along with more than a dozen persons. Now, they are used for all types of targets.

   A spate of human bombs in Pakistan, using all sorts of modes, has been inflicting heavy loss of life and property on the population in recent years. It has greatly unnerved the Pakistan government. The spate continues unabated.

14.6.1.2 Explosives

The explosive is the most important constituent of an IED. It may be any of the following substances:

1. Military or commercial explosives
2. Small-arms propellants
3. Nitrate mixtures; nitrates of ammonia, barium, potassium are often used because of their easy availability.
4. Chlorate or permanganate mixtures; they are used in the same way as nitrate mixtures, often with more disastrous results. The mixtures are also used as initiators for fires and other explosives. For example, a mixture of potassium chlorate and sugar catches fire immediately on coming into contact with sulphuric acid.
5. The highly inflammable organic liquids; they have excellent explosive properties. The famous (or infamous) Molotov cocktails contain only petrol. Aviation turbine fuel of two aeroplanes acted as the explosive to destroy the World Trade Towers, New York in 2001.

14.6.1.3 Traditional Initiation Devices

The initiation devices on IEDs vary tremendously. The common ones are.

1. **Mechanical**: fall, crushing, impact, friction
2. **Shock**: induced by other explosions
3. **Heat**: flame, steam, exhaust pipe emissions
4. **Spark**: flame, cinders
5. **Chemicals**: for example, sugar-chlorate-sulphuric acid mixture
6. **Miscellaneous**: light, infrared rays, laser, ultrasound waves
7. **Electric current**

14.6.1.4 New Initiation Modes

1. **Radio waves; t**hey may actuate an electric circuit, which starts the explosion.
2. **Trip wire; a** wire may be arranged in such a way that if it is tripped upon, it makes or breaks an electrical circuit to actuate the initiating mechanism.
3. **Remote control;** remote control devices are being used to initiate explosive devices. They function on the same principles as a remote control device in the television set. They complete an electrical circuit and initiate the infernal device. Remote controlled electronic devices have become common with the hi-tech terrorist. The devices are available which can initiate explosion even from kilometres.
4. **Capsule initiation; a** capsule filled with sulphuric acid is kept in a sugar chlorate mixture. On the corrosion of the capsule, the acid comes in contact with the mixture and starts a fire, which, in turn, initiates the explosive device.
5. **IR sensors;** there are used in electronic timers. They are quite popular for short-range initiations.
6. **The trip wires**; they have also been used to blow up vehicles on the road, in parking places or on railways tracks.
7. Mobile phone; an ordinary mobile phone was used to initiate the Bali nightclub explosions which killed a large number of tourists
8. **Miscellaneous; t**he improvised initiation device may include an anti-handling mechanism. As soon as the device is handled, it explodes. The handling may actuate chemical mixing, mechanical spring or an electrical switch and starts the explosion. The variety of mechanical devices is legion and unlimited.

   Other types of initiators utilise photoelectric devices, sound operating switches, changes in temperature and moisture.

14.6.1.5 Missiles

All sort of materials, including stone pieces, ball bearing, small iron pieces, nails have been used as missiles.

Shattered pieces of containers also form missiles of the IEDs.

Fig. 14.14
Nail as missiles found in an IED

14.6.2 Improvised Explosive Devices

The following are the common types of IEDs encountered in police work.

14.6.2.1 Throw-downs

Throw-down bombs are used frequently in India. They work on the same principle on which a similar throw-down cracker works. On throwing down, the bomb explodes due to initiation by the impact on a sensitive material kept inside. Suitable chlorate mixture, fulminates mixtures, other chemical mixtures are used to start the explosion.

Throw-down bombs are often balls of various sizes; the smallest effective bomb being over five centimetres in diameter.

14.6.2.2 Fuse Bombs

Fuse bombs are fitted with a safety fuse. The fuse is ignited before using the bomb. The fuse cord of convenient length is used so that it does not explode while being thrown. The lighted fuse puts the explosive charge on fire and the device explodes. This is the easiest and one of the safest arrangements for initiation.

14.6.2.3 Percussion Cap Bombs

In percussion cap bombs, the initiation of the charge is similar to that of a grenade. A mechanical arrangement is made to hit a percussion cap The exploded percussion cap puts the explosive charge on fire; directly or indirectly. This is rather a complicated

arrangement. The terrorists in Punjab, in the 1980s, sometimes used this mode to initiate the IEDs. They used percussion cap of standard ammunition along with a nail-hammer arrangement.

14.6.2.4 Time Bombs

Time bombs explode at a preset time. Clocks or watches are usually used to fix the time of explosion. Other modes like electronic timers also exist.

A time bomb using a clock to fix the time of the explosion is included in an electric circuit along with the initiator and a battery. One end of the wire of the circuit is connected to the metallic needle of the watch (usually the hour hand) and the other end at the hour digit or the site. When the hour hand touches the digit or the site, the electric circuit is completed. The current would activate/initiate/explode the explosive system. Suitcase bombs were usually time bomb.

A clock mechanism is the most accurate method of timing a bomb and can serve to start an explosion at any time within 12 hours. New electronic timers can fix the time of explosion even up to 18 months or more.

Other types of timing devices used are:

1. The alarm system of a clock can start an explosion if a primary explosive is placed on the gong where the hammer strikes.
2. Corrosion of a metal or plastic container and seepage of sulphuric acid into a sugar-chlorate mixture can initiate an explosion. Estimated of corrosion time can be used for timing the explosion. Alternatively, when a container is fully corroded, an electrical connection is made which starts the explosion.
3. A capsule filled with sulphuric acid is placed in a sugar-chlorate mixture. The acid corrodes the capsule walls, which trickles down and initiates the explosion.
4. Fuse cords have also been utilised for timing the explosion. However, the fuse cord gives a limited timing interval, only long enough to run away to a safe place. The rate of a slow burning safety fuse is about 70 centimetres per minute. Therefore, seven meters of burning fuse cord will give ten minutes.
5. Natural fibre strings have also been employed for a longer delay. However, smoke and burning smell can give away the device. Besides, rain and wind can also upset the arrangement.

   In an interesting case, a man was sleeping in his ground floor bedroom. The window of the room was open. His foe found it an excellent opportunity to kill him. He took dynamite sticks, fixed a string in the sticks and placed the sticks through the window, close to his head. He lighted the other end of the string and ran away from the site. However, burning smell woke up he intended victim. He got up with a start and saw the string burning. He pulled out the smouldering string and threw it out. Only then did he notice the dynamite. The smouldering end had reached quite close to the sticks. (CH)

14.6.2.5 Letter Bombs

In 1972 there was an international wave of letter bombs. The wave caused not only death and injuries to a large number of persons; worse still, it caused panic in the world. Fortunately the wave has since subsided. However, the novelty of letter bomb remains. It still pesters people, now and then.

A letter bomb is a booby trap. It has to pass as a letter or a postal packet. Consequently, it must have limited dimensions and weight. Yet the device must contain all the components of a booby trap: a container, an explosive, missiles and an initiation device.

The container is the letter or packet cover. As the package has to move through the postal process, it has to be safe through the postal process. The container and the contents, therefore, have to be carefully selected, arranged and packed.

It has been estimated that about fifty grams of high explosives is sufficient to kill or injure a person seriously from a distance of about fifty centimetres. When a person is handling a letter bomb, the distance is often less. Consequently, the quantity of fifty grams of the needed explosive can be placed in a letter bomb. It does not make the letter or packet too bulky or suspicious, especially if the explosive is placed in the form of a sheet cut to the size of the letter cover.

The main ingenuity of the culprit lies in the choice and arrangement of an initiation device. A host of modes has been used:

1. The explosive chosen is so sensitive that it explodes on rough handling.
2. A friction sensitive explosive is placed at possible tearing sites for opening the letter. The tearing process explodes the letter bomb.
3. Potassium chlorate mixtures are placed in such a position that they, at the time of opening, start the explosion.
4. A miniature percussion cap (or detonator) and spring operated hammer is placed in the postal parcel in such a way that the hammer, on opening the packet, strikes the cap and explodes the explosive.
5. On opening the letter or packet bomb, a tiny battery gives a spark and initiates the charge.

The world is so much used to postal letters and packets that nobody cares to note the address or think about the possibility of its being an infernal device, The following observations prove useful to identify a letter or packet bomb:

1. A letter bomb often does not bear the address of the sender. It is frequently unregistered and may be over stamped. It is often marked 'personal' 'confidential' or 'secret'.
2. The outer cover of a letter bomb may carry stains.
3. The letter or packet bomb may be oddly uneven. It happens when an electrical or mechanical device is used to initiate the explosion. Metallic objects, can be felt or seen inside the packet.
4. The letter or packet bomb may have a cardboard-like stiff material inside, but is heavier than a normal piece of cardboard.
5. The name and other words on the letter bomb may have been misspelled or written in capitals.
6. The letter bomb may give a smell of oil or perfume.

The above aspects of a letter are checked systematically:

1. Suspect all letters or parcels from unknown sources.
2. Do not open a letter or a packet until it is found safe.
3. Get expert help to handle a suspicious packet or parcel.
4. Scrutinise the letter visually and feel the contents manually for any incongruity. Presence of a rattling noise inside is odd. Ascertain the cause before opening the letter.
5. Examine the letter or packet in transmitted light using a strong yet cool source of light (the light rays filtered through special glass). It may indicate abnormal objects. Ascertain their nature before opening the letter or packet.
6. Observe the letter under ultraviolet light. It may reveal unusual suspicious spots on the letter or packet.

7. Get the packet checked with infrared rays. They reveal the content. Most of the Forensic Science Laboratories now have infrared image conversion devices. The nature of the contents of packet (letter) can thus be evaluated without opening the letter or package in some cases.
8. Get the packet X-rayed. They reveal opaque objects. Thus, if a letter bomb is examined (screened as at airports) the initiation metallic device is revealed in most of the cases. X-ray equipment is available in most of the hospital in addition to the Forensic Science Laboratories. Soft X-rays are used.
9. Take the suspected letter bomb to an open space. Place it in a pit of about one metre diameter and depth. Handle it roughly (shake, turn, beat and press) by a remote controlled device. A strong long staff is efficient enough in most of the cases. Give sufficient time for each process. The device will explode, if it is designed to explode.

If the above checks and rough handling fail to reveal the infernal nature of the letter bomb, open the letter cautiously. The guiding principles in opening a suspect letter are:

- cover about 90-95% of the surface of the letter with a heavy book.
- cut open all the edges with a thin wooden (bamboo) strip in turn.
- employ minimal force to cut or separate the edges and extract the contents
- open the letter/packet cautiously and slowly. Haste can cause an explosion.

14.6.2.6 Transistor Bombs

Terrorists have used transistor bombs in recent times. The terrorists would leave such bombs in public places where someone would pick them up and fiddle with them. The bomb would explode killing the fiddlers and nearby persons.

In transistor bombs, the body of the transistor is used to house the explosive and missiles. The off-on switch serves to initiate the bomb electrically.

14.6.2.7 Magnetic Bombs

Magnetic bombs are usual time bombs having a moderately powerful magnet attached to the device. The magnet helps to fix the bomb to the car of the victims. The bomb would explode at the prefixed time, blowing the car to pieces and killing the persons in the car and bystanders.

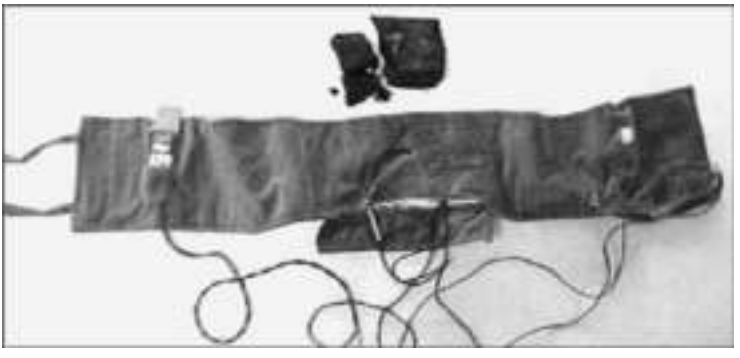

Fig. 14.15

Human Bomb belt filled with explosive and detonating device

14.6.2.8 Human Bombs

The human bombs are humans. They carry hidden IEDs (bombs) on their person. The IED contains adequate quantities of high explosives and an initiating device. It is often in the form of a belt tied around the waist of a specially made vest. They are worn under normal clothing. When the bomb explodes, it kills the person and others present at the site.

Human bomb persons are mentally deficient. They have been indoctrinated/hypnotized /tricked/purchased or fanatics motivated to act as a human bomb. When the human bomb reaches the target, the handlers, usually, trigger the initiating device through a remote control.

> *Ex-prime minister Rajiv Gandhi, and later Punjab Chief Minister S. Beant Singh, were assassinated by human bombs. The woman who assassinated Rajiv Gandhi herself initiated the bomb. In the latter case, perhaps the bomb was initiated through a remote control. (CH)*

The Taliban, in Pakistan, have refined the abuse of human bombs extensively to increase their lethality. The human bombs person drives the explosive-laden motor vehicles (motor cycles, cars and trucks) into buildings, installations and crowds, causing huge losses of life and property.

14.7 FIREWORKS (PYROTECHNICS)

Fireworks or pyrotechnics are also known as crackers. They are substances, which produce, through self-sustained chemical changes, heat, light, sound, smoke, often a combination of them, on initiation.

The fireworks are made at licensed premises only. The factories are located outside the main centres of activity in a city. They are manufactured from a host of materials, specified and approved by the authorities.

The main explosive ingredient of crackers is black powder. Barium nitrate is also used in some firework compositions. The use of chlorates in fireworks is prohibited as they are dangerous. However, many manufacturers use chlorates illegally in some of their productions.

The initiation device in crackers, ordinarily, consists of a paper tube containing mainly black powder, as in a safety fuse. The paper tube is partly exposed and partly embedded in the crackers' explosive material inside. The outer portion is lighted, the black powder in the tubes carries the fire inside the cracker and explodes the charge therein. Other initiation devices include impact initiation (as in throw-downs) or friction initiation.

There is a large variety of crackers. They differ from other explosive devices in many ways. One important difference is that some crackers (fireworks) in addition to noise, give spark and lights. In some, beautiful multi-coloured display of lights is achieved mainly through the use of aluminium, magnesium and barium metals or their salts.

Cracker manufacturers sometimes ignore regulations and make crackers, which have a larger size, and consequently, are more dangerous.

14.8 NON-EXPLOSIVE EXPLOSIONS

Non-explosive explosions are those where the usual known explosives do not form the explosive charge. Instead, ordinary substances, under certain conditions, explode and cause havoc. They may be:

14.8.1 Mechanical Explosion

Compressed gases, air or vapours, on sudden release (break loose), causes an explosion. Bursting of gas cylinders or boilers are examples of such explosions.

14.8.2 Thermal explosion

Volatile liquids on coming in contact with surfaces at very high temperature, undergo sudden (flash) conversion of the liquid to vapours cause explosion.

14.8.3 Aerosol Explosions

Aerosol is a mixture of natural gas, fuel gas others other inflammable gases/vapours of volatile liquids (petroleum products, alcohol, ethers) with air. When the concentrations of gas/vapours cross the critical limits in a confined place, such as a room, the mixture becomes an explosive mixture. A spark, flame or heat explodes the mixture to cause explosion. Such explosions are called aerosol explosion. Leakage of household gas (LPG) often causes such explosions.

Strictly speaking, these explosions are cases of rapid burning. However, due to the burning, simultaneously, of large volume of gases-oxygen mixture in confined spaces causes explosion. The explosions are powerful enough to blow out the walls, break the doors and windows, bend steel bars and even crack and move the concrete roof slabs.

Some interesting observations about these aerosol explosions are noteworthy:

1. Aerosol explosions do not start fire(s). Rather they extinguish the fire(s)[7]
2. The explosive force of these aerosols reaches maximum when the concentration of the gas in air reaches the theoretical value for its complete combustion.
3. If the amount of inflammable gases is less than the minimum critical concentration, there will be no explosion.
4. If the mixture contains a greater amount of the inflammable vapours/gas than the ideal concentration ratio, the burning is slower. It is sustained for a longer time, however.
5. The slow burning aerosol may start secondary fires.
6. If, the concentrations of combustible vapours/gas go beyond the maximum critical limits, there is no explosion.
7. Organic dust like flour, maize husk, sawdust, coal or charcoal dust sometimes dispersed in air in confined places form explosive mixtures. They explode on receiving a spark or flame.

   In a pharmaceutical factory in a town of Madhya Pradesh, the formulations of medicinal tablets contained starch as the major constituent by weight. Inappropriate humidity control dispersed the starch in the atmosphere of the hall where the tablets were being manufactured. An uneducated labourer struck a matchstick to light a bidi. There was a big explosion, which shattered the doors and windows of the hall and killed the labourer, the only person in the hall at that time. (CH)

The critical lower and upper limits are different for different materials. The limits of some of the common explosive mixtures are given in the table 8.

7. Because the available oxygen which support the combustion.

Table 14.8

Non-Explosive Explosion Mixtures

S. No.	Material	State	Ignition Temp°C	Complete burning %)	MIN. (%) Concentration	Max (%) Concentration
1	Acetylene	Gas	305	2.5	2.15	80
2	Ethyl Alcohol	Liquid	392	3.3	3.3	19
3	Ammonia	Gas	—	—	16	25
4	Benzene	Liquid	580	1.4	1.4	8.0
5	Butane	Gas	—	—	1.9	8.5
6	Carbon monoxide	Gas	609	12.5	12.0	75
7	Coal Gas	Gas	—	5.3	4.5	40
8	Ethane	Gas	472	3.3	3.0	16
9	Diethyl Ether	Liquid	165	3.3	—	—
10	Ethylene	Gas	—	—	2.7	34
11	Petrol	Liquid	280	1.3	1.3	7.6
12	Hydrogen	Gas	574	4.2	4.0	75
13	Kerosene	Liquid	255	1.2	1.0	8.0
14	LPG	Gas	—	—	2.0	10
15	Methane	Gas	632	5.3	5.0	16
16	Natural gas	Gas	—	4.8	2.2	9.6
17	Naptha	Liquid	232-277	10	—	—
18	Octane	Liquid	230	.84	—	—
19	Propane	Liquid	—	—	2.	9.6
20	Turpentine	Liquid	240	.80	—	—

A few years ago, a can containing rectified spirit was being sealed with sealing wax after use. All of a sudden the can exploded spreading the rectified spirit all around and starting a fire. It caused serious burns to the operator. The alcohol- air mixture in the empty space of the can formed an explosive mixture and caused the explosion. (CH)

14.9 ACCIDENTAL EXPLOSION

Accidental explosions are quite common because common explosives are usually unstable compounds. They are highly susceptible to various impulses. An accidentally received impulse can cause explosion.

Accidental explosions take place in the manufacture, transport, storage or in the handling of explosives, even with the best of care and precautions. Such explosions have destroyed tons of ammunition incurring huge loss of life and property.

On 16 August 2001 a devastating explosion took place in a detonators factory. The explosion took place in the crimping unit of the factory.

The explosion razed the building to the ground, killing 25 persons and injuring others. Hundreds of persons and six fire tenders were employed to bring the fire under control. Their work was hampered by the huge piles of debris and the fear of more explosions from possible live explosives in the debris.

The manufacture of detonators involves highly sensitive explosives like lead styphanate, lead azide and PETN. The former two are highly sensitive and explode even on rubbing or falling. (CH)

Accidental explosions, sometimes serious, occur mainly due to mishandling of the explosives due to ignorance and negligence. Accidents occur under various circumstances:

1. Children, mishandle crackers while playing with them on celebrations, like Diwali.
2. Something goes wrong in the manufacture, transport, storage and handling of the crackers, military explosives and explosive devices and explosions take place.
3. Accidental non-explosive explosions, due to leakage of fuel gas (LPG or CNG) cylinders, but sometimes leakage is with criminal intent and cause a serious explosion. The exact nature of the explosion has to be established to disprove or confirm the alleged nature of the explosion.

   In a case of embezzlement of a substantial amount of money in an office, the fraudsters decided to destroy the record that was likely to incriminate them. They sprinkled about five litres of petrol on the files one evening after the office hours to burn the files. They kept the files near a window from which one small glass pane had been removed. One of them returned to the scene at night after about six hours, lit a matchstick and threw it in through the window opening. There was a flash and an explosion. It damaged the doors, windows and walls.

   The police and the author visited the explosion site immediately after the incident. They found the files still dripping with petrol. They, however, did not burn, as the culprits intended. Only the edges of the files at the top were singed.

   The evaporation of petrol had filled the room with its vapours, forming an explosive mixture with air. The application of a flame caused this mixture to explode. The explosion consumed the oxygen in the room and extinguished the fire, failing to incinerate the incriminating documents, as desired by the perpetrators!

   The explosion had another unexpected consequence. The blast pushed out hot gas through the opening in the window due to the missing glass pan. They singe'd the face of the culprit who had applied the flame. He ran away from the scene unnoticed, but not before the hot gases scorched his face, leaving an undeniable stamp of his presence at the scene. (CH)
4. Stored explosives may undergo auto-oxidation or decomposition. The process generates heat and explodes the explosive.

Extensive destruction and unpredictability of possible additional explosions make investigation highly arduous, time consuming and dangerous.

14.10 HANDLING LIVE EXPLOSIVES

The tasks of locating, handling and defusing live explosives/explosive devices is an important function of the law enforcement agencies, all over the world. The explosives/explosive may be hidden anywhere: on the person of the terrorist, in his luggage, on his vehicle or he may have placed, carried and distributed the explosives in innocuous looking containers. Further, the terrorists smuggle, transport, hide and distribute the explosives and explosive devices covertly. Finally, they choose time and places of their choice to explode them to inflict maximum loss of life and property to create widespread panic and fear. The favourite sites are the public places, installations of the security forces, buses, trains and even aeroplane.

Law enforcement agencies have to prevent explosions. They can do so only if they preempt the bomber. Intensive intelligence and eternal vigilance are watchwords! Science can help them in a big way to locate/identify/handle the explosive/explosive devices. They must exploit the technologies to keep ahead of the criminal.

14.10.1 Detection/Location

The terrorist, necessarily, conceals and camouflage explosives/explosive to make them look like an innocuous object, when he is transporting them or storing them at a place of his choice. They are discovered by searching the suspected place/object manually. This is a time consuming process, and embarrassing in certain situations.

The manual search is used only when there is some evidence that the package has the offending material. Other modes have come up which are based upon the following presumptions:

1. The explosive devices have specific shapes and structures.
2. The texture of an explosive is different from the texture of other materials.
3. Explosives continuously emit micro-clusters of explosive molecules or their fragments, which are dispersed in the air and remain in the air.
4. Some of the micro-clusters of the explosive molecules (or their fragments) are adsorbed on the surfaces which are close to or come in contact with the explosives.
5. Some of the explosives are volatile and, therefore, their vapours are present in the surrounding air.

The various detection modes of the hidden explosives in bulk, are based upon the above basic concepts. Prominent methods are:

14.10.1.1 X-ray Device

X-ray machines have been in use for a long time to detect a hidden object. They are particularly handy at airports to detect firearms in baggage. They revealed bombs. Improvised explosive devices can also be recognized if they have a clock mechanism for initiating the IED; or metallic missiles to kill persons. They are, however, ineffective to identify explosives *per se*. Comparatively recent developments in technologies have come to the lacuna.

The working of these machines is simple. X-rays are passed through the baggage. The transmission creates images on the screen. The operator identifies the explosives/explosive devices.

X-ray systems are used routinely to check the baggage of the passengers. The systems are convenient and are employed in trains, buses and other targets of the terrorists, to prevent bomb explosions.

14.10.1.2 Modified X-ray Machine

In the new machine both hard and soft X-rays are used. Hard rays (higher energy rays) pass through materials of a higher atomic number, whereas soft X-rays (low energy rays) would not pass through such material; they will only pass through the material of a low atomic number.

The machine was useful, but it did not solve the problem of identification of explosives. It was further modifications and coupling it with a computer to process the data the identification/ automation was achieved. The machine is being used widely to check the baggage, especially at airports.

Continuous improvements of the device continue.

14.10.1.3 CT Scan

One is familiar with the CT (Computed Tomography) Scan used in medical diagnostics. It reveals, plane-wise, the internal make-up of an object in sections (thin slices). The same

principle is utilised to scan baggage, closed packets and parcels to detect explosives and explosive devices. Instruments have come up which are used routinely for the purpose. The instrument can distinguish between explosive and other artefacts.

The instrument is somewhat slower than the dual energy system equipment. Maintenance is also costly.

14.10.1.4 Thermal Neutron Activation (TNA)

Thermal neutron activation analysis appears to be an attractive technique as it determines the concentration of nitrogen atoms in a particular package. This concentration is about 15 to 35 % in various explosives. Non-explosive substances seldom contain that high nitrogen percentage. Hence a lot of research work is being done to utilise TNA for the bulk detection of explosives at airports and elsewhere.

The technique depends upon the fact that when thermal neutrons meet a nitrogen atom the latter picks up a neutron and becomes radioactive, emitting Gamma rays.

$$^{14}N + n_{th} \longrightarrow {}^{15}N^* \longrightarrow \text{radiations}$$

The strength of the emitted radiation is a function of the concentration of the nitrogen atoms activated (and present). Thus they will indicate whether the package (or baggage) contain explosive or not.

14.10.1.5 Detection of Explosive Traces

Explosives leave their traces at all places where they are kept. The prominent sites for their presence are:

1. The manufacturing/assembling/dismantling sites
2. The hiding/storage/disposal sites
3. The explosion site
4. The hands/body/clothes/of the handler(manufacturer, carrier/user (who exploded the explosives/explosive device) and the handled explosives in any way.
5. The vehicle in which the explosives/explosive device was carried or the containers in which they were stored.
6. The victim who was killed/injured in the explosion

Explosive vapours or of their disintegrated products diffuse in the air and float around the site. They provide micro-clusters of explosive molecules or their fragments. They are also deposited on the surrounding objects. They are heavier than air. They do not go very far from the main source. The presence of these micro-clusters of explosive molecules or their fragments permits the identification of the site as well as the nature of the explosives. Recent developments in technology have made it possible to fix their locations and identities.

In addition, the presence of these micro-clusters indicates the hiding site, storage containers or carrier vehicles. Most importantly, they lead the investigators to the hidden explosives/ explosive device.

In short, the detection and identification of the explosive traces is of great importance:

1. It identifies the hiding place of the explosive/explosive device.
2. It identifies the explosive.
3. Its identity may indicate the terrorist group who has placed the explosive at the site.

4. The device and/or its package may carry evidence, which may link it to the culprit.
5. The presence of the vapours in the air helps to locate illegal liquor production. Many police forces have trained sniffer dogs who locate the site and the paraphernalia of illicit production.

The detection of traces (vapours) of the live explosives or their disintegrated fragments is the most important preemptive action in the control of terrorist bombings. The investigating agencies use the following detection techniques routinely:

14.10.1.6 Detective Dogs

Dogs are a great gift to humanity. They are excellent companions, ever-alert security guards and perhaps the best detectives. This is because nature has bestowed them:

1. Extraordinary smelling powers; a rough guess is that the smelling power of a dog is about 300 times than that of human beings.
2. Excellent memory
3. Exceptional hearing power
4. Uncanny vision (visual powers)
5. Extraordinary alertness
6. Intense love/obedience to the master

Dogs have been employed in all sorts of police work for a long time. They are now rendering excellent service in the detection of explosives mines, bombs and other infernal explosive devices. They surpass all other modes in efficiency, versatility and certainty for the detection of explosives. Experimental trials have shown that:

1. A well-trained dog, if properly handled, could locate traces of explosives in about 85% cases.
2. Human beings, could locate explosives in about 35%.
3. The success-rate for instrumental detection of explosive traces was about 50%.

Apparently, the dogs are the best to locate explosives/explosive devices. However, the dogs give best results, if:

There are certain basics, to get the best result from dogs:

1. The dog is trained properly/adequately and the training. Is made a continuous process; no stopping.
2. The dog is in good health. Sick dogs make mistakes. A pregnant bitch, or in heat or rearing her liter does not function efficiently.
3. The dog tires in about two hours. It is not forced to work for longer hours.
4. During search, the dog is rested after every 20 minutes..
5. The dog is not put to work soon (for about 2 hrs.) after food intake. It is sluggish immediately after the meals.
6. It is better to employ a pair of dogs for searching a scene. It is synergic.
7. The handler of the dog is not changed. Dogs are one master dogs.
8. The handler must be intelligent, a natural dog lover and properly trained as dog handler.
9. The dog and the handler must get the training together.

The dogs vary in intelligence, prowess, obedience, ferocity, friendliness with strangers and working capacity. The German Shepherd is considered the best all-purpose police dog. Other notable breeds[8] commonly commissioned in police work are:

1. **Basset Hound** (locating bombs and narcotics)
2. **Beagle** (locating bombs, drugs)
3. **Belgian Milionis** (protection, attack dog, locating IEDs, locating evidence, locating drugs, prisoner transport, human tracking.)
4. **Bloodhounds;** (odour-specific ID, tracking, locating bombs, drugs, evidence)

Some studies about the sensitivity and reliability of the dogs in detecting explosives were carried out in the USA in recent times. They found that there were hardly any false positives. The dog could detect explosive traces when the concentrations as low as 90 ppt (Parts Per Trillion), a very high sensitivity.

14.10.1.7 Instrumental Detection

Instruments are widely used in the detection of explosive traces. Continued research over decades in instrumental detection of explosive traces has brought in a number of useful devices.

All instruments involved in handling explosive traces essentially perform the following functions:

1. Collect the vapours from the site.
2. Concentrate the collected samples.
3. Identify its explosive nature.
4. Identify the particular explosive involved.

The first function of the collection of the explosive traces is by suction. It may suck the air surrounding the suspected hiding place of the explosive, it may suck the explosive from the surface suspected to have adsorbed explosive traces.

In all situations, sucked traces are concentrated. It is done by passing on the traces to a filter or other special surface, which adsorb the traces. The explosive is analysed after de-absorbing the explosive.

The gas chromatograph is the usual analyser to identify the explosive. The instrument uses Electron Capture Detector, Chemiluminescence Detector or Ion Mobility Spectrometry (IMS), Mass spectrometry with or without gas chromatography is also used.

Explosive Vapour Detector is the instrument, which detects and analyse the explosive vapours at the site. It carries out the analyses at very high speed and gives results within seconds.

The reliability of these instruments is low. It is improving with the passage of time, thanks to research inputs.

14.10.1.8 Explosives Markers

Tagging chemical, added to the explosives or to substances from which explosives are manufactured, would locate the source of explosive and also indicate the site of the hidden explosive. However, the terrorists in India are using either smuggled explosives or indigenous explosives made from innocuous ingredients. The tagging may not of any use.

8. Wikipedia has given a long list of breeds used in police work (Internet).

14.10.1.9 Handling Live Explosives/Explosive devices/IEDs

There may be Live explosives/explosive devices/IEDs at the explosion site; left over accidentally or intentionally. Or, they may be at other nearby sites where they are yet to explode. The team searches the site on priority to locate/remove them so that they do not explode and cause loss of lives and limbs or property, while the scene is being processed. They examine the scene intensively and may employ sniffer dogs/instruments to detect the explosives/infernal device(s).

The location, collection and handling of live explosives and explosive devices need knowledge and experience. The novice should not handle live explosives/explosive devices. The services of the explosive expert are utilised almost invariably

The main problem in the location and collection of a live explosive or explosive device is the danger it entails. It can be a time bomb and explode at the set time, which can be the time when it is being collected. Further, the ignorance about its functioning and destructive potential can be disastrous. This is doubly true in cases of IEDs. Slight misjudgment about the infernal device may incur loss of life and property.

The live bomb is a dangerous species. It has to be handled only by professionally trained members of a bomb disposal squad. These squads were not common in India previously. However, due to the increased activities of the terrorists, most police forces have organised their own live-bomb disposal squads, both in their departmental laboratories and in their training institutes. Others utilize the services of the military bomb disposal squads for the purpose. The explosive expert should form part of the SIT whenever possible.

The SIT takes the following steps to handle the live bomb:

1. It evacuates the premises at the earliest, if not already done.
2. It surrounds the device by sandbags to make the surroundings safe, in case the device explodes.
3. It requisitions the bomb disposal squad at the earliest, if it does not form part of the SIT.
4. It considers the device dangerous, until proved otherwise.
5. It handles the device only if it and knows how to handle it.
6. It does not fiddle with an unknown device.
7. It lets the explosive disposal squad handle the explosive/bomb/IED encountered.
8. It documents the discovery and recovery through photography/videography/sketches/textual description.
9. It cordons off the explosion affected area. It does not allow any person to enter the area.
10. It does not allow any lighted match, fire or smoking on the premises.
11 It photographs the device at the site along with other evidence thereon (labels, knots, special structural features and presence of fuse or other initiation device, if any) if it is safe and feasible.
12. It guards the premises till the device is removed from the scene and other evidence collected.
13. It hands over the work of handling the live explosive/device to bomb disposal squad on its arrival. They:
    - Pick up the device with a remote controlled device, transport it in a live bomb carrier to a safe place and deactivate it.

- Freeze the device with liquid nitrogen or carbon dioxide (or other material) and remove it.
- Disrupt it at the site with shotgun, gas gun or water cannon; if it is safe to do so.
- Submerge the device in water if they are sure that water would not explode it.
- Let it age (only in an open space) away from the public routine. They guard it during the period.

14.10.1.10 Disposal of Explosives/IEDs

The nature of the device (and explosive), its location, size and the calculated hazard involved determine the mode of disposal. The bomb disposal squad has the equipment to handle the explosives/devices:

1. Protective suit for the operator including protective helmet
2. Blast container
3. Bomb suppression blanket(s)
4. Explosive detectors, including sniffer dog
5. Contactless stethoscope
6. Metals detectors
7. Probes for probing hidden bombs
8. Extension mirrors, to check areas not directly visible
9. Endoscope
10. Fiberscope
11. Thermal cutter
12. Bomb Disrupters
13. Door opening kit for rooms, cars, safes

In fact, the cities and places prone to frequent bomb attacks should have a police squad with the above equipment to meet the menace with the minimum response time and reduce the danger of the device; so that they have not to wait for the military bomb disposal squad. The police squad members must have proper training before they are put on the job.

Once the scene is safe, the investigating officer locates and collects other evidence from the scene:

1. Evidence on the device:
   - Any labels or identifying marks
   - Fingerprints, writings
   - Extraneous matter such as hair, fibres, dust, paint and tool marks
   - Any spilt-over explosive or related material
2. Footprints, footwear marks and tyre marks, if any, at or near the scene
3. Sketch(es) of the location of the device at the scene

Once the live bomb or its scare has been tackled, the SIT starts the examination of the scene systematically.

14.11 INVESTIGATIONS

The Supreme Court in one of its judgment has said that for the successful prosecution of any crime the investigation and prosecution must provide convincing evidence on the following facets of the occurrence:

1. A crime has been committed (*corpus delicti*).
2. The accused had the means, motive and the opportunity to commit the crime.
3. The accused committed the crime.

The investigation and prosecution agencies strive for the same.

The examination of the scene of an explosion provides important evidence on all of the above aspects. It is a daunting task because of its vast area, extensive damage and destruction, huge amount of debris (often pulverised) and extensive destruction of the explosive device and near-complete annihilation of the explosive used in most of the explosions. The examination requires adequate work force, time and patience.

The objectives of the examination are to find out:

1. The nature of the explosive and the explosive device
2. The quantity of the explosive used
3. The source of the explosive and the explosive device
4. The mode of initiation
5. The motive of the explosion
6. The evidence clues to link the criminal with the explosion, the victim, the scene, with the explosive, the modus operandi and the paraphernalia used

The main sources of evidentiary clues in explosions are:

1. The scene of the explosion, including the injured/dead
2. The person of the culprit including his wearing apparel, shoes
3. The mobile(s) of the culprit/associates
4. The vehicle used in the crime
5. The workshop/residence where the explosive devices were assembled/made
6. The office of the culprit's: documentary evidence
7. The computer of the culprit, if he uses one
8. The culprits' associates or helpers
9. Criminal record of the culprit, if any

14.11.1 The Scene of Explosion

The scene of explosion is the most important source of evidence. It has the crater, the shattering wave route and the destruction. It has remnants of the explosive/explosive device They indicate the power and possible nature of the explosive used, and of the explosive device itself. It is the main source of explosive/explosive related evidentiary clues:

1. Traces of the explosive(s) used. They are flash impacted on the objects around.
2. The shattered pieces of the container, scattered at the scene.
3. Missiles of the IEDs/bombs or their fragments
4. Remnants of the initiating device (detonator)
5. Remnants of the timing mechanism, clock mechanism and the like

6. Fragments of electrical and electronic systems used, including circuit board
7. Insulating and adhesive tape pieces

In addition, there may be traditional clues like fingerprints, footprints, discarded containers, bags, tools, tool marks, blood due to accidental injury, fibres, hair, cigarette stubs, match stick, and the like, which may have survived the explosion. They provide the linkage of the explosion with the perpetrator.

The scene of explosion is dangerous. It may have live explosives, which may explode any time, there may be live electrical wires which may electrocute a person, there may be unsafe building structures which may fall and injure a person. The safety of the team has the first priority. The leader of the must ensure the same. Therefore, the scene handling is properly planned to locate, collect, preserve and document the evidence thereon.:

14.11.2 First police officer at the Scene

The duties of the first police officer at the scene of explosion are:

14.11.2.1 Saves life and reduces trauma

The first police officer at the scene attends to the injured, provides medical help and sends him/them to hospital at the earliest.

14.11.2.2 Protects the scene

He expels all unauthorised persons from the scene, prevents entry of new onlookers, passerby or curiosity hunters, including media people to the site. He protects the evidence at the scene from the criminals or their well-wishers, curiosity hunters, media people, animals/beast and from weather (rain, wind!)

14.11.2.3 Demarcates/barricades the scene

The first police officer demarcates/barricades the scene. Usually the periphery of the apparent scene is increased by about 20% to avoid missing evidence, which may have flown to a longer distance. Encircling the scene with rope or string is adequate.

The pressure wave of the explosion sometimes travels to long distances and carries shattered pieces of the device along with it. He identifies the pressure wave route and protects it.

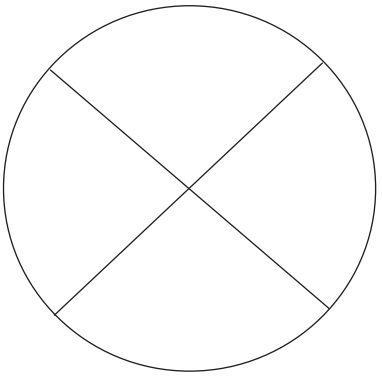

Fig. 14.16

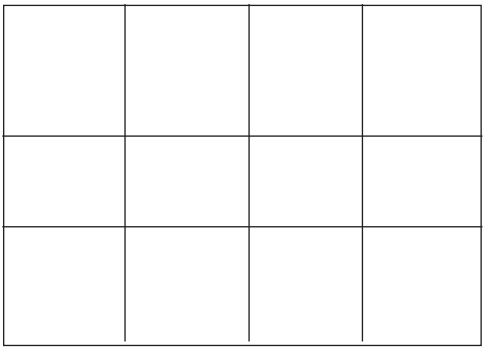

Fig. 14.17

Zonal Divisions

14.11.2.4 Assesses the scene

The first police officer assesses the special needs of the proper handling of the scene of explosion, as it is usually quite abnormal. He conveys the needs of the investigation to the concerned persons without loss of time.

14.11.2.5 Observes the audience at the scene

He observes the behaviour of the persons present there and guess the identity of the possible culprit.

14.11.2.6 Informs the SIT

He remains at the scene till the SIT comes and takes over the charge of the scene. He informs the team what he has observed, and what his general assessment of the occurrence is.

14.11.3 Special Investigation Team (SIT)

The scene of explosion needs a special investigation team. The team includes:

1) A police officer as team leader;
2) An explosive expert, to defuse any explosive device which might still be live at the scene and to study the pattern and extent of the destruction to indicate the nature of the explosive which caused the explosion.
3) A forensic expert to process all evidentiary clues;
4) a sniffer dog team to locate the live explosives, and
5) An imaging expert for videography/photography

   Sometimes, other experts in the field of electronics, electricity and architecture are needed. The first police officer may assess/give the requirements of such specialist(s) whenever needed. Or, the SIT MSR requisition the services of these specialists; if and when needed.

   A panel of members of the special investigation team is prefixed. The team is available on call at all hours.

Experts' help is indispensable in the examination of the scene of an explosion. The expert should have both practical and scientific knowledge relating to explosives being used/misused in the country.

Different explosives behave in different ways and create different types of explosion waves and patterns, depending upon their nature, quantity, mode of confinement and placement. The expert studies the destruction pattern, which indicates the nature and quantities of the explosives used. He reconstructs the explosive device and pattern of events. Further, he helps to locate the evidentiary clues which may link the culprit with the crime.

14.11.4 Equipment Needed at the Scene

The scene of explosion needs the usual equipment for documentation/collection/packing/sealing of evidentiary clues and handling of the scene. In addition, it may need special equipment, which includes the following:

1. A live explosive device may need a bomb carrier.
2. Implements like rakes/shovels/spades to remove and sift the debris.
3. Large amounts of debris at the site may need an earthmover/cranes/truck carriers.

4. Expansive scenes may need a helicopter for complete coverage of the scene photographically.
5. Flood lights/powerful hand-torches to examine the scene
6. Skilled/semi-skilled workforce to help process the debris.

14.12 EXPLOSION SCENE HANDLING

The Special Investigating Team in handling the explosion scene take up the work systematically.

14.12.1 Safety Considerations

There may be live explosives/explosive devices/IEDs at the explosion site; left over accidentally or intentionally. Or, they may be at other nearby sites where they are yet to explode. The team searches the site, on priority, to locate/remove/identify/and process the explosive/explosive device so that they do not explode and cause loss of lives and limbs or property, when the scene is being processed. They employ sniffer dogs/instruments to detect the explosives/infernal device(s). The employ explosive expert in case they discover live explosive/explosive device.

Once the live bomb or its scare has been tackled, the SIT starts the examination of the explosion scene systematically.

14.12.2 The Seat of the Explosion(s)

The team fixes the seat of explosion. It is indicated by the pit(s) or crater(s) formed at the site. The crater is photographed along with a scale. It is also sketched and video-filmed. Its dimensions including depth and direction of the flight of explosive are properly evaluated and measured/recorded.

The seat of explosion carries numerous clues:

1. The crater carries traces of the explosives, which are flash impacted/deposited around the crater and on nearby objects. They are located, photographed (whenever possible), collected, packed and sealed. They are useful to build up the IED and connect the criminal with the crime.
2. The crater may have shattered pieces of the device. They are located, their identity and their location fixed (videography, photography, sketch, textual description) and, ultimately, collected, packed and sealed. There may be scores of pieces of the debris at the site. They may be carrying traces of the explosive used. The pieces of the devices are sent to the laboratory to identify the explosive. Quantities of explosives on the debris are often small (usually in pictograms), but modern analytical equipment can handle such small quantities.

14.12.3 The Explosive Wave Pattern

The explosive wave pattern is characteristic of the /explosive/explosion. The pattern depends upon the nature/the quantity of the explosive, the explosion mode, the construction of the explosive device and the topography of the site. The examination helps to identify the explosive and the device used. The main characteristics of the wave are:

1. The wave is directional
2. It takes the path of least resistance.
3. It moves, pushes, shatters and bends the objects in its path depending upon its strength and the resistance of the obstructing object.

4. It may scorch materials, which come in come in contact with the flame or hot gases.
5. The plotting of the shattered pieces can lead to the center of explosion.

In a case of murder, dynamite sticks and a blasting cap were used to kill the victim. The explosive was placed underneath the mattress on the floor of a makeshift shed at a quarrying site. The blasting cap was placed in the sticks and the lead wires connected to a battery. The switch was turned on at night when the victim was asleep. There was an explosion. The body was shattered to small unrecognisable pieces except for the limbs and head. The explosive wave had travelled straight upward and created a hole in the roof of the shed. The surprising part of the murder was that the head and neck of the victim were in one piece and they carried no other injury. Likewise, another person sleeping about one metre away on the same floor did not suffer any injury. (CH)

The shattering pattern of the pressure wave is distinct**.** Its intensity and direction provides a lot of information. The evidentiary clues, which may be parts of the infernal device or of the targeted object (victim) fly along with the pressure wave, and are found scattered on the path taken by the pressure wave. The main misleading feature of the pressure wave is the negative pressure wave; this is caused by the sudden creation of vacuum by the original pressure wave. The negative pressure wave (not very common) may throw or tilt the object in the direction *opposite* to that taken by the actual pressure wave. It often needs knowledge/experience/care/time to delineate correctly the path of the wave. The starting point of the pressure wave(s) indicates the seat of the explosion.

The shattered pieces of the infernal device(s), including those of container, initiators, clockwork (in time bombs) and missiles scatter far and wide They are also found embedded in the nearby objects: in the body of the victims, in the debris or along the wave path.

If the infernal device has used missiles, they or their pieces are found on or in the victims. If the body is in smithereens they are found embedded in the flesh pieces. They are carefully located/collected/documented/packed/sealed.

The collected pieces are pieced together in the laboratory to determine the nature of the original object or device to which these pieces belong. It is seldom that all the pieces are available, but often the pieces available can give a correct idea about the nature of the original device.

The plotting of the positions of the pieces of the device on a graph paper and extending the lines towards the centre can indicate the seat of the explosion correctly.

LPG gas leakage from an LPG cylinder caused an aerosol explosion in a hotel. The kitchen staff had left the site at about 11 pm. They had partially closed the coal oven but the cinders continued to glow. The leaking LPG and air formed an explosive mixture concentration in about 3 hours. As soon as the gas concentration reached the explosive limit, it exploded. The red hot coal in the oven provided the needed heat/flame to explode the gas mixture.

The kitchen was on the third floor, but the gases, being heavier, travelled down to the ground, first and second floors as well. The explosion blew out the doors and windows on all these floors and the shutters on the ground floor bulged out. The maximum damage was on the third floor.

There was little fire. Only a chair and some clothes in the kitchen were singed (not burnt). (CH)

14.12.4 Evidentiary Clues at the Scene

Extensive destruction, fragmentation, contamination and the vast area where the clues are scattered at the scene of an explosion, make the search for evidentiary clues an arduous and time-consuming task. An investigator loses track of the evidentiary clues because he loses patience in the ordeal. The following points are noteworthy:

1. The area for search at the scene of the explosion is fixed before starting the search. A larger area (~20 % more) than the apparent crime scene area is marked out as the area for search. It should exclude the possibility of missing any clue at the scene.
2. The crime scene area is large, it is divided into zones and the search is carried out zone-wise. Thus, more than one team can search the scene. Even if only one team has to examine the scene, zone formation ensures a thorough examination.
3. Usually the search starts from the focal point - the crater in most of the cases. The spiral search method is used if the scene is not too large.
4. If the centre of explosion (crater) is not clear, the search starts from the outer extreme periphery, and closes at the centre; again if the scene is not too expansive.
5. In the case of a strong directional pressure wave, the path of the wave is also searched to locate the evidence. The search starts from the initiating point of the wave to the end of the wave path. The crater is examined with particular attention.
6. The size, shape, depth of the crater are also important. The devastation caused and the patterns of damage are important clues to indicate the power and nature of the infernal device. Its surface, all around, is likely to retain fragments of the infernal device from initiators, detonators, explosives, containers, missiles as already mentioned
7. The pressure wave (its size, extent and damage it causes) indicates the nature and the amount of the explosive used.
8. The traditional clues like tool marks, fingerprints, abandoned objects, foot or footwear marks, tyre marks are also sometimes available. They are searched/collected.
9. The criminal may abandon objects at the scene. They are important clues. They are searched and collected.

Theoretically, there should be a wealth of clue materials at the explosions site. However, the destruction is extensive and debris is in large quantities, whereas the residual evidence is in minute quantities. It is intermixed and hidden in or covered by heaps of debris. The search and location of evidence, therefore, needs patience, experience and time as well as manual and instrumental help.

14.12.4.1 Collection of Clues

Collection of clues from the explosion site follows the usual pattern[9]. Some of the main principles are reiterated, with advantage:

1. A video film of the scene is prepared before collection of the clues.
2. The location of the clues is documented through photography, sketches and textual record.
3. The investigator marks the clue for identification before packing.
4. Clean containers are sued to contain the collected. They are sealed at the site of recovery.
5. The recovery memo is signed by the IO, the recovery witnesses.
6. The identity/authenticity/integrity of the clues must remain above board.
7. The chain of possession must remain intact.

9. See Chapter 5 of this book.

14.12.4.2 Dispatch of Clues

For the dispatch of the evidentiary clues the following points are noteworthy:

1. Clues are sent through a special messenger from the site itself, whenever possible.
2. All person other than the investigator and the expert handle clues in the sealed packet only.
3. A log of the movements of the evidentiary clues is kept to maintain the chain of custody intact.
4. Items collected from different sites are packed separately.

All the clues collected must be logged properly in the case diary and also in the dispatch letter sent to the expert. The process of location, collection, packing, sealing and dispatch must ensure that the relevancy, authenticity, integrity and continuity of the chain of possession remain legally acceptable.

14.12.5 Evidence on the Culprit

The culprit may have evidence on his person/clothes/residence/work site. The evidence may be:

1. Particles of explosives or other materials may be present; if he has manufactured/assembled the IED. In fact, micro traces of the explosives persist on the hands, fingernails and clothes of the culprit for a long time if he has handled the explosive himself. This is especially true of RDX and other military explosives. The wearing apparel and swabs with alcohol from the hands and nails are collected.
2. Stains from the explosives or their constituents are found on the person or clothes of the culprit.
3. Dust or debris from the scene of the explosion may be found in the hair, on the clothes or in the welt of the shoes.
4. In some cases, there may be injuries on his person from the exploded material.

   In a case already mentioned elsewhere in this book, a person working in an office poured petrol on some 'offensive' files at the time of closing the office. The culprit returned some hours later at night and threw a burning match stick on to the documents through a broken window pane. There was an explosion in the process, as the petrol vapours and air had formed an explosive aerosol in the meanwhile. Hot gases coming out of the broken window singed his face, imprinting his involvement in the deed. (CH)
5. There may be embedded fragments of the explosive device on the person or on clothes of the culprit.
6. The culprit (or suspect) is the source of sample fingerprints, foot or footwear prints and body materials like hair, fibres for comparison with the corresponding extraneous material found at the scene.

14.12.6 Evidence in/on Vehicle

If the culprit has used a vehicle to carry the infernal device, the vehicle may carry the following evidence:

1. Dust, dirt, and debris from the scene.
2. Standard sample, for tyre marks found at the scene.
3. The traces of explosive from the infernal device.
4. Particles/stains/odours of the explosive or explosive device.

5. Bloodstain from the culprit/victim/accomplices if they were injured.
6. Hairs and fibres from the culprit victim.
7. Fingerprints of the culprit/victim.

14.12.7 Evidence at Residence/Work Site

The premises used for assembling or preparing the infernal device are a rich source of evidence:

1. The residual materials, chemicals and gadgets used for the construction of the device.
2. The tools used for the assembly.
3. The additional IEDs/Bombs/Explosive, if the culprit is a professional terrorist/saboteur.
4. Spare containers/initiators/timers/explosive materials/and missiles corresponding to the materials used in the IED at the explosion site.
5. Evidence relating to processing/storage/manufacture and assembling.
6. Notebooks/diaries/laptop/computer/mobile, containing incriminating evidence relating to the explosives/devices/explosions; or, names, telephone numbers and/or addresses of the gang members/clients/material suppliers or other criminal elements.
7. Incriminating literature: on explosives/explosive devices or on terrorism.

If the culprit is living with family, he usually keeps such activities secret from the family. He uses a site, which the members of the family do not frequent. Abandoned sheds or garages are the usual sites.

The site of the IEDs' manufacture is often dangerous. It may have dangerous chemicals, incomplete (or complete) IEDs which may go off. There may even be a booby trap set up to destroy the premises if someone fiddle with them (workshop/laboratory). The forensic expert, a member of the team examine the site, taking all precautions.

14.13 DISPOSAL OF IEDs

The disposal of a live bomb needs all the care, not only from the safety angle but also for the preservation of the incriminating evidence to link the culprit with the crime. The following steps help to preserve the evidence:

1. Allow the device to age at the site, if it is safe to do so.
2. Photograph the explosive device at the site covering labels/knots/special structural features/presence of fuse cord or other initiation device and the writings/symbols/signs thereon.

14.13.1 Disposal Mode

The modes for the disposal of IEDs/bombs are:

1. **Explode the device** at the site where it is found, if it is safe to do so and the process does not damage the surroundings; after collecting the evidence thereon.

   The exploding the IED have two main disadvantages:

   - It destroys most of the incriminating evidence relating to the device.
   - Destruction of the IED at site is impracticable in most of the cases because the explosive devices is placed mostly in buildings/vehicles/crowded places. It incurs heavy losses and inconveniences the public.

Fig. 14.18

An IED destroyed by exploding it in a secluded place

2. **Quench the explosive device.** the device is put in a bucket of water and allowed to soak thoroughly. Water enters into the explosive device and renders it ineffective. The quenching mode was quite effective in the old days because the usual explosive material used to be black powder, which would become ineffective in water. The explosive materials have changed since. Water has no effect on some new explosives.

   Light oil is also used as the soaking medium. It has one advantage over water. The device, which may explode on contact with water (for example, by completing an electrical circuit), will be safe in the oil.

   The 'quenching' process spoils or destroys the evidence like fingerprints, writings on the body of the device. Such evidence is photographed whenever possible, before quenching.

3. **Dismantle the explosive device.** The evidence is preserved this way. It is done by opening of the device. The opening must be certified as safe. In any case, the explosive expert alone decides and takes action accordingly. He has the necessary knowledge/experience/equipment to do so.

4. **IED/Bomb is taken to a safe place and destroyed.** It involves the following steps:

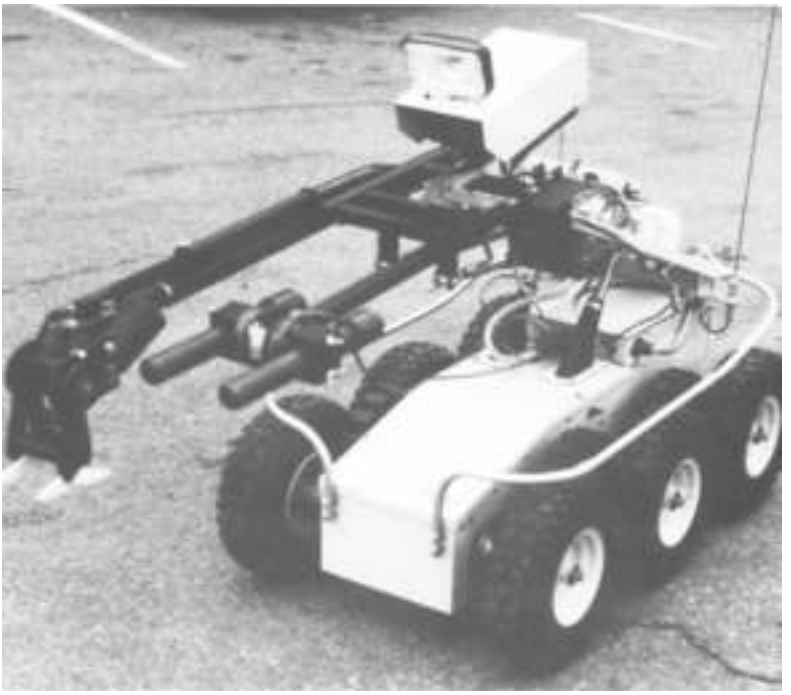

Fig. 14.19

Remote control explosive handling device

1) A remote control robot picks up the infernal device from the site.
2) It places the device in a shock-proof, specially made carriage. It has a 10 cm thick steel tube. The tube open at both ends. There is a steel wire cage hung inside the tube in the centre. The infernal device is placed inside the cage. The tube is fixed behind the carriage. If the infernal device explodes during transport, the pressure waves will go upwards or downwards. The spaces at the sides remain unaffected. Thus, practically no damage is caused even if the device explodes en route.
3) The device is taken to a safe place away from the inhabited areas.
4) It is allowed to 'age' for three days.
5) It is turned by a remote-controlled device; left for a few hours and then overturned; then again left for a few hours more. If it does not explode on turnings, it can be approached and examined.
6) The infernal device is opened from an unexpected place/way. For example, if the device is tied with a rope or string, it is cut. If there is a soldered joint, it is dissolved in mercury. It is not hammered or sawed.
7) Metal parts are removed by the action of sulphuric acid (10%).

The device is not dragged/tilted/turned or overturned/sawed at the discovery site. Minimum force is used in all operations involved in handling the device.

The circumstances of each case - location, size of the device and calculated hazard involved - determine the disposal mode.

All items, explosive charge, initiators, container, wrapper, string, wire, paper, wiring, fibre, cloth, tape, clockwork, switches, caps and adventitious materials such as hair, dust, dirt, paint and tools are evidence. They are located/collected/preserved and sealed.

If the explosive device is considered dangerous it is destroyed at the earliest with the help of a bomb disposal expert.

> *Perhaps it was a case of revenge. A person received a parcel by post. He tried to open it. It exploded and killed this man.*
>
> *Police came to the scene and discovered a wire which was recently cut. The police recovered a wire cutter. The departmental laboratory connected the cutter with the cut on the wire. It linked the suspect with the bomb. The lower courts accepted the linkage. The apex court rejected the evidence. (CH)*

14.13.2 Dispatch

The inspectors of explosives, located at different places, were the authorised persons to handle the evidence until some decades ago. Now the explosive experts of Forensic Science Laboratories carry out the examination of live explosives/explosive devices and their explosion products. The experts normally visit the scene of explosions and assist the investigator to locate, collect and pack the correct clues.

The items sent to the laboratories are primarily the products of explosion from the explosive device and those items that are not likely to explode in transit.

The expert examines the live explosives/explosive devices at the scene itself. Only those items that the expert wants to examine in the laboratory are collected/packed/sealed and sent to the laboratory. The expert guides the investigator to pack the correct amount correctly; to avoid an accidental explosion in transit.

Other evidential clues: products of explosions and extraneous objects, marks are sent to the laboratory as usual.

The following reminders are useful while dispatching explosion related exhibits to the laboratory:

1. A special messenger takes the exhibits (especially live explosives/explosive devices) to the laboratory.
2. The instrumental detection/identification requires only a very small amount of explosive. Therefore only a small amount crime explosive (a few grams only) is sent to the laboratory.
3. Initiating device (detonators: one or two only) are sent for examination. The explosive and the detonators are packed in separate packets.
4. The Station Master of the railway station is informed that a special messenger is carrying/transporting explosives in the train.
5. Dangerous explosives or explosive devices are defused when sent to the laboratory. The expert usually examines the live devices at the scene.
6. Fulminates, azides, styphnates and self-igniting incendiary solid or liquid mixtures (chlorates mixtures, phosphorus solution, bombs) are dangerous explosives. They are handled/transported with extra care.

14.14 PROBLEMS

An explosive expert can assist the investigation and trials of cases involving explosives and explosive devices in a big way. He answers most of the questions, including the following:

1. **Is the given material an explosive?**

   The expert has sophisticated instrument which can identify/quantify the explosive in all practical collection of the clues.

   The identified explosive may link the case with similar other cases involving similar explosive.

2. **Is the given contrivance an explosive device?**

   The expert examines the various components of the device. If he finds explosive/ detonator in the device, he identify the device as IED.

   He can link the device to similarly structured IEDs used in other cases. Thus, he interlinks the cases.

   The linkage may indicate common perpetrator/maker/seller.

3. **What was the modus operandi?**

   The expert can indicate the *modus operandi* from the physical clues relating to explosion and other evidentiary clues found at the scene or with the victim.

   He can also give the sources of the explosive/explosive devices used.

4. **Is the explosive device involved in the case an IED or a military bomb?**

   This is comparatively easy question to answer. The standard military bombs carry information written on them. Besides, they have proper construction/finish. The IEDs do not have proper structure/finish.

5. **How was the infernal device initiated?**

   An expert can identify the initiating device in the IEDs, most of the time, from the fragments of the initiator. Fragments of batteries, clock- work, detonator often provide ample evidence to identify the initiator.

6. **Was a similar explosive or explosive device used in any other cases(s)?**

   The expert can link the cases where similar explosive or explosive devices had been used.

7. **Can the culprit or the manufacturer be linked to the IED or the explosion?**

   The expert can link the person who has handled the explosive in any way. This is possible through comparison of traces of explosive which are transferred to the person who handles the explosive. The explosive traces can now be analysed even in Pico-grams.

8. **Could non-explosive substances like LPG-air mixtures cause the explosion?**

   Fuel gases, volatile organic liquids or even finely dispersed combustible organic powders, in the form of an aerosol, make an explosive mixture. When such an aerosol is exposed to a flame, it explodes. Sometimes even a spark from a static discharge is sufficient to cause the explosion.

9. **Is the explosion accidental or intentional?**

   The accidental and intentional explosions are not always easy to distinguish. In some cases, there may be evidence available to determine the same; in others the evidence may not be there.

   Total evidence (eyewitness accounts, scientific evidence and circumstantial evidence) can often discriminate between the two.

10. **What was the level of expertise used in the manufacture of the IED?**

    This question can be answered in most of the cases.

11. **Is there any evidence to link the given IED with the premises used for the manufacture?**

    Ordinarily, there is plenty of evidence to link an IED with the premises where it was manufactured/assembled. However, it may not always be available. Traces of explosives, residual material and the tools used may connect the manufacturing site with the device.

    In a mid-night blast, a double storey building of a local police station was razed to the ground. Huge amount of debris was searched and primary fragments formed due to the blast shown in the photograph could be located. Typical fragments indicated conclusively to form a steel Tiffin box, which helped the police to nab the culprits responsible for the blast. Explosive substance RDX, causing the blast was also detected. (CH)

Fig. 14.20

Fragments of Tiffin bomb (RDX)

12. **Was the given vehicle used to carry the IEDs?**

    If the vehicle can be examined soon after its use to carry the explosive device, it is possible to link the vehicle with the explosive as there may be traces of the explosive in the vehicle. Delay may cause loss of the traces. Besides, the construction of the device also affects the amount and nature of evidentiary clues available in the vehicle.

13. **Was the explosion accidental, due to negligence? Or, was it due to the illegal or defective manufacture of the cracker?**

    It is difficult to answer this question with certainty in most of the cases. The question can only be answered in probabilities either way.

14.15 EVALUATION

The evidentiary clues, in explosion cases, are found at the scene, with the culprit, at his residence, on his vehicle or en route. Their proper evaluation helps the investigation and trials of the cases to find:

1. The nature of the incidence
2. The type of the explosive/explosive device used
3. Linkage/de-linkage of the perpetrator with the evidentiary clues/scene of explosion/ the victim/the vehicle used in the crime /modus operandi and other similarity with other cases of the explosion.

4. The source(s)/the manufacturer/the seller of the explosive/infernal device which the culprit used.
5. The helpers/accomplices and the gang members/the terrorist group that helped him to cause the explosion .

In view of the above, the investigator does his best to locate/collect/pack/seal the evidentiary clues with all the formalities to maintain their relevancy, integrity, authenticity and continuity. He dispatches the exhibits to the expert analyst at the earliest. He provides him leads for a correct and early solution of the case.

14.15.1 The main evidentiary Clues

The main evidentiary clues at the explosion site are:

1. **Vapours of explosives;** they are available in all sites of blasts which have taken place in a closed space, in the crater of the blast, and adsorbed on the surfaces surrounding the blast sites, including debris. The vapours from the air are collected by passing the air over some adsorbent (charcoal or some synthetic substitute).

   The adsorbed vapours are detected with the help of the electronic detectors. They are desorbed on heating. They can also be extracted with a solvent.
2. **Unexploded explosive;** it is available in traces in most of the cases, being usually flash impacted on the surfaces and objects close to the explosion site. They persist for a long time if not washed away by rain or carried away by the wind. Adsorption on the surfaces retains them for a long time. The explosive traces in the form of clusters of microcrystals and decomposition products may also be found in the air of the enclosed areas like a room or vehicle even after long intervals.
3. **Explosive residues;** residue formation is certain. The particles of residues are scattered all around the scene. They may help to find the nature/amount of the explosive.
4. **Fragments; t**he explosion shatters the container/timing device/initiators,/ detonators,/batteries and electronic devices used for initiation through remote control. The fragments are scattered all around at the scene. They help to visualise the infernal device.
5. **Burn marks;** detonating cord leaves burn mark at the surface where it was placed.

   The mark indicates that the detonation cord was used to initiate the explosion. It also indicates the position of the explosive device *vis-à-vis* the position of the perpetrator.
6. **Electric blasting cap;** when an electric blasting cap is used as the initiator, it leaves its insulating material and fragments of the cap at the scene. They are useful clues to reconstruct the infernal device and the explosion.
7. **Missiles;** missiles like nails, ball bearings, nuts, bolts, used in IEDs. They are frequently recovered from the scene or from the body of the victim(s) and objects at the scene. They prove useful to link the criminal with the crime as similar material is often found with the person who has assembled the device.
8. **Electrical insulating tape**; electrical insulating tape and hook up wires are sometimes used to delay explosion of an IED. They survive the explosion in some cases and help to link the criminal with the crime.

The expert in the laboratory can piece together the materials recovered and come up with a reconstructed entity, which often permits identification of the original IED.

14.15.2 Evidence in Debris

Explosions create heaps of debris and leave traces of the explosives and other materials used in the IED in the debris. The residue traces are intermingled with heaps of dirt, dust and rubble. It is a daunting task to locate and identify them. However, enlarged investigative teams and equipment have made the task easier. Often electronic detectors are used to detect explosive residues impacted on the debris. Mechanical devices are used to sift the debris.

The sifted suspect material is thoroughly examined, visually and microscopically. A stereomicroscope with an extended arm is useful.

14.15.2.1 Separation or Extraction

The separation/extraction of the explosive residues or their decomposed products from the debris and locating the shattered pieces of the IED is a time consuming process and needs patience. Some sources of the debris are comparatively richer in explosive residues. They provide more convenient materials to work with. They are:

1. The **crater;** the crater surface and the soil to some depth are the most important locations for residual traces of the explosives and the explosive devices. The debris from the crater surface and underneath the soil is thoroughly explored. Fragments of the device/initiators/detonators/boosters/containers/missiles are driven into the soil. They are found embedded in the surface. In addition, traces of the explosive are always found in the crater debris.
2. The **surface and objects surrounding the seat of explosion;** these places and objects carry adsorbed traces of explosives. They are explored.
3. The **pressure wave route; a**rticles displaced or disturbed in the path are likely to carry traces of the explosive residues and fragments of the device.
4. The **blasted items (animate or inanimate);** they are important sources of evidentiary clues. They are similar to those items found in the crater debris.

In a railway compartment, dynamite sticks were used as an IED placed on luggage shelf, which was made of flat metallic bars with empty spaces in between. When the site was examined after the explosion, a part of the dynamite was found still sticking to the metallic bars. Perhaps the metallic bar prevented the transmission of the shock wave to the unexploded dynamite. (CH)

14.16 IDENTIFICATION OF THE EXPLOSIVES

14.16.1 Preliminary Tests

In testing live explosives, only small amount of the material is used to eliminate the danger of an accident. The investigator can perform these tests himself. The tests are:

14.16.1.1 Friction Test

Some explosives are sensitive to friction. They explode when rubbed against rough surfaces.

A trace of the suspected material is placed on a stone slab. The material is scratched with a metre-long bamboo stick. The experiment is repeated with increasing amounts of the material. If the material catches fire, it is an explosive.

14.16.1.2 Impact Test

Some explosives are impact sensitive. They are tested with a hammer blow.

A small quantity (starting from a trace and increasing the amount gradually to a pinch) is taken on a piece of paper, kept on a standard anvil and struck with a hammer. An explosion indicates that the material is an explosive. The experiment is repeated about half a dozen times to ensure that case it does not explode.

14.16.1.3 Flame Test

A small amount of the material under test is taken on the tip of a strip of paper. If the material is liquid, the paper is dipped in the liquid to absorb a fraction of a drop of the liquid and dried. The paper tip is then exposed to a candle flame. If the burning takes place violently, it is possibly an explosive. The colour of the flame may indicate the nature of explosive.

Fig. 14.21

Flame test indicate explosive

14.16.2 Laboratory Tests

Identification of the explosives, from the explosion scene debris involves the following steps:

1. **Stereomicroscopic examination**; the debris is examined under a stereomicroscope and suspected explosion materials, especially the fragmented pieces of the non-explosive components of the device, are picked out manually for a detailed examination.
2. **Solvent extraction**; after the stereo-microscopic sorting, the debris is extracted with solvents (acetone, chloroform). The solvent extracts the organic constituents of the explosive/explosion residues. The extracts are concentrated and tested for the constituents.
3. **Hot water extraction**; inorganic constituents are extracted with hot water. The extracts are concentrated and tested for the constituents.
4. **Gas Chromatographic identification**; it identifies the explosive. The explosive vapours are collected/concentrated and analysed by gas chromatography.

Other techniques used identification procedures are similar for most of the explosives. They are:

- For organic Constituents[10]: TLC, IP, IR, XRD, GC-MS, HPLC and HPLC-MS
- For inorganic constituents: IP, IR, XRD, SEM with EDX

14.17 PRESENT SCENARIO

Explosives, explosive devices and explosions were a rare phenomenon about three decades ago. Neither the public nor the law keepers had to bother much. Terrorism has changed the scenario. There have been so many explosions in the past few decades that nobody feels safe from the extreme danger they pose. The law keepers have to be vigilant and ready to meet the terrorists' challenges of new sophistications and the more powerful explosives that they are increasingly employing. The investigators have to join hands with the intelligence agencies on the one hand and the explosives and forensic experts on the other hand. In addition, they must use modern technology. Besides, the combined efforts, on international level, will provide the necessary synergy to meet the menace effectively.

The government need take the following steps to meet the challenges of the terrorist squarely:

14.17.1 Creation of Explosive Division in FSLs

The investigation of the explosion is both time and expertise intensive. The expert presence at the scene is indispensable. He needs long hours in the laboratories and the courts need him at the trials where often weeks are spent to exhaust the exhaustive cross-examination. And the need has arisen only in the past decades The volume of work, the high expertise needed and proof the court need creation of full-fledged explosive divisions. This should be done without further delay. Their work is already well-defined.

1. Analysis of pyrotechnic mixtures, low and high explosive substances and their preparations/formulations
2. Analysis of improvised explosive mixtures
3. Identification of plain/electric detonators and their fragments
4. Ascertain electric and non-electric initiation (triggering) mechanisms
5. Identification of IEDs, their different parts in exploded/unexploded forms
6. Evaluation of LPG explosions
7. Characterisation of live, exploded or diffused hand grenades
8. Identification of delay mechanism from the original or from their fragments.
9. Reconstruction of the sequence of occurrence of the blasts from the available information.
10. Plan and adopt a methodology for the investigation, collection and evaluation of the evidence material.
11. Identification of explosive substance or ascertaining original formulations used in improvised explosive devices from the samples collected from the blast sites.
12. Preparation of technical opinions relevant to the investigation and for legal purpose.
13. Creation of a data bank of IEDs, components of IEDs and profiles of different blasts.
14. To conduct research and develop methods to provide solutions to tackle the bombing related crimes.

10. Sharma, BR. 2011. Firearms in Criminal Investigation and Trials, Chapter 2. Universal Publishers, Delhi.

15. Validation of test methods (SOPs).
16. Calibration of the instruments.
17. Maintenance of the integrity of reference standards
18. Interconnect different bomb blasts from their profiles.
19. Revisit old blast sites to collect more clues appropriate to the investigation.
20. Evaluation of old samples of different blasts retained by other investigating agencies.
21. Connect the perpetrators of different bombings from the clue materials such as initiation mechanism, explosive formulations, the containers housing the device and other mechanisms controlling the device for its blast to occur in an intended way.

14.17.2 Induction of Modern Equipment

New equipment like SEM, RDX apparatus, Ion exchange chromatography, GC-MS, LC-MS, IR Spectrophotometery and mass spectrometery need induction in Explosive Division of forensic science laboratories to study, estimation and analyse:

1. The fragments and structural changes to identify primary and secondary fragments
2. The particles recovered from the craters or blast points to identify detonators or initiation devices.
3. The residues from the blast sites for detection and estimation of cations and anions for identification of inorganic substances.
4. The unexploded explosive substances for their identification
5. The organic explosive substances in unexploded preparations by Liquid Chromatograph.

14.17.3 Creation of Low Temperature Storage Facility

Many explosive substances like TATP, Nitroglycerin and explosion products are volatile in nature. Samples collected from the explosion/blast sites need to be stored at low temperature to avoid loss of volatile substances especially like NG and TATP. Low temperature facility should comprise circulation of chilled air inside the store without any electrical switches or any electrical appliance.

14.19 CASE LAW

14.19.1 Offence[11]

The contention of the learned counsel for the petitioners is that the offence, even if it is true, falls under section 6(3) of the Indian Explosives Act 4 of 1884, that it is a bailable offence and that, therefore, the petitioners are entitled to bail. Indian Explosives Act 4 of 1884 was enacted to regulate the manufacture, possession, sale, transport and importation of

11. *Masha Angami v Manipur Administration*, 1968 Cr LJ : 187 (Manipur).

explosives. Section 4(1)(a) of the said Act defines "explosive" as gunpowder, nitro-glycerin, dynamite, gun cotton, blasting powder, fulminate of mercury or of other metal and every other substance, whether similar to those above mentioned or not, used or manufactured with a view to produce a practical effect, explosion, or a pyrotechnic effect Section 6(3) of the said Act lays down that any person who manufactures, possesses or imports an explosive in contravention of a notification issued under section 6 shall be punishable with imprisonment for a term which may extend to 3 years or with a fine which may extend to Rs 5,000 or with both.

But, the Explosive Substances Act 6 of 1908 was enacted to amend the law relating to explosive substances. Section 2 of the Act defines "Explosive substance" as deeming to include any material for making any explosive substance Section 5 of the said Act runs as follows:

> *Punishment for making or possessing explosives under suspicious circumstances.- Any person who makes or knowingly has in his possession or under his control any explosive substance, under such circumstances as to give rise to a reasonable suspicion that he is not making it or does not have it in his possession or under his control for a lawful object, shall, unless he can show that he made it or had it in his possession or under his control for a lawful object, be punishable with transportation for a term which may extend to fourteen years, to which fine may be added, or with imprisonment for a term which may extend to five years, to which fine may be added.*

Gunpowder is also an explosive substance within the meaning of section 2 of the Explosive Substances Act (Act 6 of 1908). The case of the prosecution is that, when the driver of the vehicle questioned the first petitioner about a bag carried by the first petitioner in the vehicle, the first petitioner told him that it contained rice. So, the first petitioner appears to have made a false representation about the material, if the case of the prosecution is true. Also the court has to take judicial notice of the fact that Kohima in Nagaland is a disturbed area. So it cannot be said at this stage that the first petitioner was in possession of 32-one-second kg. of gunpowder with him for any lawful purpose. There is *prima facie* reasonable suspicion that the first petitioner had gunpowder with him for an unlawful object. As such, the punishment for the offence may extend to 14 years imprisonment under section 5 of the Explosive Substances Act 6 of 1908, and it is a non-bailable offence.

14.19.2 Non-dangerous Explosions[12]

So far as the charge under section 3 of the Explosive Substances Act is concerned it has to be established that the accused concerned had caused "an explosion of a nature likely to endanger life or to cause serious injury to property....." In the present case although the evidence clearly indicates that there were explosions resulting from the throwing of bombs there was no sufficient evidence that the explosions were of a nature likely to endanger life or to cause serious injury to property. All that the evidence shows is that some minor injuries were caused to some of the constables of the police party by splinters thrown out by the exploded bombs. The evidence being that the bombs were thrown at the party and in their midst, the fact that only minor injuries were caused by the explosions would indicate that the bombs were not of such a nature as to cause explosions likely to endanger life. There is also no evidence that any injury not to speak of serious injury was caused by the explosions to property. The explosions that were caused might very well have been caused by bombs and not by crackers, but that fact alone would not satisfy the requirements of section 3 of the Act. The position appearing from the evidence is the want of proof that the explosions actually caused by them were of a nature likely to endanger life or to cause serious injury to property and such being the case the conviction of the concerned appellants under section 3 of the Act although based on the expert's evidence that a bomb of the type examined

12. *Nema Adak v State of West Bengal*, 1965 (1) Cr LJ 160 (Cal).

by him would be capable of endangering life on explosion is not justified, particularly in view of his positive evidence in cross-examination which shows that although a chemical examination of the remnants of a country made bomb indicated existence of potash chlorate and arsenic sulphide therein, it is on the quantity and proportion of the said ingredients about which there is no evidence, that the mischief-making power of a bomb depends. We find that in face of the positive evidence as to the nature of the explosions caused by the bombs in this case, the conviction of the concerned appellants under section 3 of the Explosive Substances Act and the sentence passed thereunder cannot be sustained and must be set aside.

14.19.3 Identification[13]

It appears that soon after the explosion, the Inspector of Explosives, West Circle, Bombay, proceeded to Latur for investigation. He took into possession certain substances from the scene of the accident. By means of a letter dated May 11, 1962 sent from the office of the inspector of explosives these substances were forwarded to the chemical examiner, Government of Maharashtra, for examination. The samples were as follows:

A white substance in a packet suspected to be potassium chlorate.

An orange yellow substance suspected to be arsenic sulphide.

A round stone piece containing smears with orange yellow chemical adhering to it. (This was to be examined for the presence of arsenic sulphide and potassium chlorate.)

A contraption to test the explosibility of a mixture of potassium chlorate and sulphur.

Dinesh Chandra, P.W. 10, assistant inspector of explosives also went to the scene of the explosion along with the Inspector on May 9, 1962 and various samples were collected from the shops of the appellants as well. All these were forwarded to the chemical examiner for examination. The report of the chemical examiner (Ex-87) which is to be found on the original record gives the following analysis in respect of the above substances:

"Exhibit (1) is potassium chlorate. Exhibit (2) is arsenic sulphide. Exhibit (3) has sediment containing arsenic sulphide and sulphide and sulphur adhering to it. Exhibit (4) has potassium chlorate and sulphur in its cavity. Apart from the original record these facts stand established from the evidence of Dindesh Chandra, P.W. 10 and the report (Ex. 38) which he had submitted on November 2, 1962 which was duly proved by him when he appeared as a witness. He has further stated that when he inspected the premises of the factory on May 9, 1962 he noticed half burnt raw material like sulphur, white powder, the ingredients of which he could not ascertain. There were grinding stones as also empty tubes for manufacturing exhibition fireworks. As regards the cause of the explosion, his opinion may be given in his own words:

> *Probable cause of the explosion must have been the large quantities of the raw materials, gunpowder and finished fireworks and the raw materials for the same were stored in the premises.*

At the time of the explosion there were large quantities of the fireworks, finished as well as in the process of preparation, loose compositions and the gunpowder. They were being dried in the open court yard of the premises. Some of the items contained very sensitive explosive compositions which might have exploded due to the spark, percussion or friction or fire.

Although there was no direct evidence of the immediate cause of the explosion but indisputably the explosives the possession of which was prohibited under the notifications issued under the Act were found in the shops or the premises where the appellants carried on their business and the substances that have been mentioned which were of a highly hazardous and dangerous nature were apparently being used in the manufacture of the fireworks since

13. *Bhalchandra v State of Maharashtra*, 1968 Cr LJ 1501 (SC).

they were found at the scene of the explosion, (*vide* the evidence mentioned before and the finding of the trial court and the additional sessions judge.) As stated by Dinesh Chandra, P.W. 10 these explosives had sensitive compositions and even friction or percussion could cause an explosion. It is further proved that in the factory itself where the explosion took place the persons who were employed were mostly women who brought their small children with them and young children below the age of 18 had been employed in the manufacture of the fireworks. The factory was situated in close proximity to residential quarters. It becomes therefore all the more incumbent on the appellants to have completely avoided the use of highly sensitive compositions of the nature mentioned above.

Fig. 15.1
A case of arson. Evidence.

15.1 GENERAL

Fires cause extensive destruction of property and life, incurring colossal losses. The incidences of arson were few and far in-between in India previously. The occurrence of the incidents is increasing now. The extent of arson (malicious fires) can be visualised from the number of **registered cases of arson in Assam** in three years for which figures were available.

Table 15.1

year	2010	2011	2012
No of cases	437	506	700

As per NCRB (National Crime Record Bureau) arson Incident data for 2014 to 2016 are as follows:

2014	2015	2016
9289	9710	11196

The losses reported for the year 2016, in USA, are:

Table 15.2

1	Reported fire incidents	1,342,000
2	Fire deaths (civilian) [One civilian death occurred every 2 hours and 35 minutes]	3,390
3	Injured persons [One civilian injured occurred every 34 minutes]	14650
4	Property loss	$10.6 billion

The law, therefore, takes a serious view on arson (malicious fires). Sections 435 and 436 of the Indian Penal Code contain the penal provisions:

[s 435.] **Mischief by fire or explosive substance with intent to cause damage to amount of one hundred or (in case of agricultural produce) ten rupees.—**

Whoever commits mischief by fire or any explosive substance intending to cause, or knowing it to be likely that he will thereby cause, damage to any property to the amount of one hundred rupees or upwards [1]*[or (where the property is agricultural produce) ten rupees or upwards], shall be punished with imprisonment of either description for a term which may extend to seven years, and shall also be liable to fine.*

[s 436.] **Mischief by fire or explosive substance with intent to destroy house, etc.—**

Whoever commits mischief by fire or any explosive substance, intending to cause, or knowing it to be likely that he will thereby cause, the destruction of any building which is ordinarily used as a place of worship or as a human dwelling or as a place for the custody of property, shall be punished with [2]*[imprisonment for life], or with imprisonment of either description for a term which may extend to ten years, and shall also be liable to fine.*

Bride burning or dowry deaths have added a new dimension to fire investigations in India. Husbands/in- laws of the newly married woman kill those brides who have not brought an adequate dowry with them. Burning them before or after killing is a severe and unfortunate crime. This mode of killing is popular as the killers proclaim that the bride caught fire accidentally or she committed suicide. The crime is viewed, as it should be, very seriously. The law has been modified to facilitate investigations and pin the crime to the perpetrator. A new sub-section 113 B has been added to section 113 of the Indian Evidence Act.

[3]***[s 304B. Dowry death.—***

(1) Where the death of a woman is caused by any burns or bodily injury or occurs otherwise than under normal circumstances within seven years of her marriage and it is shown that soon before her death she was subjected to cruelty or harassment by her husband or any relative of her husband for, or in connection with, any demand for dowry,

1. Ins. by Act 8 of 1882, sec. 10.
2. Subs. by Act 26 of 1955, sec. 117 and Sch., for "transportation for life" (w.e.f. 1-1-1956).
3. Ins. by Act 43 of 1986, sec. 10 (w.e.f. 19-11-1986).

such death shall be called "dowry death", and such husband or relative shall be deemed to have caused her death.

Explanation.—For the purpose of this sub-section, "dowry" shall have the same meaning as in section 2 of the Dowry Prohibition Act, 1961 (28 of 1961). (2) Whoever commits dowry death shall be punished with imprisonment for a term which shall not be less than seven years but which may extend to imprisonment for life.]

[4]***[s 113 B. Presumption as* to dowry death.—**

When the question is whether a person has committed the dowry death of a woman and it is shown that soon before her death such woman has been subjected by such person to cruelty or harassment for, or in connection with, any demand for dowry, the Court shall presume that such person had caused the dowry death.

Explanation.—For the purposes of this section, "dowry death" shall have the same meaning as in section 304B of the Indian Penal Code (45 of 1860).]

Bride burning is inhuman. It is a slur on the society. Hundreds of brides are burnt every year in India. It has increased from about 400 a year in the early 1980s, to around 5800 a year by mid-1990s.

According to NCRB, there were 1948 convictions and 3876 acquittals in dowry death cases in 2008. Is investigative negligence/non-accountability/ corruption responsible for this sorry state of police investigations?

The investigation of fire has assumed tremendous importance for other reasons also:

1. The fire has great potential for destruction of property and life. It is perhaps a more potent weapon than a firearm to settle score directly or indirectly.
2. It destroys most of the evidence by burning it.
3. The efforts to put down the fire often destroy or contaminate the evidence.
4. Arson fires are involved in serious crimes:
   - Communal or political riots
   - Murders
   - Personal vendetta
   - Insurance frauds
5. Fire is used to destroy evidence of illegal activities:
   - Manufacture and storage of explosives, narcotics, illicit liquors, counterfeit currency, arms, and ammunition
   - Clandestine press
   - Evidence relating to espionage; spies often burn records at a pinch
   - Evidence relating to smuggling

4. Ins. by Act 43 of 1986, sec. 12 (w.e.f. 19-11-1986).

The investigation of the cause of a fire, due to its destructive nature and huge piles of debris is a difficult, tedious, and daunting task. The possibilities to establish whether the fire is accidental or malicious are meagre. The chances of pinning the guilt on to a suspect are still less. The main reason for the failures is that the investigations require long hours, in fact, days and weeks, and the patience of the proverbial donkey, which are not available with most of the IOs these days.

Main motives for arson are communal and political vendetta, personal enmity, and destruction of incriminating evidence relating to crimes like embezzlement, theft, robbery, and murder.

Maniacs also cause fires.

Further, the crime is being committed for economic gains (insurance claims!). The vast economic potentialities of the crime are coming home to the criminal mind. The crime is likely to be exploited on an ever-increasing scale in the coming years.

15.1.1 Profile of an Arsonist

The cases of arson are common in the USA. The psychologists in the USA have evolved a profile of an arsonist. It may be of some interest in India also in view of the increasing incidences of arson. The elements of the profile are:

1. **Age:** 16-30 years usually
2. **Mental status:** About 25% of the arsonists are unbalanced, mentally/emotionally
3. **Social status:** Most of them are from slums. A few of them are from the middle and upper class, usually unemployed
4. **Marital status:** Usually unmarried, divorced, and maladjusted
5. **Personality:** Feeble, cowards, with an inferiority complex, introverts, frustrated, lonely, anxious, tense, obstinate, contemptuous of authority and society, lack ambition and self-respect
6. **Associates:** Usually criminals and drunkards
7. **Motive:** Excitement, revenge, sadistic pleasure, to attract attention or show-off
8. **Target:** Random
9. **Time:** Night
10. **Recidivism:** Common

Professional arsonist is a different species. He is known in the USA as TORCH. They are professionals. They have different profiles. Likewise, maniacs do not correspond to the profile. They are also called pyromaniacs.

15.2 NATURE

Fire is combustion (burning, rapid oxidation) of substances. It is a chemical reaction (process). It is accompanied by light and heat. The process is possible only if certain requirements are met with, which are:

1. Appropriate ignition temperature
2. Proper initiator

3. Combustible material — fuel
4. Oxygen

If any of these requirements are not available, burning does not take place. Commonly, oxygen is supplied by air, the ignition device (e.g., flame) provides ignition temperature and any combustible material, usually organic matter, burns on being heated in the ignition process. The combustion/burning proceeds if the supply of oxygen and combustible substance is sufficient. If the supply of oxygen is limited, smouldering takes place, there are no flames, in the process. It may be noted that most of the substances burn in the gaseous state only.

Sometimes, there are no signs of combustion, but it may be going on inside a substance on a limited scale. Such substance may cause a fire on getting an opportunity to spread. For example, a charcoal piece may appear 'cold' and 'dead' from outside but inside it, the fire may continue. The oxygen absorbed by the charcoal piece supports the combustion. The coal piece may start a fire in such cases.

15.2.1 Progress

The progress of fire depends upon a number of factors. In addition to the availability of combustible material and oxygen The important ones are:

1. Temperature of fire
2. Humidity
3. Direction and velocity of the wind
4. Rate of production and dissipation of heat energy

The consideration of these factors carefully helps to discriminate between accidental and malicious fires.

> *In a case, a guard of a coal tar drum store had been selling coal tar clandestinely for some period. He was caught. The fear of the pending inquiry and consequences thereof, loomed large on his mind. One night he poured one drum on the floor of the closed storeroom and put it on fire to commit suicide and to destroy the evidence. Next day he was found dead, stuck in the coal tar. He had burns on the lower parts of the body only. The fire consumed, only partially, even the coal tar of the drum he had poured out. It appears the limited supply of the oxygen did not permit the complete destruction of the body and the store. (CH)*

15.2.2 Control

The spread of fire is controlled not only to protect property and life but also to save the incriminating and other evidence having a bearing on the cause of the fire. The methods employ the basic principles of production of fire in the reverse order:

1. Supply of oxygen is prevented by covering the fire with carbon-dioxide gas or non-combustible foam or other materials.
2. Vapourisation of the fuel is prevented by soaking it with water or by covering it with sand.
3. In the jungle and other big fires, spreading over a large area, the fire is controlled by creating a belt of "open space" from where all combustible materials are removed, segregating the burning area.

Fire may be malicious or accidental. The law presumes the origin of all fires to be accidental unless proved otherwise. The burden of proof, as usual, is on the prosecution.

15.2.3 Arson

Arson is a malicious fire. The arsonist tries to achieve:

1. Proper initiation
2. Quick spread
3. Complete destruction

The culprit uses various devices and materials for initiation:

1. A flame through a matchstick, a candle or a fuse cord is the commonest. They may or may not leave traces.
2. Explosives and incendiary materials are used as initiators. A large variety is available in this class. It may be a simple cracker or even an incendiary bomb. The choice depends upon the material available and the ingenuity of the culprit. The explosive device is, usually, kept in a container, which may or may not get destroyed in the ensuing fire.
3. Chemicals used for the purpose are, sulphuric acid with sugar and potassium chlorate, sodium and potassium metals, ethyl lead and yellow phosphorus. The materials start fire under certain conditions.
4. Heating appliances are excellent initiators. A live electric heater, electric iron, or a radiator, if kept in contact or near contact position with combustible material, such as clothes, papers, fibres, grass, leaves, or films, may cause the fire.

   In an interesting case, a heater was on during office hours. The current supply stopped. It was not restored during office hours. While closing the office, the concerned staff forgot to put off the heater. A fire was noticed by the guard at about midnight. It was put off soon after. The investigation of the fire revealed that there were some files lying near the heater. When the current was restored, the heater put the files on fire. (CH)
5. Remote control electronic devices to start malicious fires are increasing. They trigger a heating mechanism, which starts fires.

The arsonist uses accelerators in order to ensure that the intended target (say a building) catches fire quickly. He uses the following accelerators:

1. Inflammable liquids, such as petrol, kerosene oil, diesel, alcohol, turpentine oil.
2. Easily combustible solids, particularly celluloid[5] (old films), paper, rags, clothes, straw, grass, cotton and cotton waste. They are sometimes are soaked in vegetable or other inflammable oils or resins.

   Buildings do not burn easily. The arsonist, therefore, ensures sufficient supply of combustible materials like furniture, books and clothes to destroy the building.

5. New films are made of cellulose acetate. They do not burn easily.

Fig. 15.2

Limited supply of combustible material limited the loss

The common targets of the arsonist in India are cattle sheds, crops and haystacks, standing crops and jungles. Factory godowns, government buildings and factory premises are the targets of the political arsonist. Indiscipline among students may lead to arson in academic institutions. Students and mobs set buses, railway stations, and trains on fire.

15.2.4 Accidental Fires

Accidental fires are caused by:

1. Discarded burning cigarette ends or matchsticks.
2. Heating appliances, which generate sufficient heat. If combustible materials obstruct dissipation of heat, the materials catch fire.
3. Short circuiting and defective insulation.
4. LPG leakage
5. Lightning. Its occurrence is rather rare in India.
6. Sparks generated by friction in factories, or cinders thrown by locomotives or factory flues. They may fall on combustible materials and start fire.
7. Domestic pets (e.g., cats and dogs) which may upset a lighted candle or kerosene oil lamp and start fire.
8. Explosives are highly susceptible to pressure, friction, impact, heat and flame. Their defective storage is a constant source of accidental fires.
9. Sun's rays, passing through bottles or glass get concentrated as with a lens. If they fall upon combustible materials, they start fire.

CAUSES OF FIRES

- Appliances & equipment: cooking; heating; washing machines & dryers; air conditioners and fans; and more
- Arson: juvenile fire setting: children playing with fire and intentional fires
- Candles; home fires may involve candles
- Chemical and gases: Natural gas and LPG start fires spontaneous combustion. It is rare.
- Electrical and consumer electronics; short circuiting, overheating, overload
- Fireworks: They start fires in the manufacturing processes, in storage, in transport, in using
- Holiday: Christmas trees, holiday lights and decorations
- Household products: Mattresses, bedding and upholstered furniture
- Lightning Fires and Lightning Strikes
- Smoking materials: Fires involving smoking materials (i.e., tobacco products)

National Fire Protection Association of USA

15.2.5 Spontaneous Fires

Spontaneous fires occur due to internal exothermal reaction. The temperature increase rapidly and finally, spontaneous fires start. There is no external agent to cause these fires. Internal changes in the materials cause such fires. Common examples of spontaneous fires include:

1. **Auto-oxidation**; some haystacks and refuse/dung heaps catch fire if correct conditions of temperature and humidity are present. The bacteria initiate

auto-oxidation but the later stages are purely chemical. The bacteria cannot survive the temperatures developed by the process.

2. **Exposure**; drying oils give heat while 'drying' (example linseed oil). If the oil is impregnated in rags or fibres, it gives an expansive thin film of oil in compact space, sufficient heat is generated to put the fabric on fire.
3. **Chemicals**; they undergo exothermic chemical changes to produce sufficient heat to start fires.
4. **Coal**
5. **Pyrites**
6. **Pistachio nuts**

Spontaneous fires are rare.

15.2.6 Automobile Fires

Automobile fires are rather rare in India. It is almost impossible to burn a vehicle without external fuel. A vehicle contains very little combustible material. It is its tyres, wire covering, upholstery, paint and a tank of fuel. All this is just insufficient to burn the vehicle completely as shown by actual experiments. Experiments have also proved that short-circuiting in a vehicle, ordinarily, does not start a fire capable of consuming the vehicle. Under normal conditions of an accident, the tank bursts and most of the fuel in the tank scatters on the ground. It is not entirely consumed in burning the vehicle. However, the combustible load in the vehicle may start a fire.

> *A truck had been loaded with kerosene oil drums. It was going on a hill road. One of the drums was seen leaking by passers-by. The liquid spread over most of the hind part of the vehicle and started dripping. The vehicle, at one point, bumped against a bolder and probably generated a spark. The liquid was already (presumably) sufficiently heated due to the friction of the tyres. It caught fire. It consumed the whole vehicle in a matter of minutes.*
>
> *The driver had not noticed the seepage*. (CH)

Automobile fires are frequently malicious in origin. The culprit may start the fire to destroy the vehicle for any of the following reasons:

1. To collect insurance money
2. To burn incriminating evidence
3. Domestic quarrel
4. Revenge or jealousy

The main evidence to the crime is the seeped fuel found in the earth underneath, in the debris or in the upholstery if the vehicle is not fully consumed. The fuel used to burn the vehicle may be different from the one used in the vehicle.

The following points are also checked:

1. Incriminating evidence in the debris
2. Prior removal of small gadgets and accessories
3. Tampering of fuel distribution system-fuel pump, gas line and gas cap.
4. Short-circuiting is indicated by fused wires, discharged battery, blown fuses and bulbs (If lights were on).

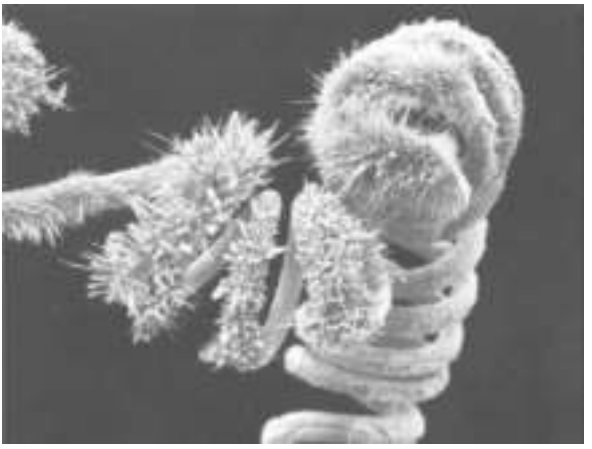

Fig. 15.3
Head lamp wire fusion on blowing-up

Ignition Sources for Vehicle Fires

1. Open flame
2. Electrical Fittings (short-circuiting, Sparking)/overloading
3. Broken bulbs
4. Mechanical sparking
5. Hot surfaces/objects
6. External spark
7. External electric heat/spark
8. Catalytic converter
9. Turbocharger

15.2.7 Burnt Bodies

Human burnt bodies are the *corpus delicti* in some crimes. The burns may be superficial, serious or fatal. Fires, explosives, corrosive chemicals (acids, alkalis) or electromagnetic rays (X-rays, ultraviolet rays) may cause them. The present discussion mainly concerns with burns from the fire directly or indirectly.

15.2.7.1 Classification

Burns are classified as first degree, second degree or third-degree burns:

1. First degree burns; in first degree burns the affected site becomes red. No tissues are destroyed. The burn does not leave any scar.

2. Second degree burns; they ulcerate the tissues. The skin is blackened and the hairs are singed. They form permanent scars.

3. Third degree burns: prolonged contact of the body with naked flame or materials at high temperatures causes third-degree burns. These burns are often fatal. In some cases, the life is saved by amputing the burnt limb. Ordinarily, when the body surface involved is more than 30%, the burns prove fatal.

The percent of the body burnt can be calculated from '**the Rule of 9'**. The rule indicates the relative approximate surface area of the various body parts:

1. Head = 9%
2. Chest (front) = 9%
3. Abdomen (front) = 9%
4. Entire back and buttocks = 18%
5. Each arm (front = 4.5%, back = 4.5%) total = 18%
6. Each leg (front = 9%, back, back 9%) total = 36%
7. Groin = 1%

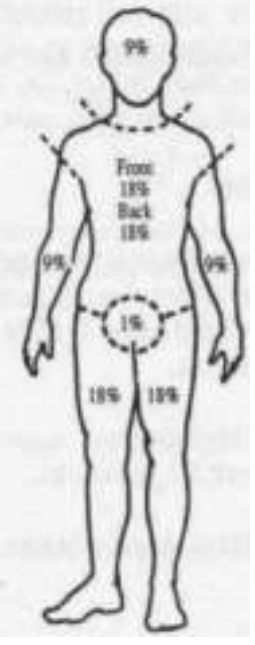

Fig. 15.4
Rule of Nine

Death of the victim, due to burns, is painful. If the victim does not die of shock, immediately, the death may take place in four to ten days. In some cases, death has taken place even after six weeks. The time of death depends upon the age and health of the person, the part of the body burnt, the depth to which the fire (or heat) has penetrated and the treatment which he received after the burning. Death may also occur indirectly due to medical complications of the body functions and formation of toxins; or, due to suffocation and inhalation of smoke and poisonous gases when the victim is engulfed by fire.

15.2.7.2 Post-Mortem or Ante-Mortem Burns

Whether the burns are ante-mortem or post-mortem, is an important question. The answer often helps to decide whether a particular death is homicidal or otherwise. Quite frequently a person is killed and set on fire.

The features, which distinguish ante-mortem burns from post-mortem burns, are:

1. Ante-mortem burns show inflammation.
2. Old burns show reparative scars, partial or complete.
3. Ante-mortem burn is surrounded by a red line (ring). If the burn occurs within a few minutes after death, it may also show the ring. Post-mortem burns show no such red rings/line, ordinarily.
4. The blisters are usually caused in ante-mortem burns. They may also appear, sometimes when dead bodies are burnt.
5. Ante-mortem burns blisters contain albumen rich serum, whereas post-mortem burns blisters contain little liquid, instead, the vesicles contain air.
6. If a person has died in a fire, which engulfed the victim, the air passage contains soot particles and the blood contains carbon monoxide (> 5%). Their absence indicates homicide. The cause of death is not suicide or accident. The absence of these clues has proved useful in establishing in bride burning cases.

Table 15.3

Signs of Ante-Mortem and Post-Mortem Burns (Nutshell)

S No	Evidence (sign)	Ante-mortem burns	Post-mortem burns
1	Redness line(s)	Present	Absent
2	Blisters	Blister with serous fluid. Base inflamed	Blisters with watery/air fluid. Burst easily. Dry base.
3	Vital reaction	Present	Absent
4	Enzymes	Increase in enzyme activity	Does not show
5	CO-Hb	Carboxyhemoglobin > 5% or more. 10% common. Blood colour change to cherry red	No cherry red colouration
6	Soot	Present	Present: passive intake in some

15.2.7.3 Accident, Suicide or Murder

It is often important to establish from a given burnt body whether the death was homicidal/accidental/suicidal. The following checkpoints help:

1. If the burns are post-mortem, death is homicidal.
2. If the victim carries injuries other than burns, it indicates struggle. Death is probably homicidal.
3. If the body contains intoxicants or sedatives, the death is probably homicidal, though an accident cannot be excluded from this observation alone. The quantity of drug/intoxicant/stupefying agent found may prove a useful guide.
4. Recovery of projectiles or the injuries on the person of the burnt body indicates homicide.
5. Examination of the scene of occurrence, its photograph, sketches and description often reveal the true nature of the occurrence.
6. A bone fracture may indicate murder
7. Cuts of sharp-edged weapon
8. If the body of the victim was burnt after death, it is most likely murder. The features, which discriminate ante-mortem and postmortem deaths (*supra*) help.

Fig. 15.5

The person was killed first then he was burnt in lonely shop to simulate accidental death due to fire

15.3 EVIDENTIARY CLUES

15.3.1 Preliminaries

In the systematic handling of clues in cases of arson/accidental/other fires, the investigating team takes the following preliminary steps to:

1. **Guard the scene of occurrence**, until the examination is complete.
2. **Survey the scene of fire**, to assess the needs to handle the scene effectively.
3. **Record of the scene**; by videography/photography/sketching and making a textual record; covering the extent of damage, the pattern of smoke deposit, the site of origin, the presence of foreign matter and damage to various installations.
4. **Take close up photographs of the evidence**, to clarify important points and to identify evidence.
5. **Observe the fire in progress**; at various intervals, if he reaches the site to observe the live scene and record its progress/control inputs.
6. **Contact the media people or other parties**, who have recorded (photographed) the fire in progress. He collects the copies of the photographs from them, in case he reaches the scene after the occurrence.
7. **Collect a copy of the site/**building plan.
8. **Make complete inventory of the stores** on the burnt premises [from the occupant(s)].
9. **Inspect** the following with the help of experts:
    1) Electrical installations
    2) Heating appliances
    3) Burnt materials
    4) Remnants of the burnt materials. The owner may help.
10. Collect information about the character of the fire.
11. Ascertain the time when the fire started and when it was extinguished.
12. Ascertain the mode of extinguishing the fire.

In arson cases, the nature of the clues vary from one case to another; depending upon the technique employed by the arsonist, the extent of damage and destruction caused by the fire and the efforts and processes used to put down or control the fire.

15.3.2 Collection

15.3.2.1 Fingerprints

Fingerprints are found on articles touched by the culprit but not destroyed by the fire. Some fingerprints remain in cases where complete destruction did not take place.

Points of entry/exit, doorknobs, door handles and windowpanes may carry fingerprints. If the culprit broke open a safe, cupboards or handled furniture, utensils and other articles, there is a likelihood of fingerprints on them. The culprit usually does not take the usual precaution to avoid leaving fingerprints in arson cases. He believes that fire will destroy them.

Left over articles by the culprits often carry fingerprints.

15.3.2.2 Track Marks

Track marks: foot, footwear, and tyre marks are found on the approach and exit routes and in or around the scene of occurrence, provided the visitors to the scene do not destroy them.

15.3.2.3 Miscellaneous Traces

If locks, windows, ventilators or skylights were broken, they may have exchanged evidentiary clues with the culprit. The culprit may carry evidence, such as glass fragments, paint, varnishes, wood fragments, dust and dirt at the sites. He leaves tool marks, tool fragments and foot and finger marks at the scene. These traces are checked/located/collected. The exchanged traces on comparison with the authentic source link the criminal with the crime, almost invariably.

15.3.2.4 Initiators

An initiator may not get destroyed in the fire. The unconsumed parts form useful clues. They are found at the point of initiation of fire.

Even if the initiator is destroyed in fire, its residues (smoke ash patterns or their chemical composition) may indicate the initiator used.

If a mechanical or an electronic device was used to initiate a fire, it may be found intact or damaged at the point of origin of the fire.

The usual types of clues relating to initiator are:

1. If a fuse cord was used as an initiator, burnt residue or burn marks are found on the surface. The residue and the mark are photographed. The residue is collected.
2. If explosive has been used as initiators, it leaves a characteristic pattern or smell/vapours at the scene. The burnt residues/vapours of the explosive may identify it. The identification of the explosive may lead to the source/culprit.

   Destruction pattern of an explosive is also characteristic. It indicates the possible explosive.
3. Remnants of the explosive devices are found sometimes. They provide linking evidence.
4. The initiation may have been done through a remote control device. The remnants of the counterpart initiator device are found at the initiation site. They are located/collected/evaluated.
5. If chemicals have been used as initiators, they may leave characteristic smell/residues, which identify the chemical used.

15.3.2.5 Accelerators

The accelerators are promoters to speed up the burning and to enlarge the target area. All types of easily inflammable materials (in solid, liquid or gaseous, state) especially of organic origin, are used as accelerants. The frequently used accelerants are, however, liquid hydrocarbons: petrol, kerosene and diesel.

Accelerators are not always destroyed in the fire. Some inflammable liquid/its vapours seep into the soil, debris, smoke deposit, ash or other absorbing material. It is possible to extract and identify them.

The accelerators are found at the point of origin of fire, near the point of initiation usually. Even if the investigating officer fails to detect any accelerant himself, he should collect some debris from the likely places for examination by an expert in a forensic science laboratory. Or, he should get the help of a laboratory expert to collect the correct sample.

Accelerators are dispersed over a large target area to ensure quick and complete destruction.

15.3.2.6 Combustible Materials (Fuel)

Insufficient attention is paid to ascertain the material responsible for the production of fire. In city arson cases involving pucca buildings are consumed, combustible material has to be inducted. Where has it come from? The answer can help a lot in solving the arson case.

Common promoting fuels are:

1. Wood, wooden furniture
2. Grass, dry leaves, fodder
3. Clothes and garments; mineral fibre textiles resist fire.
4. Paper in all forms, newspapers, magazines, books, files, all are excellent fire promoters
5. In laboratory fires, organic solvents act as accelerants.
6. Plastic and rubber materials

If the combustible material was not present at the arson site, it must have been brought from outside. The induction process and the nature of the residue may lead to the arsonist.

Burnt documents, furniture and clothes are examined to identify them. The motive of the arsonist in burning the documents may indicate the arsonist.

15.3.2.7 Electrical Installations

It is difficult for an average investigating officer to detect tampering of the electrical installations. The services of an electrical engineer, preferably of the one who had laid the wiring, is requisitioned. The opinion of the engineer, along with the evidence he has uncovered, is recorded.

15.3.2.8 Heating Appliances

Heating appliances (such as stove, furnace, electric heater, electric iron, radiator and the like) start many a fire. They are often not destroyed in the ensuing fire. They, therefore, provide vital information relating to the origin of fire.

15.3.2.9 Fire-extinguishing Devices

An arsonist usually tampers with the fire extinguishing devices if present on the premises to make them non-functional. This is done only when he has planned the act. The damaged devices indicate arson. Besides, they may lead to the arsonist through fingerprints or tool marks left on the devices while tampering them.

15.3.2.10 Foreign Matter

Tools, fragments of tools, containers for initiators/accelerators/fragments of explosive devices and personal articles of the arsonist are found at the scene of occurrence. They help to identify the culprit through the usual clues (fingerprints, residual initiators, accelerators, containers.

The articles are searched at and around the scene of fire, dustbins and waste heaps.

15.3.2.11 Evidence of Other Crime

The arsonist may have tried to destroy incriminating evidence relating to other crime(s) like murder, fraud, theft or robbery. Naturally, the IO checks the debris carefully to find/eliminate evidence of some other crime.

A fire once broke out in a factory and consumed part of the building. As there was ample fire hazard in the factory, the origin was considered accidental. However, when debris was being examined and removed a charred body of a person was recovered. The recovery led to the investigations of two crimes—arson and murder. (CH)

The premises may have been used for illegal activities, like counterfeiting currency, secret press, espionage, manufacture of illicit arms, liquor or narcotics. For fear of detection, the premises may have been burnt down. A careful search of the debris often provides evidentiary clues.

15.3.2.12 Character of Fire

The character of fire depends upon the nature and quantity of the substances burnt and the conditions prevailing at the scene. It is, therefore, useful to note down the elements of fire, which will reveal the origin, history and the progress of the fire.

Most of the characteristics of the fire can be observed only when the fire is in progress. Therefore, if the investigating officer is not present at that time, he should get the information from the witnesses especially from the fire brigade staff who observed the fire in progress and controlled it. Media person and their photographs are other important sources of evidence of the character of fire. The media photographers are requested to provide the images.

A new source of evidence of the character of fire has come up It is the mobile phone Many onlookers have phones with excellent camera facilities. The public is requested to E-mail the photographs.

Temperature of the fire is estimated from the havoc caused and the colour of the flame.

The elements of the character of fire are:

1. Extent of flame and its colour: The colour of the flame is dependent upon the material/ temperature. The table below may provide some idea:

Table 15.4

Smoke and Flame Colours

Material	Smoke Colour	Flame Colour
Petroleum products (Petrol, Kerosene, Diesel)	Black	Yellow to white
Paper, cloth, wood	Grey to brown	Yellow to red
Hey, dry leaves/twigs	White	–
Turpentine/thinners	Brownish black	Yellow to red, white
Coal tar	Black	–

2. Temperature developed: An idea of the temperature of the fire can be had from the colour of the flame:

Table 15.5

Flame Colour-temperature Relationship

Flame Colour	Temperature
Dull Red	500 — 600° C
Dark Red	600 — 800° C
Bright Red	800 — 1000° C
Orange	1000 — 1200° C
Brighter Yellow	1200 — 1400° C
White	1400° — and above

Table 15.6

Melting Points of Metals

Metal:	Alumi-num	Brass	Cast iron	Chro-mium	Copper	Gold	Iron	Lead	Nickel	Silver	Steel
MP°C	660	850-1000	1232	1857	1084	1 064	1535	327	1455	9621	1427

Table 15.7

Effect of Heat on Wood

Temperature °C	110	150	230	250	300
Effect	Water/ aromatics evaporate	Resins ooze CO given off	Carbonisation starts	Pyrophoric carbon	Charcoal formation

3. Odour of the burning material

Petroleum products, turpentine, rubber insulation give characteristic odour on burning. The odour is known not only to the specialist but also to the novice. Likewise, if explosive is used to initiate fire, it can be guessed from their characteristic odour. The various chemicals also give characteristic smells. The general public does not know them but they can tell whether the odour is:

1. Choking
2. Pungent
3. Pleasant

Sulphur oxides, oxides of nitrogen give pungent odour. Polyvinyl Chloride (PVC) plastics produce Chlorine, on burning, which has a pungent odour.

4. Nature and extent of smoke deposit patterns, their volume and the colour of smoke.
5. Spread pattern of fire.
6. The havoc caused.

They give the areas where combustible material was kept. They may also indicate the nature of the material burnt.

Smoke deposit patterns are observed after the fire has been subdued. They are mutilated sometimes in controlling the fire.

15.4 PROBLEMS/POSSIBILITIES

The main purpose of the investigation of fire is to find whether it is arson accidental fire, spontaneous fire or an act of God. Yet, more important problem is to identify the arsonist and link him with the arson, beyond a reasonable doubt. A significant problem has emerged in significant volume is bride burning/dowry deaths. Is the bride burning a case of suicide, murder or accident?

All cases of fire need intensive/extensive investigations and to locate/collect/get evaluated evidentiary clues to provide real justice to all concerned. Linked problems are; firstly, to find out the physical cause of the fire, secondly to know the *modus operandi* of the arsonist, and thirdly, to find ways and means to prevent all types of future fires.

In summary, the aims of the fire investigations are to determine:

1. the nature of fire: arson, accidental, spontaneous or Act of God?
2. the cause of fire and to use the knowledge to prevent future fires.
3. the nature and quantity of the materials burnt.
4. cause of the spread of fire and to modify building constructional strategy.
5. evidence to link the culprit with arson/fire.
6. the extent of damage and loss.
7. evidence of other crime, if any.
8. the *modus operandi.*
9. the origin (the seat) of fire.

In bride burning (dowry death) cases, the investigator must find out-:

- **Psychological autopsy** of the bride; to ascertain her compulsions: health. Social, financial, familial,
- the bride committed suicide; or, was she murdered?
- the bride was tortured/ill-treated, to force her to commit suicide.
- the suicide letter/note, allegedly written by the victim, is genuine or fake.
- the source of initiators, accelerators, promoters.
- there were their residues at the scene.
- the bride was burnt alive or dead.
- the bride mentally was disturbed.

15.5 EVALUATION

Evaluation of fires requires ample time, patience, perseverance and knowledge on technical matters. The investigating officer should seek help from all the possible sources.

15.5.1 Expert Help

The clues, which indicate whether the fire is malicious or accidental in nature or those clues, which can connect the criminal with the fire, are available at the scene of occurrence. They are associated with debris. It is, therefore, essential that the expert help is procured at an early stage so that the expert examines the scene in its nascent form. Once the scene of fire is mishandled, the possible clues may get lost in the debris.

The following experts are helpful in the investigation of arson/fires:

15.5.1.1 Fire Brigade Staff

The fire brigade staff has extensive experience of all types of fires. They, from the character of fire, the colour of the flame and the smell of the material burnt, can indicate the nature of materials burnt (the accelerators, foreign substances). They also indicate as to how the fire spread and how it was extinguished. The IO obtains the following specific information from them:

- The nature of the material burnt.
- The seat (origin) of fire
- The number of seats of fire, One or more than one. More than one seat indicate arson usually
- Direction of spread of fire
- The extent of fire
- *Modus operandi* for the suppression of fire

15.5.1.2 Architect

Architect is the person who prepared/supervised the construction of the building, which got burnt. He can provide:

- Building Plan
- Constructional material used and their combustibility

15.5.1.3 Electrical Engineer

The electrical engineer knows about the electrical installations in the building. He:

- gives the wiring layout in the building drawing.
- identify electrical short-circuiting as the cause of fire.
- indicates the load capacity of the installed electric system and the load capacity of the installations (gadgets).
- locates possible fault line, which started the fire.

The engineer, who had laid down the wiring of the installation, should be called for help, whenever available.

15.5.1.4 Inspector of Explosives

If an explosive is suspected to explode and cause fire, the help of an explosive expert is necessary. He gives the nature, quality, and quantity of the explosive involved in the fire. He also helps to locate evidence relating to the explosion and the explosive.

15.5.1.5 Forensic Scientists

The Forensic Scientist helps to:

- locate the seat(s) of origin of fire.
- identify initiators/accelerators/combustible materials.
- assess the quantity of the combustible material consumed by the fire.
- locate and collect the correct samples of clue materials to link the crime and criminal.
- decide if the fire is accidental or arson.

A forensic expert is indispensable in the investigation of fires. He should always be associated in the examination of the scene of fire.

15.5.1.6 Photographer

Police photographer establishes the location of the scene and the clue materials. Photographs in *situ* give information about the extent of fire, nature of the materials burnt and the direction of the spread of fire.

15.5.1.7 Videographer

Videography of the burning process presents an overall collective clear picture of the burning scene. The scene must always be video graphed for the record, before it is processed.

15.5.1.8 Occupants

Occupants of the house are the most important witnesses. They help to:

- Provide a correct inventory of the articles present on the premises. It is prepared before searching the scene.
- Identify the foreign articles present at or around the scene and in the debris.
- Understand the various stages of the spread of fire.
- Ascertain the nature of the initiator/accelerators and the burnt material.
- Indicate/fix possible suspect(s) in an arson case.

15.5.2 Systematic Investigation

A Special Investigation Team (SIT) is constituted for systematic and planned investigation. It:

15.5.2.1 Proves Malicious Intent

The following circumstances indicate malicious fire (arson):

- More than one seats of fire, without interconnection between them
- Presence of foreign inflammable materials
- Evidence of extraneous initiators
- Discovery of evidence relating to some other crime
- Destruction of only account-books and other important documents

- Removal of valuables before the start of the fire
- Release of animals before the start of fire
- Occurrence of fire soon after the receipt of a consignment of goods, the consignment may contain only spurious goods
- Recent heavy insurance of the premises
- Presence of worthless combustible stores of recent origin
- One and the same individual seen at a number of fires. He is probably a pyromaniac
- The character of fire if different from the one possible from the stores on the premises
- The occurrence of similar other fires
- The evidence of broken doors, windows, skylights, ventilators or even walls
- Tampering with fire-extinguishing devices

Fig. 15.6

Two buses burnt simultaneously at a bus stand.
Their similar fire spread pattern, the extent and the time element indicated arson

15.5.2.2 Eliminates Accidental Cause

The team eliminates the accidental origin of fire with the help of various experts if they do not find:

- Any defective heating appliance
- Any short-circuiting or leakage in the electrical installations
- Any negligence in the disposal of live matches, cigarette ends, lighted candles, live fires, and running electric appliance or heat radiators

- The possibility of a spark/cinder from, a close-by factory, starting the fire
- The possibility of lightning causing the fire
- The possibility of spontaneous combustion

15.5.2.3 Procures Side Information

- Movement of a Pyromaniac in the locality
- Economic Position of the occupant of the premises, his latest dealings and commitments
- The position and relation of the owner with his competitors/rivals/enemies/tenants
- Condition of the building, its construction/stores and the nature of business[6] being carried out at the premises.
- The time at which the fire was noticed?
- Who noticed the fire first?
- Who extinguished the fire?
- How was the fire extinguished?
- The opinion of the fire brigade staff
- The alleged losses
- The estimated losses.

In a police institution, gas masks were stored in a closed room. One day, smoke was noticed to be coming out of the room. On opening the room, it was found that a large number of gas masks were smouldering. The fire was quickly put down. But the damage to the stores was extensive.

The author examined the premises to find out the cause of fire. No extraneous material was discovered at the site. The smoke patterns were then closely studied. It was found that the site of origin was adjacent to a broken power point, which had not been used for years. It was hidden behind a stack of the gas masks.

Two alternatives for the origin of the fire were possible.

1. *It could be the auto-oxidation (spontaneous combustion) of carbon contained in the gas masks.*
2. *It could be short-circuiting at the power point. The burnt gas masks were carefully studied. The burning was found from outside to inside. In spontaneous combustion, the fire would have spread from the carbon contained in the gas mask to outside, to its container. It was not found in any gas mask. The spontaneous combustion in the present case had, therefore, to be ruled out.*

Electrical short-circuiting had also to be eliminated because the electrical installations were in working order.

The weather conditions were then studied. It was found that weather was extremely dry for one month prior to the day of occurrence. On the day, there were clouds and lightning, though no lightning was observed to have fallen on the building.

It appeared that the static electricity in the clouds was conducted through the lightning conductor. But due to dry condition it was not dissipated completely. Probably a part of it got discharged through the open end of earth wire of the power point. The spark produced set the stack on fire.

6. Manufacturing of explosives/crackers/drugs are fire-prone activities.

It was a closed room. The fire, therefore, remained smouldering until it consumed most of the oxygen contained in the room. By then it was noticed and extinguished.

The closed room, thus, controlled fire, which could have consumed the building and its stores worth millions of rupees. (CH)

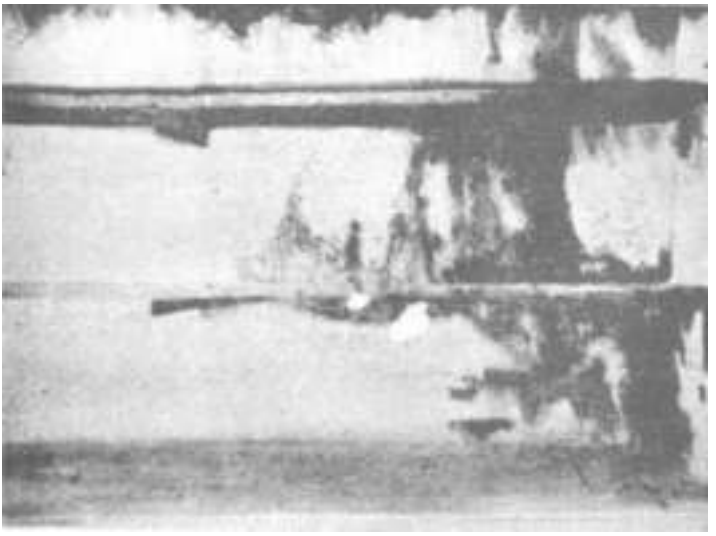

Fig. 15.7

Smoke patterns indicated the seat of fire and probable cause – an electric spark from a broken socket

Forensic Science Laboratories examine/evaluate the clues materials. The IO/SIT sends all the crime and corresponding sample clues to departmental laboratory, observing all legal formalities.

15.5.3 Laboratory Evaluations

Fire cases, especially arson cases, involve two types of evidence from the laboratory point of view:

1. General evidence like fingerprints, track marks, tool marks, abandoned articles, which is common to most of the crime. Such evidence has been discussed in various chapters of the book.
2. Fire related evidence, which is mostly of initiators, accelerants, fuel materials involved in arson/fire cases. Accelerants are the most frequently examined evidentiary clues.

Accelerants used are mostly petroleum products. Petrol and kerosene oil is the commonest, though diesel oil, mobile oil, lubricants are also used.

15.5.3.1 Extraction

The main problems of handling accelerants are:

- They are volatile and labile. The small amount in the debris evaporates if they are not processed early.
- They are often in extremely small amounts and dispersed in large amounts of substrata, the debris: may be soil, soot, wood or other debris like un-burnt,

semi-burnt materials: papers, garments and other household goods or vehicular upholstery. The evidence has to be collected.

The evidence is extracted from the substrata. The following techniques are common:

1. Floatation Process
2. Steam distillation
3. Solvent extraction
4. Solvent flushing
5. Vacuum distillation
6. Overhead space sampling

The success of extraction is dependent upon proper collection, efficient packing, expeditious and correct processing. If the package is not airtight, the vapours of the accelerants leak and the evidence is lost.

In a case of bride-burning case, the author visited the scene of occurrence. There was ample smell of kerosene oil in some carbonised pieces of clothes lying at the scene. The investigating officer was asked to collect/pack the clues correctly and dispatched them immediately. The parcels of the clues were received after about six months. They were packed in a cloth wrapper. Even the smell of the kerosene oil had vanished. No oil could be extracted! Was it negligence? Or, was it wilful destruction of evidence by replacing the clues? (CH)

In another cases, there was fire in an office. Apparently, embezzlement had been committed. The crime was being covered by destruction of the records. One of the involved persons, one evening, after the office hours, at about 17.30 hours sprinkled five litres of petrol on the files to be destroyed and left the office. He returned to the site at about 20.30 hours. He lighted a match and threw it inside through a broken window pane. There was an explosion. But before he could run away, hot air singed his face and stamped him as the perpetrator. The explosion alerted everybody and the police reached the scene. The author examined the scene. It was found that margins of some files had been scorched but not a single file was destroyed. From some of the files petrol was dripping. The explosion had broken many a door and window and cracked some wall portions also. But the intended fire did not spread.

The investigation agency took their time to send the liquid for examination. The laboratory analysis of the accelerants corresponded more to kerosene oil rather than to petrol mentioned in the scene of crime examination report. The variations had to be explained. (CH)

Formerly, floatation method, being the simplest, was commonly employed to extract the petroleum product vapours. It is the most inefficient method. It has been given up almost completely. Likewise, the identification of the product was being done through conventional methods: boiling point, boiling range, distillation curves, and refractive index. These tests required mostly amounts that often were not available and consequently could not be carried out. New technology has since come up. It needs only micro or nano-gram samples. The new techniques have revolutionised the identification of the involved products (Petrol? Kerosene? Diesel?). They also permit individualisation and comparison of the individual disputed vapours with a given sample. The techniques of choice are:

1) **Gas chromatography (GC):** Long capillary columns (hundreds of feet long) has separated hundreds of constituents and thus promoted individualisation of the sample. Columns of shorter length with suitable stationary phase packing material are also efficient. But the former have almost completely replaced the latter. Efficient detectors like electron capture are used in the process. Formerly thermal conductivity detectors were common. They are not so efficient.

2) **GC–MS:** Gas Chromatographs (GC) have been coupled with Mass Spectrographs (MS). They permit the identification of the individual constituents. The arrangement has increased the identification potential of the clue materials many times.

3) **Atomic Absorption Spectrophotometers (AAS):** AAS has been utilised to identify the metallic constituents of the materials. For example, lead in leaded petrol was identified by the technique. It is also used to analyse the residue of the chemical imitators.

4) **High Performance/Pressure Liquid Chromatography (HPLC).** It is being used increasingly to identify petroleum products. This technique proves, especially useful where the product used is a result of cracking. The cracking process introduces aromatic constituents, especially in petrol. They act as markers of the product.

The main hurdle in the identification of the accelerants is the variations of the evidentiary clues from the scene due to the action of fire on the petroleum products (varied evaporation changes the composition of the components). Secondly, pyrolysis inducts products of the substrata that may consist of plastic material. Though reference files are available for the former problem, after controlled evaporation of the lighter constituents in various percentages, yet it is best to do the homework with the involved product itself and prepare one's own reference product profiles. Products with a varied percentage of evaporation (say, 10%, 20%, 30% ….) are prepared and then compared with the product from the scene.

The pyrolysis of the plastic and other like materials at the scene is a more serious problem. It is tackled by pyrolysing similar plastic material at corresponding temperatures and durations to those at the scene and the products examined. However, it is more easily said than done. The seasoned analyst usually ignores the peaks of plastic products.

15.6 EXPERT TESTIMONY

Expert evidence in fire and arson cases relates to two examinations:

1. The scene of occurrence examination
2. The laboratory examination of the clue materials

15.6.1 Fire Scene Examiner

Qualified (educated, trained and experienced) scientists carry out Laboratory examination of the collected materials. But the collection of the clues is carried out by police or other investigators most of the time. They are not scientists. Unfortunately, a lot depends upon their initial examination of the scene and collection of the evidence thereof. They have to have proper education, training and experience. The National Fire Protection Association of USA[7] has suggested a list pertaining to knowledge/skill requirements, which include:

1. Fire science;
2. Fire chemistry;
3. Thermodynamics;
4. Thermometry;
5. Fire dynamics;
6. Explosion dynamics;
7. Computer fire modelling;
8. Fire investigation;

7. National Fire Protection Association (NFPA), USA Document, No. 1033, Standard for Professional Requirements for Fire Investigator.

9. Fire analysis;
10. Fire investigation methodology;
11. Fire investigation technology;
12. Hazardous materials;
13. Failure analysis and analytical tools;

It is a tall order. In India, there are no such training programs.

15.6.2 Crime Scene Report

The scene of occurrence report should provide data/information on the following heads:

1. Occurrence: place, date and time
2. Request for investigation: reference
3. Arrival at the scene
4. Weather conditions
5. Fire control mode
6. Fire-affected premises
7. Fire-affected areas
8. Fire-affecting materials — details
9. Evidence located
10. Evidence collected: General clue materials, fire-related due materials, initiation device or remnants thereof, accelerants or residues thereof, promoters or residues thereof, smoke patterns photographs, smoke residues, residues of the alleged burnt materials, remnants of explosion, if any.
11. Fire safety equipment, if any: Tampered? Removed? Used or not used?
12. Informational statement or report from: Fire-brigade staff, Owner(s)/tenant(s), the injured, the report of the first viewer, Media people.
13. Expert help obtained
14. The crime scene report indicates:
    - Absence/presence of accidental cause, with reasons
    - Presence/absence of arson, with reasons
    - Possible leads, for further investigations
    - Elimination of possible cause(s)
15. Documentation of the scene; videograph, photographs, Sketches, textual description.

15.6.3 Laboratory Reports

The laboratory report is furnished on a standard format devised by the laboratory for the purpose. It contains all the relevant information about the crime, about the exhibits, mode and date of receipts, the examination process, the observations and the conclusion reached. The necessary diagrams, charts, photographs, are furnished along with the report.

The absence of other possible modes of fire and other negative evidence is also discussed succinctly and reasoned out lucidly.

15.8 CASE LAW

15.8.1 Burning[8]

Author's Summary

The culprit poured kerosene oil on the clothes of the victim and put the clothes on fire. The act was patently murderous and the victim died. No special knowledge that the act would kill the victim was needed to know that. The lower courts wrongly acquitted him. He was convicted for culpable homicide under Section 300 (4) IPC.

8. *State of Madhya Pradesh v Ram Prasad*, AIR 1968 SC 881 : (1968) 2 SCR 522 : 1986 Cr L J 1025 (SC).

Relevant Extracts (Verbatim)

In the present case, Ram Prasad poured kerosene upon the clothes of Mst. Rajji and set fire to those clothes. It is obvious that such fire spreads rapidly and burns extensively. No special knowledge is needed to know that one may cause death by burning if he sets fire to the clothes of a person. Therefore, it is obvious that Ram Prasad must have known that he was running the risk of causing the death of Rajji or such bodily injury as was likely to cause her death. As he had no excuse for incurring that risk the offence must be taken to fall within the fourth clause of section 300, Indian Penal Code, in other words, his offence was culpable homicide amounting to murder even if he did not intend causing the death of Mst. Rajji. He committed an act so imminently dangerous that it was in all probability likely to cause death. We are accordingly of the opinion that the High Court and the Sessions Judge were both wrong in holding that the offence did not fall within murder.

15.8.2 Negligence[9]

Author's Summary

This is a case of extreme negligence. 4 burners were allowed to burn near the place where turpentine and other combustible materials were stored at a distance of about 8 feet against the condition of the licence. The turpentine vapours caught fire and engulfed the premises. 7 persons were burnt. The owner was rightly convicted.

Relevant Extracts (Verbatim)

We have already pointed out that four burners were in one corner of the room and combustible matter was in another corner of the same room and there was only a distance of 8 or 10 feet between the two. The burners were lighted against the general as well as the special conditions of the licence for storage granted to the appellant. The proximity of naked fire to the stores of turpentine and varnish is in our opinion always a matter of probable danger to human life, namely, the life of the persons working in the room. This was particularly so with respect to turpentine which has a low flash point, *i.e*. 76°F to 110°F. The use of naked fire could, in conceivable circumstances, even raise the temperature of the room itself above the flash point of turpentine and if the turpentine ever happened to be exposed it might easily catch fire. There was, in our opinion, therefore, always a probable danger to human life by the appellant negligently or knowingly omitting to take proper care in the matter of the four burners and turpentine and varnish. His action in allowing burners to be lighted in the room without any safeguard did in our opinion amount to omission to take such order with fire and combustible matter as would be sufficient to guard against probable danger to human life. We can only say that it was lucky that fire had not broken out earlier. But there can be no doubt that the omission of the appellant to take proper care with burners in particular when such combustible matter as turpentine in large quantity was stored at a distance of 8 to 10 feet from the burners was such omission as amounted to insufficient guard against probable danger to human life. Finally when we remember that all this was done in breach of the general and special conditions of the licence given to the appellant for storage of turpentine, varnish and paints, we have no doubt that the appellant knowingly, or at least negligently, failed to take such order with fire and the combustible matter as would be sufficient to guard against any probable danger to human life. In the circumstances we are of opinion that the appellant has been rightly convicted under section 285 of the Indian Penal Code. Considering that seven lives have

9. *Kurban Hussein Mohammedali v State Of Maharashtra*, AIR 1965 SC 1616.

been lost on account of the negligence of the appellant in this connection, the sentence of six months rigorous imprisonment which is the maximum provided under section 285 cannot be said to be harsh[10].

15.8.3 Bride-Burning[11]

Author's Summary

In this case, the culprit murdered his wife and attempted to make it a case of suicide by self-immolation. The court found plenty of evidence to indicate it was not a suicide. The position of the body, the burn pattern on it, cleanliness of the scene, absence of burning of combustible materials close to the burnt body and the conduct of the culprit proved a case of murder by burning.

Relevant Extracts (Verbatim)

The city inspector, Rameshwar Kumar Sharma, P.W., had also arranged to get the dead body in the closet photographed from Gurcharan Singh, Photographer, P.W. 9. Two photographs, exhibits P. 1 and P. 2, along with their negatives, are also on the record. These photographs were admitted by all the four accused. From photographs, exhibits P. 1 and P. 2, it is quite evident that the dead body was placed just at the threshold of the door which was the entry of the closet. The dead body appears to have occupied the entire breadth of the store. The head and the back of the dead body were raised against the wall in such a position that the body could not fall. It also appeared that the legs could not be stretched beyond the opposite wall. In this closet were also found various household articles including drums etc. From a look at the photographs when perused with the statement of the doctor, which has been reproduced above, it becomes crystal clear that the right side of the dead body except the portion just towards the upper right thigh in contact with the mattress on which the dead body was seated had not been burnt. The blouse on the right side except for a few burnt portions was intact. According to the doctor the blue colour of the blouse had not been affected. The petticoat or the sari cloth on the left leg seems not to have been burnt. All the tell-tale burn marks were on the left arm, left shoulder, left chest and the left side of the face and head. All the articles lying in the store near the dead body do not seem to be disturbed. At point D in the photograph, Exhibit P. 1, some article appears to be in close contact with the left side of the dead body. A basket appears to be lying near the left knee, but none of the articles appears to have been disturbed. Plastic bangles on the right arm also do not appear to have been at all burnt. A close look at the second photograph, Exhibit P. 2, which was taken by the photographer from the back, shows that the left upper arm and the left shoulder are completely burnt mass and below the elbow nothing is observable. Towards the left of point B and the right of point Y there appears to be some portion of either ulna or radius which in the opinion of the doctor was jutting out from the elbow joint in a completely burnt condition. There does not appear to be anything below figure Y. The doctor was exhaustively cross-examined at this point by the trial court. In reply to one question, it was stated that the left arm up to the elbow was so much burnt that there was no flesh left and the bones were charred to ashes. In reply to another question, it was clarified that "the burnt bones turned to ashes just like remains left after the cremation". It was also deposed that only the upper two-thirds portion of the radius and ulna were jutting from the elbow joint and the rest had fallen off. In reply to another question it was stated that the rest of the portion was missing. However, after the

10. *Kurban Hussein Mohamedalli Rangawalla v State of Maharashtra*, 1965 (2) Cr L J 550 : AIR 1965 SC 1616 : (1965) 1 SCWR 718.
11. *Kuldip Sham v State of Punjab*, 1980 Cr LJ 75.

statement had been completed, the doctor, before signing the statement, without the order of the court and without bringing the same to the notice of the court, himself added the word "not" thereby showing "the rest of the portion was not missing."

A close perusal of the statement of Dr. G.D. Chawla, P.W., leaves strong impact on the mind that it was his clear statement in the first instance that the portion below the elbow joint of the left arm was missing and had been completely burnt to ashes. Subsequently, however, he made a deliberate attempt to wriggle out of it and to make equivocal statement that some bones were jutting out of the elbow joint.

According to the trial court, the burns on the dead body of Usha Rani, deceased, were not ante-mortem and that one-third portion of the left arm below the elbow was missing before the dead body was put to fire and the same was done in order to conceal the injuries which may have been inflicted on that part before her death. It was also pointed out that the doctor had not dissected the head and the face from which also correct opinion could be formed if some injuries had been inflicted on the said part of the body. The doctor, however, categorically stated that the burns on the dead body of Usha Rani were ante-mortem in nature and were sufficient to cause her death in the ordinary course of nature. Though it is not possible to form a categorical opinion from the material on the record if the burns on the dead body were ante-mortem or post-mortem in view of the categorical statement of the doctor, yet from the oral evidence of the witnesses who had seen the dead body lying in the closet as referred to above, the two photographs and the statement of the doctor, no doubt is left that even if it was a case of death by fire and the consequential burns, the body of Usha Rani had not been subject to fire in the closet and that the dead body was placed therein only after death. If Usha Rani had caught fire whether accidentally or intentionally to commit suicide, after the body caught fire, she must have writhed with pain and made frantic movements of hands and legs and the natural consequence would be that the articles lying near the dead body must have been disturbed. Besides, the wall, the door and the threshold where the body was seated or was in contact must have also borne the impact of fire and the smoke. At least, the rice lying in the thali could not but show signs of the impact of intensive fire. It is clear from the photograph, Exhibit P.1 that a cloth is covering the dead body which did not have any sign of fire or even smoke. Indisputably, this cloth had been put on her after she had died. Even according to Mohan Lal, C.W., who had just followed Ram Lal, accused, after Shanti Devi, accused had raised hue and cry, he did not see any fire or smoke. There is absolutely no evidence on the record to show if any person had seen the fire or the smoke coming out of the closet. Thus, the only conclusion possible is that Usha Rani was already dead whether by fire or otherwise when her dead body was placed in the closet.

After having arrived at the above conclusion, the conduct of Kuldip Sham, accused, assumes considerable importance as in a case based only on circumstantial evidence, the conduct of the accused is also an important link in the chain of incriminating circumstances to arrive at the correct conclusion. According to the statement of Kuldip Sham, accused, after the close of the prosecution evidence, he used to go for a morning walk every day and on March 28, 1976, had gone for a walk at 6.15 a.m. along with his partner and friend, Dharam Vir Mahajan, C.W. 1. At that time, his wife Usha Rani was quite fit and alive. When he returned at about 6.45 a.m., he found a crowd of people having collected in front of his house. It was then that he came to know that Usha Rani was dead and her dead body was lying in the closet. He further stated that Usha Rani had died by sprinkling kerosene oil on her body and then putting herself on fire after he had left the house for a walk in the morning. This defence version stands completely negatived and contradicted by the convincing evidence and the objective circumstances on the record. As discussed above in detail, Usha Rani had not caught fire in the closet but her dead body had been placed there subsequent to her tragic end. Even Mohan

Lal C.W., who had immediately followed Ram Lal, accused, on hearing the cries of Shanti Devi, accused, had not seen any sign of fire or smoke coming out of the closet at any time in the morning. The version of the accused that he had gone for a morning walk with Dharam Vir Mahajan. C.W., was also belied by the deposition of the later as a court witness (C.W.1). According to his deposition, he did not even know Kuldip Sham accused, and I had not gone with him for a morning walk.

This conduct of the accused in fabricating a story that he had gone out of the house in the morning and that it was in his absence within a short span of half an hour or so that his wife Usha Rani committed suicide is a strong indication of his guilty mind and a deliberate attempt on his part in order to conceal the commission of offence. If it was Kuldip Sham, accused, and Usha Rani, who had slept in the house on the relevant night, and Usha Rani had for one reason or the other, committed suicide or had died by accident, it was not probable that Kuldip Sham, accused, would concoct such a cock and bull story. The relations between the two being strained and Kuldip Sham being aggrieved against his wife whether on account of the non-fulfillment of his demand for more dowry or because he suspected her fidelity on account of the seizure of the letter addressed to her by some other person, the dead body of Usha Rani found in the closet in suspicious and mysterious manner and the deliberate attempt on the part of the accused to concoct a false story are such incriminating circumstances from which no other conclusion is possible except that it was Kuldip Sham, accused, who was instrumental in committing the murder of his wife by putting her on fire or in any other manner. It has been held in *Deonandan Mishra v State of Bihar*[12], that in case of a murder when there is no direct evidence and the prosecution case is based only on circumstantial evidence, absence of explanation or false explanation by the accused serves as an additional link in the chain of circumstances to connect the accused with the offence. In the present case, as discussed above, the accused, Kuldip Sham, came out with statement in explanation regarding the cause of death of his wife which has been found to be palpably false.

15.8.4 Accidental, suicidal or Homicidal Burning[13]

Author's Summary

It was an incompetent attempt to dub 2 murders as accidental deaths. The culprit killed his mother and wife and placed the burnt bodies on 2 beds in the same room. He alleged that they caught fire from a kerosene lamp and got burnt. All the evidence indicated the falsehood of the story.

Relevant Extracts (Verbatim)

The manner in which the charred bodies of the two women *viz.,* wife and mother of accused were found lying on the cot and cradle in the same room completely excludes the possibility of their death either by an accidental fire or suicide. It is impossible to believe that the flame of a small kerosene oil lamp could have simultaneously ignited either the clothes or the bed of both these women when they were lying in two separate beds separated by a distance of at least 2 feet as has been proved by evidence. Even assuming that the bed or clothes of any one of them were ignited accidentally in this manner that does not explain the setting of fire to the clothes and bed of the other woman. Neither of these two women was infirm or disabled in any manner. There is absolutely no reason why even that women whose clothes or bed may have caught fire could not get up from the bed and rush for help and the other woman would

12. AIR 1955 SC 801 : 1955 Cr LJ 1647 : (1955) 2 SCR 570.
13. 1979 Cr LJ 94 (NOC) 213.

not come to her rescue leaving her own bed. Even assuming the improbable that the clothes or bed of both of them simultaneously caught fire, neither their clothes nor bed comprised of any highly inflammable substance so that the flames could spontaneously engulf them completely. At any rate, even in that situation, they would not remain lying coolly in the bed to let the fire consume their bodies in the manner they were found next morning. The suggestion of an accidental fire catching both or either of them is impossible to accept. On his own admission accused was the first person to enter that room and to find both the bodies totally charred and almost wholly consumed by fire. In case of an accidental fire catching these women, their bodies would not be found lying in the bed as they were discovered next morning.

Multiple vehicle crash

16.1 GENERAL

Motor vehicles frequently figure in criminal investigations. They are involved in road accidents. The criminals use them to reach and leave the crime scene or to transport incriminating articles from the scene to the place of disposal. Heinous crimes like murder rape and kidnapping are committed in vehicles. Vehicles are also used to crush/kill persons. In short, they are used in all sorts of crimes including thefts, smuggling, rape, riots, robberies, dacoities and murders.

The vehicles are also the objects of crime. They are burnt/destroyed to claim insurance money. They are stolen for sale or sometimes for joy rides. The functional parts of the vehicle are tampered to cause accident when they are driven.

Sometimes a crime is committed in the vehicle itself, making it the crime scene. Physical assaults, looting, kidnapping, murders, rapes and for carrying and destroying incriminating evidence are quite common crimes committed in vehicles

Vehicles are increasingly becoming the object of crime. They are stolen and after changing the identity parameters (Engine/chassis/registration numbers, paint, decorative additions, etc.), they are sold. They are stripped and parts are sold. It is a flourishing trade in some big cities. They are often damaged for revenge/vendetta and in political or communal riots.

The evidence on the vehicles helps to establish *corpus delicti,* links the culprit with the crime scene and the victim. They help to reconstruct the crime and the sequence of events.

The number of motor vehicles on the Indian roads was very small prior to and even after independence in India. It slowly increased in the first few decades after independence. But the advent of the 21st century saw a vehicular explosion. It ushered in vehicular era in India. The number of vehicles, especially of light transport vehicle has increased many folds. It is still increasing exponentially. The increase in vehicular crimes (involving vehicles) is natural fallout of the explosion of vehicular use.

16.1.1 Crimes and Vehicles

Motor vehicles are used, now increasingly, in the commission of practically all types of crimes:

1. The criminal may hire a taxi and order it to a secluded place. The criminals may rob/manhandle/kill the driver. A road accident may then be simulated.

2. Criminals molest/assault young females travelling alone in vehicles. Kidnapping/rape/murder has become a common occurrence in vehicles.
3. Vehicles are being used increasingly to kidnap/manhandle/molest/kill rivals/enemies.
4. Vehicles are used to transport stolen/smuggled/contraband goods/objects.
5. Vehicles are being used to transport incriminating evidence from the place of occurrence to a safe place, for hiding or for destruction.
6. Vehicles are used sometimes to kill a person by running over the victim or by causing fatal accidents.
7. Terrorists in Pakistan (and elsewhere) are using vehicles, filled with explosives, for suicidal bombing with great effect, in terms of loss of life and property.

Road accidents, however, account for the maximum number of vehicular crimes in India. They were sensational affair in the past. Not so now, it is a common occurrence. We are fast catching up with the western countries in respect of incidences of road accidents.

16.2 NATURE

The variety of the vehicles on the Indian roads is very large. In addition to the non-mechanized transport, we have auto-cycles, scooters, motor cycles, cars, buses, trucks, tractors, bulldozers and road-rollers. The variety of the vehicles and their number is ever increasing and hence the number of accidents is increasing.

Vehicles also kill/injure pedestrians in road accidents.

Table 16.1

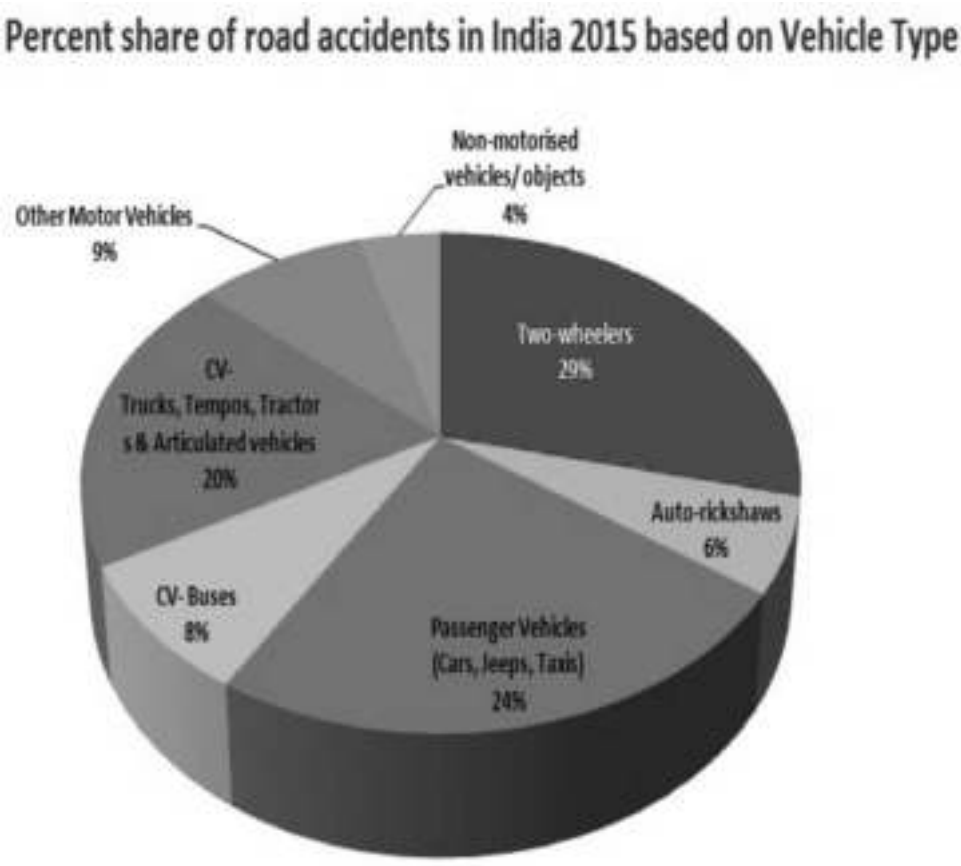
Road accidents covering the period from 2005 to 2016

Year	Number of Accidents		Number of Persons		Accident Severity*
	Total	Fatal	Killed	Injured	
2005	4,39,255	83,491 (19.0)	94,968	465,282	21.6
2006	4,60,920	93,917 (20.4)	105,749	496,481	22.9
2007	4,79,216	1,01,161 (21.1)	114,444	513,340	23.9
2008	4,84,704	1,06,591 (22.0)	119,860	523,193	24.7
2009	4,86,384	1,10,993 (22.8)	125,660	515,458	25.8
2010	4,99,628	1,19,558 (23.9)	134,513	527,512	26.9
2011	4,97,686	1,21,618 (24.4)	1,42,485	5,11,394	28.6
2012	4,90,383	1,23,093 (25.1)	1,38,258	5,09,667	28.2
2013	4,86,476	1,22,589 (25.2)	1,37,572	4,94,893	28.3
2014	4,89,400	1,25,828 (25.7)	1,39,671	4,93,474	28.5
2015	5,01,423	1,31,726 (26.3)	1,46,133	5,00,279	29.1
2016	4,80,652	1,36,071 (28.3)	1,50,785	4,94,624	31.4

Source: Information supplied by States/UTs (Police Departments).
Figures within parentheses indicate share of fatal accidents in total accidents.
* Number of persons killed per 100 accidents

During 2016, there were **55 road accidents and 17 deaths every hour**, in India.

The analysis of road accident data in 2015 reveals that motorised vehicles accounted for 95.5% of the total road accidents. Amongst the vehicle categories, two-wheelers accounted for the highest share in total road accidents (28.8%) in 2015 followed by cars, jeeps and taxis (23.6%); trucks, tempos, tractors and other articulated vehicles (19.7%), other motor vehicles (9%), buses (8.3%) and auto rickshaws (6.1%).

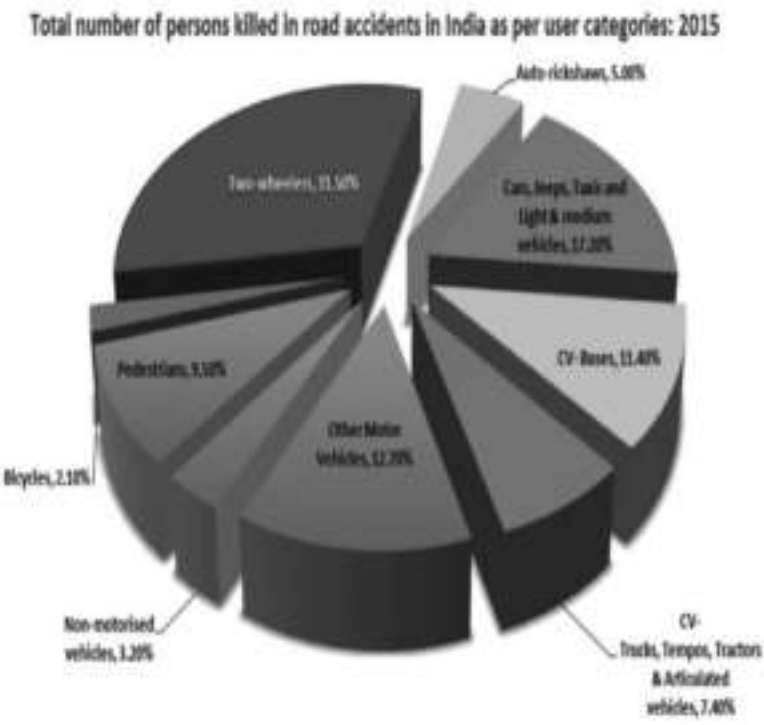


Percent share of road accidents in India 2015 based on Vehicle Type
Non-motorised vehicles/objects 4%
Other Motor Vehicles 9%
Two-wheelers 29%
CV- Trucks, Tempos, Tractors & Articulated vehicles 20%
Auto-rickshaws 6%
CV- Buses 8%
Passenger Vehicles (Cars, Jeeps, Taxis) 24%

Fig. 16.2

As for the road fatalities[1], 31.5% two-wheeler riders died in road accidents in 2015. They are the most vulnerable and unprotected road users. Other road users killed in road accidents are those in cars, taxis, vans and other light and medium motor vehicles (17.2%), other motor vehicles (12.7%), trucks (11.4%), pedestrians (9.5%), buses (7.4%), auto-rickshaws (5.0%) and others (3.2%).

1. **Driver at fault in most accidents**
As per the report, driver's fault is the single most factor responsible for road accidents, accounting for 77.1% of total road accidents during 2015; killing 64,633 persons mainly due to exceeding lawful speed/over speeding.



Total number of persons killed in road accidents in India as per user categories: 2015
Auto-rickshaws, 5.00%
Two-wheelers, 33.50%
Cars, Jeeps, Taxis and light & medium vehicles, 17.20%
CV- Buses, 11.40%
Pedestrians, 9.50%
Other Motor vehicles, 12.20%
Bicycles, 2.10%
Non-motorised vehicles, 3.20%
CV- Trucks, Tempos, Tractors & Articulated vehicles, 7.40%

Fig. 16.3

The commercial vehicles category accounted for the highest proportion of persons killed (25.6%) out of the total number of persons killed in the country during the calendar year 2015.

Meanwhile, the share of accidents, persons killed and injured in total accidents in the country caused by non-motorised vehicles such as cycles, cycle rickshaws, hand-drawn and animal-drawn vehicles are 1.10%, 1.57% and 0.88% respectively.

16.2.1 Types of Accidents

There are different types of road accidents, including the following:

1. **Head on collision**

   Head on collusion are most frequent. The collision may take place with another vehicle, cyclist, and pedestrian or with an animal. Many lives are lost in such collisions every year.

2. **Lane departure accidents**

   Such accidents usually occur at night. The driver momentarily falls asleep. The vehicle moves out of the lane, hits the embankment, other vehicle or some other object.

3. **Vehicles Roll over**

   Rollovers are common in hills where a vehicle going on high speed is unable to manage the curve and rolls over, often with extensive loss of lives and limbs.

4. Accidents at junctions

Vehicular accidents at road junctions are quite frequent. Majority of them are not serious. Creation of roundabout has reduced the number of such accidents.

16.2.2 Causes of Road Accidents

Road accidents may occur due to any of the following causes:

16.2.2.1 The Driver

The driver is the main cause of accidents. The situations under which he causes accidents are varied:

1. He may be tired. He falls asleep momentarily, and he loses control of the vehicle.
2. He may suffer from some fit of illness and is unable to control the vehicle.
3. He may be driving the vehicle at a high speed. Some unexpected obstruction (animal, man, child, stone, pit or other vehicle) suddenly comes in his way to cause an accident.
4. The driver may be drunk or intoxicated and thus his judgment is impaired.
5. The driver may have taken stimulant(s) to keep awake and alert. The effect of the drug wears off and extreme fatigue (and drowsiness) takes over the driver. The accident occurs.
6. The driver's attention is diverted due to some unusual occurrence inside/outside the vehicle and accident takes place.
7. The driver may cause an accident in the struggle to save some pedestrian/cyclist/animal.

16.2.2.2 The Vehicle

1. The brakes fail.
2. The steering handle does not function properly.
3. The lights of the vehicle are faulty.
4. Some other machinery of the vehicle fails.
5. A tyre bursts.
6. The tyre wheel may break loose from the vehicle.
7. There may be a fire in the engine

16.2.2.3 The Road

1. It may be slippery.
2. It may be bumpy.
3. It may have boulders or pits.
4. It may suddenly give way, in hilly areas and the vehicle falls down into a gorge.
5. It may be narrow with sharp curves.
6. There is a sudden obstruction on the road.

A person was driving at high speed. All of sudden a wild cow (Neel Gai), dazzled by the light, came in the way and struck against the windshield. It was broken. The force was so much that the animal was propelled inside. It struck the passenger sitting on the front seat and killed her. (CH)

16.2.2.4 The Victim

1. He did not observe the traffic rules.
2. He misjudged the safety margin/zone.
3. He is practising stunt driving.
4. He miscalculates the speed, the time and the distance while crossing the road.
5. He may be drunk and suddenly comes before the vehicle going at high speed.
6. He may be a maniac. He comes in the way of the vehicle without knowing or caring for the consequences.

Table 16.2

Major Causes of Road Accident Deaths during 2014, (NCRB)

1.	**Over-speeding**	**47.9%**
2.	**Careless driving**	**41.5%**
3.	**Poor weather conditions**	**5.3%**
4.	**Mechanical defects in vehicles**	**2.8%**

Table 16.3

Number of road accidents and number of persons Involved: 2002 to 2011[2]

Year	Number of accidents		Number of persons		Accident severity*
	Total	Fatal	Killed	Injured	
2002	407497	73,650 (18.1)	84,674	4,08,711	20.8
2003	406726	73,589 (18.1)	85,998	4,35,122	21.1
2004	429910	79,357 (18.5)	92,618	4,64,521	21.5
2005	439255	83,491 (19.0)	94,968	4,65,282	21.6
2006	460920	93,917 (20.4)	1,05,749	4,96,481	22.9
2007	479216	1,01,161 (21.1)	1,14,444	5,13,340	23.9
2008	484704	1,06,591 (22.0)	1,19,860	5,23,193	24.7
2009	486384	1,10,993 (22.8)	1,25,660	5,15,458	25.8
2010	499628	1,19,558 (23.9)	1,34,513	5,27,512	26.9
2011(P)	497686	1,21,618 (24.4)	1,42,485	5,11,394	28.6

P: Provisional, Source: Information supplied by States/UTs (Police Departments),
Figures within parentheses indicate share of fatal accidents to total accidents.
*Accident Severity: No. of Persons killed per 100 accidents

2. 4.96 lakh traffic accidents, 1.8 lakh deaths in 2015. (NCRB). WHO gives the death toll more than **two** lakhs.

Table 16.4

Accident Deaths in India, during 2010-2015 (NCRB)

Year	Deaths
2010	1,33,938
2011	1,36,834
2012	1,39,091
2013	1,37,423
2014	1, 41,526[3]
2015	1,80,000

16.2.3 Theft of Automobiles

The likely places for automobiles theft are public parking places, markets, university campuses, cinema-halls and other places of entertainment. The whole vehicle or only its parts may be stolen.

The motives for the thefts are varied:

1. **Joy ride;** the culprit(s) steal the vehicle, enjoy a ride and abandon it at a place convenient to them.
2. **Financial gains;** the stolen vehicle or its parts are sold. The 'business' is becoming an organised crime increasingly. The crime syndicate (gang) change the identification data (Registration number plates, engine/chassis numbers, paint/decorative item/ additional gadgets, etc.). Identification documents/insurance papers/pollution certificate/repair bills are all changed.

Fig. 16.4

The part bearing the serial number of a discarded vehicle welded on a stolen car after removing the original.

Theft of vehicles was not very common in India some years ago, except in some metropolitan and cities like Mumbai/Delhi. The crime is increasing at a fast rate.

3. **Committing other crime,** the vehicle is stolen sometimes to commit some other crime: smuggling/, illicit trade/robbery/murder. The vehicle is abandoned after the

3. WHO statistics for India, in 2014: 1). Total 'Road Accidents': 4,50,898; 2). Deaths: 207,551; 3). Persons injured: 4,77,731. NCRB's figures are: deaths 1,41, 526 and injured 4,77,731.

commission of the crime. Terrorists are using stolen vehicles to commit murders robberies and suicide bombing. Bombay blast of 1993 is a notorious glaring example of what destruction can be achieved by vehicular bombing.[4]

4. **Escape from the scene**; the vehicle may be stolen just to run away from the crime scene. The vehicle is abandoned as soon as the criminal feels that he is at a safe/distance/place.
5. **Crime vehicle**, Sometimes a vehicle is involved in some accident/crime. The owner fears prosecution. He therefore, lodges a false report of the theft of the vehicle.
6. **Insurance fraud,** the vehicle is insured heavily. The valuable parts are removed and the vehicle is destroyed or declared stolen. The insurance money is claimed.

The modus operandi of the theft of the vehicle is simple. The criminal opens the door of the vehicle with a master key. Or, he pushes down the glass window with a screwdriver. Alternatively, he forces open the door lock with a rod/pipe, used as a lever. He connects the ignition wires and drives away the vehicle,

16.3 THE PROBLEMS/POSSIBILITIES

Road accident investigations provide answers to many questions, including the following:

1. Is the reported accident genuine? Or, is it a ploy to conceal some other crime; or, is it to collect insurance money?
2. What is the identity of the "hit and run" vehicle?
3. Who was the driver; if the owner of the vehicle alleges theft of his vehicle?
4. Who is responsible (at fault) for the accident?
5. Is it a case of rash or negligent driving?
6. What was the speed of the involved vehicle(s)?
7. What is the available evidence to link the offending vehicle with the accident?

In automobile thefts, the following important questions need answers:

8. What is the original (true) identity of the suspected stolen vehicle?
9. Who is the thief?
10. Are the seized stolen parts of the alleged stolen vehicle?

When a vehicle is the crime scene; or, a crime has been committed with the vehicle, the following questions crop up:

11. Has the given crime committed in the alleged vehicle?
12. Has the culprit been linked with the vehicle and hence with the crime?
13. Can the victim be linked with the vehicle/culprit?
14. Has the sequence of events of the crime reconstructed? Reconstruction helps to verify the version of the accused or of the victim which is often necessary.

There is a variety of large variety of clues in road accidents. Their evaluations facilitate to understand various facets of crimes, including the following:

4. See chapter 14 on Explosives and Explosions.

16.3.1 Tyre Marks

The examination of tyres and tyre marks can answer the following questions:

1. Are the given marks left by a bus, a truck, a car, a motorcycle, a scooter, or a Tonga?
2. What is the make and model of the vehicle?
3. In which direction did the vehicle move?
4. Was driving normal? Or, was the driver intoxicated?
5. Did the driver apply brakes in time?
6. Are the given marks from the tyres of the given vehicle?
7. Was the tyre (tyres) not properly fitted to the vehicle?
8. Are the latent tyre marks from the suspect vehicle or from the given tyre?

16.3.2 Vehicle

1. Was the suspect vehicle at the scene?
2. Was the suspect vehicle involved in the given accident/crime?
3. Does the evidence on suspect vehicle sufficient, to link it with the crime?
4. Did the culprit use the vehicle to transport a dead body or other incriminating evidence?
5. Did the accident occur due to tyre burst?
6. Was there any mechanical failure of the vehicle?

Fig. 16.5

Tyre burst identifiable from irregular tearing, often fibres are protruding (as in this case). Simulated burst carry clean cut edges and indicate fraud

Fig. 16.6

The tyre burst faked, clear cut edges indicate the fraud

16.4 EVIDENTIARY CLUES

In the investigation of crimes, physical clues provide very important evidence to identify the culprit, and to link him with the crime/victim/scene/vehicle, etc. It is particularly so in road accidents and other crimes. They should be carefully located/collected/preserved/documented and got evaluated. The culprit, the victim, the vehicle and the scene exchange *inter se*. Road accidents fully demonstrate the validity of Locard's principle of exchange

'In Contact, traces are exchanged mutually'.

The following are the sources of important clues:

16.4.1 The Vehicle(s)

In '**hit and run'** case, the vehicle will carry traces from the scene of occurrence, from the object (vehicle) involved and the victim. The important clues on the vehicles are:

1. Fingerprints, palm prints, footprints, tool-marks and fabric prints.
2. Hairs, fibres, bloodstain or skin pieces from the victim
3. Small broken parts or fragments of the vehicle or of the article(s) hit.
4. Imprint of decorative pieces removed
5. Broken glass, paint, greases and lubricants from the victim's vehicle and control samples from the suspected vehicle for similar articles to those left at the scene.
6. Dust, mud and dirt from the scene of occurrence, from the victim or from the driver
7. Cigarette and '*Bidi*' ends, the culprit left in the vehicle. They can link the smoker with the vehicle with the driver, if he has absconded after the commission of the crime.
8. Mechanical fault(s) in the vehicle
9. Presence of new paint/registration number/numbers plate/change or mutilation of the engine and chassis number indicates the culprit's attempt, to conceal the identity of the vehicle.

10. Dent, scratches, holes and other damage to the vehicle
11. Temperature of water can fix the time if the vehicle is found at the site or nearby soon after it has been abandoned. Or, it can refute the defence that the vehicle has not been driven for hours or days.

16.4.2 The Scene

The scene of an accident usually carries the following evidence:

1. **Track marks;** they impressions or the prints of the four wheels are found either at the sharp turns or where the vehicle has been reversed.
2. **Skid marks;** they are found if the brakes have been applied suddenly and with force.
3. **Broken parts of the vehicle**
4. **Glass pieces**
5. **Paint streaks; smears or flakes**
6. **Greases and lubricants**
7. **Dust or dirt;** caked or otherwise, fallen from the suspect vehicle at the time of impact
8. **Fallen articles;** personal or parts of the vehicle
9. **Drag marks;** of the loaded material (*e.g.,* logs of wood, iron bars).
10. **Odour;** the load (petroleum products!) on a vehicle may leave a characteristic smell on the way through which it has moved.

16.4.3 The Culprit/Victim

In addition to dust, dirt, paint, glass pieces, greases and lubricants and tyre marks on clothes and body from the offending vehicle, the victim carries the following important clues:

1. Injuries

Fig. 16.7

The shape and positions of the injuries help to identify a run away vehicle in a hit and run case

2. Blood, fibres, hair and skin for control samples
3. Intoxicant (alcohol, narcotics) in the body, if the victim was intoxicated
4. Signs of disease (from post-mortem report); it may have contributed towards the death of the victim.

16.5 COLLECTION

The collection of evidentiary clues from the suspect vehicle, the scene of occurrence and from the victim needs immediate action, care and planning. Otherwise, the evidence may get lost. The suspect gets the vehicle repaired and repainted. The scene of occurrence is trampled over by the traffic and the victim is cremated or buried.

In the systematic collection of the evidence, one should:

1. Videograph, photograph and sketch the scene at the earliest, before removing anything from the place. The videograph, photographs and the sketches must establish the location of the scene and the objects at the scene *vis-a-vis* some prominent landmark at the scene. The Videography is ideal for the later appreciation of the scene of occurrence, by all concerned.
2. Before towing away the vehicle, carry out the following drill:
   - Note down the odometer reading at the scene itself.
   - Record the temperature at the temperature dial.
   - Ascertain the temperature of the atmosphere and the water in the radiator.
   - Ascertain the quantity of fuel in the vehicle.
   - Examine the area underneath and around the vehicle for any physical clues.
   - Remove and collect any loose evidence that is likely to get lost in transit.
3. Put a clamp on the steering wheel and take the vehicle to the nearest sheltered place, preferably with an arrangement to hoist the vehicle to permit examination of the underneath surface.
4. Record the discovery of any evidence, collect it and pack it properly in glass or cellophane containers depending upon the nature of the evidence.
5. Photograph (to scale) the evidence which cannot be seized and moved.
6. Observe the following precautions while developing finger and palm prints on the vehicle:
   - The vehicle is completely dry and at normal temperature.
   - The vehicle is not exposed to rain or wind, if possible.
   - Use aluminium and lycopodium powder mixture on non-greasy surface of a vehicle (steering wheel, mirror, side windowpanes, instrument panel, glove compartment, doors and door handles, etc.
   - Use white lead powder on greasy surfaces.
   - Establish the location, and identity of the lift. It is preferable to photograph the lift before removing the same. The lift itself is labelled. It contains information relating to the place of origin, the case in which it is lifted and the person who lifted it and the date on which it was collected.

- Remove and collect the loose evidence (fibres, glass pieces, paint flakes, dust, etc.) before starting the development of fingerprints.
- Whenever possible engage a fingerprint expert to develop fingerprints.

7. Prepare the casts of the plastic marks whenever possible.
8. Ascertain ownership of the vehicle.
9. Collect greases and lubricants found at the scene of occurrence. If they are found absorbed in the material, cut the absorbent material in the form of a cone. Collect a control sample of the material from the nearest point.
10. Collect liquid or semi-solid material on clean white cloth piece/filter paper or in a clean vial, with a dropper.
11. The victim may carry tyre marks. Collect the marks through photographs.
12. Get the victim medically examined, if he is injured. Collect the medico-legal/post-mortem report as the case may be. The evidence helps to decide whether injuries on the victim or damage to the vehicle are consistent with the version of the victim, of the culprit of the witnesses. Or, whether they are inconsistent *inter se*.
13. Find out if the culprit/are drunk or drug intoxicated.
14. Collect the skid marks.

Fig. 16.8

Head Injuries are the major cause of death in road accidents. The records of a hospital reveal that 95% deaths in accident cases are due to skull fractures and brain damage

16.6 EVALUATION

Motor vehicles accidents/crimes produce varied types of clues like fingerprints, track and other marks, broken parts of machinery, bloodstains, fibres, hairs, alcohol, glass, paint, soil including dust and debris, greases and lubricants, cigarette and '**bidi**' ends, etc. They have been discussed elsewhere in the book. Important vehicle specific clues have been discussed below:

16.6.1 Tyre

Tyres are important clues in crimes involving vehicles. They help to:

1. Link the vehicle and hence the culprit with the accident/crime.
2. Link the vehicle with the scene if rubber residue is left at the scene. It is available in skid marks almost invariably.
3. Fix the presence of the vehicle at the scene through dust, dirt and other traces the vehicle picks up at the scene.
4. Track the route/movement of the vehicle (presence of dust/dirt from the route!).
5. Reconstruct the occurrence (accident/crime).

   In a road accident, it was claimed that the accident took place due to tyre burst. When the deflated tyre was examined in the laboratory, radial cuts were found on both the tyre and the tube. The tube, surprisingly, contained a wooden piece about 5 X 4.5 X 2 cm. There were three possibilities:

   a. *The wooden piece had entered the tube at the time of manufacture.*
   b. *It could come in between the tyre and the tube at the time of tube change and enter the tube on its bursting.*
   c. *It could enter the tube at the time of the accident.*

   The first possibility was ruled out by a visit to the manufacturer of the tube, the second possibility was found improbable as there was no corresponding impression on the inside of the tyre. The third possibility was confirmed. The wooden piece fitted with a corresponding wooden piece from the hedge where the accident took place. (CH)
6. The suspected tyres are used to get test skid marks to help detection of over-speeding.

16.6.2 Tyre Marks

The tyre marks may be prints or impressions. They are found at the scene of occurrence, on the routes, at the parking places, at the hiding places (if any) and at the sites of disposal of incriminating evidence. The marks are clearly imprinted on soft soil, on the surface covered with a thin layer of powdery material and on wet earth. They are also well imprinted when the tyre is smeared with a liquid or a powder and the trodden surface is congenial to register the marks. Ordinarily, the marks of the front tyres are superimposed by the marks of the rear tyres, but if the vehicle is reversed, all the tyres of a vehicle leave their marks. The vehicles therefore, leave marks from all the tyres at the parking/reversing sites or at the sharp turning site.

The tyres and tyre marks help the criminal investigation in many ways, including:

1. Identify the vehicles in hit-and-run cases.
2. Indicate the culprit's mode of arrival/departure from the scene.
3. Identify the vehicle used for the removal or the disposal of the booty or the incriminating evidence.

4. Trail the criminals in vehicles to their hideouts, if the culprit takes an unfrequented route.
5. Indicate the disposal site of the incriminating evidence (if it was carried in a vehicle to a pond, river, etc.

The identifications/evaluations of tyre/tyre marks including skid marks are the most important evaluations. They permit determination of the speed of the vehicle, in hit-and-run or accident cases, the identification of the tyres; the evaluation of tyre bursts identify the route followed by the crime vehicles through the traces picked by the tyres from the route.

Identification of tyre marks vis-à-vis a tyre is based upon the following:

16.6.2.1 Tyre Width

The tyre width is the distance between the two edges of the tyre. The measurement of the width of the tyre or its clear mark offers no particular difficulty. The size varies for scooters, cars, buses and other types of vehicle used. It also varies with the type of the tyre; *e.g.*, radial tyres have greater width.

16.6.2.2 Tyre Circumference

The circumference of a tyre is an important parameter to determine the tyre size to type the vehicle. It is often difficult to determine from the marks. However, if the tyre imprints some conspicuous mark, the distance between the two consecutive imprints gives the circumference. Likewise, foreign object, wear and tear, manufacturing defect, legend or other peculiarity, imprinting its mark repeatedly help the determination of the circumference.

16.6.2.3 Tread Pattern

Tread patterns are often distinct. They help to identify the make. They vary with the maker; and also with the types/size. However, the following points are noteworthy:

1. Some small manufacturers imitate the design of well-known/respected firms.
2. Retreaded tyres may or may not carry the same design. Usually, they do not. They carry imitations of the design of respected brands.
3. The wear and tear may partially obliterate the design. The visible design, thus, may be confused with some other design.
4. Incomplete marks may mislead!

In some cases where the tyres are original, *i.e.*, fitted for the first time on the vehicle, the marks may lead to the manufacturer. Variations in tyre patterns of the various tyres, fitted on to a vehicle *inter se* will lead to the identification of the suspect vehicle.

16.6.2.4 Wear and Tear

Wear and tear in a tyre is unique. No two tyres, even of the make and fitted to the same vehicle, would suffer dissimilar wear and tear. This is so because the surface, with which they come in contact, the angle at which they meet the surfaces and the weight or pressure under which they meet are never alike. Further, wear due to misalignment, load in front or rear part, cornering (in heavy cars), sophisticated suspension system, over inflation or under inflation etc. wear the tyres/patterns differently and confer individuality. Peculiar driving habits also affect the wear patterns. Consequently, the wear and tear in any two tyres is never alike. When their patterns are available, they identify the suspect vehicle.

Fig. 16.9

The worn-out tyres carry many peculiarities. some of these may be transferred to the surface on which it moves. It may link the vehicle with the scene

16.6.2.5 Adventitious Peculiarities

Adventitious peculiarities are those, which are unintended, unexpected and unwanted. They include:

- **Mould defects**
- **Tyre damage**; cuts, clipping, chipping, tear and the like tend to facilitate the tyre identification
- **Embedded extraneous material**; like stone/metal pieces/glass pieces/wooden pieces, during use, get trapped in the tread of the tyre. Their marks often help to identify the tyre.

  The individuality of the tyre marks and their linkage to the original source are established easily if the adventitious entity is of some dimensions. In actual cases, adventitious evidence is rare.
- **Repairs**; they create individualising features.

Fig. 16.10

Adventitious change on the tyre includes inclusion of stone pieces, etc. in the tread pattern. The mark left by such pieces help to identify the tyre and consequently the vehicle

16.6.2.6 Crab-track Vehicle

The inter-distances between the front and the rear tyres in some vehicles vary. Such vehicles are called crab-track vehicles. The differences are usually peculiar to the make and model and provide useful information to identify the vehicle. The standard data is obtained from the manufacturers' catalogues or through reference to the manufacturer/dealer.

16.6.2.7 Wheelbase Difference

Vehicles, made by different manufacturers, in their different models, have different wheelbases,[5] which are useful guide to identify the make and model of the vehicle. However, it is difficult to determine the wheelbase from the marks of the wheels. When the vehicle is, parked for some time and there is some evidence of the original positions of the tyres, , the distance between the positions of the front and rear tyres give the wheelbase.

16.6.2.8 Turning Arc

An arc described by a vehicle while taking a turn, or at sharp turns, depends upon the size of the vehicle. The arc gives a good idea about the type of vehicle. A small arc indicates a small vehicle and a large arc points to a big vehicle. However, the manufacturer continues to reduce turning arcs. One studies the turning arc data about the vehicle before predicting the type of the vehicle. It is estimated when the vehicle has taken a 'U' turn (~180°).

16.6.2.9 Side Prints of the Tyres[6]

The sides of tyres carry legends, which identify the make, model and size of the tyre. Their registration at the scene or elsewhere is extremely rare. The presence of legend simplifies the identification of the make, model and the dimensions of the tyre. The information, in turn, indicates the type of vehicle used. If, however, legend from all the tyres is available (rarest of the rare cases), it facilitate considerably the identification of the suspect vehicle.

16.6.2.10 The Position of the Tyres Inter se

The direction of a tyre is ascertained from the earth, which is thrown in a characteristic way. The position of the stationary vehicle is ascertained from the drops of lubricating oil found below the engine.

If the vehicle has turned, the turning circle indicates the positions of the tyres. Front tyres make wider arc than the rear tyre. Tyres may be of one or more brands.

In a study on the subject, it was found that a fair percentage of new cars carried tyres of the same make. In many extensively used cars, tyres of different makes were found. The percentage of cars carrying tyres from two or three makes was substantial.

In India, no statistics has been collected. Besides, the retreated tyres on vehicles are quite common.

5. The distance between the front and rare axles is wheelbase.
6. The author has not seen such prints in his long service.

16.6.3 Skid Marks

Fig. 16.11

When brakes are applied to a vehicle, they lock the wheels and stop them from revolving. When the vehicle, with locked wheels, traverses a certain distance the vehicle is said to skid. The marks created by the skidding tyres are called skid marks.

The friction between the tyres and the surface abrades the tyres and black tyre material is deposited at the surface. The mark is conspicuous because of the black rubber residues, which makes the skid marks easily discernible and conspicuous.

When the vehicle is moving on soft earth, the sudden application of brakes ploughs through the earth. The skid marks in such cases are identified from the displacement of earth from the track.

When a vehicle is moving in dust or dirt, the skidding tyres removes the dirt from its path and creates the marks.

When the tyre is moving on a tarry road, it creates the marks in the tar, by pushing away the tar from its path.

Skid marks are created in loose or hard set snow, metalled, concrete or *kacha* road. The road may be wet or covered with mud, water, sleet, frost or oil.

Skid marks have great evidentiary value. They provide useful evidence.

1. The tread in the marks is clear to start with, because the wheels are not fully locked yet. They help to identify the source tyres.
2. They help to determine the speed of the vehicle.
3. The rubber residues deposited at the site is used to link site/skid marks to the tyre(s) source.
4. The tyres deposit fluorescent materials (anti-oxidants) wherever they are placed. About one minute's placement leaves sufficient residues to give a fluorescent outline of the tyres under ultraviolet rays, to permit their identification.

   In a case a boy was murdered while asleep. The culprit wrapped the body in the bedsheet, carried it in a mini station wagon of the victim's father and dumped the body at a refuse heap. The vehicle was set on fire. The investigation started with the discovery of the vehicle. It led to the house of the owner. Discovery of heavy blood staining there and the missing boy led the police to seek the help of the laboratory to trace the movement of the vehicle.

   A bloodstained axe and the boy's wallet were found where the suspect (a contractor) was constructing a building. Five garages had already been completed but none of them had been put to use. A thorough search of the garages revealed a small oil drop. Nothing else was visible on the floor. The experts, however, decided to examine the floor in ultraviolet light. The examination revealed four clear prints of the four tyres. It was possible for them to determine the possible make of the tyres, the front track width and rear track width. Comparison of the fluorescent prints at the site and those from the tyre, on the suspected vehicle tallied. All these observations placed the questioned vehicle in the garage. It provided a vital link in the chain of evidence to link the contractor with the murder. (CH)
5. The absence of skid marks in serious accidents indicates either a mechanical failure of the vehicle, (brake failure) or the failure of the driver who may be drunk, diseased, tired and dozed off. Or, the vehicle was used as weapon to kill. The absence of skid marks, thus, is very important in the reconstruction of the crime.

Many factors affect the length of the skid marks, including the following:

1. The speed of the vehicle
2. Weight of the vehicle
3. The condition of the road surface; rougher, the surface, shorter the skid marks.
4. Wet and greasy surfaces reduce friction; increasing the skid length.
5. Extraneous materials (mud, slush, water, snow, ice, sleet, frost, etc.) on the road, affect the skid length.
6. Condition of the tyres (over/under inflation, tread pattern, the extent of wear and tear of tyres) and their width affect the skid length.
7. Condition of the vehicle (mechanical efficiency of the engine/brakes/tyre fixture), etc. affect the skid length.
8. High temperature reduces friction; thereby increasing the skid length.
9. Reaction time is the time, which the driver takes to apply the brakes fully after he has perceived the necessity for braking. It varies with different individuals. Reaction time 0.5 to 0.8 second is normal. If a vehicle is moving at a speed of 60 km/h the distance travelled in reaction time is 8.

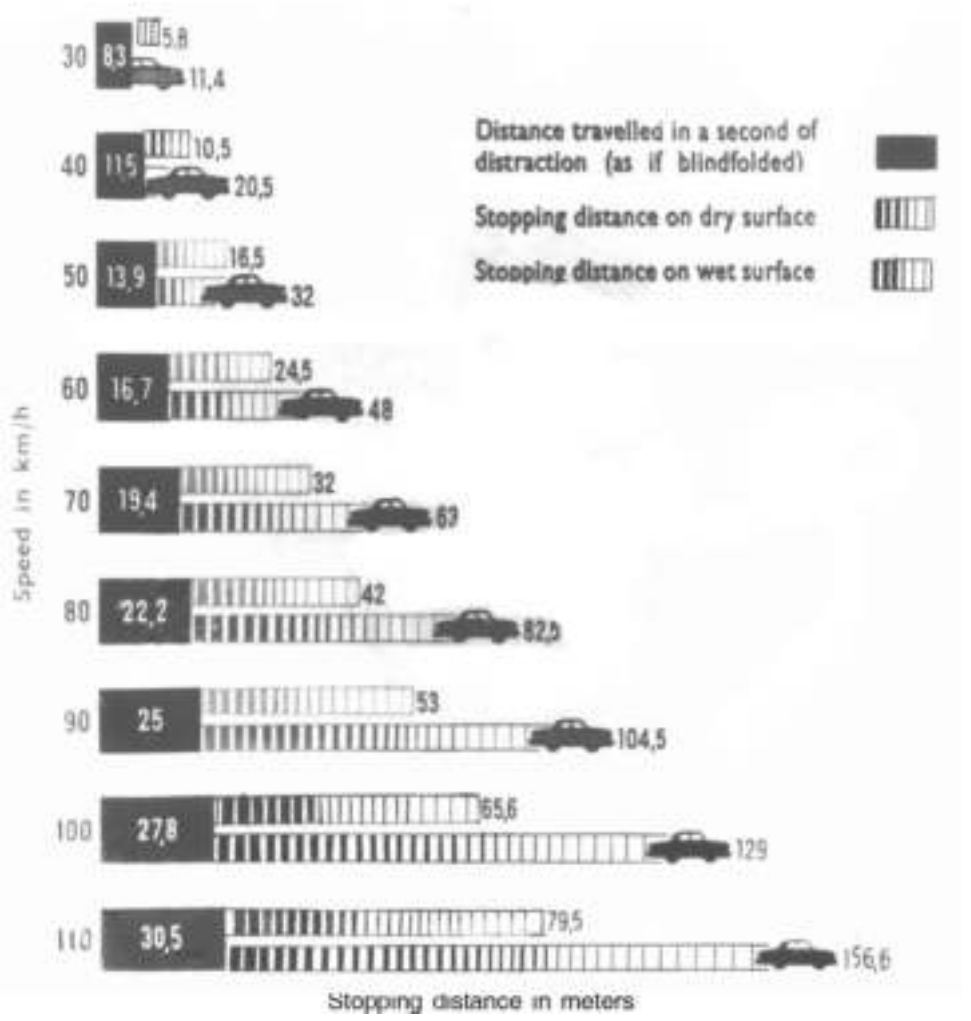


Fig. 16.12

The above diagram indicates the distances which the vehicle at various speeds travels before it stops after perceiving the necessity to stop. The distances in the black rectangle are roughly those distances which one traverses in reaction time, the time taken between sensing the necessity of braking and applying the brakes. as seen above wetness of the road makes appreciable difference

16.6.3.1 Speed Determination

Theoretically, it is quite easy to calculate the speed of the vehicle from skid marks. The kinetic energy of the vehicle is dissipated through friction and creates skid marks.

In calculating the speed of the vehicle, the experts make the following assumptions:

1. The skid mark is the result of the interplay of the vehicle (speed, weight, the efficiency of brakes, tyre conditions, etc.) and the friction of the road.

2. The vehicle is not obstructed by a vehicle/pedestrian/roadside tree, bolder, etc.
3. The vehicle is free from any mechanical defect, likely to affect the speed of the vehicle

16.6.3.2 Calculations

Let the mass of the vehicle be 'M' and its speed (= velocity) S'. Then, its kinetic energy (KE) is:

$$\mathbf{KE = 1/2\ MV^2 = 1/2\ MS^2 \ldots\ldots\ldots\ldots\ (1)}$$

Let **'f'** be the co-efficient of friction, 'L' is the length of skid marks and 'Mg' the weight of the vehicle. Then the friction energy ($\mathbf{E_f}$) is given by:

$$\mathbf{E_f = Mg\ x\ 'f'\ x\ 'L' \ldots\ldots\ldots\ (2)}$$

When the vehicle comes to stop, frictional energy, 'E_f' is equal to kinetic energy 'KE', *i.e.*

$$\mathbf{1/2\ MS^2 = Mg\ f\ L}$$
$$\mathbf{Or,\ S^2 = 2\ g\ f\ L;}$$
$$\mathbf{Or,\ S = \sqrt{2g\ f\ L}}$$

If we know the co-efficient of friction (f) and 'L', the length of skid mark (measured), 'g' is the gravitational constant, we can find out 'S', the speed of the vehicle. Now it is difficult to determine the co-efficient of friction accurately. It will vary from place to place, vehicle to vehicle and from time to time (weather conditions). Therefore, it is customary to determine the speed by creating test skid marks with the suspect vehicle at known speeds at the given site. With the experimental data, the unknown speed is determined.

If we denote crime scene speed and skid length as 'Sc' and 'Lc' respectively and corresponding test data as 'S_t' and 'L_t', we have:

$$\mathbf{'Sc' = 2\ g\ f\ L_c \ldots\ldots\ldots(3)}$$
$$\mathbf{'S_t' = 2g\ f\ L_t \ldots\ldots\ldots\ldots(4)}$$

Dividing (3) by (4), we get

$$\frac{\mathbf{'Sc'}}{\mathbf{'St'}} = \frac{\mathbf{'Lc'}}{\mathbf{'Lt'}}\ \mathbf{or,}$$

$$\mathbf{'Sc'} = \frac{\mathbf{'Lc'}}{\mathbf{'Lt'}}\ \mathbf{X\ 'St'}$$

If we know 'S_t', 'L_c' and 'L_t', questioned the speed of vehicle (S_c) can be determined.

In actual determinations, the expert observes the following precautions:

1. Skid marks from all the four tyres are measured. Average of the four skid marks is taken, whenever, possible.
2. Skid marks must be distinguished from ordinary tread marks. Mistaking the later for skid marks will give the wrong speed of the vehicle.

Co-efficient of friction consists of two components:

- Road-tyre interaction
- Mechanical efficiency of the engine and other parts of the vehicle

Co-efficient of friction for normal vehicle and for the metalled road is about 0.6 to 0.8 though it varies with road-vehicle conditions. Wet road reduces the co-efficient to 0.5 or less. Likewise, rise in atmospheric temperature or due to heavy load, the friction decreases..

Generally, the coefficient of friction is not measured. Instead, test skid marks, as given above are used to determine the speed. This method is more accurate and practical as it duplicates the accident conditions. Here the skid marks at the scene are measured individually, care being taken that the initiation point of the skid marks is correctly located. If $\mathbf{L_1, L_2, L_3}$ **and** $\mathbf{L_4}$ are the four measurements for the four tyres, the average LC is used as the length of crime skid mark:

$$\mathbf{Lc = \frac{L1+L2+L3+L4}{4}}$$

The test skid marks are created in the following situations:

- **Suspect vehicle is available;** Whenever suspect vehicle is available in working conditions, the same vehicle, load, road and road conditions should be used. Four test runs should be made. Average of the skid marks of the four runs is taken to ascertain test skid length.
- **Suspect vehicle is damaged;** vehicle of the same make and model, in similar wear condition is chosen. The tyres of the damaged vehicle are transferred to the test vehicle and test marks obtained as in (1) above. Skid marks, thus obtained/used for the speed calculations. The results are less accurate.

The vehicle is repaired sometimes to create test skid marks.

- **Suspect vehicle not available;** A vehicle of the same/model is used for test marks; obtained as in (1) above.
- **Gap in skid mark(s);** if the involved vehicle has bumped at the site or brakes have been released there will be a gap in skid marks. This gap in skid marks is not included in the total length of skid marks.
- **Test start point;** the starting point is fixed carefully to create test marks. It is best to prefix the point from where the brakes are applied. The skid marks at the start are faint. They are also taken into account.
- **Rear tyre skid marks;** they may overlap the front tyre skid marks. The lengths have to be ascertained carefully
- **Reaction time;** the distance travelled in reaction time, is part of the stopping distance. It varies even with the same individual at different times and different situations. It is difficult to correlate it with skid marks. It is, therefore, ignored.

The Accurate determination of the speed from skid marks is cumbersome. An approximate idea of the skid length/speed relationship of an ordinary Indian small car is obtained from the table given below:

Table 16.5

Skid Length Versus Speed

Skid length (metres)	5	10	20	30	40	50	60
Speed (km/h)	30	40	50	70	80	90	100

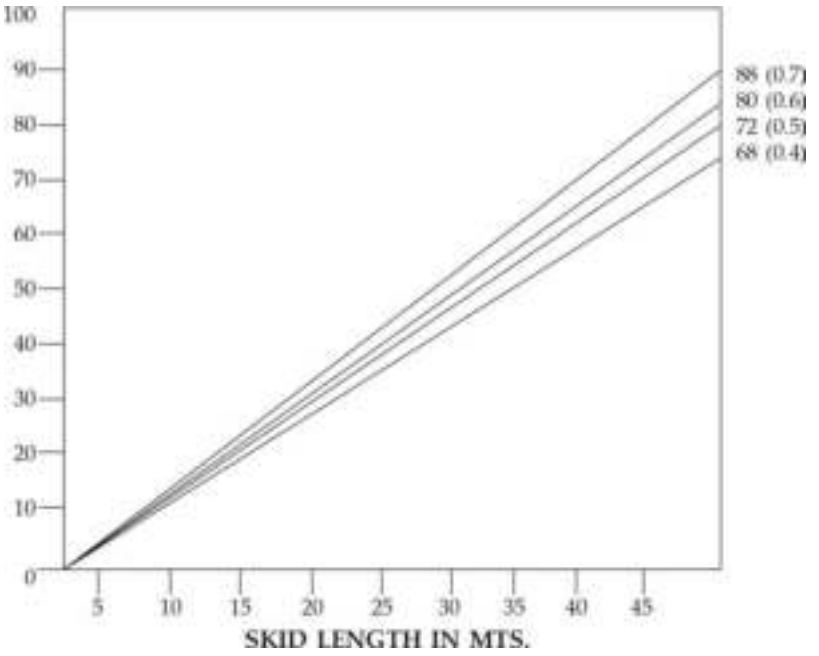

Fig. 16.13

Breech face marks, unusual pattern, sufficient to establish the common source

Table 16.6

Stopping Distance at 50 Kilometers Speed

S. No.	Road Surface	Co-efficient of Friction	Stopping Distance (metres)
1.	Dry concrete, dry asphaltic Concrete	0.8	11.3
2.	Dry bricks	0.7	13.1
3.	Wet asphaltic concrete	0.6	15.2
4.	Wet dry gravel/cinders, wet tar	0.5	18.3
5.	Wet concrete/bricks	0.4	23.9
6.	Packed snow	0.2	50 (?)

The above skid length-speed calculations are valid only when the vehicle comes to a stop of its own, without any obstruction. However, in most of the accidents the vehicle collides with other vehicle(s), some other object like tree, parapet or sidewall. Thus, the total momentum of

the vehicle is not used in the creation of skid marks. It is spent in damaging the other vehicle or the object hit. The energy lost in the impact is taken into consideration for correct speed determination of the vehicle.

Calculations become more complex if the other vehicle is also moving. Instead of sliding to a stop, our skidding vehicle ultimately collides with a vehicle (say, a bus), causing major damage to both the impacting vehicles. The obstructing vehicle impedes the sliding vehicle, changing the possible skid length as well its direction, which would otherwise have continued in its original direction of skid if the impact had not occurred. Longer skid marks would have resulted if no impact had occurred. Therefore, it is always erroneous to use the skid length alone to estimate the pre-impact speed.

In a collision, the vehicle's loss of kinetic energy, due to impact, is taken into account to get correct speed of vehicle.

16.6.4 Tyre Residues

Tyre residues are residues of the material abraded from the tyres, which contain many materials including antioxidants and extenders. They give a tyre pattern, tyre width, wheels base, etc. Thus, it is possible to identify the tyre and the vehicle with respect to its make, model and the individual vehicle in some cases from these residues.

The antioxidants leave fluorescent marks at the place of parking. The intensity of fluorescence varies directly with the time for which the tyres were in contact with the surface. The fluorescence fades with time and vanishes in due course.

The skidding tyre deposit residues in the skid marks. Only small quantities are required for analysis. The residue deposited even on a small piece of stone is often sufficient for analysis. The residue material is in such a way that interfering materials do not get scraped along. The IO sends the object itself when feasible. Otherwise, he scrapes the material from the surface and sends it to the departmental laboratory.

Fluorescence in tyre residues is due to the following substances:

1. **Antioxidant;** they are added to improve the keeping quality of the rubber. The fluorescence of their traces are characteristics of the material and provide substantial evidence.
2. **Extender oils**; they are important constituents added in large amounts to the composition of tyre materials. They facilitate the manufacturing process. Their fluorescence is used to identify/discriminate the tyre materials.

   The exact nature and quantities vary with different manufacturers. Fluorescence of the tyre residue is mostly due to these substances. Extensive variations exist in the fluorescence of the tyre residues. Both qualitative and quantitative analyses help in linking the tyres with its traces. Some of these substances fluoresce at 300-350 nm.
3. **Polynuclear aromatic hydrocarbons**; they are formed at high temperatures to which the tyre rubber is subjected in the manufacture and later due to friction. Wear of the tyre increases these compounds. They ordinarily exhibit fluorescence at 415 and 465 nm.

New tyres contain fewer amounts of polynuclear aromatic compounds. They show less intense fluorescence at the above wavelengths.

Spectrofluorometer and gas chromatograph are the main instruments used to study tyre residues.

The surface on which tyres leave residues plays an important part. The following facts about the surface effects are noteworthy:

- If the surface is metalled, the residue is contaminated with bitumen, which absorbs and masks the fluorescence from tyre residues.

  If the fluorescent materials of the residues are extracted, the bitumen components are also extracted and give far stronger fluorescence of their own, masking the fluorescence from tyre residues.
- The dirt, absorbent surfaces or the carbon in the tyre residues mask the fluorescence of the tyre residues.
- Fluorescent tyre prints are developed from their residues. 15% solution of polyvinyl acetate in ethyl acetate is one of the popular spray solutions to develop the prints.
- Polythene sheets or waxed paper is used to pick up tyre residues. They absorb the fluorescent components of the tyre materials and fluoresce under ultraviolet rays.

  Bricks and paved surfaces take the marks fairly well, provided the surface is not driven over too frequently and is not covered by materials, which give their own fluorescence. Thus, latent marks can be developed at parking places and garages with concrete surfaces, which, are not in constant use.

The tyre residues, as evidence, have a great future. They are likely to provide useful evidence to solve serious crimes in the coming times.

16.6.5 Tyre Bursts

Tyre burst is one of the commonest excuses given for accidents. Tyre bursts are easily identified from tears on the tubes. Sometimes the tears may be on the tyre also. In explosive tyre bursts, part of the tube is separated from the tube and the tear is characteristic in shape. In normal deflation due to puncture or cut caused by nail, glass, metal piece, stone or even piece of wood, the characteristic tear pattern is absent; the tube also does not blow off.

Intentional deflation to show burst is often crude. It consists of one or two regular tears or cuts. They are easily identified.

Tyre burst is distinguished from tyre failures. The latter are concussions (compaction on impact), towing damage (especially when tyres are deflated), dislodgment damage, head breaking, aquaplaning (incorrect metal wire in the tyre rim), damage due to tyre fitment etc. Besides, the vehicle failure due to mechanical defect may cause an accident. These points need careful evaluation *vis-a-vis* tyre burst.

In a tyre burst investigation, the investigating officer should send:

1. The whole wheel unit: tyres, tube, flap and wheel-rim
2. Detailed information on how the accident occurred including the angle of impact, speed of the vehicle (if possible), load, surface conditions, weather, etc.
3. Videograph of the scene/vehicle
4. Photographs of the scene of occurrence, including those of damage
5. Copy of the site plan

It will promote justice if the expert is called to the scene.

16.6.6 Mechanical Failure

Mechanical failure sometimes causes an accident. A vehicle mechanic, engineer or a vehicle inspector can help to locate the cause of the failure. He will be able to ascertain the general

condition of the vehicle and the mechanical defects, if any, which cause the accident. He furnishes a detailed written report after the examination.

Fig. 16.14

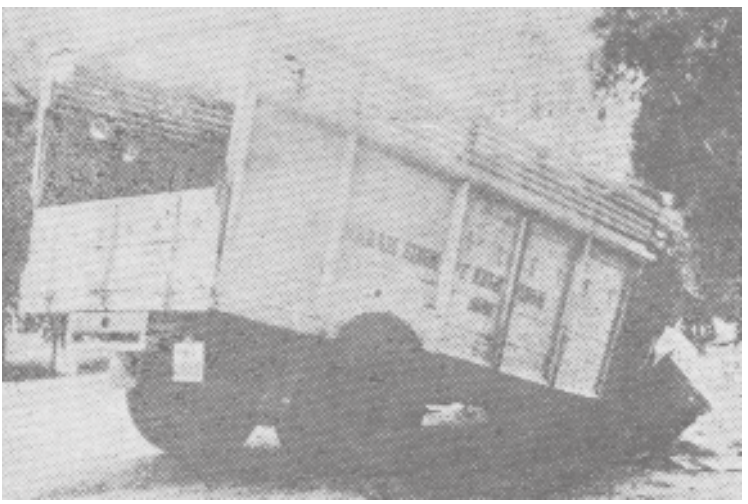

Fig. 16.15

The positions of the vehicle, extent of damage and the site of damage help to establish theguilt of a particular vehicle involved in the crime. in the above road accident involving abus and the truck (Fig. 16.10), (Fig. 16.11); the position of the vehicle as well as the siteand extent of damage clearly indicated that the truck (fig. 16.11) was at default

16.6.7 Leftover Objects

The culprit may leave tools, articles of clothing and other personal belongings in the vehicle or at the scene of occurrence. In addition, broken parts from the vehicle are also left at the scene. They provide a link between the crime and the criminal. The following points prove useful:

1. The source of origin of the article may lead to the owner who may be the culprit or his companion.
2. Articles of clothing may carry tailor or laundry marks. They may carry letters and other items, which may reveal the identity of the owner culprit or his co-travellers.
3. Handkerchief may have saliva, nasal secretions and other body fluid stains, which may permit blood grouping.
4. The leftover article may have a smooth surface and, if the culprit had handled it, it may carry fingerprints.

16.7 RESUSCITATION OF VEHICLE NUMBERS

If a motor vehicle is stolen, the thief tries to change the original serial numbers on the engine and chassis, etc., by filing, hammering or chiselling. He changes the original digits and designs. He also changes the registration number on the plate. Sometimes instead of using a fresh registration number plate, the fictitious number is painted over the previous numbers after covering the first with a thick coat of paint. The change in numbers is deciphered through resuscitation. The painted over number is found by removing the paint.

The resuscitation of erased punched number is based upon the principle that the punching increases the concentration of the metal molecules underneath the punched number. This increased concentration of metal help to resuscitate the original number in the following ways:

1. The surface is cleaned, polished and etchants (usually mineral acids, suitably modified for various types of surfaces) are applied. The difference in reaction rate at the punched surface and the rest of the surface makes the original number visible.
2. Radiograph sometimes reveals the number.
3. The metal is placed in a magnetic field and iron filings, suspended in a liquid base, are spread over the surface. The digits and letters are formed by the arrangement of the iron particles on the edges of the punched writings.
4. Electrolytic dissolutions or depositions also help to resuscitate the number.
5. If the number is engraved with chisel and hammer, engraving may compress the metal somewhat and permit resuscitation. If an electric engraver is used for engraving, resuscitation may not be possible. Enlarged photographs of the engraved marks after polishing, cleaning and removing paint and dirt may reveal the original number in some cases.

Fig. 16.16

Registration number as seen before and after processing

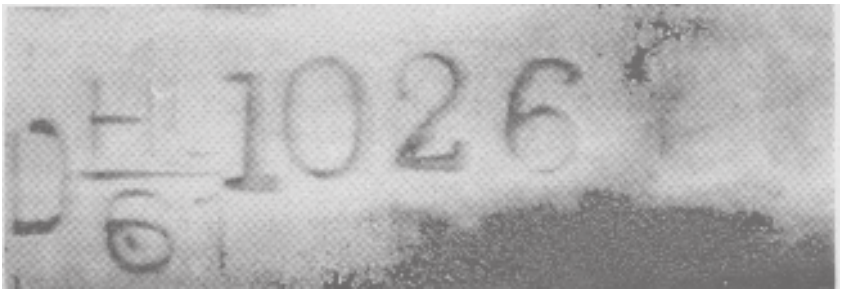

Fig. 16.17

Breech face marks, unusual pattern, sufficient to establish the common source

Fig. 16.18

Filling of the serial number of vehicles from the metallic surfaces is common in stolen vehicles. Fig. 16.13 indicates the filed number and Fig. 16.14 indicates the resuscitated number, by chemical etching

Mantra for Accident Prevention

1. Avoid excess speed. It is single biggest cause in road accident deaths.
2. Avoid driving after drinking. In 50 % of fatal accidents, in USA, drivers were drunk/intoxicated
3. Avoid using mobile while driving
4. Avoid driving when tired.
5. Always take a break on long driving.
6. Avoid hasty/unnecessary lane change. Observe lane change discipline.
7. Avoid tailgating. Avoid getting close to the vehicle in front.
8. Avoid pushing ahead of the queue.
9. Avoid misuse of horn.
10. Maintain the vehicle in top-driving conditions.
11. Use dippers at night.
12. Observe traffic rules. Obey traffic signs.
13. Remember there are numerous irresponsible drivers (speed maniacs/rash drivers/ thrill hunters/intoxicated/inexperienced). Eternal vigilance against them is the word while driving.
14. Cater for the pedestrian who may be mentally deficient//intoxicated/old and the like.
15. Avoid the man in hurry crossing the road or overtaking to bypass your vehicle.
16. Drive slowly in congested areas.
17. Avoid speeding while going down the hill.
18. Never leave you side (lane) on sharp turnings on hill roads.
19. **Drive according to road conditions**
20. Follow speed limits
21. Ignore aggressive drivers.
22. Don't change CD's/pen drive while driving.

16.8 VEHICLE THEFTS

16.8.1 General

Vehicle thefts are common. The following table indicates the extent of the problem in India for the years **2010** to **2013**

Table 16.7

Vehicle theft in India

S.No	year	Vehicle thefts
1	2010	147,475
2	2011	151,000
3	2012	154,000
4	2013	165,000

Thieves steal them for varied reasons/purposes, including the following:

16.8.1.1 Joyride

The misguided youths steal vehicles for joyrides. They abandon the vehicle after the abuse, wherever they find it convenient. Often the vehicle is recovered intact unless it met with a road accident during the joyride.

16.8.1.2 Escape

Criminals cornered in a locality often pick up any available vehicle and run away. They abandon the vehicle where they find it safe to do so. Often the vehicle is undamaged unless it was damaged during the flight.

16.8.1.3 Commission of Crime

Some criminals find it convenient to use stolen vehicle to commit a crime like smuggling/ robbery/murder, theft, etc. They abandon the vehicle after the abuse. They thus, escape apprehension in some cases.

The thieves abuse the stolen vehicles to carry dead bodies, injured culprit(s) or booty. They are being used increasingly for kidnapping/abduction/rape. They often burn the stolen vehicle abused to carry dead bodies/rape-murders, along with the bodies or other incriminating evidence, to destroy all linking evidence.

16.8.1.4 Economic Gains

Most of the vehicles are stolen for clandestine sale. The culprit changes the identity of the vehicle before selling. Sometimes the thief disassembles the vehicle into parts and sells the parts.

In a recent case, police officials from Punjab and UT Chandigarh formed a gang to steal vehicles. They sold them after changing their chassis and engine numbers and forging their registration and other documents through computer and scanner. Modus Operandi was well organised. The work was divided to 'specialists' groups:

- *One group stole the vehicle.*
- *The Second group would bring in the essential changes in the identity of the vehicle and prepare/forged legally required documents.*

- *The third group would sell the vehicle in distant cities/towns.*

  The 'profits' were thereafter divided among the members of the gang.

  *When the law caught up with them, they were found to be in possession of eight vehicles. How many they had already sold, was not fully disclosed. (**CH**)*

16.8.1.5 False Theft Reports

Some owners, involved in some serious accident (or crime), lodge false report of the theft of their vehicle to escape from the responsibility of the accident or crime. False theft reports are also made by some unscrupulous persons to collect insurance money.

In U.S.A. in an old survey, the disposal of one million vehicles stolen in a year offers an interesting study:

- *About 55 percent were resold as such.*
- *About 10 percent were dismantled and parts sold.*
- *5 percent were used in the commission of a crime.*
- *The rest were used for joy rides.*
- *Automobile thieves form 30 % of the population of Federals jails of USA. **(CH)***

Automobile thefts are a big social, economical and law and order problem in USA. A similar picture is emerging in India also. Every year the number of stolen vehicle is increasing. The worst part is that the figures of the traced stolen vehicle are dismal.

16.8.2 Vehicle Theft Prevention

The tracing and recovery of the stolen vehicle is a difficult task. Recent figures of untraced/unrecovered stolen car, in Chandigarh, are extremely dismissal. In 2017, 78 % of the stolen cars remained untraced/unrecovered! In 2018 in Delhi 44,158 vehicles were stolen against 39,084 in the previous year. While 6,751 auto lifters were arrested in 2018, cops could recover only 4,619 stolen vehicles. It appears that the professional thieves are at work. They induct one or more of the following changes after stealing the vehicles:

1. Replaces the registration plate
2. Changes the original engine/chassis number
3. Repaints the vehicle in a different colour
4. Moves the vehicle to a distant place/big city and sells it after changing its identity.
5. Dismantles the vehicle and sells the parts.

Vehicle/car theft prevention needs multi-pronged inputs from the following:

16.8.2.1 Owner's role

Owner plays a pivotal role in the prevention of vehicle theft. He must:

1. Use anti-theft devices: power supply interrupter; Fuel cut-off device; ignition column guard; steering wheel lock; alert sounding devices on forced entry.
2. Fit GPS auto-theft recovery gadget to a GPS navigation device is to locate the stolen car.
3. Registration number on hardly visible parts. It helps to identify the vehicle on recovery.

4. Park the car in well-lighted part of parking space, after locking it properly.
5. Do not leave important car papers in the car.
6. Scrutinise online sale websites selling used cars/spare/body parts if your car is stolen.

16.8.2.2 Police Role

Delhi police has issued a useful advisory (given below). It should be followed by all concerned:

1. Enhance police presence and patrolling.
2. Identify vulnerable areas based on crime patterns in the jurisdiction of each police station.
3. Target checking of youths on motor bikes.
4. Gather macro-intelligence (District police as well as specialised units on the operation of criminal gangs).
5. Ensure close surveillance on known-criminals.
6. Ensure no registrations of second hand vehicles; without NOC from the concerned authority. Request and check with State Transport Authority.

Car thefts crime is an organised 'trade' now; gangs of thieves carry it out efficiently. They give new 'changed' physical identity to the stolen vehicle and corresponding fake documents (Registration number, insurance, purchase receipt) pertaining to the new identity of the vehicle. The high mobility, anonymity in the cities and high expertise in changing the identity of the vehicle have made the tracing task of the police difficult. Population explosion and inter-state and inter-city gangs are making the task even more difficult. The vehicle may be stolen in Delhi and stripped into parts and sold in Mumbai. The communication gap[7], the geographical and the jurisdictional barriers help the car thieves.

An IO takes the following action:

Interviews the owner to collect the following information:

- Make, model, paint shade(s) of the vehicle
- Registration/identification/purchase document
- Collects genuine documents of the vehicle (Registration number, chassis/engine numbers with the year of purchase
- Photographs of the suspected vehicle
- Any accident marks
- Repair marks
- Any special identifying feature(s)
- Description of all peculiarities and oddities, which the owner can recall

7. Government of India has hosted a website—**"Vahan Samanavay"**—for coordination and consolidation of information about the stolen/recovered motor vehicles
The online Motor Vehicle Coordination system, "Vahan Samanvay" is designed for coordination of stolen and recovered motor vehicles. Police, Regional Transport Offices and Insurance Sector are the stakeholders of this system. A motor vehicle enquiry counter for the convenience of the public is operational at NCRB at New Delhi. Many State/UT police organizations are also operating motor vehicle enquiry counters in their respective States/UTs for the convenience of public. The online enquiry service is available for the general public.

Identifies a stolen vehicle from the following features:

- The thief uses a duplicate key or direct connection of the wires. A stolen vehicle normally does not have original keys. Or, he starts the vehicle by connecting the ignition wires directly.
- The thief changes the number plates or the number thereon. The following observations help to identify the change:
  a. Clean/brand new plates on an old vehicle indicate stolen vehicle.
  b. Dirty number plates with illegible registration number also indicate stolen vehicle.
  c. Altered/repainted number plates.
  d. The thief repaints the vehicle. Fresh paint used indicates a stolen vehicle.
- The culprit leaves tool marks, on doors due to forced opening, in the absence of key.

Identifies the thief through the following traits

- The thief is not familiar with the vehicle, he fumbles while starting the ignition.
- He is nervous in traffic jams.
- He does not stop at traffic lights, especially when there is no traffic officer.
- Document papers relating to the vehicle, if any, in the possession of the thief, are improper/fake.
- The thief is often a youngster.

Seizes the vehicle if the driver is not able to satisfy the investigating officer about its ownership

- He tows the vehicle to a forensic science laboratory. He does not drive.
- He checks/compares the owner's identifying data.
- He Searches for evidence like fingerprints, cigarette stubs, abandoned articles, etc.
- He shows the vehicle to the owner for identification purposes.
- He ascertains that the identification data is adequate/sufficient.
- He provides all relevant information to the laboratory to facilitate analysis; important numbers (Registration, Engine, Chassis, etc.).
- He gets the vehicle's documents verified from a document expert, including the seals and signatures of the registration and licensing authorities.

The automobile thefts are on the increase. They will increase further. The present investigative inputs are inadequate. An auto-thief is not a local/lone entity. He is often a part of an organised crime syndicate/gang.

Handling automobile thefts need a proper strategy. —**"Vahan Samanavay"** website of the government of India coordinates/consolidations information about the stolen/recovered motor vehicles. It is an important starting point. However its success depends upon the vigorous participation of the state police. All states must participate whole-heartedly and diligently to keep it updated and use it whenever a vehicle is stolen or recovered. It can be an efficient tool if all state police departments contribute sincerely to keep it updated.

Additional steps needed are:

1. Formation of Auto-Theft Investigation Teams at central and state level, with appropriate jurisdictional powers
2. Comprehensive information on vehicle thefts should be available to all investigating officers.

Identify theft-prone areas. Maintain increased effective police presence and covert surveillance on those areas.

Identify the disposal sites; where the stolen vehicles are disposed of before/after striping the vehicle. Covert surveillance of the suspected sites can be highly productive.

Watch the online Sale outlets for second hand vehicle and spare parts of the vehicles on daily basis for identifying the stolen vehicles or their parts.

16.8.3 Possibilities

Science and the scientific expert can find answer to the following questions, on stolen vehicles:

16.8.3.1 Is the seized vehicle stolen?

Whenever a criminal steals a vehicle, he changes registration, chassis, engine numbers and repaint the vehicle. The Forensic expert looks for and locates these changes. They indicate whether the vehicle is stolen or not. The genuine owner also can help to identify his vehicle or dents/damage or from other peculiarities which may have survived the depredation of the thief.

16.8.3.2 Who was its original owner?

The expert is often able to find the original registration, chassis and engine numbers on the vehicle. The correct numbers, identity the stolen vehicle, from the registration office or from the dealer. The police computers have also the record as given to them by the victim owners. Central government Website **Vahan Samanavay** should prove a boon in this respect.

Forensic document expert identifies the forged documents and their author, if the original documents have been altered or new fake documents have been created.

Vehicle registration offices are particularly useful for the purpose.

16.8.3.3 What is the make and model of the given vehicle?

It is comparatively easy to find out the make and model of the vehicle. Authentic information in this regard can be provided by the manufacturer/authorised dealer. Some laboratories keep catalogues of most of the vehicles currently available in the country. They can give the make and model of the vehicles.

16.8.3.4 Was the stolen vehicle used in the commission of the crime in hand?

Whenever a crime is committed in the vehicle or it is used as transport, contact traces are exchanged. The expert, on examination of these traces, indicates whether the vehicle in question was used for a particular crime or not.

16.8.3.5 Is the suspect linked with the theft of the vehicle?

Usually, the culprit and the vehicle come in close contact *inter se*. The culprit exchanges traces with the vehicle. The contact provides numerous evidentiary clues (fingerprints, hair, fibres, cigarette stubs, leftover articles, etc.). Likewise, fibres from the upholstery or carpet are found on the clothes of the thief. The exchanged clue materials link him with the vehicle in the majority of the cases.

16.8.3.6 Was the alleged crime committed in the suspect vehicle?

The person involved in the crime and the instrument of crime and the vehicle exchange traces *inter se*. It is therefore usually possible to say that a particular crime was committed or not. For example in cases of murder or rape-murder which are being committed in vehicles increasingly leave traces like blood, semen, saliva stains, hairs, fibres, etc. They not only indicate the commission of crime but also help to identify both the culprit and the victim.

16.8.3.7 Has the given part come from the suspect vehicle?

In most of the cases, it is possible to identify a broken part of the vehicle in respect of the vehicle from which it has come. However, in some cases a part (number plate!) is removed. The original contact may or may not leave identifiable traces. For example, a detached plate may have exchanged marks, dust, paint, to permit inter-linkage of the plate and the vehicle.

16.8.3.8 Is the driver driving the stolen vehicle?

The behaviour of a driver driving a stolen car can sometimes indicate that the driver is driving stolen vehicle:

- The driver usually becomes nervous/agitated on seeing a policeman/police vehicle.
- He is incoherent when questioned/interrogated.
- He tries to drive away the vehicle from the place where the police are checking the vehicles.
- He is unfamiliar with the vehicle and is uncertain in his driving.
- He and his companions wear sunglasses in the car.
- He or his companions may change dress while sitting in the closed stationary vehicle,

16.9 CASE LAW

16.9.1 Victim's Fault[8]

Author's Summary

A girl was going on a cycle. A bus going in the same direction crushed/killed the girl. The sessions' court convicted the driver. In the appeal, the High Court found that the driver was not driving rashly. Nor the motor mechanic found any defect in the vehicle. The court found that the girl suddenly turned towards right and was killed. It acquitted the driver.

Relevant Extracts (Verbatim)

Learned assistant government advocate argued that from the statement of P.W. 6, Guman Singh, it is proved that there was free travel pedal play of more than 1/2", indicating that the brakes of the vehicle were not in a perfect condition. He has stated that the handbrake of the bus was out of order as its linkages were disconnected. In the cross-examination, motor mechanic Guman Singh has stated that the free-play could result, even when the vehicle was in motion, and that in that event it would take hardly a fraction of a second to apply the brake. The witness has further pointed out that the hand brake in a heavy vehicle like a bus could not have been made use of at the time when it was in motion and that disconnection of the linkages

8. *State of Rajasthan v Hari Singh*, AIR 1969 Raj 86 : 1968 Raj LW 485 : 1969 Cr LJ 445 (Raj).

in the hand brake could also result when the vehicle was in motion. From the above evidence, it is not clear that there existed any material defect in the vehicle at the time when it was put on the road. The defect in the hand brake was of no consequence as such a brake, according to the expert, could not have been applied by the driver while the vehicle, was in motion. The defect of free-play according to the expert could possibly occur even when the vehicle was in motion.

When there was no rashness or negligence on the part of the bus driver, for having killed the girl, so far as the use of the road and the manner of driving the bus was concerned, the fact that the vehicle of the accused had free-play cannot be taken into consideration in convicting the accused under section 304 A, Indian Penal Code, though it can be made the subject of prosecution under the Motor Vehicles Act, when it is clear that the defect in question was not in any way responsible for the accident. I am fortified in my view by the case reported in *Emperor v Akbar Ali.*[9]

I further get support in this view from a Division Bench decision of this court reported in *State of Rajasthan v Chater Singh*.[10] In that case there was no evidence on the point that the accused knew of the defect. It was also not brought out that he had been driving the vehicle for a long time, so that knowledge of the defect could be imputed to him. If the defect was such that it could not be detected without meticulous examination of the machinery, it cannot be laid down that criminal liability could be fastened on the accused on that ground. In this case the defect was such that it could not be detected without a thorough examination of the machinery. It cannot be suggested that the accused Hari Singh should have undertaken such an examination before starting the vehicle. In that view of the matter also, no criminal responsibility can possibly be imputed to the accused.

It may also be stated here that from the evidence as pointed out above, it has not been found that the vehicle was being driven with rashness or negligence. On the other hand, there is the evidence to suggest that the bus was moving towards the extreme left side of the road. According to the prosecution, the girl turned towards the right side of the road. It is not clear how the girl suddenly turned towards the right side. When a person is run over by a bus and is crushed on the spot, the spectators are prejudiced against the driver of the vehicle and in such a case it becomes difficult for the court to ascertain the circumstances of the case. It is possible that the present mishap took place because the girl abruptly pedalled from the left side of the road towards its right, without knowing its consequences. The lorry stopped at a distance of about 7 ft. away from the place of the accident. In that circumstance, the accused cannot be held liable for the accident. Thus, circumstances of the accident being doubtful, the trial court rightly gave benefit of the doubt to the accused.

16.9.2 Mischief[11]

Author's Summary

A person was being taken away forcibly in a Jeep. The relative of the victim stood before the jeep to prevent kidnapping. The accused, however, did not bother and ran over the man. The person fell down and was dragged to a distance inflicting many injuries. The trial court convicted the accused for attempted murder. The High Court in their wisdom changed the charge of attempted murder to minor offence; in spite of numerous injuries and 45 days of hospitalisation and medico-legal opinion. Travesty of law!

9. AIR 1936 Oudh 400 : 37 Cr LJ 975; *Emperor v Akbar Ali*, (1933) Bom LR 1021.
10. ILR (1962) 12 Raj 103 : 1962 Raj LW 281.
11. *Marudevi Avva v State of Kerala*, AIR 1958 Ker 8 : ILR 1957 Ker 781 : 1958 Cr LJ 33 (Ker).

Relevant Extracts (verbatim)

The prosecution version is that while accused 1, aided by accused 3, forcibly made P.W. 12 get into the jeep notwithstanding the protests of P.W. 1, the latter stood in front of the jeep to prevent its moving and that at that time at the bidding of accused 1, accused 4 drove the jeep over him making him fall down and to be dragged along the road by the jeep for a short distance. The medical evidence clearly supports the case of the prosecution that P.W. 1 sustained several injuries as the result of the fall and the subsequent dragging by the jeep.

Ext. P. 6 is the wound certificate issued by P.W. 7 for the injuries he noticed on P.W. 1 when the latter was admitted to the headquarters hospital at Kozhikode as an in-patient during the night of the occurrence. There were as many as 15 injuries and Ext. P. 6 describes them as follows:

(1) An abrasion 1-1/2 x 1" over the front of right knee.

(2) An incised wound about 1-1/4" deep one inch above the right knee-cap.

(3) and (4) series of abrasions on the lateral aspect of the right leg and right thigh

(5) Three abrasions each about 1 x 1-1/2" along the lateral and anterior surface of the left knee.

(6) Minor abrasions 1/2" x 3/4" on the left thigh.

(7) An abrasion 5" long 2" wide over the lateral surface of right upper arm.

(8) An abrasion 2" long and 1" wide over the lateral surface of right elbow.

(9) Minor abrasion 1/2 x 3/4" over the posterior aspect of right elbow.

(10) Minor abrasion 3/4 x 3/4" over the tip of right middle finger.

(11) A contusion 1 x 1/2" over the lateral half of right eyebrow.

The question for us is whether these injuries were caused as alleged by the prosecution when the jeep ran over P.W. 1 and dragged him or was it a case of mere accident as suggested by the defence. The defence had a further case that, assuming the whole prosecution version that the jeep was allowed to run over P.W. 1 deliberately with the intention of killing him or with the knowledge that he would thereby meet with his death is accepted, they were protected from the consequence of their action by the right of private defence.

We shall now refer to the evidence of eyewitnesses as to how P.W. 1 happened to be injured. P.Ws. 1 to 5 have given consistent evidence that after P.W. 12 was forced into the jeep and all those who had that day gone over to Kootamunda estate in it, except accused 2, got into it, P.W. 1 stood in front of the jeep with a view to prevent its moving and that then accused 1 asked accused 4 to drive the vehicle over him and that the latter acted as ordered, with the result P.W. 1 fell down and was dragged for some distance by the jeep. The early records of the case already referred to (Exts. P1, P4, D2, and P2) lend support to this evidence. The nature of the injuries makes it unmistakably clear that P.W. 1 had fallen down and that the jeep had dragged him for a distance. We see no reason to doubt the truth of the prosecution evidence that accused 1 had bid the driver to let the vehicle move and the words attributed to her, set out more or less uniformly in the earlier records as also in the evidence given at the trial, clearly indicate that she wanted the driver to take the vehicle along regardless of the consequences. There is, however, more than one difficulty to believe that P.W. 1 was right in front of the jeep when accused 4 made the vehicle move as per the direction of accused 1. If P.W. 1 was right in front of the vehicle, probabilities are he would have sustained far more serious injuries. The height of the bottom of the engine from the ground level was only 1 foot 2 inches. The evidence that he fell on his back is more or less belied by the injuries noticed on the front part of the body particularly the knees. While we have no hesitation to think that accused 4 took a very rash step in allowing the vehicle to move while P.W. 1 was in such close proximity to it as

to get hurt by the motion, we cannot agree that accused 4 or even accused 1 ever intended to kill P.W. 1 or knew that he might sustain such injuries as would result in his death. Probably accused 1 thought the threat that the vehicle will be taken over his body would make.

P.W. 1 move away and accused 4 also must have thought likewise. The lower court itself would appear to have been in two minds as to whether the facts of the case warranted the conclusion it came to, namely, that by his act accused 4 intended to cause the death of P.W. 1 or that he knew that death would be the result of his action and whether accused 1 was instigating him to do that with such intention or knowledge. In paragraph 21 of its judgment in discussing the medical evidence the lower court observes:

> *.....The contention of the learned counsel for the defence is that P.W. 1 could not have fallen on his back in front of the jeep and caught up and dragged away by the jeep as alleged by the prosecution. They would contend that P.W. 1 was standing on a side of the jeep, that when the jeep was driven his clothe probably was caught up in the hooks and then he fell down on his right side and was dragged. P.W. 7 has stated in very clear terms that all these injuries could be caused by being knocked down by a jeep and dragged for some distance. In cross-examination he was asked whether the injuries could be caused by being knocked down by a jeep and dragged for some distance. In cross-examination he was asked whether the injuries could not be caused by P.W. 1 falling on his right side and then being dragged by reason of his clothe getting entangled in some portion of the jeep. He said that, that was also possible. "This only means that the injuries are consistent with the prosecution case and also consistent with the defence theory." The matter was further pursued in cross-examination and it was elicited that if a man falls on his back by a violent push the prominences on the back side will come into violent contact with the earth, that the back of head and buttocks are the two major prominences on the back side and that if the back of head comes into violent contact with the earth, necessarily an injury right on the back of the head can be caused. But then in re-examination he has stated that injury No. 14 is on the left side of head partly to the back of head also, that if in falling on the back the head is slightly tilted to a side there will not be any injury right on the back of the head and that if when the body is dragged by the jeep the body is turned slightly to the right the injuries will be mostly on the right side. "It will not be seen that the medical evidence is not inconsistent with the prosecution case regarding the manner in which P.W. 1 sustained the injuries." There is the consistent testimony of P.Ws. 1, 2, 3, 4 and 5...*

On the finding that the injuries are consistent with the prosecution case and also consistent with the defence theory, the learned judge should, in our opinion, have inclined to accept the defence suggestion. To our minds, had the occurrence taken place as alleged by the prosecution nothing short of the happening of a miracle would have allowed P.W. 1 to come out of the ordeal with only such injuries as he actually sustained. He must have been hanging on to the jeep from the side. That the jeep left suddenly is clear from the fact that accused 2 was not able to get into it before it left. We would, therefore, take the view that accused 4 drove the jeep at the bidding of accused 1 at a time when P.W. 1 was in such close proximity to the jeep as suggested by the defence and that accused 4 drove the jeep so rashly or negligently as to endanger the life of P.W. 1. Hurt was thereby caused to P.W. 1. Though he had to be kept treated in hospital as an in-patient for 45 days, P.W. 7 stated in his evidence that after 14 days P.W. 1 could have been discharged and that after the said period he was in a position to attend to his ordinary avocations in life. Such evidence from a medical witness is rather unusual but it is there. In the circumstances the criminal act of accused 4 would fall only under section 337, Penal Code, and not under section 338 as it naturally would have been as the result of the 45 days' stay in the hospital.

In all the circumstances of the case we consider it more prudent and safer to arrive at the above conclusion that the offence committed by accused 4 would only amount to the offence stated above and not under section 307, Indian Penal Code. We are certain in our minds that but for the instigation from accused 1 accused 4 would not have emboldened himself to take the rash step of driving the vehicle in such a way as to endanger the life of P.W. 1. She therefore abetted accused 4 to commit an offence under section 337, Penal Code. During the course of the argument we put it to the learned counsel for the defence whether in case we were to come to this finding that they would consider their clients to have been prejudiced by our convicting

them accordingly when they were not tried for these offences. Their reply was that we would be within the law in so doing and that in that event they could not complain of any prejudice to their clients. We feel the concession is perfectly right.

16.9.3 Accident Evaluation[12]

Author's Summary

The main causes of road accidents are rash and negligent driving, width and characteristics of the road, traffic density and tendency to overtake, often going to the wrong side. These factors caused the accident in this case. The trial court unfortunately could not appreciate the evidence and opined that the there was no rash driving ignoring the it had hit a vehicle on the other side, struck an electric pole ,then travelled another 45 feet and hit against the parapet wall and turned turtle showed that the car must have been travelling at an extremely high speed. The SC rejected the findings of the trial court.

Highlights italicised

Relevant Extracts (Verbatim)

The facts in the case speak eloquently about what should have happened. *The main criterion for deciding whether the driving which led to the accident was rash and negligent is not only the speed but the width of the road, the density of the traffic and the attempt, as in this case, to overtake the other vehicle resulting in going to the wrong side of the road and being responsible for the accident.*

Even if the accident took place in the twinkling of an eye it is not difficult for an eye witness to notice a car overtaking other vehicles and going to the wrong side of the road and hitting a vehicle travelling on that side of the road. The criterion adopted by the learned judge for assessing the evidence of P.Ws. 3 and 4 and rejecting it is thoroughly unjustifiable. There may be cases where it is difficult to be clear or specific in giving details as to the cause of the accident but this is not one such case. The reference by the learned judge about the slight damage to the electric post and the conclusion drawn there from that the car could not have been going at a high speed is not correct as we shall show later. His further observation, that the fact that the car travelled another 45 feet and hit against the parapet wall and turned turtle showed that the car must have been travelling at an extremely high speed but there is a little blue paint on the pole and a faint grey stain on the parapet wall is self-contradictory unless we are to infer that the learned judge implied that the one or the other is not true. He does not so hold.

> *There can be no doubt about the car having hit the electric post and the parapet wall. That and the fact of its overturning would establish the rash and negligent driving. A car driven normally and travelling behind a bus does not go to the opposite side of the road and hit an electric post and parapet wall and turn turtle. The car apparently stopped only because it turned turtle. It did not hit the electric post or the parapet wall full tilt, if it did it would have stopped at one of those points. We should remember that the collision with the scooter and pushing it back would have considerably reduced the speed of the car. Even so it travelled farther.*

The slight damage to the electric post and the parapet wall is because the car hit them sideways. Nobody has suggested that they were brought into existence for the purpose of this case. The car would probably not have stopped but for turning turtle and it should have been travelling quite fast before it could overturn as the learned judge himself realises.

> ***There is only one conclusion possible on the facts of this case and that is that the accused came over to the wrong side of the road and was responsible for the accident and that is clearly a rash and negligent act in the condition of the road and the condition of the traffic.***

Edmond Locard on Trace Evidence

"Wherever he (culprit) steps, whatever he touches, whatever he leaves, even unconsciously, will serve as a silent witness against him. Not only his fingerprints or his footprints, but his hair, the fibres from his clothes, the glass he breaks, the tool mark he leaves, the paint he scratches, the blood or semen he deposits or collects. All of these and more, bear mute witness against him. This is evidence that does not forget. It is not confused by the excitement of the moment. It is not absent because human witnesses are. It is factual evidence. Physical evidence cannot be wrong, it cannot perjure itself, it cannot be wholly absent. Only human failure to find it, study and understand it, can diminish its value."

17.1 NATURE

Microtrace in forensics is clue materials in small amounts, often in traces. They may have any physical or chemical entity. They may be organic or inorganic substances, plant materials or material from human or animal kingdom. They can be microorganisms, sub-life materials; they can be gases, liquids, or solids.

Micro traces are frequently found in crime situations, at crime scenes, with the victim, on the culprit, in the vehicle used in the crime or on the weapon used in all types of crimes such as homicides, rapes, assaults, burglaries, and automobile accidents or thefts.

All types of materials are encountered as micro traces in Forensics, including:

1. Plant Materials
2. Dust, debris
3. Fibres
4. Polymers
5. Minerals
6. Hair
7. Glass
8. Paint
9. Soil
10. Materials of animal origin
11. Gunshot Residue (GSR) on clothing and other items
12. Marks (prints and Impression)
13. Grass
14. Bloodstains, smears, droplets, washed blood, flakes, dry powder
15. Semen stains, smears, streaks
16. Skin
17. Marks: tool marks, fingerprints, foot/footwear marks, bite marks, puncture marks, holes, injuries
18. Plastic materials
19. Minerals
20. Odours, and
21. The list continues

Some of the traces form chapters or parts of the chapters in this book. Some others, which are being used increasingly in forensics, are discussed here.

17.1.1 Plant Materials

Wood, wood splinter, bark, twigs, starches, sawdust and shavings, leaves, flowers, petals, pollen, plant hairs, fibres, seeds. They are different from different species/sources.

17.1.2 Dust

Dust is a general name for all types of materials in extremely fine form, usually in mixture form of two or more entities. They are fine particles of flora, fauna, soil, minerals, and other

materials found at the place. Weather conditions affect the nature of the dust as it almost continuously changes the composition of the dust. They, in short, represent the environment and the various activities at the place. Dust vary from place to place.

17.1.3 Fibres

Fibres of all sorts—natural fibres, fibres from animals, human beings (hair!), plants and minerals, and synthetic fibres are found as micro traces. The number and variety of fibrous micro traces are increasing every day. They are an important part of the usual dust.

17.1.4 Polymers

The extensive all-round use of plastics, rubbers, elastomers and the like materials has inducted these materials into micro trace evidence. Tyre residues in skid marks provide important evidence to interlink the tyre (and hence the vehicle) with the accident. Wire covering material, in the theft of wires/cables, provides useful linking evidence.

Plastic containers and bags are frequently and increasingly being utilised for package for all sorts of materials, including drugs which the peddlers often ell in small pouches. Their analysis and comparison can often lead the IO to the distributors/packers. The analysis of plastic bags, containing drug, has been used in identifying the premises; and the persons who were the kingpin in the packing of the drugs in small pouches.

17.1.5 Minerals

Sand, soil, plaster particles, metallic dust, grit, naturally occurring oxides and other compounds, industrial products and waste, ores form part of some dust. Persons working/visiting quarries and mining sites pick up the special mining material dust. It helps to link the persons with the site. The professional dust, found on unidentified dead bodies, helps in their identification.

17.1.6 Glass

Glass is one of the commonest/most important micro traces in Forensics. It provides linking and reconstruction evidence in a variety of criminal cases; including:

1. Hit and Run cases
2. Road accidents
3. Burglaries and dacoities
4. Kidnapping
5. Rapes and murders
6. Drunkards' brawls
7. Vehicular insurance frauds.

There are many types of glass. The variety helps in their discrimination and thus, enhances the evidentiary value of the evidence.

17.1.7 Paint

The paint is used extensively for preservation and beautification of many articles in daily use. Painting of the interiors of the buildings and that of the vehicle is almost universal. Thus, in

the commission of the crime, the criminal and the victim may come in contact with paint and pick up smears, paint dust, tiny flakes. These traces link the criminal the crime and the victim *inter se.*

Further, the variety of paints is very large, which allow high discrimination of the paint source.

17.1.8 Soil

Soil is important evidence. There are infinite variations in the soil, especially in the topsoil due to varying flora and fauna, effect of sun, wind, rains, and the human and animal activities. Minerals, fragments of materials, organic matter, all confer individually. One forensic scientist has studied even the amino-acid variations in various soils for individualisation.

17.1.9 Materials of Animal Origin

The prominent materials are hair, tiny particles of skin, flesh, bones, and particles of dried blood or other body fluids. They may be as smears or solid or semi-solid residues, bone fragment, nail pieces, horn or feather fragments and their disintegrated products in the form of proteins, enzymes and amino-acids. They often figure in microtraces.

In addition to the above, other types of microtraces also come up now and then like grass, microorganisms, polymers, and insects.

17.2 IMPORTANCE

Microtraces as evidence have great importance, mainly for the following reasons:

1. **Microtraces are omnipresent**; they are always exchanged (Locard's Principle of Exchange). They are present in all crimes.
2. **They are inconspicuous**; they are usually very small. The culprits and/or his well-wishers often do not notice them. In fact, they are often unaware of their existence, location and their value. He, therefore, does not take the usual precautions to prevent their occurrence or destruction. They are, thus, available undisturbed/unmutilated and undestroyed most of the time. They provide useful evidence.
3. **The culprit knows and avoids macro incriminating evidence**; he is becoming more and more aware of the same. He does not leave such evidence at the crime scene, whenever possible. For example, fingerprints evidence was, once upon a time, the most respected and frequently available evidence. Its occurrence is now dwindling.
4. **The eyewitnesses' accounts**; they were the kingpin of the judicial proof. They are not only becoming rarer but are also becoming highly undependable and unreliable. Quite a few of them jump the fence for cash or kind; or, for fear of retaliation from the accused.
5. **Microtrace evidence has high evidentiary value;** this has become possible because of the tremendous progress the science and technology have made in recent years. It is now possible to link the tiniest clue material to its possible source of origin, with certainty.
6. **Microtraces can indicate the *corpus delicti*.**

   In the case of death of an elderly person, by drowning, it was given out that she drowned accidentally. The police, however, as a matter of routine, checked homicidal

angle also. The son-in-law with whom she was living was interviewed. He did not give satisfactory answers to various queries. One of the suspicious circumstances, found by the police, was the discovery of a mud stain on the trousers of the suspect. He informed the police that he picked up the stain from a street drain where he had slipped.

The police collected the mud sample from the site indicated by him and from the place where the dead body was found on the side of the lake. The three mud samples were sent to a microbiologist. He found that whereas the microbiological population of the mud stains on the trousers tallied with the one from the lakeside, it was completely different from that of the drain mud. The son-in-law, when confronted with the evidence, confessed to the crime. (CH)

7. **Microtraces help identification** of the culprit, of the victim, of the witnesses, of the various materials involved in the crime, of the *modus operandi* and reconstruction of the occurrence. The root of a hair, after comparison of its DNA profiles of the hair and of the suspect, can establish the identity (or non-identity) of the suspect as the culprit.
8. **Microtraces can link/de-link suspect** with the crime. For example, a bite mark on the breast of the victim was the only evidence on which the suspect was convicted of murder[1]. It was perhaps the first case in which the conviction was based on bite marks (Odontology!) only.
9. **Microtraces permit verification of versions** of the given event.

   Some years ago, a young girl was found murdered and stuffed in a gunny bag, left under the staircase of a multi-flat multi-storied building. The girl had been seen in the company of a wandering tribe of gypsies. The police suspected that a member of the tribe must have killed her after rape, as they noticed blood coming out from her vagina. The post-mortem examination, however, revealed that the girl had not been raped but her vagina had been mechanically interfered with. The police continued, for some time to check the members of the gypsy tribe. However, they failed to link the murder with the gypsies.

   The police then concentrated on the residents of the building. Ultimately they came to suspect one old lady living all alone in a flat of the building complex. It was learnt that the girl used to tease the old woman and who in turn would abuse her.

   The doctor, who had carried out the post-mortem, had found that the vagina of the victim had inflammation, which should not have been there unless the instrument (rod) used for interference carried microorganisms. He preserved the microorganism. The police searched for a possible instrument at the woman's flat, which could create the wound and inflammation. They located a rod used by the woman to clean the kitchen drain hole. The microbiologist found that the vaginal microorganism had come from that rod which had been used by the woman to ward off suspicion from her, to make it the crime look like a sex crime. When confronted with the evidence, the woman admitted her crime. (CH)

10. **Microtraces provide leads** to help the IO in the investigation of crime.

    In a classic case of the use of Microtraces, the expert led the police to the culprit from a length of string which had been utilised as an initiator to explode a heavy charge of explosive kept near the window of the intended victim, who had been sleeping near the window. One end of the string was embedded in the charge, the other was smouldering and the smouldering end was advancing towards the charge. Fortunately, the intended

1. Biggar murder case took place in Scotland in 1967. The victim was a teen-age girl, Lind Peacock and the murderer was Gordon Hay, also a teen ager.

victim woke up, sensed burning and at once extinguished the burning string. The expert who examined the string gave the following information:

- *The string had come from an agricultural farm.*
- *The location of the farm is by the side of a fast flowing stream.*
- *There are white and brown horses at the farm.*
- *There are red chickens at the farm.*

The farm could be located. The culprit was apprehended. (CH)

11. **Microtraces fix the identity of the scene**.

In a case of rape, the suspect denied both the offence and the visit to the alleged scene. The clothes of both the culprit and the victim were examined. Certain seeds were found on the clothes of both. Checking at the scene indicated that the seeds had come from an uncommon weed, which was found at the scene. (CH)

12. **Microtraces help to reconstruct the occurrence**, the sequence of various events and the *modus operandi*. Microtraces have one great drawback, which has prevented its exploitation as evidence. Its utility remains unknown until it has been evaluated in the laboratory. Consequently, the investigating officer remains groping in the dark. Often he feels the exercise is not worth the trouble. However, in the coming times, in view of the dwindling utility of traditional evidence, he has to depend upon increasingly on the microtraces to provide convincing evidence against the culprit.
13. **Microtraces help in other ways:**
    - Promote real confessions
    - Help to identify unknown dead bodies through professional dust and other traces found on them.

I am an Investigating Officer

1. I arrange medical facilities to the injured at the crime scene to save life.
2. I protect and preserve the crime scene.
3. I assess the scene and requisition the needed expert help.
4. I fix the scene site, evidential sites and the evidence through. Videography/photography/sketches/textual notes.
5. I locate, collect, pack, and seal microtraces and other evidence from relevant sources: the scene, the victim, the culprit, the vehicle, used the residence/office of the culprit.
6. I pick the leftovers and the residuals of the picks.
7. I send the microtraces to departmental FSL, with all legal formalities.
8. I maintain their identity/integrity/authenticity/relevancy and Keep the chain of their custody intact.
9. I interlink the leftover, the picks, the culprit, the Crime Scene, the weapon, the vehicle and the victim *inter se.*

10. I ascertain the *Modus Operandi*.
11. I check the sequence and verify the versions.
12. I find and handle the victim/criminal/witnesses for physical/oral evidence.
13. I seek expert help to evaluate the scene (at times) and to reconstruct the occurrence.
14. I integrate the total evidence: the eyewitness accounts, the circumstantial evidence, the medico-legal evidence, the expert evidence and ensure their compatibility when I present the challan.

17.3 LOCATION

The main sources for the microtraces are:

1. The culprit
2. The victim
3. The Crime Scene
4. The weapon
5. The vehicle
6. The routes

17.3.1 The Culprit

The culprit carries traces on his clothes, on his shoes, in his hair, underneath his nails, or on his sexual body parts in case of sexual offences. Trace evidence may be in the form of stains or material sticking on his person or it may be in the form of dust particles. He may carry the traces of liquor or drug even in his breath, blood or body.

> *In a case of sexual murder, the culprit left a saliva stain on the cup in which he had taken tea. The fact eliminated his husband as the possible culprit and indicated that the murderer was someone known to the victim. Later on, it provided corroboratory evidence to prove his guilt to the hilt. (CH)*

The culprit carries standard exemplars. They are matched with the traces he left at the scene of crime or with the victim or on the objects with which he came in contact. They link him with the crime/crime scene/victim.

17.3.2 The Victim

The victim carries traces in the same fashion and at similar places as the culprit. In addition, powder residues in cases of shooting, needle marks in case of killing by injecting poison or even traces of poison at the point of administration may be available on the victim.

Like the culprit, the victim provides standard exemplars to match the traces that the culprit has picked up from him.

> *In a case of sex murder, there was a physical struggle. In the process, the culprit picked up wool fibres from the sweater of the victim. He also picked up feather fragments from the pillow used by the victim to defend herself. Later, when the culprit was apprehended, the fibres recovered from the coat that the culprit had been wearing at the time of struggle, matched with the fibres recovered from the sweater of the victim and the torn pillow in spite of the fact that the culprit had got his suit dry cleaned, some tiny fibres continued sticking to the coat. (CH)*

17.3.3 The Scene

The scene of the crime is a rich source of trace evidence. Saliva on cigarette stubs, on cups or glasses, ash from cigarettes, dust, fibres, and body fluids. are important traces offender leaves at the scene. He may also leave objects like garments, shoes, weapons of offence, vehicles or other items at the scene. They carry traces from the culprit which link him with the crime.

> *In a case of dacoity, the culprits hijacked a bus to escape from the scene. They abandoned it later. On search of the vehicle, the police not only found fingerprints but also plenty of microtraces like hairs, fibres and dust, etc. which ultimately, helped the police to link the culprits to the vehicle used in the dacoity. (CH)*

In addition, the scene provides matching evidence for the traces, which the offender picks up from the scene. For example, if the offender has entered the house after breaking window pan, He is likely to carry tiny glass fragments on his person (in his hair and or embedded in his body parts), garments, shoes. Their comparison with the glass from the window can link the culprit with the scene/victim.

17.3.4 The Weapon

The weapon of offence often carries tell-tale traces. In suicide cases, if the firearm is pressed against the body, blood, skin, flesh, even tiny particles of bone may be sticking to the inside of the barrel, at the muzzle end.

> *In an interesting case, a culprit was standing in a queue to board a bus. When the bus started moving, he was still in the queue. He gave a knife blow to his victim and before the persons standing there could catch the offender, he boarded the running bus. He left the bloodstained knife in the bus and vanished after getting down at the next bus stop.*
>
> *The police recovered the knife from the bus. It was stained with the blood of the victim. The IO had also found rabbit hair on the knife handle. Later, when the culprit was apprehended, matching hair were found on the clothes of the suspect matched, though the hare skin gloves were not recovered. The traces on the knife provided excellent corroboratory linking evidence to connect the culprit with the victim/crime. (CH)*

The weapon leaves traces in the form of marks or injuries, on the person of the deceased or the injured; or, may leave its fragments of the weapon on the person of the victim or at the scene. They provide excellent, often definite, linkage, in many a case.

> *In a simulated case of suicide, a sawn off gun was lying close to the body of the deceased, as if he had shot himself. Examination of the gun revealed that the gun barrel was freshly sawn off. The cut piece of the barrel and the hacksaw were searched for. They were not found in the house where the dead body was found. Murder was suspected. A hacksaw was recovered from the house of a suspect. Tiny particles on the hacksaw connected it with the sawed-off gun, linking the suspect with the murder. (CH)*

17.3.5 The Vehicle

The entities like a dead body, stolen or contraband goods, injured person or even kidnapped person transported in a vehicle leave their traces in the vehicle. They provide useful link evidence.

> *In a case of theft, a number of plates of lead batteries were stolen. The suspected vehicle had some black stain in the boot space. Examination of the stains chemically, revealed that they had come from the lead plates. (CH)*

The mud or dust picked up by the vehicle from the crime scene or deposited at the scene, links the crime vehicle with the crime scene/the criminal.

The cigarette stubs, cigarette ash, fibres exchanged, hair shed, perspiration, saliva found in a vehicle can provide useful trace evidence.

Fingerprints on the rare view mirror of the vehicle, if found, provide a definite identity of the driver.

17.3.6 The Route

Offenders often discard unwanted incriminating evidence on their flight from the scene. Sometimes important pieces of evidence are recovered from the route, which helps to pin the crime to the offender.

> *In an interesting case, the offender had murdered the victim in a secluded place. The police searched for the weapon at the scene and at the residence of the culprit, but without success. They then reasoned that he might have thrown the weapon en route. There were three footpaths, all about 5 kilometres each (from the crime scene to his residence). He could follow any route. It was fixed by examining the dust on the shoes of the culprit. The IO then followed the route examining all possible places where the weapon was likely to be thrown. He recovered the weapon from a bush thicket. (CH)*

17.3.7 Location Techniques

Location of trace evidence is usually more difficult than the macro evidence. The investigation officer usually uses the following gadgets:

1. Magnifying glass
2. Strong light
3. UV lamp

As a rule, whenever possible, the article suspected to carry trace evidence is transported to the laboratory if it can be done without loss of the evidence. The laboratory has the proper equipment for locating and collecting the evidence:

1. Wide spotless (white) examination table
2. Large shadowless lamp
3. Stereomicroscope with a movable flexible arm
4. Polilight
5. An array of locating chemical agents

The most important equipment to locate trace evidence is the trained eye and tuned brain of the IO who carries out the search. Usually, the Forensic Science Laboratories also possess such expertise and provide help.

Nowadays, most of the police departments have mobile laboratories or scientific teams for crime scene inspection. The team join investigations in all important cases. The team has the necessary equipment and expertise to locate the trace evidence. They locate the ever-present trace evidence and provide leads for further investigation.

17.4 COLLECTION

Collection of minute microtraces is somewhat a difficult task. The IO has to be experienced and well versed in handling minutiae. He gets the help of the scientific crime scene team whenever he needs assistance. Once the trace evidence is collected (and preserved), the investigation officer follows the standard routine drill to ensure:

1. Identity of the evidence
2. Integrity of the evidence

3. Authenticity of the evidence
4. Intact chain of possession of the evidence

The techniques used for the collection of micro evidence depend upon the nature of the microtrace and the sub-strata. They are:

1. Handpicking
2. Taping
3. Vacuuming
4. Scraping
5. Dissolving — solvent action
6. Clipping
7. Collecting the object carrying the trace evidence

Collection of the objects carrying traces and clipped items need special care. The microtraces thereon are to be protected from loss in transit, contamination or mutilation.

17.4.1 Handpicking

It is the method of choice whenever it is possible. It ensures the purity of the microtraces, proper fixation of their location and individual collection and separation. The process saves both time and effort.

The picked-up evidence is placed appropriately in small-sized clean containers. The purity and cleanliness of the same are ensured before placing the evidence in the container. Plastic containers often develop static a charge. They can repel the tiny trace materials, which may get lost in the process. In such cases, paper or glass containers should be preferred.

Ordinarily, the tiny traces do not need preservation from chemical changes or putrefaction. However, certain bio-traces (e.g., body fluids) may need treatment to preserve the trace from putrefaction or disintegration. Certain vapours may also get lost due to absorption or diffusion. They need protection. Besides, if the evidence is wet or on wet substrata, it should always be dried before packing.

Handpicking needs no elaborate paraphernalia. A strong light source, a magnifier, in some cases a magnet, a forceps with sharp thin tips, and a strong Tungsten fine-tipped needle are all that is needed. An operating zoom stereomicroscope on a zoom stand, if available, proves more helpful than a magnifier.

17.4.2 Taping

Taping for microtrace evidence is not only a successful and useful method but also an indispensable method in some cases, especially for the micro-evidence which is too small for handpicking or which is not easily discernible against the background. The method involves the use of adhesive tape(s) of 2 to 5 cm in width. The tape should be strong, clear, transparent and colourless, chemically inert and stable. There should be only a thin layer of the adhesive to prevent immersion of the small particles in the adhesive. The tape is pressed against the microtrace evidence carrying substrata. The adhesive picks up the evidence. The picked up evidence is preserved by covering the evidence carrying tape with fresh length of the same tape. Thus, the microtrace is sandwiched between the two layers of the tape. Alternatively, the tape is pasted on clean, transparent and clear acetate or a glass sheet. The microtrace is embedded in the adhesive and is protected by the sheet and tape.

The taping technique has certain advantages:

1. It is possible to pick up the finest trace by this method.
2. Isolation of the individual constituents is easy.
3. Preservation of the evidence is convenient.
4. It is not contaminated after the collection.

The tape picks up traces from plain or curved surfaces. It may miss traces in the crevices unless the investigator is careful. Likewise, it may miss traces embedded in the substrata. Moreover, the *substratum* may transfer its own material, especially if there are loosely held fibres or particles. The method is also not practicable on wet or oily surfaces.

A piece of the substrata material is always collected and sent along with the trace evidence.

The taping method is bound to be used frequently in the coming times. The tape should be, as seen above, thin but strong, clear and transparent; of a width of 2 to 5 cm. The adhesive thereon should be inert, soluble in organic solvent (Xylene!) and the layer should be neither too thick nor too thin.

17.4.3 Vacuuming

Vacuuming is an ideal technique for:

1. The collection of professional dust
2. Ascertaining the area through which the subject has travelled/passed
3. Collecting evidentiary traces from large areas
4. Collecting trace evidence in crevices

The technique is not good to collect traces exchanged in a single contact, which is common in most of the crime situations. Besides, it collects old traces which have no relevance to the crime and create problems at times. Consequently, it is used only when the other techniques prove inefficient for recent traces.

The technique involves an ordinary household vacuum cleaner with a modified suction end. The suction end is fitted with a rubber bung in which a glass tube is fitted. A pressure tube is attached to the outer end of the tube. The free end of the rubber tube is attached to a cassette, fitted with a cellulose acetate membrane (filter) trap that retains the microtraces. The open cassette is moved along the surface after putting the vacuum cleaner on. The arrangement is good for small areas, individual clothes, shoes, even for bed sheet, sofa sets, chairs and seats in vehicles including that of aeroplanes. The membrane filters can be stored conveniently in the cassette itself or in similarly shaped containers. Cellulose acetate membranes (filter traps) are changed frequently, using separate filter trap for each item of clothing or one for each specified area.

The laboratory technician uses Petri dishes to collect microtraces.

Vacuuming suffers from the following lacunae:

- It collects all old/new dust, substrata particles.
- It dilutes evidence. Additional dust may be from the ‘real criminal’; other than the suspect/accused. The defence argues.
- Fixing the site of collection of the microtrace evidence needs care.

Vacuuming is not used in those cases where microtraces can be collected by handpicking or taping. If necessary, the vacuuming is done after these processes.

17.4.4 Dissolving and Washing

To a novice, use of washing technique, to collect microtraces, might appear puzzling. But it becomes indispensable in some cases. For example:

1. A tiny fragment of a petal is embedded firmly in a small mud stain. Attempts to remove the fragment will further break up the petal and make examination difficult.
2. A small oily or greasy stain is sticking to clothes, covering tiny soil particles. They can be collected only after dissolving the oily material in a suitable solvent.
3. Tiny body fluid stains.

The washing technique is not used frequently. However, when it is indispensable, the sticking trace has to be carefully examined to determine its nature, in order to select the appropriate solvent. The solvent may dislodge the stain with the help of a tungsten needle. At times, ultrasonic bath may be needed to dislodge the evidence. The minimum amount of solvent is used. In case a large amount of solvent has to be used, the trace material is concentrated with a centrifuge.

17.4.5 Scraping

Scraping of stains of appreciable dimensions is common in most of the laboratories. It may not be feasible with tiny stains. A spatula or a scalpel is the usual gadget for scraping the microtrace. However, a Tungsten or Platinum needle with a flattened tip is better. The scraped material is collected on to a paper. It is preserved by folding or transferring it to some other container like a watch glass/Petri dish.

Scraping is inefficient, as it does not often dislodge the total material. It also does not allow the strongly adhered material to be scraped off without being contaminated by the substrata material. In scraping, substrata material is taken into account. The danger of contamination, in tiny stains, is real and ever-present.

Laboratory technicians do not use scraping is when they have the stain bearing article itself.

Microtraces need care in packing. The small amount and sizes make it essential that the material is not contaminated or lost. The following table gives a proper packing mode:

Table 17.1

Microtrace Packing

S No.	Microtrace	Packing
1	diatoms	Side/plastic envelopes
2	Industrial dust	Vials/paper fold/plastic envelops
3	Mineral	Vials/paper folds and plastic envelopes
4	Pollen	Vials/paper folds and plastic envelopes
5	Polymers	Paper folds/envelopes/vials
6	Spices	Vials
7	Wood	Vial/slides
8	Fibres: Natural/synthetic	Paper folds/envelopes
9	Food products grains	Vials/paper folds and envelopes
10	Hairs	Plastic envelopes

17.5 FORENSIC PROBLEMS/POSSIBILITIES

Evaluation of microtraces can provide answers to the most important questions in forensics:

1. Do the collected microtraces fix the identity of the culprit/victim?
2. Do they identify the crime scene(s)?
3. Do they indicate the *modus operandi* of the culprit(s)?
4. Do they identify/indicate the type of weapon of offence used?
5. Do they link the vehicle with the crime?

In addition, they answer many other Forensics problems, including the following:

1. Are the microtraces, found on the person of the suspect (including his clothes, shoes), from the crime scene, from the victim or from the objects/materials at the scene?
2. Are the microtraces left at the scene from the culprit (or from his clothes, shoes), from his weapon of offence or from the vehicle that was used in the commission of the crime?
3. Do the microtraces provide corroboratory/definite evidence to link/delink the suspect with the crime?
4. Which of the given versions of occurrence is supported/contradicted by the collected microtraces?
5. Do the microtraces help to reconstruct the occurrence?
6. Do the microtraces indicate the sequence of events?
7. Do the microtraces provide some leads for further investigating?

17.6 EVALUATIONS

Fig. 17.2

Scanning electron microscpoe (SEM), the ultimate tool in microtrace analysis

Microtraces, as already seen, involve all types of entities. The nature, composition and state of the traces vary from case to case. The only common denominator is their small size/amount. The examinations have, therefore, to be trace-specific and quantity-specific. However, the micro-analyst has an array of instruments and techniques, which are sensitive, specific and time-effective. The analytical results he produces are simply miraculous.

17.6.1 Tools and Techniques

The tools and techniques used for the evaluation of evidentiary clues, in general, are applicable to evaluate microtraces also. The only difference is that in some cases they are modified to make them suitable for minute quantities. The important tools and techniques include:

17.6.1.1 Microscopy

The single most important technique in the examination of microtraces is microscopy. It helps to locate the evidence, to isolate it and determine its physical nature, and with modern advances its chemical nature as well, even at sites.

Microscopy helps to study and examine the evidentiary clues in their varied aspects: morphology, size, crystal structure, refractive index (Beckline method) of transparent objects, density (floatation method), even chemical nature by colour reactions or crystal formation.

Indispensable instruments in this category are:

1. Scanning Electron Microscope (SEM)
2. Stereomicroscope
3. Petrographic microscope
4. Polarized light microscope
5. Phase contrast microscopes
6. Fluorescent microscope

These microscopes are proving highly effective in the discrimination and identification of microtraces, especially of synthetic fibres and of other polymers.

Scanning Electron Microscopy (SEM) has revolutionized the examination. It can indicate the morphology in its finest form. With EDX, it can determine the elemental compositions. SEM has drastically changed microtrace analysis complexion:

1. Its very high magnification and unbelievable resolution reveal structural details, which permit discrimination and identification of the tiniest particle, provided the analyst has necessary standard data and experience.
2. It identifies Gun Shot Residues (GSR) through its morphology and chemical composition. It contains small lead balls and lead, barium, antimony. Their presence specifies the GSR.
3. It identifies a shooter through the identification of GSR on the hand the shooter.
4. It is capable of giving both qualitative and quantitative analyses.
5. It is capable of giving even the number and sizes of the particles, with special software.
6. Energy dispersive detectors permit the identification of almost all elements having an atomic number greater than that of fluorine.
7. Crystal detectors analyse wavelengths. Though a cumbersome technique, it provides a quantitative analysis of elements having an atomic number greater than four.

17.6.1.2 Micro-chemical Tests

Theoretically (and to an extent, practically also) micro-chemical tests can identify the chemical nature of the trace evidence. However, in practice, they are on the way out. They may be used now and then for confirming the nature of a particular trace, which has been more or less identified by microscopy or by other physical characteristics. The small amounts and destructive nature of micro-chemical methods inhibit its extensive use. Non-destructive instrumental methods are being used increasingly.

17.6.1.3 X-ray Diffraction

X-ray diffraction technique is not used extensively in our country. However, in competent hands, it can be very useful especially for analysis of structural materials, paint fragments, fertilisers, corrosion products.

In principle, the technique is simple. X-rays are passed through the tiny particle to be analysed. The X-rays are diffracted by the elements in the particle according to their disposition in the crystal. The diffracted patterns are photographed. The circular bands obtained at various distances (element-specific) from the centre. Intensity of bands is directly related to their concentrations. Reference to the standard tables and comparison indicate the identity of the entity.

17.6.1.4 Micro-FTIR Spectroscopy

Fourier Transform Infra Red (FTIR) spectrophotometer has changed the complex of identification of microtraces of organic nature, especially of polymers, synthetic fibres, paints, drugs, plastics. It can analyse even the particles of the order of 20 μm.

The technique has been extended for those organic materials which contain some inorganic materials also — by micro pyrolytic technique, where pyrolyzate organic material is identified by FTIR spectrophotometry and the "ash" left can be identified by microprobe.

Many other techniques like Gas chromatography (TLC, LC, GC), Mass Spectrograhy (MS), Microspectrophotometer (MSP) are also being used infrequently.

Analytical techniques have truly crossed all physical barriers. One can analyse even the tiniest clue material both qualitatively and quantitatively. The outstanding example is the analysis of drugs (or their metabolites) in the hairs of addicts in quantities which surpass imagination (nanograms/picograms!). The instrumentation has reached the zenith and can meet any analytical demand of microtrace analysis adequately, most of the times.

17.6.2 Data Bank

The most important weapon in the hands of the analyst is proper, adequate reference source(s) for the various types of materials so that he can check the findings with them for confirmation.

There are two types of sources:

1. Atlases
2. Museums

The analyst should be aware and have liaison with the data source people. In fact, if the number of such cases is large, the analyst should organise his own reference source.

17.7 INDIVIDUAL MICROTRACES

Anything can leave a microtrace. It is not possible (nor necessary) to discuss all of them in the present works. Here only those microtraces, which are frequently involved in forensics, have been discussed briefly to indicate their potentialities and how they are processed.

Microtraces are often as mixtures of many materials. Whenever possible, the entities are separated with the help of a magnifying lens, (or a stereomicroscope), under proper lighting (shadowless lamp) and a pointed, sharp and stiff tungsten/platinum needle. The individual microtrace, is then, studied in detail.

17.8 PLANT MATERIALS

Plant material microtraces are fragments of wood, bark, leaves, flowers, seeds, pollen, plant fibres, fruit pulp, starches, and crushed leaves, flowers or seeds. The plant microtrace may also be a stain of crushed materials.

The examination starts with microscopic morphological studies. Detailed microscopic examinations, is done after preparing radial, transverse and longitudinal sections of the evidential fragment(s). When microscopy does not help much (stains or crushed or pulped materials), micro-chemical/biological tests are used to ascertain the nature of the trace.

New techniques based on cell materials, on the pattern of DNA profiling, are known. They are waiting for exploration/exploitation. However, DNA technology is costly and time-consuming. Besides plant microtraces are not frequently involved in Forensics. Therefore, it is used only in important cases. A reference to Forest Research Institute, Dehradun is of great help. The Institute has an excellent specimen museum and expertise of very high order, *vis-a-vis* plants and plant products.

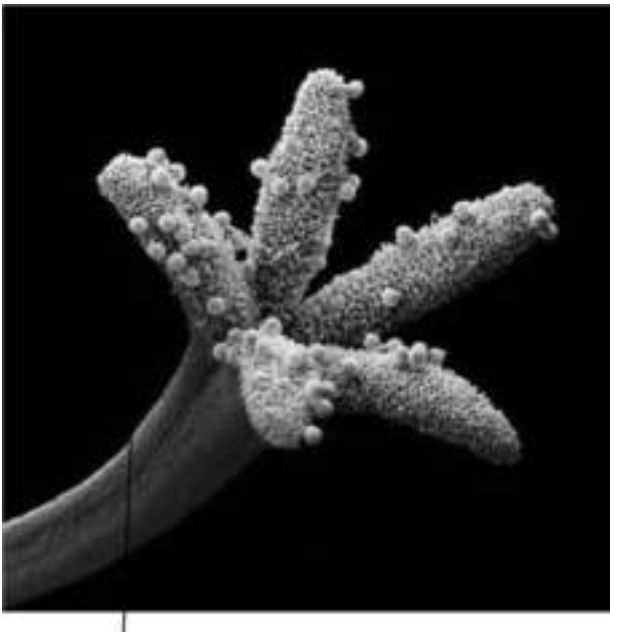

Fig. 17.3
Pollen grains on flower

17.8.1 Wood

Wood as microtrace evidence occurs in the form of sawdust, paper shreds, fillers in polymers, professional dust (of carpenters and workers in furniture-making units, for example). Saw dust is usually from heterogeneous trees. The heterogeneity helps the identification of the source.

It is possible to identify the nature of the wood even from a single particle, from the variations in cell structures. The work is facilitated with a reference library. Computerised data banks have been proving to be a big help in the identification of wood microtraces.

17.8.2 Leaves

Fragments of leaves, as microtraces, are encountered in many situations, for example, cannabis abusers can be identified from the presence of cannabis leaf fragments, on the person or their paraphernalia. Many herbal drugs (powders, residues plant plants) are used as plant poisons. They may be part of the dust picked up from the scene, route(s), site of disposal. They may be part of the explosive debris fallen off the culprit. Or, they may be part of narcotics, particularly of the cannabis or opium family.

The fragments of leaves are often identified from the varying structures, their fibres and colour. Scanning electron microscopy, along with a reference library (data bank) and expertise help. In difficult cases, a plant anatomist and taxonomist should be consulted. Herbaria and botanical gardens are useful sources for standards. In the case of certain plants, specificity of the hair make identification of the material easy, e.g., the horny hair on cannabis leaves permit easy identification of cannabis products.

Fig. 17.4

SEM photograph of cystolic hairs on the leaf of cannabis.

17.8.3 Flowers

Fragments from various parts of the flowers can occur as microtraces in almost all types of cases. They have the advantage in that most of the flowers are seasonal. Thus, they indicate the season when the culprits may have picked up the traces. Though all parts of the flower are important, the pollen grains have proved to be exceptionally useful in forensics.

17.8.4 Pollen grains

Pollen grains are time-/location-specific. They, therefore, indicate when and where the subject has been moving about. If the pollen is of the type transferred by the insects, the scene of

occurrence is also indicated, as the subject must have picked up the pollen from the scene where he had come in physical contact with the flowers. The presence of pollen in adequate quantities (and that of seeds from weeds) has often linked the rapist with the rape site and the victim, in outdoor crime scenes.

> *Examination of crude opium indicated that it had been cultivated in a field which had maize crop, as the opium contained pollen grains of maize. It appeared that the cultivator had planted the opium plants in a field where maize crop was being grown, to conceal the poppy plants. Search of the suspected area revealed the field where the stumps of both the plants (maize and poppy plants) were found. (CH)*

Pollen grains are identified after boiling them with acetic anhydride and sulphuric acid (9:1) and studying the skeleton. The structures of the pollen grain skeletons vary extensively from plant to plant. They are studied through SEM. For definite results, authentic samples of the pollen are required.

Study of pollen grains is called 'Polynology'. It has not been exploited extensively in forensics. But in certain blind murders and in some other cases with rural a background, where there is little else to go by, pollen search, examination and comparison may prove useful.

17.8.5 Seeds

The importance of the identification of seeds can be visualised from this case:

> *A girl alleged rape by an elderly person. She indicated the spot. The investigating officer not only noticed the disturbance and a semen-like stain at the spot, he also saw that the site was infested with a rare type of weed, which had ripened. He collected some seeds from the weed. He sent them for examination to the expert along with the clothes of the suspect and the victim. The expert found corresponding seeds on the clothes of both. The suspect, who had been denying visiting the spot, confessed to the crime. (CH)*

Seeds, as microtraces, are found in a number of crime situations in outdoor crimes. Besides, they are found in dust/mud fallen from the hit and run case and in other vehicular accidents.

Seeds are identified from their morphology. SEM gives the best results. Internal morphology of the seeds and micro-chemical and biological tests for some specific chemical constituents also help. The expert requires reference/specimen seeds for comparison and definite results.

17.8.6 Starches

Starches, from different sources (plants), vary in their structures, which permit the identification of the source. Starches from food material, food/fruits form microtrace evidence in some cases. The source is identifiable in most of the cases. If the starch has hydrolysed, the basic structure goes off and the identification may not be possible.

Microscopy and staining are used to identify starches. Standard samples should be available for comparison. Photomicrographs of starches are poor substitutes for specimen samples.

17.9 DUST

17.9.1 Definition

Dust are fine particles of matter of anything and everything. They come from all types of sources such as soil, dust lifted by weather (an Aeolian process), volcanic eruptions, and pollution. Dust in homes, offices, and other human environments contains small amounts of plant pollen, human and animal hairs, textile fibres, paper fibres, minerals from outdoor soil, human skin cells, burnt meteorite particles, and many other materials which may be found in the local environment.

17.9.2 Nature

The dust is an all-inclusive heterogeneous mixture of materials. It may consist of anything and everything. As already seen, it depends upon the soil of the place, its flora and fauna and the activities of man, animal and beast at the site or suburbs which are being carried out at the place including the weather condition of the place, geographical feature of the land.

Dust vary from place to place, mainly due to its varying constituent materials:

1. **Soils;** Sand, soil, plaster particles, metals, grit, rust, minerals, and diatoms
2. **Plant**; Wood, bark, twigs, starches, sawdust, wood splinters/shavings, leaves, flowers, petals, pollen, plant hairs, fibres, and seeds
3. **Animal, beasts, bird materials;** tiny fragments of feathers, hairs, skin, bone, hoofs, horn, flesh, body fluids, excreta
4. **Human**; hair, body fluids, skin, flesh, bone fragments or their degradation products
5. **Man- made materials**; construction material, glass, paints, polymers, chemicals, food materials, synthetic fibres, plastics, dyes, and sawdust
6. **Unusual entities**; Microorganisms, sub-life
7. **Professional dust**:
   - A coal miner will carry coal dust.
   - A miller will carry flour of various grains being ground at the mill.
   - A textile mill worker will carry fibrous fluff.
   - A farmer carries farm soil and plant materials.
   - A carpenter carries wood dust.
   - A safe breaker carries sawdust, and so on.
   - A dyer carries dye stains

Professional dust have great potential for the identification of unidentified dead bodies of culprits, victims of disaster/road accident, suicide, lost persons. Professional dust has helped to identify many a culprit/victim/dead body.

17.9.3 Importance

Dust is an important microtrace; because of its frequent availability in forensics. They help to establish *corpus delicti*, link the entities involved in crime, identification of men, materials and situations, verification of versions, sequence of events and permit reconstruction of occurrences. Yet, unfortunately, this type of evidence is rarely utilised in India, not even in one per cent of those cases where it should be helpful.

17.9.4 Collection[2]

Collection of dust needs special care and attention as the amounts involved are truly small and are easily contaminated:

1. Fix the location of the evidence.
2. Whenever possible take the item bearing dust to the laboratory for better and contamination-free collection.

2. Detailed methods of collection are given in **section 4. Collection**, above.

3. Use 2 to 5 cm wide adhesive tape for the collection of dust.
4. Vacuuming should be the last resort.

Dust, as associative evidence, is ever-present. It must be utilised.

17.10 SOILS

17.10.1 Nature

Soil is the top surface material of earth. It consists mostly of clay, silt and sand. In addition, it has coal, chalk, minerals, plant fragments, humus, microorganisms and other items.

17.10.2 Importance

Soils have great importance as evidence in a criminal investigation:

1. They are available in most of the cases involving outdoor activities. Unfortunately, the normal investigator is not fully aware of their potentialities as evidence. Hence, he does not utilise them fully. Due to increasing scarcity of the traditional evidence, the soil as evidence might be used more frequently in the coming times.
2. The soils are individualistic due to the variability of their constituents. They differ from place to place. Nature, human beings, animals, beast and vegetation change their identity. Wind or rain may bring/take away fine soil particles, plant materials or other materials. The man throws his discards. Animals, insects and microorganism change the soil continuously. Plant deposit twigs, leaves, seeds, flower petals.

   Soils, like other microtraces, link the criminal, the victim, the scene of the crime, the vehicle, the weapon of offence and other paraphernalia involved in the crime *inter se*. It identifies the scene. It may identify the place from where the person (the culprit, the victim) or the vehicle has come.
3. Soil examinations have provided useful evidence in a variety of cases:
   - *The soil on the shoes of a suspect did not correspond with the soil from the scene or with the soil from his residence. Ultimately, the suspect led the police to the site where he had buried the stolen ornaments. The soil from the place tallied with the soil on the shoes of the suspect. (CH)*
   - *The soil on the clothes of the victim of a rape identified the scene of the crime. Additional evidence at the scene provided the necessary corroboratory evidence to link the culprit with the crime. (CH)*
   - *The soil on the deceased victim was different from the soil where the dead body was found. The finding indicated that it was a fake crime scene. (CH)*
   - *Soil cake dropped by a hit and run vehicle (truck) ultimately linked the vehicle with the scene. (CH)*
   - *Soil on the shoes of the suspect murderer was utilised to find out the possible route (out of three routes), used by the suspect after the murder. Three persons put on similar shoes and walked the routes. The correct route was identified by comparing the soils on the three pairs of the shoes with the one recovered from the shoes of the suspect. (CH)*
   - *The theft of saplings of plants was proved by comparing the soils attached to the roots of the saplings with the soil from where the plants were stolen. (CH)*

- *In a case of murder, the soil sticking to the clothes of the suspect and the soil of the place where the body was found did not tally* inter se. *It was suspected that the scene of crime was elsewhere. The soil sticking to the clothes ultimately helped to locate the correct scene. (CH)*
- *In a case of murder, fresh soil was found in the welt of the shoes of a culprit. It ultimately linked him to the place from where the buried dead body of the victim was recovered. (CH)*

17.10.3 Location/Collection

Soils are found on the shoes, clothes, vehicles, stolen goods, implements, weapons. It may also be found in the hair of the suspect. The amount of available questioned soil varies. Collection, preservation and dispatch follow the usual microtrace handling pattern.[3]

17.10.4 Soil Examination

Soils examination techniques vary tremendously. The amount and the nature of the questioned soil determine the choice of the technique. The general evaluation drill is:

1. **Visual examination**; it indicates the colour, texture and presence/absence of some gross items.
2. **Microscopy**; it is the most useful tool for soil analysis in its varied forms. Stereomicroscope and petrographic microscopes have been extensively utilised in the past and have their utility beyond doubt. They help to identify the individual particles through their morphology, optical properties and observations of chemical reactions on micro scale. The evaluation of soil starts from microscopy.
   - If certain conspicuous particles like those of stones, metals, bone, paper, coal, chalk, minerals, seeds, plant material fragments or seeds are discovered, they are picked up and compared with corresponding particles in the standard sample, separately. The standard larger sample should contain all or most of the particles.
   - The colours of the soils vary tremendously. Non-match of the two samples, under normal conditions, eliminates the possibility of the common sources. The colour of the minerals is sometimes masked by humus. It should be unmasked. Water contents of the samples also affect the colour. It is taken into account. The colours of the soils are also examined after heating the samples to different, but corresponding, temperatures.
   - The comparatively small amount of the samples does not permit the comparison of the particles, through sieving. The particle sizes of soil vary. Special types of measuring microscopes especially SEM are used for this purpose. The sizes of the soil particles commonly found are:

Table 17.2

Soil particle size

a. Clay	up to 2 micron
b. Silt	up to 20 micron
c. Sand	0.2 to 2 mm

3. Kindly see **Section 4. Collection**.

3. **Settling time;** if the sample is large, the material is sieved through sieves of various meshes and the fractions are studied microscopically.

   The questioned and standard samples are centrifuged and the time for settling and layer formation provides the comparison of sizes and the amounts.

4. **Density**; density of a soil sample depends upon the density of its particles. When a soil sample is suspended in a density gradient column, the sample is distributed over a length of the column. The pattern of spread is characteristic of the place. It is not duplicated by a sample taken even from a place quite close to the place of the first sample. The differences increase if the samples are collected from distant places. If, however, samples are collected from the same place and in the same way, they show the identity of the distribution pattern in the gradient tube.

5. **Chemical Analysis**; chemical analysis of soil is a tedious and laborious task. It is seldom attempted. However, paper chromatography for amino acids in soil samples is simple and holds some promise.

6. **Differential Thermal Analysis**

   The complexity of the soil makes this technique ideal for the examination. It is likely to be used on an increasing scale in the coming years.

7. **Micro-organism Analysis**; the identification of micro and macro-biological life in a soil sample is theoretically an attractive technique but the practical work involved has not been streamlined so far.

8. **Scanning Electron Microscopy**; Scanning Electron Microscope is now the tool of choice for the evaluations of soils. It gives not only the sizes of the particles but their number and the chemical composition also. The method has not been exploited fully. The technique offers unlimited opportunities to the soil analyst.

17.11 FIBRES

17.11.1 Importance

Transfer and cross transfers of fibres frequently take place among persons, places and paraphernalia *inter se* through wearing apparel, carpets, upholstery, bedding when they come in contact. Fibres surround us all around. So much so, it is difficult to imagine a person who would not exchange fibres even in his day-to-day contacts. This transfer/cross transfer also takes place in crime situations. The fibrous evidence, therefore, should be available, most of the time, in most of the crime situations, on most of the persons and materials involved. Mutual exchange once established clinches the case against the accused, as it provides the necessary corroboration, especially in cases of offences against the person, to the main evidence.

Fibres are valuable evidence because of large variety. It has been calculated that if six different common fibres (different in colour, sizes, material, treatment or extent of use), have been exchanged, they provide the linkage. The probability of reoccurrence of such exchange, on a conservative estimate, is one in 64×10^6. A similar exchange of eight fibres reduces the probability of reoccurrence to one in 256×10^8. If the fibres are of rare types, they provide a still higher linking probability.

Fibrous evidence is often inconspicuous. It remains unnoticed. The culprit, therefore, does not destroy it. For the same reason the evidence also remains undisturbed. However, all the exchanged fibres do not remain attached to the sub-strata. In fact, most of the fibres are shed off soon. Some, however, resists shedding and even withstand dry cleaning or washing. They provide excellent evidence even after long periods:

In a case of rape- murder, the victim resisted. A scuffle ensued, as was evident from the disturbance at the scene. The investigator was sure that the culprit must have carried fibres from the scene. The culprit was apprehended after months. However, the jacket of the culprit, in spite of dry cleaning, still carried fibres from the sweater of the victim and from the pillow. (CH)

Unfortunately, the fibre evidence is considered weak evidence. The non-professionals think that it offers no individualising features. It is not true. The fibres have numerous discriminating characteristics including the following:

1. Chemical composition
2. Manufacturing process
3. Dimensions
4. Dyes
5. Optical properties
6. Adventitious impurities picked up in the manufacture or while being used (melting, paint smear or other stains)
7. Age-related changes in the fibre material.

The fibre evidence can save innocent suspects:

In a case of burglary the suspect denied entering the house where costly items like jewellery were stolen from a carpeted room. The shoes of the suspect smeared with mud carried about 50 different types of fibres. None of them corresponded to those of the carpet. The mud on the shoes that corresponded with the mud from the club grounds corroborated his alibi *that he was in a particular club at the material time. (CH)*

The new technologies, new and ever-increasing number of materials, more and newer modes of manufacture and ever-increasing sophistication in examination techniques can give near individualistic identity. Besides, cross transfer and variations in transferred fibres can fix the culprit-victim contact. We have no quantitative probability values for all types of fibres. However, it is believed that cross-transfer of two or more fibres of uncommon nature should clinch the contact issue.

17.11.2 Nature

Fibre is defined as a natural or synthetic material that is significantly longer than its width or diameter. There are many types of fibres, including:

17.11.2.1 Plant Fibres

The commonest and important plant fibres, in India, are cotton, flax, hemp, jute and coir. However, there are other fibres obtained from other plants though they may not be common. The latter can also figure in crimes sometimes. Formerly, plant fibres dominated the cloth, clothes and upholstery industry. They are more comfortable to wear. Synthetic fibres are now being used increasingly because of their strength and cost.

17.11.2.2 Animal Fibres

The frequently utilised animal fibres, in India, are wool, mohair, cashmere, angora, feathers (down feathers for pillows, quilts). Camel, goat and other animal hairs have also been utilised.

Animal furs are also used as dress materials and their fur fibres, sometimes, figure in crimes.

17.11.2.3 Natural Silk

Silk is a natural protein (fibroin) fibre, produced by certain insect larvae. They form cocoons. The best-known silk is produced by mulberry silkworm larvae. Several other insects also produced Silk.

The silk fibre has a triangular prism-like structure which allows silk cloth to refract incoming light at different angles, giving scintillation appearance to silk.

In India, in addition to mulberry silk, there are other natural silks also. For example, Assam produces three different types of silk; namely, Muga, Eri and Pat silk; collectively known as Assam silk. Muga is also called the golden silk.

Silk Garments, especially the silk sarees, are the favourite dress of the elite ladies in India.

Silk fibre does come as evidence in some cases.

17.11.2.4 Mineral Fibres

Asbestos, glass and carbon fibres are the most important mineral fibres. They do come up as evidence in forensics.

17.11.2.5 Metal Fibres

Metal fibres are extensively used in textiles and for some other purposes, in India. Gold, Silver, Brass, Aluminium fibres are common. Metal-coated plastic fibres and plastic-coated metallic fibres are also in use. They and their fragments may also form evidentiary clues sometimes.

17.11.2.6 Modified Fibres

Rayons are modified cellulose fibres. Important varieties of the rayon are Acetates, Viscose and Cuprammunium rayons. They are extensively utilised in the textile industry. They have also manufactured fibres but their base is a natural fibres, mostly cotton and wood. Plastic coated natural fibres, like plastic coated coir is also used in mattresses and sofas.

The paper is manufactured from a variety of fibres, natural or synthetic. The disintegrated paper provides fibre evidence.

Naturally occurring proteins have also been used to produce modified fibres. For example, casein fibre is obtained when the alkaline solution of proteins is extruded through the acidic solution.

It is obtained when an alkaline solution of a certain protein is extruded through acidic solutions.

17.11.2.7 Synthetic Fibres

Synthetic fibres dominate the scene and it is becoming more and more dominant. The number of different synthetic fibres is already a legion and the number is increasing with vehemence with the passage of time. There are about 25 varieties. The main types are:

1. Acrylics—a big family
2. Polyamides—numerous nylons
3. Polyesters—varieties are increasing in number.
4. Polyvinyl
5. Fluorocarbons—Teflon
6. Olefins

Other synthetic fibres, which are likely to invade the industry increasingly, are chlorofibres, fluorocarbon and polyurethane elastomers.

In a case of homicide the body of a young woman was found at the edge of a rural road. The autopsy showed injuries typical of those produced by a car hit. Post-mortem examination revealed that she had strangulation marks also. Apparently, she had been run over after being strangled.

The police investigation led to the estranged husband. Debris from under-surface of his car was submitted to the laboratory and was found to include nylon filaments like those composing her panty hose and green woollen fibres like those composing her coat. Human blood was also identified on some of the nylon filaments. The husband was convicted for the murder. (CH)

17.11.3 Evidentiary Clues

Fibres provide the following variety of clue materials:

1. Individual fibres
2. Threads
3. Pieces of cloth
4. Clothing
5. A cord, string, rope or their piece(s)
6. Hairs from different sources
7. Furs.

17.11.3.1 Location

The main sources of fibrous evidence are the clothing, the bedding, vehicular upholstery, carpets, household furnishings, human and animal bodies, skins, furs, fur garments. Fibrous evidence may be sticking to the weapon of offence (sticks, knives, hammers, axes, firearms, and the like). The evidence may be found at the scene, with the culprits, with the victims, on the floors and on the objects at the scene. The search, as in other types of microtraces, should be carried out systematically and thoroughly. The search should be rewarding most of the times as transfers and cross transfers of fibres take place usually.

Location and collection of the fibrous evidence are rather troublesome, being almost 'invisible' against the background substrata. The novice may even miss the bus and lose the evidence. It is, therefore, advisable to send the article suspected to bear the fibrous evidence to the laboratory whenever feasible. Alternatively, the laboratory specialist is called to help in the location/collection of the evidence. If the investigator has to collect the fibres, he should:

1. Fix the location of the evidence through photography, sketching and textual record.
2. Ensure contamination-free collection — use transparent plastic small envelopes. Small fibres are kept in paper folds.
3. Use gadgets — hand magnifier, bright light, UV light, fine-tipped forceps.
4. Collect a small piece sticking to the substrata by scraping with blade or pin, as the situation requires.
5. Use separate packing for each garment. Fibres get easily exchanged and thus get contaminated easily.
6. Ensure extreme cleanliness for containers, storing place, examination table.

17.11.4 Problems

Study and evaluation of the fibre evidence can answer a variety of questions:

1. Has the fibre come from a particular garment, carpet, or any other given source?
2. What is the nature of the fibres? Are they foreign to the scene or the person where they are found? Or, are they part of the background where they have been found?
3. What is the evidentiary value of the given fibre evidence:
   - Definite linkage or de-linkage?
   - High probability?
   - Corroborative evidence?
4. Do the location, nature and pattern of the evidence indicate the sequence of events that may help in the verification of versions or identification of the real or fake nature of the scene?
5. Does the fibre, piece of cloth, string, and rope recovered from the scene match with the corresponding material recovered from the suspect or the victim?

17.11.5 Evaluations

The main evaluation techniques for the fibre evidence follow the general pattern of evaluating the microtraces. However, there may be some specific determinations to be made.

The evaluation involves the following steps:

17.11.5.1 Preliminary Examination

The fibres are examined visually, with a hand magnifier and under a stereomicroscope. The study indicates:

1. The twist of the thread, string, rope, or cord
2. The number of strands
3. The number of thread in the string
4. The number of fibres in each thread
5. The defect in the thread or weave pattern
6. The weft and warp thread counts of the clot.
7. Recovered torn piece of cloth originally formed part of the cloth (mechanical fit!).

17.11.5.2 Microscopic Examination

Microscopic examination is useful to find out:

1. The structure of the fibre
2. The nature of the fibre materials
3. The diameter of the fibre
4. The presence or absence of contamination
5. Colour of the fibre
6. Cross-sectional structure
7. Inclusions, including de-lustring agents

8. Adhering materials
9. Process failure defects
10. Damages, if any
11. Abrasion, wear

17.11.5.3 Use of UV/IR rays

Using ultraviolet rays (for fluorescence) and polarised light (for phase contrast) extends the microscopic examination and provides additional discriminating data.

17.11.5.4 Physical Properties

Physical properties like density, refractive index, melting or softening point and tensile strength give important information about the fibres.

17.11.5.5 Microtomy

A cross-sectional study of fibres reveals structural features that are otherwise difficult to comprehend. The technique is similar to the one employed in the study of hair.

17.11.5.6 Chemical Test

Burning, solvent action and staining techniques are employed for the evaluation of the evidence. Different types of fibres can be distinguished by systematic analytical techniques.

17.11.5.7 Differential Thermal Analysis

Differential Thermal Analysis is a useful technique employed for fibre analysis. Each fibre has a characteristic thermogram, which can help to establish the identity or otherwise of the common source of the questioned and the standard fibres. The technique, however, requires a comparatively large sample of about 25 milligrams and hence not useful in real crime cases where only a small amount of fibre is available.

17.11.5.8 Optical Properties

The following optical properties are useful for fibre identifications:

- Refractive Index
- Birefringence
- Fibre elongation

17.11.5.9 Fluorescence

- Presence or absence of fluorescence
- Colour and intensity of the fluorescence
- The exciting wavelength

17.11.5.10 Colour Comparison

Textile fibres are frequently dyed. The dye provides the following features for discrimination:

- Colour shade
- Fluorescence

- The Chemical nature of the dye
- The action of certain reagents on the dye

The usual process is to compare these features of the dyes of crime and specimen samples *inter se*.

In a case, the evidence sent to the laboratory consisted of a strand of yarn, approximately 1 inch long taken from the fender of the suspect's car. The report returned to the submitting agency identified the questioned yarn as having come from the shirt of the victim. This identification was based on colour sequence, strand length, yarn construction, and fibre type. (CH)

17.11.5.11 Microspectrophotometry

UV-VIS spectra of both the questioned and standard (specimen) exhibits are obtained and compared *inter se*. Correspondence in the two indicates a common source.

17.11.5.12 Infrared spectroscopy

Infrared absorption traces of a substance are individualistic in nature, like fingerprints. If the patterns of absorption of the infrared rays of the crime and the standard sample correspond, a common source is established.

17.11.5.13 Pyrolytic Gas Chromatography (PGC)

In this technique, synthetic fibres are pyrolysed under controlled conditions. The fibre gives degradation products which are characteristic of the material. If the chromatograms of the crime and the standard samples correspond, it indicates a common source of the two.

17.11.5.14 Thin Layer Chromatography (TLC)

Thin layer chromatography is the technique of choice for the identifications and comparisons of the dyes on fibres. It is highly sensitive, specific, rapid and simple. It does not involve costly equipment and can be used in all the laboratories. It is employed extensively for the purpose, all over the world.

17.12 GLASS

17.12.1 Importance

Glass, as an evidentiary clue has great importance because:

1. It occurs in a variety of crimes:
   - **Hit and run cases** and other road accidents.
   - **Burglary cases**; window glass is broken to affect entry/exit.
   - **Vehicles theft;** or stealing from the vehicles
   - **Shooting cases,** through glass windows on passengers sitting/travelling in a vehicle
   - **In brawls** where glass bottles are used as weapons.
   - **Gang wars**

     In a case of theft, a large amount of cash and ornaments was stolen. The police during the investigation found that a glass pan of a window was found broken. It

indicated that perhaps the thieves had entered the house after breaking the windowpane. However, the IO as a matter of routine interrogated the household servants to find if they were the accomplices of the thief. The replies of one of the servants created a suspicion that he was involved in the crime. Was he lone or had he some accomplice?

The IO reasoned that if he was the lone culprit, he would break the glass pane from inside. He sent the glass pieces to the forensic science laboratory. They reported that the glass was broken from inside!

The IO interrogated the suspect again more intensively. He confessed to the crime. The police recovered most of the stolen money/ornaments. (CH)

2. The glass evidence is highly individualistic. The discriminatory factors come from:
   - **Composition**; almost limitless compositional permutations and combinations are possible. One single manufacturer in a western country alone has about 1,00,000 formulations.
   - **Raw materials ingredients**; raw materials come from different areas. They contain varied amounts of ingredients. They create variations in the final composition of the manufactured glass. The raw materials even from the same source are not homogeneous. There are compositional variations from one batch to another.
   - **Trace impurities** vary from place to place and from one batch to another.
   - **The manufacturing processes**; they introduce variations due to high temperature, high viscosity and the corrosive action of the melt.
   - **Imperfect mixing of the raw materials**
   - **Non-uniform cooling of the glass;** it inducts stress in certain parts of the glass.
   - **Trace elemental profiles;** of the impurities in the glass are different in different glass. They individualise the source of the evidentiary glass trace.
3. The evidence is stable: it can be collected and examined even after long time.
4. The evidence often remains unnoticed by the culprit especially when he picks up tiny particles on his clothing or in the welt/soles of his shoes or even on his person (hair and, skin, nail). It can link the culprit with the crime.
5. It is not easily contaminated.

17.12.2 Nature

Glass is an inorganic product of fusion cooled to a solid state, without crystallisation. Ii is also called a *super-cooled liquid*. It contains a variety of oxides, which are categorised as formers and modifier. Some oxides act as both formers and modifiers.

Table 17.3

Formers and Modifiers

Formers	Modifiers	Formers/Modifiers (intermediates)
SiO_2, B_2O_3, GeO_2	Li_2O, Na_2O, K_2O	Al_2O_3, PbO, Sb_2O_3
P_2O_5, V_2O_3, As_2O_3	CaO, MgO, BaO	ZnO, TiO_2, BeO

Chemically, ordinary glass is mostly sodium-calcium-silicate. Heat-resistant glass (e.g., borosil) contains about eighty per cent silica and some boron oxide. Optical glass contains a comparatively larger amount of lead and barium. Coloured glass contains oxides of various metals known to give coloured compounds. Sunglass contains rare earths. The compositions of some of the common types of glass are given in the table below. They are representative only. The exact compositions vary with the various manufacturers.

Table 17.4

Composition of Common Glass

(In Percentages)

Glass	SiO_2	Na_2O	K_2O	CaO	MgO	BaO	B_2O_3	Al_2O_3	PbO
Window	71-73	12-15	–	8-10	1-4	1-4	–	0.5-1.5	–
Plate	71-73	12-14	–	10-12	1-4	–	–	0.5-1.5	–
Bottle	70-74	13-16	–	10-13	–	0.5	–	0-2.5	–
Optical	35	–	7	–	–	–	–	–	58
Borosil	80	4	0.5	–	–	–	13	2	–

Certain materials are specially added to give special effect, especially colour to the glass. The common materials are listed below:

Table 17.5

Elements for Special Effect

Element	Arsenic	Titanium	Chromium	Cobalt	Sulphur + Iron
Effect	De-colourisation	Removes air bubble	Green colour	Blue colour	Brown colour

17.12.3 Location

Glass evidence is available at the scene, with the culprit, with the victim, in the vehicle or *en route*. Minute particles of glass may be so placed that unless proper care is taken the evidence may remain unnoticed and un-utilised. The glass evidence is collected in the same way as the other microtraces or the gross evidence, as the case may be.

The following are searched specially:

1. **Clothes, shoes and hair of the suspect**; tiny glass pieces may be embedded in the soles of the shoes.
2. **The upholstery of the vehicle**
3. **The victim(s)**; if bottles have been used as weapon(s), they are likely to carry glass particles in the wounds on his person and on his clothes.

17.12.4 Evaluation

The following evaluations are done to identify and compare glass:

17.12.4.1 Colour

Colour of the glass may permit easy elimination of a large number of suspect samples of glass.

17.12.4.2 Fluorescence

Fluorescence of glass under ultraviolet rays may sometimes permit identification or elimination of the given samples. Some varieties of glasses contain uranium oxide. They give characteristic fluorescence.

17.12.4.3 Measurement

Thickness, curvature, shape or pattern on the pieces may permit the elimination of a large number of samples.

17.12.4.4 Fusion

Fusion temperature of a glass is useful property to characterise glass. However, it needs larger quantities of the clue material.

17.12.4.5 Specific Gravity

Specific gravity of glass varies not only from one batch to another but it also varies in the same batch, because, in the manufacture of glass it is not possible to mix up the various constituents thoroughly due to high viscosity of the molten mass. Some of the constituents get evaporated from the molten mass near the surface only. Besides, the molten glass dissolves some material from the container. Hence, there are variations in a glass of the same batch even. Specific Gravity along with Refractive Index and Bi-refringence is highly useful to discriminate glass.

Specific gravity is measured by the following techniques:

- **Floatation method;** the glass fragment is placed in liquids of decreasing densities. The liquid in which it neither sinks nor floats has the same density as that of the glass fragment.

  In actual practice, a mixture of a heavier and a lighter liquid is employed. The technique is called the floatation method.

- **Density gradient columns**; they are convenient and sensitive for the determination and comparison of densities of glass.

  Two or more density gradient columns are prepared from two liquids, one heavier and the other lighter than the glass. The columns show a gradual increase in density from top to bottom of the tube.

  Questioned and started glass samples are put in the two similar columns. If they settle down at the same level, the common source of origin is a high probability. Absolute density can be ascertained with the help of calibrated glass beads.

17.12.4.6 Refractive Index

Like density, the refractive index is a very useful property in the identification of glass. Two methods are commonly employed for the determination of refractive index.

- **Immersion method:** the glass fragment is placed in various liquids of varying refractive index and its non-visibility is observed under a microscope. The liquid in which it is indistinguishable has the same refractive index as the glass piece.

  In practice a mixture of two miscible liquids (one with higher and the other with lower refractive index) is used, one of them being added gradually until the glass in the liquid mixture becomes invisible. The measurement of the refractive index of the mixture gives the refractive index of the glass.

- **Hot stage method**: it is a modification of the technique. Here a liquid of higher refractive index is chosen and the glass piece is immersed in it. It is then gradually heated on the hot stage of a microscope. The temperature at which the glass piece becomes invisible is noted. The refractive index of the liquid at that temperature gives the refractive index of the glass piece.

  The refractive indices of the liquid at various temperatures are available in the pre-calibrated graph.

  Usually monochromatic light (sodium light) is used to observe the glass in the liquid under the microscope.

17.12.4.7 Dispersivity

Glass shows different dispersions to different wavelengths. Two wavelengths from the two ends and one from the central region of the visible light spectrum are chosen to study this property.

Differences in refractive indices with different wavelengths give dispersivity of the glass.

17.12.4.8 Spectrographic Analysis

Glass, in addition to common constituents, contains traces of elements that vary not only from batch to batch but they vary even in the same batch. A spectrograph is used to identify the trace elements.

17.12.4.9 Neutron Activation Analysis

Neutron Activation Analysis is a highly sensitive technique. It has not become a routine analytical technique in forensic work because it needs an atomic reactor for the analysis. However, it has great potentialities for identification and estimation of traces of various elements in glass to give trace elemental profiles. Corresponding profiles of the crime and the standard samples indicate a common source.

17.12.4.10 Mechanical Fit

If glass pieces are involved, a mechanical fit is tried. If a mechanical fit is achieved, the identity of the common source is established beyond doubt. Even one millimetre long mechanical fit, of crime and specimen pieces of glass, establishes the common source of origin.

The above techniques provide an excellent mode of analyses. However, the commonly used techniques used in most of the cases are:

1. Dispersion
2. Refractive Index
3. Density

If the above evaluations fail to give satisfactory results, other techniques are used.

Microtraces are invisible and inconspicuous visiting cards of the culprit. They are available in all crimes. They provide dependable evidence most of the times. They are to be used increasingly in the coming times.

Fig. 17.5
Infinite variations in colour Shade

17.12.5 What is paint?

Paints are usually coating materials, mostly in liquid form. But they are also used in aerosol and powder forms. When applied to surfaces, they stick to them. On drying, they harden to form a thin film coating on the surfaces. The thin film performs two main functions. Firstly, it protects the surface from oxidation, corrosion and secondly, it improves the aesthetic values by imparting pleasing colour and texture.

17.12.6 Nature

There is a large variety of paints in the market. Most of the paints contain some pigment or colouring agent; some filler and a solvent (called vehicle) in which they are mixed, suspended or dissolved. The nature and quantities of the pigment, fillers and the vehicles differentiate them. The presence of trace impurities in the paints smears or powdery particles make them individualistic. Quantities involved are small and almost invisible.

The paint is composed of different chemicals substances, natural or synthetic, which are classified into the following basic categories:

- **Vehicles;** they solvents (fluids) and take the paint material to the surface, being painted.
- **Pigments;** they are solid materials added to impart colour to the paints. Some of them are anticorrosion or luminescent materials.
- **Binders;** they are a polymer and hold the paint ingredients together.
- **Fillers;** they are material which provide 'body' to the paints and improve their physical/mechanical/chemical properties.
- **Thinners;** these material are used to lower the viscosity of the paint to the desired extent for better application to the surface in question.
- **Additives;** they are chemical compounds, added in small amounts, to improve the processing of painting (for example wetting agents, film-formation promoters)
- **Hardeners;** they are chemicals, which react with the polymers/resins to hasten the processing of drying/hardening of the applied paint.
- **Catalyst;** they promote/accelerate drying processes of the paints.

17.12.7 Evidentiary clues

Paint, as evidence, is met with mostly in road accidents. One may also come across paint in burglaries and in offence against a person where the struggle has taken place.

17.12.8 Location

The investigating officer locates and collects. He follows the drill and the general instructions given for the trace evidence:

1. Whenever possible, he collects the article bearing the paint smear and sends it to the laboratory.
2. He locates the possible source(s) of the origin of the smear and collects specimen smears and paint from that source.
3. He checks all the likely sources of crime paint from where the culprit/victim/vehicle, could pick up to collect specimens from the places close to those sites.
4. He tries to locate the site from the paint flake has come; if the incrimination paint is in the form of a flake. He safeguards the site for assessing it for later mechanical fit.

17.12.9 Collection

In the collection of paint evidence, the IO sticks to the fundamentals: He:

1. Fixes the site from where the evidence is collected (photographs, sketches, textual description).
2. Ensures its identity/integrity/authenticity and intact chain of passion.
3. Arranges witnesses to the collection.
4. He packs the evidence in pilfer-proof packages.
5. Collects specimen in the corresponding mode to the questioned sample. For example, if the is questioned paint is a streak only, the specimen is from the top layer only. If evidentiary clue is a paint flake He collects similar paint flake(s) from the place, as close to the original site as possible.
6. Safeguard the shape of the paint flake from damage.
7. Seizes the source of the flake, for ultimate linkage.

17.12.10 Evaluations

1. Examination and comparison of evidential/sample paints find out if the paints have come from the common source.
2. In some cases, it is possible to fix a flake in a jigsaw fit at the site of its dislodgement. Such fit establishes the source of origin.
3. In some cases, paint layers help. If there are a number of layers in both the questioned and the sample paint flakes, which correspond in colour, composition, thickness, and sequence, the identity of the common source is established.
4. In other cases, the evaluation and comparison of the following feature help:
    - Colour
    - Density

- Fluorescence
- Solvent action
- Striations on the paints flakes
- Chemical composition and trace elemental profiles

The main mode of identification and comparison of paint are to identify (and quantify) chemical constituents of paints, both of organic and inorganic origin. If there is a preponderance of common components in the disputed and standard samples, common source is indicated.

The common techniques, in use, are:

1. Pyrolytic Gas Chromatography
2. Scanning Electron Microscopy
3. Infra-Red Spectrometry
4. GC-MS

17.12.11 Possibilities

With the data obtained through the above examinations, it is possible to answer the following questions:

1. Does the victim carry paint on his person, clothes, or on the vehicle from the suspected source?
2. Has the disputed (crime) paint (powder, flake, streak, or smear) on the victim/his vehicle/object come from the given source (from the culprit's vehicle, in a hit–and–run case!)?
3. What was the original paint colour on the stolen vehicle?
4. Was the vehicle repainted, recently?
5. Do the wood shavings on the clothes or the shoes of the suspect bear paint? If so, is the paint similar to that of suspected source?
6. Does the paint bear fingerprints, cloth marks or tool marks? Are these marks from the suspected source?
7. Are the paint particles, on the tool of the suspect, from the suspected source?

17.13 FINGERNAIL SCRAPINGS

17.13.1 Importance

In India, fingernail scrapings have not received the attention they deserve in spite of the fact that can provide significant linking or corroboratory evidence especially in offences against persons and scuffles. They are likely to play an important role in the coming times in the face of dwindling traditional evidence.

Fingernails pick up, accumulate and retain debris from the source materials with which they come in close contact. The nails retain the debris for a long time. It is not easily removed as protruding nails protect the materials. Besides, most of the criminals (and the IOs) do not know its importance of fingernail and fail to collect the same.

The fingernail scrapings provide useful information in the following situations:

1. **Murder cases:** If the culprit has smeared his hands in blood, some of it will seep into the fingernails crevices and remains there even after washing hands.

2. **Rape cases:** The rapist often scratches the body parts (face, breast, genitals) of the victim. As a result, the hands are smeared with the body materials, which also get deposited in the fingernail crevices. Likewise, if the victim has resisted the attempts of the rapist, he/she may scratch his body and thus carry the body materials from the culprit in his/her nails crevices.
3. **The culprit** may handle liquids or powders at the scene while committing crimes. These materials in small amounts get lodged in the nail crevices.
4. **Drug addicts:** They handle drug frequently. The drugs seep into their nail crevices unnoticeably and thus tag them as drug addict/peddlers.
5. **Professional dust and stains** are retained in the fingernail crevices. They help to identify criminals and corpses.

17.13.2 Investigator's Role

The investigating officer while collecting the fingernail scrapings observes the following guidelines:

1. He collects the scrapings in separate clean paper folds/bags from different fingers, separately and put them in small plastic bags, after drying
2. He uses a blunt toothpick for scraping
3. He does not pair nails to collect the finger nail evidence
4. He does not use a metallic needle to scrape the debris from the nail crevices.
5. He takes the needed precautions to ensure identity/authenticity/integrity and intact chain of custody of the evidence in the collection process of traces from the fingernails

17.13.3 Possibilities

Fingernail scrapings can provide an answer to the following questions:

1. **Has the culprit scratched the victim (or vice versa)?** The presence of skin, blood and hair, from the scratched person, in the nail scrapings, can inter-link the culprit and the victim.
2. **Was the suspect at the scene?** Certain materials, which he may have handled at the scene, may get into the nail crevices. The nail scrapes may link the suspect with the scene. Absence of the materials does not exclude the suspect.
3. **What was the profession of the subject**? Characteristic nail scrapes may indicate the profession of the subject.
4. **Is the suspect a drug addict/Drug dealer?** The presence of drug traces in the nails scrapings is a fair indicator that the person is involved with drugs. Absence of drug does not prove that the subject is not involved.

17.14 MISCELLANEOUS

17.14.1 Erased Numbers and Designs

Metallic articles (Firearms, Vehicles) of value are often marked with serial numbers, trademarks, and maker's name. The marking is done in a number of ways- casting, stamping, engraving, etching and printing. When a thief steals such a marked item, he mutilates, modifies or removes the numbers/designs/other identifying information to hide the true identity of the entity. If the investigating officer can find out the original numbers and designs, he can establish theft.

Besides, he can trace the original owner. Thus, finding of erased numbers and designs is an important help to the investigating officer.

Erased numbers and designs are also found on articles of wood, plastics. It is possible to resuscitate the numbers and designs in some cases.

The process of restoring number is called resuscitation. All Forensic Laboratories undertake the work. The entity should be sent to the departmental laboratory.

17.14.2 Laundry Marks

Laundrymen put identification marks on the garments sent to them. Usually, the identification marks, the place where the marks are put and the marking media vary with different establishments. The laundry marks, thus, can indicate the laundry or the dry cleaner's shop. The record with the laundry people often indicates the names and addresses of the individuals/ owners who have requisitioned the laundry services. Thus, garments left at the scene of a crime can lead the investigating officer to the criminal.

Sometimes, laundry marks on the clothes of an unidentified corps help to identify the deceased.

The identity of the owner of the stolen garments carrying laundry marks can also be established.

Laundry marks may be visible or invisible. It is always advisable to send the clothes to the laboratory specialist, to find out the correct laundry mark. He can decipher even invisible or faded marks.

In India, no organisations keep records of the laundry marks, perhaps due to ignorance about their utility. It is high time NCRB (National Crime Record Bureau) start compiling the data on the pattern of the National file of laundry marks. FBI, USA.

17.14.3 Jeweller's Marks

Jewellers and watchmakers of repute put mark on the jewellery or watches they sell or repair. The marks are in the form of tiny engravings, which can be seen only through a magnifying lens. A jeweler or watchmaker would, ordinarily, identify his mark and may indicate the customer.

17.14.4 Microorganism

Microorganisms are microscopic life invisible to the naked eyes. It grows profusely on organic matter, under congenial environment. Their nature depends upon the sub-strata, the availability of air, light, humidity and temperature. They differ widely even in adjoining areas. They form useful clues. The culprit may leave or pick them up without being aware of them.

Microorganism evidence can prove extremely useful where traces of organic matter (they contain microorganism) have been exchanged by the culprit, his transport or his weapon of offence, with the victim, the scene or the surrounding articles *inter se*. They can sometimes provide decisive evidence to link the criminal with the crime.

17.14.5 Tobacco

Smoking is a widespread habit. Thus, cigar, cigarettes, bidis, their stubs, ash or tobacco sometimes figure as evidentiary clues. In addition, saliva on the stubs and burnt matchsticks at the scene are also important clues when the criminal had smoked at the crime scene and left ash, stubs or matchstick at the scene. The traces of the pipe tobacco, snuff, Zarda (chewing tobacco) left at the crime scene can, likewise, and be an important evidentiary clue.

Some criminals smoke Cannabis Ganja or Hashish in cigarettes alone or mixed with tobacco. The residuals of the smoked material not only help to identify the criminal but they also indicate that the criminal is a drug addict. The latter is prohibited drugs. The IO process the evidence.

The evaluation of tobacco evidence can answer the following questions:

1. Is the crime tobacco sample similar to the one recovered from the culprit?
2. Is the crime matchstick from the matchbook of the suspect?
3. Are the cigarette/bidi stubs/wrapper found at the scene of the same brand as the suspect smoke?
4. Is the cigarette stub, recovered from the scene, similar to the one seized from the suspect?
5. Is the **spittle** found at the scene of the suspect?
6. Is the tobacco ash at the scene from the tobacco of the suspect?
7. Do the cigarettes seized from the suspect contain cannabis or its products?
8. What is the source of origin of the cannabis sized from the suspect?
9. Is the saliva on the stubs of the cigar/cigarette/bidi of the suspect?

MICRO EVIDENCE GALORE

(A classic example of trace evidence)

In a murder case of a female the clothes of the culprit and the orange blanket recovered from him were examined for trace evidence. 30 categories of trace evidence, including hair, washed sand, white and green paint chips; charcoal, plaster, wood chips and sawdust were found and introduced in the court. These fragments of wood chips, paint and fibers were linked to culprit's 25 separate items or locations, including her body, her clothing, workshop, and the blue pickup....

The trace evidence: hair, fibers, metal fragments, paint chips, wood chips, charcoal, and plaster were analyzed. The blood was typed using electrophoresis. The presence of seminal fluid was detected using an acid phosphatase test. Hair and fiber comparisons were done with a comparison microscope. Paint chips and metal fragments were tested with infrared spectroscopy, x-ray fluorescent spectroscopy and a micro spectrophotometer

,.

The trace evidence linked the culprit to the crime and brought him the highest punishment. (CH)

18.9.2 Hair and Article 20(3) of the Constitution 1174
18.9.3 Hair Evidence Essential 1177

Fig. 18.1

18.1 NATURE

Hairs grow on most of the limbs of human beings and animals. Mammalian species (those who suckle their young ones) have two types of hair:

1. Long and stiff hair, and
2. Fine fuzzy (woolly) hair

Hair growth starts from the hair centres called follicles. They are fine rods in shape. They may or may not have fine tips. Some hair having fine tips in the start later acquires the diameter of the main part of the hair.

Hair grows to certain lengths, and then they fall off unless they are clipped/cut. New hair may replace the fallen ones. The head and beard hair grows about 0.4 mm per day. The growth rate of hair from other parts of the body is less.

Chemically hair is made of proteins, mostly of Keratin. Hair pigments usually consist of melanin proteins. Other compounds in the hair are uric acid, cholesterol, vitamins. Some elements like arsenic, lead, iron, and silicon are also present in the hair. These elements form the basis for the Neutron Activation Analysis of hair. Hairs help to detect Chronic Lead/ Arsenic.

External contamination of hair with oily substances, dust, and dirt is common.

Morphologically, a hair consists of root, shaft and tip, which have characteristic shapes and structures. Pigment distribution and the presence of air bubbles (vacuoles) in the hair give additional points for characterisation.

Fig. 18.2
Normal root of hair

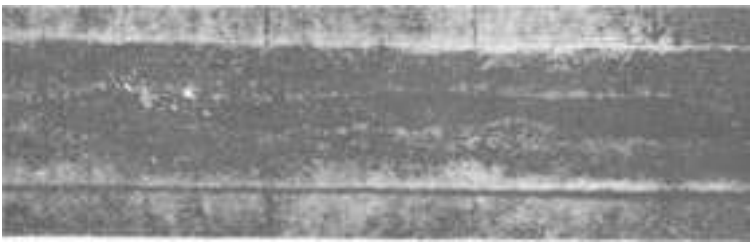

Fig. 18.3
Usual structure of human hair
1. Medulla. 2. Cortex 3. Cuticles 4. Pigment

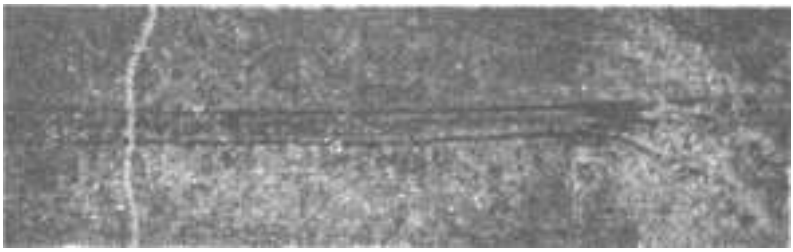

Fig. 18.4
Frayed uncut tip of a human hair

The structure of hair is characteristic in another way. It has three parts: the central part (called medulla), the outer part (called cuticle), and the part in between the two parts (called cortex). The nature of medulla and its diameter concerning the total diameter of the hair are highly characteristic and often indicate the species of the source of the hair. Further, the structure of cuticles, like the scales of a fish or shingles of a roof, is also characteristic of the origin. Physical properties of hair like refractive index, birefringence, and the density differ not only from species to species but they also vary from one individual to another.

A human being sheds about ten hairs a day. The falling rate increases under emotional stress, like that in serious crime situations of rape or murder.

The hair undergoes changes. These changes are conditioned by food intake, habits, climatic conditions, environment, emotions, and age. External treatment of hair: bleaching, dyeing, cutting, and combing also affect.

18.2 IMPORTANCE

Mutual transfer of hair, due to contact, is a classic example of Locard's principle of exchange of traces. Hair, if properly searched, are found in most of the criminal cases. It is one of the earliest types of physical evidence, which was considered/collected/evaluated and utilised in forensics. Individualisation of the hair, *vis-a-vis* its source, had been, however, eluding the scientist up until recently. The advent of DNA profiling has changed the scenario completely. Nuclear DNA (nDNA), available in the live roots of the hair, can individualise the hair owner decisively. Mitochondrial DNA (mDNA or mtDNA) links the individual with maternal relatives.

> *In a case, a young man was standing in his front yard talking to his friends when a car swerved off the road, struck the young man, and killed him. From the description given by the victim's friends, the police seized a suspect car with a damaged fender and broken head light. The police sent the fender, pieces of the head light, the victim's clothing and hair samples to the Forensic Science laboratory. The evidence found included:*
>
> 1. ***A fabric impression on the fender;*** *It was consistent with test impression of the victim's trousers.*
> 2. ***Numerous fibres;*** *corresponding to the victim's trouser, were found embedded in the paint in the area of the fabric impression.*
> 3. ***Several head hair****, microscopically matching with the victim's head hair, was found wedged under the metal trim on the fender.*
> 4. ***Particles of paints*** *like that on the fender and glass particles consistent with headlight glass from the car were recovered from the victim's clothing.*
>
> *Faced with the evidence, the defendant entered a plea of guilty. (CH)*

The identification of hair provided mainly corroboratory evidence, until recently. In some cases, however, exclusion of some suspects was possible from the examination/comparison of

the questioned/standard specimen hair. Only in rare cases, the presence of some individual dye, contamination, some extraordinary defect or disease in the hair could permit individualization of the source. The new technologies have now changed the scenario. Hair can provide the definite linkage of the hair with its source, making hair an important piece of physical evidence. It helps to:

1. Establish the presence of culprit(s)/victim at the crime scene/in the crime vehicle.
2. Establish contact of the culprit with the victim/crime scene from the transference/exchange of hair.
3. Show the route of ingress/egress if some strands of hair are retained at the points of entry/exit.
4. Identify the weapon of offence if a hair is found sticking to the weapon.
5. Link the vehicle used in the commission of a crime with the culprit/victim.
6. Establish the ownership of the articles left at the scene.
7. Detect slow poisoning and determine the nature, quantity and the period over which the poison had been administered.
8. Identify alcoholics.
9. Identify the drug addict and the drug he has consumed.

In the case of Napoleon' death, the cause of death was found to be slow Arsenic poisoning. His hair contained 14 times the normal quantity of the poison. The nature and quantity of the poison was determined after about 140 years, from the analysis of his hair. (CH)

Hair evidence is available in many crimes. Every human being sheds hair, normally about 10 hairs a day. The falling rate increases under emotional stress, like that in serious crime situations of rape or murder. The hairs are, therefore, likely to fall at the scene. They provide an important link in murders, sexual assaults, road accidents, rapes, abortions, bestiality, housebreaking, maiming, poaching, worrying and thefts of furs and animals. Identification of hair through DNA profiling provides definite acceptable identification evidence.

In an interesting case, a culprit stabbed a person at a bus stand, just before boarded a running bus. He placed the knife on the bus seat and got down at the next bus stop. The police recovered the weapon from the seat. They found that the knife was smeared with blood and there was some hair sticking to it. The blood matched with that of the victim and the hair matched with the hair of the gloves of the suspect. The hair evidence linked the criminal with the victim. (CH)

The hair is almost invisible. It goes unnoticed many times. The culprit does not bother about it. The investigating officer should locate/collect and use it in his investigations.

18.3 PROBLEMS/POSSIBILITIES

The evaluation of hair evidence provides answers to many questions including the following:

1. Is the given fibre a hair?
2. Is the hair of human or of animal origin?
3. Does the hair come from a male or a female?
4. From which part of the body has the hair in question come?
5. What is the age of the individual to whom the hair belongs?
6. Do the given two sets of hair come from the common source?
7. What are the species of animal to which the hair in question belong?

8. Was the questioned haircut, fallen or pulled out?
9. Has the hair been dyed or bleached? If so, can the dye be identified?
10. Is the hair of the subject cut, if so, when were they cut last?
11. Do the chemical tests of hair indicate chronic poisoning?
12. Does the hair contain traces of drugs or their metabolites?
13. How long has he been taking the drug?
14 . What is the nature of the drug?
15. Is the hair contaminated? If so, what is the nature of the contaminant?
16. Is the hair suitable for microscopic comparison?
17. Is the hair suitable for DNA analysis?
18. Is the hair (strand of hair) characteristic of a certain racial group?
19. Are the hair damaged by the weapon of offence or fall?
20. Does the given hair suffer from disease?
21. Are the hairs from one or more than one person?

In a murder case, it was alleged that certain hair found in the hand of the deceased were pulled out from the culprit in the struggle. When the hair was examined, no root could be discovered. Instead, they bore cut marks. It was opined that the hair has not been pulled out as alleged. (CH)

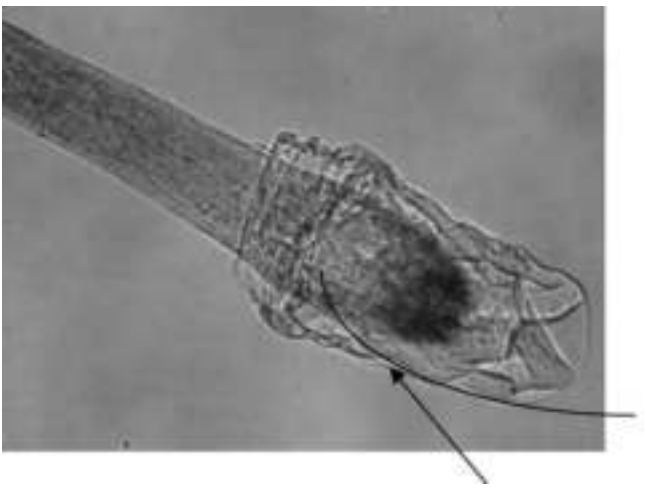

Fig. 18.5
Hair with root

18.4 LOCATION

The location of hair evidence is a difficult task because of their dimensions, quantity and colour. The search is tedious and time consuming. A strong torchlight and a magnifying glass prove handy.

The following are the usual sources of the hair evidence. They are thoroughly searched:

18.4.1 Scene of Occurrence

The whole scene of occurrence is thoroughly searched for hair. Particular attention is paid to:

1. the furniture where the criminal might have rested;
2. the bed where he might have lain,
3. the carpet where some hair might have fallen in the scuffle,
4. the draperies where the culprit might have wiped his hands and face,
5. the discarded pieces of cloth, garment or paper,
6. the articles he might have handled in the commission of a crime such as safe, wardrobes, trunks and suitcases,
7. the culprit might have combed or brushed his hair at the house of the victim. The comb or the brush would carry hair evidence.

The culprit might have abandoned some articles at the scene such as headgear, gloves, and the weapon of offence, shoes, clothing, and the like. They are likely to carry hair evidence.

18.4.2 Culprit and Victim

The culprit and the victim exchange hair in many situations:

1. **Scuffle;** the victim might have grappled with the culprit and come in close contact with him in some other way. They, thus, often exchange hair. The victim may carry hair in her/his hand.
2. **Sexual assaults;** in sexual assaults/acts, the culprit and the victim are likely to exchange hair. They may be on his or her sexual parts or clothes.
3. **Fights;** if the victim has hit the accused with shoes or something else the same may carry hair. If any of the combatants had struck/pushed the head violently against a hard surface the head of the other, hair may be deposited at the struck site.

18.4.3 Vehicles

If a vehicle has been used to carry the victim, the victim is likely to leave hair in the vehicle. Likewise, if the culprit has used a vehicle to get away from or to reach the scene, he is likely to leave hair in the vehicle.

If the vehicle is the crime scene itself (rape, assault, murder) the vehicle is likely to carry a rich harvest of hair.

18.4.4 Weapon of Offence

If a weapon like a sword, stick or stone has been used to attack a victim, the weapon is likely to carry hair from the site which has been struck. The hair is often found sticking to the weapon in such cases.

18.4.5 Other Sources

Other likely sources for hair evidence are:

- Hiding places of the culprits
- Bathrooms, if the subject has washed his face/head/hands
- Disposal site of the discarded clothes; the clothes are likely to carry hair

18.5 COLLECTION

Collection of hair involves collection of incriminating hair and sample hair.

18.5.1 Crime (incriminating) Hair

As already mentioned, the incriminating hair is found in a variety of sites/situations. They are minute objects, not easily visible. Bright light and a hand magnifier are used for location and collection. Hairs, collected from different places, are put in separate envelopes. The place of collection and identification data is put thereon. The envelopes for one case, are then enclosed in bigger envelopes and sealed.

The collection methods are:

1. **Hand picking;** the hair is picked up with hands, placed in a paper fold, which carries identification data. The paper fold is then placed in paper/plastic envelope. Some IOs record the identification data on the envelope.
2. **Tweezers picking;** the hair found attached to immovable articles are picked up with tweezers and processed as in (1). In hand and tweezers picking infrared or laser are sometimes used to enhance the ability to the visibility of the hair.
3. **Article collection;** if an article like clothing or weapon of offence is suspected to carry hair, the article itself is placed in a clean envelope and sent to the laboratory.
4. **Brushing;** cloth objects like garments, bedding, upholstery, **are brushed on to a white paper sheet/evidence examination table and the dislodged micro traces are examined and hair is picked up**.
5. **Combing;** it is used to collect cross-transferred hair in close contact, especially to collect pubic hair in sexual offences. Pubic hair areas of both the suspect (culprit) and the victim are combed to comb out the loose transferred hair.
6. **Tape lifting;** the use of adhesive tape to lift hair from suspected articles/entities is often convenient. Furniture, beds, and clothes can be taped easily. A convenient length of tape is unfolded and pressed against the suspected surface. The tape picks up hair talon with other loose traces (fibres, dust, and debris). The material lifted on the tape is protected by sandwiching it by folding fresh tape over the used tape.

   Sheet or square lifters are also used in place of lifting tape.

   Stereomicroscopic examination of the tape indicates the location of hair. It is recovered from the tape with a drop of xylene, which dissolves the adhesive and the hair is freed. It is picked up with tweezers. There is little chance of losing the hair using this technique.

   The tape fails to lift hair (and other evidence) when hair is lodged in some crevice (or covered by some material) and it does not come in contact with the tape.
7. **Vacuuming;** it is a road roller technique to collect hair (and other such evidence) from large areas like the inside of a car, furniture or floor is to be searched for hair. The vacuum cleaner is modified/adapted for the collection of hair (and dust, dirt and the like). Microtraces containing hair from different items and places is collected separately by using different filter discs for different areas. They are kept in the folds of a paper and properly labelled. Or, they are kept in transparent petri dishes in laboratories. The plastic container of suitable size can be used for preservation of the evidence.

The technique is useful in sexual offences committed in cars, on carpeted floors, on sofas or in beds; or, in those cases where a large area is involved in the struggle.

8. **Solvent action;** if the hair is found stuck in mud, blood, paint or semen stains, they are taken out after loosening them by suitable solvent action.

18.5.2 Standard Sample Hair

Sample hair is collected from the victim, the accused, and anyone who may have left hair at the crime scene, for comparison purposes. About 25-specimen (minimum) hair from each source is adequate for comparison. However, it is better to send about 100 hairs from each source, if available.

The collection is done in the following ways:

18.5.3 Combing or Brushing

Combing or brushing is done with a stiff brush; it is the best way to collect the sample hair of a person. Representative samples from various parts of the body (crown, temple, nape, eyebrows, eyelashes, moustaches, beard, sexual, and other parts) are collected and packed separately. Combing or brushing gives hair of all types, such as hair with roots, broken hair, and hair ready to fall. They are also of all shades and have varying characteristics. They are usually the best representative hair.

18.5.4 Pulling

Pulled out hair is the best sample hair. Samples from animals and dead persons are invariably pulled out. Some living persons may not allow pulling out their hair.

Pulled out hair sample is necessary, where the damaging hair is allegedly pulled out. When the number of hair being pulled out is only one or two, the pulling out process does not hurt much.

18.5.5 Clipping

Collection of hair sample by clipping is the least satisfactory method and should be adopted only when other methods cannot be applied or fail. The hair is clipped as close as possible to the skin.

18.5.6 Precautions

In addition to observing the usual precautions in handling microtraces, the following specific precautions pertaining to the collection of hair are observed:

1. The investigating officer (IO) does not clean the collected hair. He forwards them to the laboratory in the same condition (the original condition) in which he seized the hair. However, if they are wet, smeared with wet blood, semen or other fluids, they are dried before packing.
2. The IO sends all the collected incriminating hair.
3. He invariably collects sample hair of the victim in fatal/non-fatal cases from the likely source on the body.
4. He invariably collects sample hair from the suspect and the victim in rape cases.
5. He specifies the site of origin of the hair samples collected from various parts of the body on the paper/envelope used for collection.

He collects about twenty-five (preferably one hundred) sample hair whenever possible.

18.6 EVALUATIONS

The hair is examined visually and microscopically. Microtomy is used for cross-sectional studies. Appropriate instruments are used to study physical properties: density, refractive index, and birefringence. Neutron activation analysis is helpful in the detection of elemental traces. Briefly, the evaluation methods are:

18.6.1 Visual Examination

Visual examination reveals the colour, length, and general conditions of the hair. It may give an idea of whether the hair has been dyed or not. It also indicates the presence or absence of contaminants and their nature.

Hand magnifier and stereomicroscope extend/supplement/improve the visual examination. They permit a better appreciation of the colour and contaminants of the hair.

18.6.2 Microscopy

The various microscopes used in the study of hair are:

1. Stereomicroscope
2. Compound microscope
3. Phase contrast microscope
4. Comparison Microscope
5. Scanning Electron Microscope (SEM)

The stereomicroscope is used for a preliminary examination of the hair without cleaning or mounting them. It reveals their colour, contamination, and character, whether they are curly, wavy, soft or coarse, whether the ends are frayed or have tips or whether roots are present or not. It is possible to say whether the hairs have been pulled out, cut or fallen. Pulled out hair have live **"bulbs"** and signs of stretching near the bulb. In fallen hair, the root bulbs are emaciated (shrunken).

The detailed microscopic examination of hair is done after cleaning them in the alcohol-ether mixture (or acetone). They are mounted in Canada balsam on a microscopic slide and examined under magnification (400 X). The examination reveals:

1. **Actual colour of the hair;** the contamination, which may be masking the real colour of the hair, is removed in the cleaning process.
2. **Dying/bleaching treatment;** it is the colour of the main shaft with the original colour, found near the root end. This portion bearing the original colour of hair may be long or short depending upon the period elapsed between the dyeing or bleaching and the collection from the head or shedding of the hair.
3. **The body part from which the hair originated;** the head hair is like rods, whereas the hair from eyebrows or eyelashes has pointed tips. The beard hair is somewhat flattened
4. **The morphology of the hair;** it indicates the presence or absence and nature of the medulla and the pigmentation pattern.

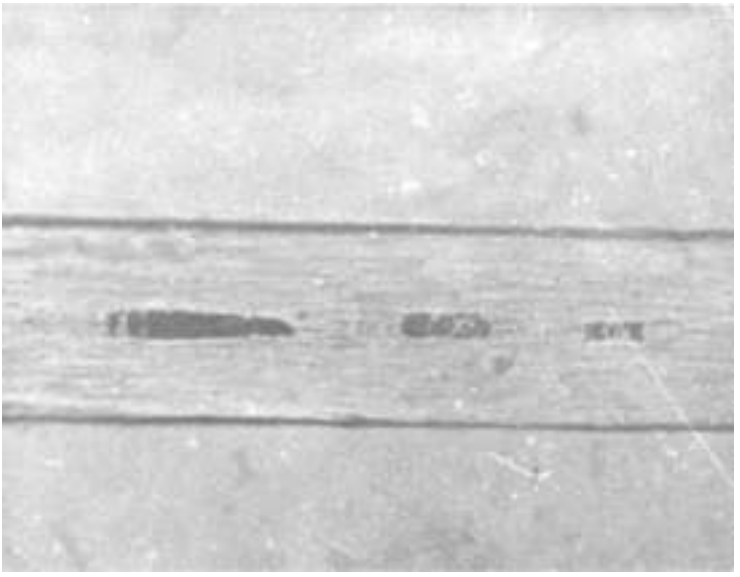

Fig. 18.6
Fragmentary medulla

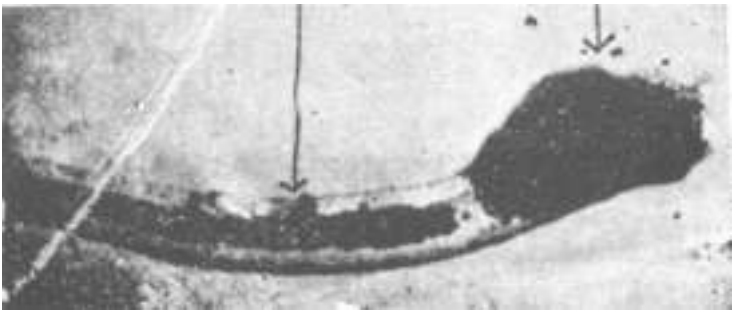

Fig. 18.7
Bending and other change in hair on heating and burning

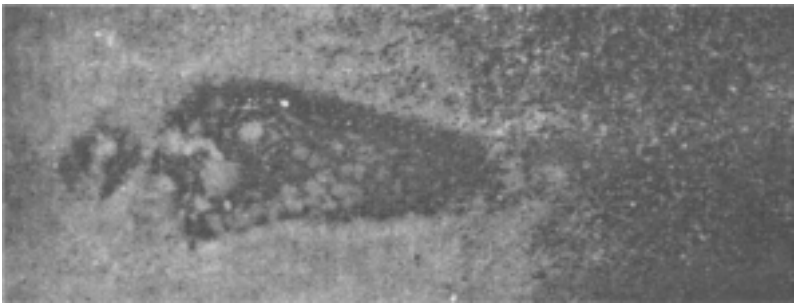

Fig. 18.8
Changes in scale structure of partially burnt hair

5. **The Medullary Index;** the ratio of diameters of the medulla and of the hair, measured at the thickest point, is known as *Medullary Index*. It indicates the species of origin. The medullary index of the human hair is commonly less than 0.3 and in animals; generally, it is more than 0.5.

   The Medullary index varies somewhat in male and female hair and in the hair from different parts of the body. Ordinarily, the medullary index is greater in the woman when hair from the other parts of the body is compared. The male beard hair has greater medullary index than hair from other parts.

   The Medulla may be continuous, fragmentary, or it may be absent in human beings. Hair pigment may mask it sometimes. Bleaching of the hair makes it visible.

6. **Pigment distribution;** it is helpful in the study of species and in the identification of hair of an individual. It is often an important characteristic and permits the elimination of certain suspected sources of hair.

7. **The roots and the ends;** the roots reveal whether the hair has been cut, pulled out, or fallen. The ends reveal whether the hairs have been cut and if so when were they last cut. Freshly cut tips have sharp cut ends/edges. The tips (hair ends) become round over time.

   The possible nature of weapon with which the hair was severed is also revealed at times by the severed edges of the ends. With blunt weapons, the cut end is found frayed and irregular. With sharp edged instruments, the cut ends have sharp edges.

8. **Deformity/disease in the hair**

9. **Vacuoles;** they give characteristic formations in certain species, which are useful in their identifications. They are also known as air bubbles.

10. **Special treatment;** it is revealed by the changes in the hair.

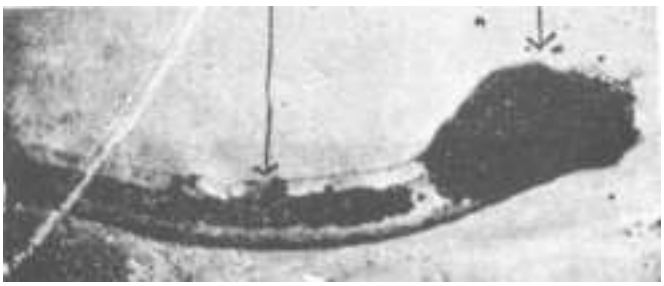

Fig. 18.9
Bending and other change in hair on heating and burning

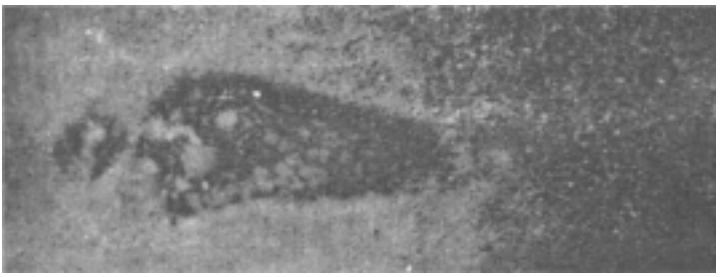

Fig. 18.10
Changes in scale structure of partially burnt hair

18.6.3 Microtomy

A microtome is used to create cross-sections of hair. Clean hair is embedded in hard wax, plastics or flesh. It is sliced into thin disks/circles. The slices are fixed in Canada balsam on a microscope slide, the embedding material removed with a suitable solvent, and the cross-sectional structure of the hair is studied.

Microtomy is helpful in the microscopic study of the cross-section of the hair to determine pigment distribution, medullary shape and medullary index of the hair. In human hair, the pigment is found concentrated near the periphery of the cortex close to cuticles while in animals, pigment concentrations are near the medulla and in the cortex. Cross sectioning also, facilitates the proper study of the shape of the hair and relative sizes of the hair parts: medulla, cortex and the cuticle.

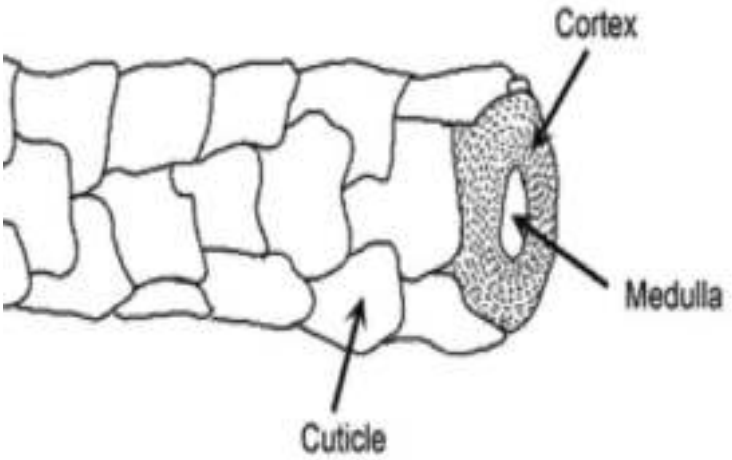

Fig. 18.11
Schematic Cross sectional structure of human hair

18.6.4 Scale Count

The cuticle scales of hair are difficult to study directly under a microscope. The casts of the hair are, therefore, prepared on plastic sheets or in clear fingernail polish. The hair being cast is placed on a plastic sheet slightly stretched, covered with a glass slide and evenly pressed with a weight. It is then warmed with a table (or an infrared) lamp for a suitable length of time. It is cooled. The pattern of the scales is imprinted on the plastic sheet. If the nail polish is used, it is spread over a slide and the hair is fixed over it when it is still wet. When the nail polish has hardened, the hair is removed. The scale pattern is printed in the nail polish. The number of scales per unit length and their shapes and pattern varies with different species and individuals. They, therefore, help to identify the source of the hair.

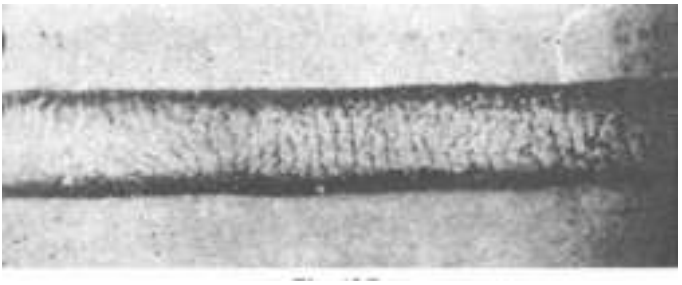

Fig. 18.12
Scales of human hair

18.6.5 Density

Density is an important physical property of hair. Density gradient tube method is used to study and compared the density of hair (and other microtraces). The question and sample hair are placed in the columns of two similarly prepared gradient tubes and allowed to settle. They settle at the levels where the densities of the hair correspond to the liquid mixtures. If the hair settles at the same height in the two columns, a common source is indicated.

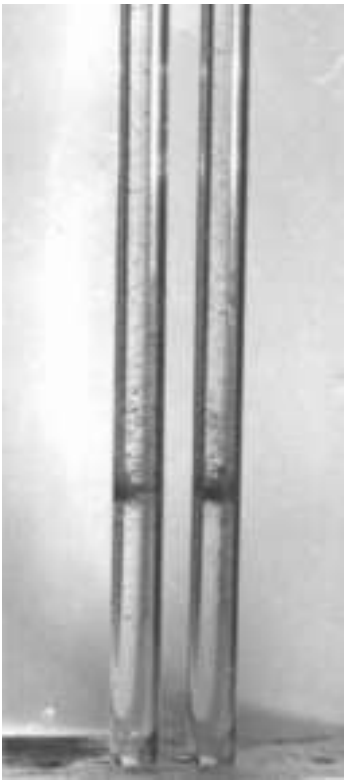

Fig. 18.13
Comparison of densities of incriminating hair and specimen obtained from the suspect

Table 18.1

Human Head Hair Features

1.	Length	Indefinite. It can be short, in millimetre to about 2 metres (in exceptional cases only). Female keep long hair in India.
2.	Diameter	It is 20 to 100 μm. It varies with various individuals.
3.	Colour	Black, Brown, Grey, White.
4.	Tip	Uncut will be tapered, freshly cut have sharp edges, which become increasing rounded with passage of time. The edges may also be frayed and splintered.
5.	Roots	Stretched in pulled hair, round in recently fallen hair, follicular.
6.	Medulla	Continuous, discontinuous fragmentary, absent, invisible.
7.	Cortex	Healthy, damaged, brittle, fibrous, air bubbles present or absent.
8.	Pigment	Distribution of pigment, massive, dense, concentrated at places, size of granules, decolourised or not. Greying of hair.
9.	Cuticles	Thickness, number of layers, scale count.
10.	Scales	Prominent, smooth, serrated, flattened.
11.	Relative densities	Relative densities (specific gravity) inhuman hair varies from 1.3 to 1.4
12.	Miscellaneous	Curly, Wavy, Kinky, Straight, Diseased, Any defect.

Notes:

1. The hair roots with live roots are now being utilised to identify the owner of the hair via nuclear DNA profiling.
2. The hair shaft is being utilised to identify the owner of the hair via mitochondrial DNA profiling.

18.6.6 Refractive Index

Refractive index of hair is determined by Backline method. There are minor variations in the refractive indices of hair of the same individual; the variations are ignored statistically.

Refractive index of hair also gives some idea about the age and sex of the source of origin.

18.6.7 Birefringence

The phenomenon of deviation of light passing through some transparent materials, differently at different angles is called birefringence. The deviations are characteristic of the materials. The hair shows the phenomenon but due to inconsistency in the deviations of different hair of the same person, it has not been used to any appreciable extent to identify or individualise hair.

Other properties such as elasticity, tensile strength, and elongation under stress have been studied in the textile industry. They can be adopted in the evaluation of hair evidence in the criminal investigation.

18.6.8 Neutron Activation Analysis

Many substances, including hair, when bombarded with neutrons in an atomic reactor become radioactive. The induced radioactivity is highly specific of the elements present and can be used

to identify them quantitatively and qualitatively. The technique can determine these elements in very small quantities, which defy analysis with conventional chemical and physical methods.

Carbon, hydrogen, oxygen and nitrogen elements form over 95% of the bulk of the biological samples. They do not interfere in the determination of other trace elements in biological materials in this technique. In the initial stages of hair analysis by this technique, it was hoped that individualisation of hair is within reach. But extended work in the field showed variations in the hair composition of the same individual at the same time and at different times due to diet, climate, contamination, and diseases.

A quantitative and qualitative examination of the element such as arsenic, iron, lead, and silicon, which are present in hair, permit the identification of the possible common source of hair because the composition varies from one individual to another. It does not lead to the individualisation of the person.

The technique is simple in principle. The hair, under examination, is exposed to neutron bombardment. The trace elements in the hair become radioactive. Gamma-rays-spectrometry gives qualitative and quantitative analyses. Comparison of the analyses of the questioned and the standard samples indicates the possible common/different source.

The technique requires an atomic reactor and, therefore, it has not become a routine technique so far in forensics.

18.6.9 Scanning Electron Microscopy

Scanning electron microscopy is playing an increasingly important part in the evaluation of hair structures. The instrument has been utilised particularly for the study of cuticles/scale structures. They are studied with the instrument in both ways, direct or after preparing the casts of the hair.

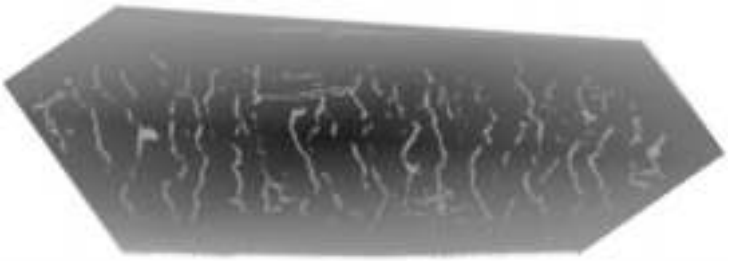

Fig. 18.14
SEM view of scales on human hair

18.7 SPECIFIC PROBLEMS

18.7.1 Species

The species of the source of hair can be identified from morphology, nature of medulla, cortex, cuticle, and pigment distribution. Extensive experience and compiled reference data are needed for such identifications.

18.7.2 Racial Identification

With the intermarriages among the persons of different races, the problem of identification of the racial origin of the person from the hair is becoming increasingly difficult. However, hair studies do provide some guidance.

The main features, which distinguish the hair of the different races, are given below.

Table 18.2

Racial Features of Head Hair

Race	Colour	Diameter (mm)	Special (features)	Section	Cuticle
Caucasoid	even black	70-100	Curly	oval	medium
Mongoloid	dense black clusters	90-120	Straight	round	thick
Negroid	dense auburn	60-90	Straight, wavy (sometime)	flat	nil

18.7.3 DNA Profiling

If the skin, flesh or blood was sticking to the hair root, definite identification of the source person of the hair is made through *n*DNA profiling. However, hair in criminal situations is usually fallen hair. They do not carry sufficient body cell materials and thus fail to provide the *n*DNA profiling. However, the discovery of mitochondrial DNA (*mt*DNA) has changed the scenario. Now, hair can be linked to an individual through mitochondrial DNA though to a limited extent. Mitochondrial DNA is inherited from the mother only. Other maternal relatives also carry the *mt*DNA. Therefore, it suffers from individual specificity. In *mt*DNA, the success rate is about 80%. Both shaft and roots can be used for the extraction and amplification of *mt*DNA and a final comparison of the *mt*DNA profiles. Usually, it is used in conjunction with microscopic examination.

If nuclear material is not available *for n*DNA analysis, *mt*DNA analysis is done in all cases in which identification of the source is desired. It is done after the microscopic examination; as DNA analyses are destructive.

18.7.4 Age

A rough estimate of the age of a person from the hair can be made. In growing children the hair is soft and fine. They become coarser with age. The pigment distribution, refractive index, and density also undergo changes but no definite co-relation between the age and these changes in the hair morphology has been established so far.

18.7.5 Male or Female

It was difficult to say whether the given sample of hair comes from a male or female only a few years ago. However, research in the field has proved fruitful. Identification of the sex via Y-chromosomes analysis, from the hair, is possible in pulled out hair.

18.7.6 Cut, Pulled or Fallen

Microscopic examination of the root ends indicates whether the hair has been pulled out, fallen or cut. Healthy roots indicate pulling out the healthy hair, dried/decimated root bulbs indicate fallen hair and absence of roots indicates cut or broken hair. The shapes of the lower tips indicate whether the hair has been cut. An idea of the duration of the cutting can also be given from the extent of rounding of the cut edges.

18.7.7 Bleached or Dyed

Microscopic examination of hairs reveals whether they are dyed/bleached or not. Chemical examination of the dye or the bleach reveals the identity of the dye or bleach. TLC helps in the identification of the dye or bleach.

18.7.8 Parts of the Body

Hairs from some parts of the body have characteristic morphological structures and contamination. They indicate the part of the body from which they have originated. For example, nasal secretion may indicate that the hair has originated from the nose. Semen and similar secretions may show the pubic origin of the hair and waxy contamination may show ear as the source of the hair. The varying characteristics, given for the hair from different parts, are indicative only. The identity of the parts is not absolute. Therefore, unless there are some highly characteristic features in the hair, part of the body is given only 'probable'/'likely' terms.

Table 3

Characteristics of Human Hair on Various Body Parts

S. No.	Body Part	Length upto (cm)	Dia. µm	Root	Shaft	Tip	Config-uration	Medulla usually	Growth	Misc.
1.	Head	100	25-125	Small	Uniform thickness	Tapered	Wavy	Continuous, discontinueous, artificial fragmentary	0.4 mm/ day	May be
2.	Eye	5	Variable	—	Coarse	Pointed	Smooth curved	Large	0.16 mm/ day	—
3.	Eye lash	5	Variable	—	Short	Pointed	Curved	Continuous	—	—
4.	Beard	100	—	Large	Irregular	Usually cut	Wavy	Continuous	0.40 mm/ day	Sometime-cross section triangular
5.	Chest	5	Variable	Large	Variable diameter	Arch like tip	Wavy	Continuous	0.30 mm/ day	
6.	Armpit	5	Variable	Large	Lighter colour, course	Frayed some	Kinky	Continuous	0.30 mm/ day	More air in the cortex than in head hair
7.	Arm/ leg hair	1	Variable	Small	Lighter in colour	Fine	Curled	Irregular	—	—
8.	Pubic	6	Variable	With	Coarse follic	Tapered if uncut	Highly complex	Broad		Asymmetric cross section. ular tag Special Configuration variable; con-stricted twist-ed, buckling, ven straight

18.7.9 Poisoning

The concentration of poisonous metal, in slow poisoning cases, increases in the hair over time. It is detected and estimated in the roots and the shafts near the roots. The period over which slow poison has been administered can also be estimated.

18.7.10 Drug Addicts

Hair analysis to detect drugs of abuse has come up worldwide. It is being used increasingly in the United States, the United Kingdom, Canada, and other countries. The drug and its metabolites can both be identified and quantified. These drugs are those which the addict has ingested/injected/inhaled. They are not the drugs absorbed in passive mode. Besides, segmental analysis can give the period over which the addict has been abusing the drug.

Most hair tests screen and identify the main drugs of abuse Cocaine, Amphetamines, Methamphetamines, Opiates, PCP, and Marijuana (cannabis).

The hair testing results are both legally and scientifically recognised, almost all over the world.

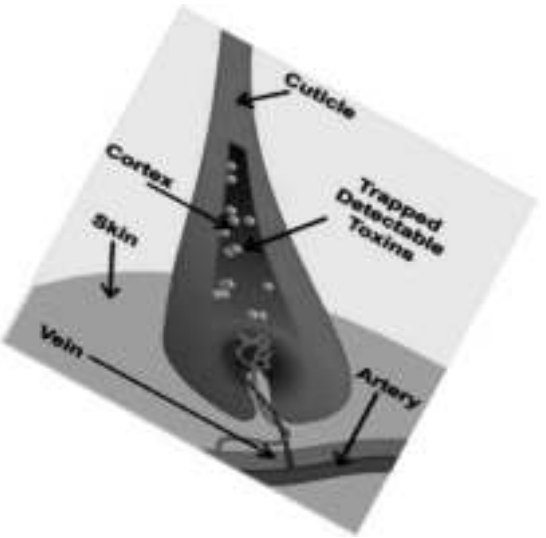

Fig. 18.15
Drug transfer from blood to hair

18.7.11 Drunkenness

Hair testing for alcohol markers is now recognised/utilised, both in UK and US judicial systems. Body hair growth of head hair is used to study the timeframe in body hair for up to 12 months.

Alcohol reacts with fatty acids in the body to form esters called **F**atty **A**cid **E**thyl **E**sters (FAEEs) They are:

1. Ethyl myristate,
2. Ethyl palmitate,
3. Ethyl oleate and
4. Ethyl stearate)

They are used as indicators of the alcohol consumption. The amounts found in hair are obtained in nanograms (10^{-9} g).

Ethyl Glucuronide (EtG) is another metabolite, which is used to ascertain drinking time. It can be detected even in picograms (10^{-12} g).

Hair alcohol testing is a commercial in the UK.

Hair test for drinking is superior in many ways, including:

1. The test material is easy to collect and process
2. It is non-invasive
3. It covers long periods

18.7.12 Contamination

The dust and other contaminants of hair are identified by micro-chemical and instrumental methods.

18.7.13 Individualisation

Nuclear DNA, found on the live roots when there is blood, skin or flesh sticking to it, can individualise the hair in most of the cases. The discovery of *Mito*chondrial DNA, has, as seen above, changed the discrimination power of the hair tremendously. The hair can now provide high discrimination in about 80% of the cases.

*mt*DNA is not specific to one individual. However, it can be used with other evidence (anthropological evidence, circumstantial evidence, and the like) to establish identification. *mt*DNA is certainly an effective weapon for possible eliminations. Further, a match with a living relative is possible even if maternal generations separate the two.

Exposure to light, bacteria, dust, and dirt affect the determinations.

Hair Evaluation (Nutshell)

A. Purpose: it helps to:

1. Find if it is hair and whether it is human or animal hair.
2. Ascertain the body part from which it has come.
3. Identify the racial group.
4. Determine the age/sex of the person
5. Determine suitability for DNA analysis
6. Identify the subject through DNA (*Nuclear-/mito*chondrial) analysis.
7. Compare and link the criminal, the victim, the crime scene, the points of ingress/egress, the weapon of offence, the vehicle used, in some the routes of approach/departure and of modus operandi/versions(s) *inter se*.
8. Identify poisoning, poison and the period of poisoning.
9. Identify disease/damage of the hair
10. Identify hair sprays, gels, or other hair treatment of the hair which helps match crime-sample hair
11. Identify the drug addict, the drug taken, the quantity of the drug and the period of addiction.
12. Identify the drunk, the amount of alcohol intake and period of intake.

B. Process

1. IO collects cross-transferred crime hairs from the scene and sample hairs from the suspected parts of body of suspect; ensuring their relevancy, identity, integrity, authenticity and an unbroken chain of custody, from the time of collection to the time of presentation of the evidence in the court.
2. The forensic scientist Links the culprit with the crime through comparison of hairs (length, diameter, colour, hair structure, medulla, pigmentation, scale, medullary index, hair parts (root, shaft, tip) colour, treatment material, evidence of disease, damage, DNA.
3. The expert presents the evidence in court in nontechnical language, with relevant data, illustrations, photographs, etc. to support the presentation convincingly.

18.9 CASE LAW

18.9.1 Identification[1]

Author's Summary

Two persons murdered the victim. Their extrajudicial confessions, bloodstained clothes/ Kirpan and other evidence identified them. The apex court, however, found clinching evidence when the hair on the Kirpan matched with the hair from the head of the victim.

Highlights italicised

Relevant Extracts (Verbatim)

The High Court has pointed out that there was sufficient circumstantial evidence, even apart from the extra-judicial confession to connect the two accused with the murder of the deceased. There was the evidence of the recovery of the blood-stained clothes from Surjit Kaur, there is evidence of Sarwan Singh who had seen the deceased along with Surjit Kaur and Maghar Singh shortly before the murder took place and immediately thereafter. The F.I.R. was lodged on 15 June 1972 at 9.00 am, the blood-stained Kirpan was also recovered at the instance of the accused Maghar Singh and the blood was found to be human blood. The matter did not rest here, but even bloodstained clothes were found from the person of the accused which also contained human blood.

> *Apart from this circumstantial evidence, which conclusively connects the deceased, namely, recovery of the weapon of offence, the false explanation given by Surjit Kaur, the recovery of the clothes from the person of the accused, there is another important circumstance which almost clinches the issue and completes the link in the chain of circumstantial evidence and this is that the Kirpan recovered from the possession of the appellant Maghar Singh contained braids of hair of the deceased stuck to it and on scientific examination the braids were found to be identical with the hair of the deceased. This, therefore, completely establishes that it was the accused Maghar Singh alone who had caused the death of the deceased with the Kirpan and this circumstance is not explainable on any other hypothesis except that the accused was guilty of the offence of murder.*

1. *Maghar Singh v State of Punjab*, AIR 1975 SC 1320 : (1975) 4 SCC 234 : 1975 Cr LJ 1102 (SC).

Thus, the circumstantial evidence against the accused referred to above is not only conclusive and independent to prove the charge for the offence of murder but also constitutes substantial and sufficient corroboration of the approver's statement in material particulars.

18.9.2 Hair and Article 20(3) of the Constitution[2]

Author's Summary

A student is a hostel at Jaipur, was beaten to death. The IO collected hair from the scene and wanted to collect hair from the culprits. Their lawyer objected that the collection infringes Art 20(3) as it made them a witness against themselves. The court quoting the apex court said it does not. Hair are materials and as such do not furnish evidence like oral/written statements.

Highlights italicised

Relevant Extracts (Verbatim)

One Dilip Singh is alleged to have been beaten in room No. 42 of Vivekanand Hostel, in Jaipur, on 3 February 1970, at about 2.30 pm. The First Information Report of the incident was lodged the same day at police station Gandhinagar, and a case was registered for offences under sections 307 and 452 read with section 149, and section 148, IPC. The room was inspected by the investigating officer on 4 February 1970 in the presence of "motbirs," and some hair was found on and under the bed of Dilip Singh and on the wall. They were taken in police custody under memorandum (B/76) for purposes of comparison. Dilip Singh succumbed to his injuries on 14 February 1970. The investigation of the case was then made over to the Central Bureau of Investigation, Government of India and the case was altered to one for offences under sections 148, 302, 307, 453 read with section 149 and section 120B, IPC. During the course of the investigation, the deputy superintendent of police, Central Bureau of Investigation, made an application on 12 March 1970, to the special magistrate, stating that it was essential for purposes of investigation that the hair which had been recovered from the scene of occurrence should be examined by experts and compared with the hair of the "principal accused" like Vijay Punia and Mahipal Maderna "with a view to fix up the identity of the hair recovered by the police from the scene of occurrence." It was prayed that accused Vijay Punia and Mahipal Maderna may be called and directed to give a few specimens of their hair in the presence of the court for that purpose. The learned magistrate allowed the application and recorded an order to that effect on 6 April 1970. Mahipal Maderna and Vijay Punia filed an application before the Sessions Judge for revision of that order, and this is how the present reference has been made by the Sessions Judge for quashing the order.

It has been argued by Mr. Bhimraj, learned counsel for accused Vijay Punia, that the reference should not be accepted for the reason that the order of the learned magistrate violates the fundamental right of the accused under Article 20(3) of the Constitution inasmuch, as it compels each one of them to be a witness against himself. Reliance for this submission has been placed on *State of Bombay v Kathi Kalu Oghad,* AIR 1961 SC 1808 : (1962) 3 SCR 10 : (1961) 2 Cr LJ 856 (SC); *Pritam Singh v State of Punjab*, AIR 1956 SC 415 : 1956 Cr LJ 805 (SC) and *Rochin v People of California*, (1952) 342 US 165 : 96 Law Ed 183. The learned counsel has further argued that the investigating officer could make an order for the production of the hair only under section 94(1), Cr PC but that section does not apply to the accused as has been held in *State of Gujarat v Shyamlal Mohanlal Choksi*, AIR 1965 SC 1251 : 1965 (2) SCJ 18 : (1965) 2 SCR 457.

2. *Mahipal v State of Rajasthan*, 1971 Raj LW 43 : 1971 Cr LJ 1405 (Raj).

Now clause (3) of Article 20 of the Constitution provides as follows:—

> 20(3). No person accused of any offence shall be compelled to be a witness against himself.

In the United States of America also the immunity against self-incrimination is constitutional, and the Fifth Amendment provides, *inter alia* as follows:

> *No person ..... shall be compelled in any criminal case, to be a witness against himself.*

It will thus appear that the provision in our Constitution is similar to that in the Fifth Amendment of the American Constitution, so that it will be profitable to examine the argument of the learned counsel in the light of the decisions in this country and the United States.

The nature and the meaning of the aforesaid privilege against self-incrimination have been considered at length in Wigmore, Evidence section 263—(Mc Naughton rev. 1961), and it has been stated as follows:—

> .....It is not merely any and every compulsion that is the kernel of the privilege, in history and in the constitutional definitions, but testimonial compulsion. The later idea is as essential as the former. (p 379)

It has then been further stated in section 264 (supra) that while it is universally conceded that the production of documents or chattels by a person in response to a *subpoena*, or to a motion to order production, or to other form of process relying on his moral responsibility for truth telling, may be refused under the protection of the privilege, documents or chattels obtained from the person's control without the use against him of process relying on his truth-telling are not within the scope of the privilege. As Mr. Justice Holmes said in *Johnson v United States*, (1913) 228 US 457 "a party is privileged from producing the evidence but not from its production."

> *In our country, their Lordships of the Supreme Court have laid down in M.P. Sharma v Satish Chandra*[3] *that, broadly stated, the guarantee in Article 20(3) is against "testimonial compulsion", but there is nothing to confine the content of the guarantee to oral evidence in the courtroom and that it may well extend to compelled testimony previously obtained against him, as also to any compulsory process for the production of evidentiary documents which are reasonably likely to support a prosecution against him. It has further been laid down that neither the search nor the seizure are acts of the occupier of the searched premises, for "they are acts of another to which he is obliged to submit and are, therefore, not his testimonial acts in any sense.*

The matter again came up for consideration in *State of Bombay v Kathi Kalu Oghad,* AIR 1961 SC 1808 : (1962) 3 SCR 10 : (1961) 2 Cr LJ 856 (SC) and while considering the earlier judgment in *M.P. Sharma's* case,[4] their Lordships have held that the expression "to be a witness" in its original grammatical sense means giving oral testimony in court, but that the case law has gone beyond this strict literal interpretation of the expression which may now bear a wider meaning namely, bearing testimony in court or out of court, by a person accused of an offence, orally or in writing. Their Lordships have taken note of the observation in *M.P. Sharma's* case that "to be a witness" means "to furnish evidence" and includes not only oral testimony or statements in writing of the accused but also production of a thing or of evidence by other modes, and have observed that it may be that the court did not intend to laydown that "calling upon a person accused of an offence to give his thumb impression, his impression of palm or fingers or of sample handwriting or signatures comes within the ambit of 'to be a witness' which has been equated to furnishing evidence." In para 10 they have laid down the law as follows:

> *"To be a witness" may be equivalent to 'furnishing evidence' in the sense of making oral or written statements, but not in the larger sense of the expression so as to include given thumb impression or impression of palm or foot or finger or specimen writing or exposing a part of a body by an accused person for purpose of identification. 'Furnishing evidence' in the later sense could not have been within the contemplation of the Constitution makers for the simple*

3. 1954 SCR 1077 : AIR 1954 SC 300 : 1954 Cr LJ 865.
4. *Ibid.*

> *reason that though they may have intended to protect an accused person from the hazards of self-incrimination, in the light of the English Law on the subject—they could not have intended to put obstacles in the way of efficient and effective investigation into crime and of bringing criminals to justice. The taking of impressions of parts of the body of an accused person very often become necessary to help the investigation of a crime. It is as much necessary to protect an accused person against being compelled to incriminate himself, as to arm the agents of law and the law courts with legitimate powers to bring offenders to justice.*

Their Lordships have also dealt with the character of the self-incriminating evidence and made the following observation:—

> *In order that a testimony by an accused person may be said to have been self-incriminatory, the compulsion of which comes within the prohibition of the constitutional provision, it must be of such a character that by itself it should have the tendency of incriminating the accused, if not also of actually doing so. In other words, it should be a statement which makes the case against the accused person at least probable, considered by itself. A specimen handwriting or signature or finger impressions by themselves are no testimony at all, being wholly innocuous, because they are unchangeable except in rare cases where the ridges of the fingers or the style of writing have been tampered with. They are only materials for comparison in order to lend assurance to the court that its inference based on other pieces of evidence is reliable. They are neither oral nor documentary evidence but belong to the third category of material evidence which is outside the limit of 'testimony'.*

The law has thus been well-settled by the above pronouncements of their Lordships of the Supreme Court.

As in the present case I am concerned with the identification of a part of the body of the accused, namely their hair, exposing the hair or taking specimen thereof cannot be said to be "furnishing evidence".

It may be mentioned that while dealing with the bodily condition of the accused, his claim to the privilege of the Fifth Amendment (extracted above) has been answered as follows in Wigmore's: *Evidence*, section 265 (Mc Naughton Rev. 1961) (p 386).

> *section 265. Bodily condition (clothes, features, fingerprints, medical examination,).* If an accused person were to refuse to be removed from the jail to the court-room for trial, claiming that he was privileged not to expose his features to the witnesses for identification, it is not difficult to conceive the judicial reception which would be given to such a claim. And yet no less a claim is the logical consequence of the argument that has been frequently offered and occasionally sanctioned in applying the privilege to proof of the bodily features of the accused."
>
> "The limit of the privilege should be plain. From the general principle it results that an inspection of the bodily features by the tribunal or by witnesses does not violate the privilege because it does not call upon the accused as a witness *i.e.*, upon his testimonial responsibility. That he may in such cases be required sometimes to exercise muscular action as when he is required to take off his shoes or roll up his sleeve is immaterial, unless all bodily actions were synonymous with testimonial utterance; for, as already observed, not compulsion alone is the component idea of the privilege, but testimonial compulsion. What is obtained from the accused by such action is not testimony about his body, but his body itself. Unless some attempt is made to secure a communication written, oral or otherwise upon which reliance is to be placed as involving his consciousness of the facts and the operations of his mind in expressing it, the demand made upon him is not a testimonial one. Moreover, a practical consideration applies to this class of evidence. When the person's body, its marks and traits are in issue, there is ordinarily no other or better evidence available for the prosecutor.
>
> Hence the public interest in obtaining the evidence is usually sufficient to outweigh by a clear margin the private interests in the process.
>
> Both principle and practical good sense forbid any larger interpretation of the privilege in this application.

In this state of law, which should apply equally to our country, there can be no justification for the claim of the accused that the impugned order of the learned magistrate denies them the privilege against self-incrimination guaranteed by Article 20(3) of the Constitution. This is a case in which

the question of the identity of the accused will be the main question for consideration and decision. And the recovery of some hair from the place of occurrence has prompted the investigating officer to make an effort to utilise that piece of evidence for the purposes of establishing the identity of the participants in the crime, if possible. His effort to make use of that material is quite genuine for it cannot be doubted that, in the case of a person's body, its marks and traits are the main evidence for purposes of its identification and there is no reason why the investigating officer should be prevented from making use of it when it is well-settled that there is no protection against the exhibition of the body of the accused. The privilege against self-incrimination does not extend to the use of defendant's body as real evidence.

Wigmore (supra) has summarised a number of cases on the question of the privilege against self-incrimination, and the following notes deserve a mention for purposes of the present controversy:

State v Tettaon, (1900) 159 Mo 354 : 60 SW 743 (testimony of physicians to the condition of a wound on defendant's head, shaved by compulsion, admissible). (p 390);

State v Maclaughlin, (1916) 138 La 958 : 70 SC 925 (murder; no denial of constitutional privilege to use scrappings from under fingernails, taken against the will). (p 392);

Smith v United States, 194 F. 2d 192 (D.C. Cri 1950) (homicide and rape; forcibly dyeing defendant's hair for purposes of identification upheld). (p 397); and

People v Strauss, [(1940) 174 Misc 881] (motion by district attorney to require defendant to be shaved and have the hair on his scalp trimmed was granted; privilege held inapplicable). (p 398).

The view taken in these decisions seems, with all respect, to be quite correct and forthright, and there is no reason why the application of the investigating officer should not have been allowed in the present case.

18.9.3 Hair Evidence Essential[5]

Author's Summary

In a murder case bloodstained hair were collected from the drain of the house of the accused. The IO also collected sample hair of the deceased. However, no comparison/examination was done. Valuable evidence was wasted! Why?

Relevant Extracts (Verbatim)

The bloodstained hair recovered from the drain of the house were not sent for comparison with the hair of the deceased and as such, there is no evidence on the record to show that the bloodstained hair recovered from the drain of the house of the accused was that of the deceased only. This lapse on the part of the investigating agency to have the bloodstained hair compared with the hair of the deceased is a serious lapse and has deprived the court of a very valuable piece of evidence which could have clinched the case specially when according to Dr. M.L. Gupta, P.W. a few hairs of scalp of the deceased were got removed by the police and packed and sealed in his presence. No explanation is forthcoming as to why these were not got compared with the bloodstained hair recovered from the house of the accused. It would not be too much in these circumstances to draw an inference against the prosecution that had these been got compared they would not have supported the prosecution case. This recovery, therefore, does not advance the case of the prosecution nor does it connect either of the accused with the crime.

"Will all great Neptune's ocean wash this blood clean from my hand? No, this my hand will rather the multitudinous seas *incarnadine*, making the green one red."

Shakespeare in *Macbeth*

Blood Evidence in 13th Century

Song Si was perhaps the first person to report, in his book (**Washing Away of Wrongs**), *the use of blood as evidence to identify a murderer. It happened in 13th century, in China, In that case, the throat of a farm worker was slit with a sickle. A number of farm workers were working on the farm to cut the crop with their sickles.*

The investigator suspected that one of the workers had murdered the victim, presumably with his sickle. He tested a test sickle to create wounds on animal carcasses. He kept the sickle in the open environment. He observed the sickle attracted flies and a number of them gathered thereon.

He instructed everyone to bring his sickle to one location and asked them to lay their sickles side by side, in the open. Only one sickle attracted flies.

The case stood solved. The sickle with blood thereon attracted the flies. The owner of the sickle alone could be the murderer. In the light of this transparent demonstration, the murderer confessed to the crime.

Perhaps the first case of blood evidence!

19.1 GENERAL

Among the body fluids, which include blood, semen, saliva, urine, sweat, nasal secretions, tears, human milk forensically, blood is the most important fluid. It plays a very important part of crime detection. It is a mute witness in offences against persons. Now, with the discovery of DNA profiling, which provides a definite identification/linking evidence, it is the most important piece of evidence along with other body fluids/parts to provide proof of the guilt, beyond a reasonable doubt. Remarkable strides in genetics have changed the scenario, and the individuality of blood is a reality now.

In addition, blood spatter patterns at the crime scene furnish data for reconstruction of the crime.

Blood as evidence has passed through many stages. It was possible only to say whether a given stain is of blood or not, in the initial stages. Later, it became possible to identify whether the given bloodstain is from a human being or from an animal. Further progress made it possible to classify blood into four main groups, O, A, B, and AB. Later, the division was extended further. For example, group A factor was found to exist in six forms, A_1 to A_6. Excepting A_1 and A_2 others are rare. Sub-division of A into A_1 and A_2 brought blood group division to six. Determination of M, N and MN types, the study of P factors and eight 'Rh' types, Duffy, Lutheran, Lewis, Gm, Gc serum group and enzymatic groups like PGM, AK, divide blood into hundreds of groups. Discovery of additional antigens, antibodies, and behaviour of blood in the electric field (electrophoresis) has increased the division of blood in many groups. They have increased the discrimination probability figures manifolds. However, the discovery of DNA[1] profiling has revolutionised the value of blood evidence. DNA profile of a person is unique (individualistic) like fingerprints. In fact, blood evidence today, is far superior to fingerprint evidence. It is now possible to individualize a given sample of blood and to say that it belongs to the given individual and to nobody else, except for identical twins.[2]

1. See chapter 21 on DNA profiling.
2. There are roughly 12 million monozygotic twins in the world!

DNA profiling has made the blood evidence definite. However, the classical techniques still continue in almost all the laboratories in India because of high cost, time involved and sophistication involved in the DNA profiling process. Continued research is tackling all these problems. DNA profiling is likely to be used routinely in the coming times.

19.2 NATURE

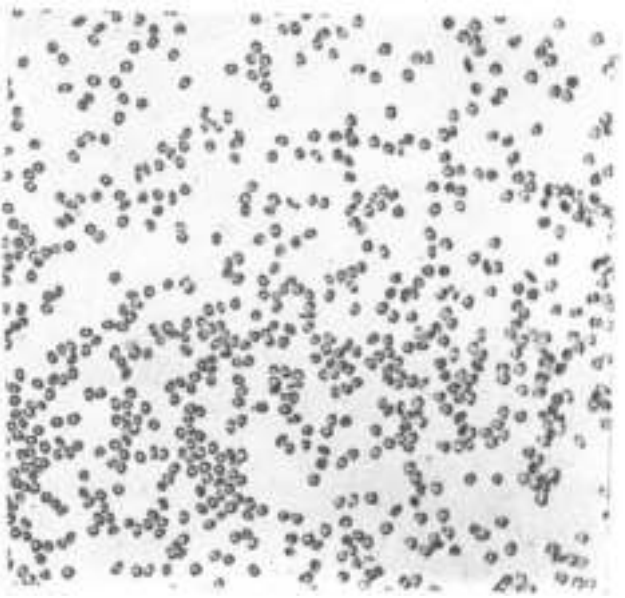

Fig. 19.1
Blood Corpuscles under Microscope

The red fluid in the body living person is blood. It is about 7% of body weight in human beings. It has both liquid and solid constituents:

1. The liquid part is called plasma. It forms 55% of the blood volume. It is mostly water (~90%). Plasma bereft of fibrinogen (and other clotting factors) is a serum.
2. The solid constituents are mainly:
   - **Red blood cells (erythrocytes);** they occupy 44% of the blood volume. They are also called **red corpuscles.**
   - **Platelets;** they are about 0.7% by volume. The other names for platelets are **thrombocytes** and **discs**.
   - **White cells (leukocytes);** they are the remaining part of the plasma.

When the blood flows out of the body, a part separates out as blood clots consisting of blood corpuscles and discs. Platelets (discs) are responsible for the clotting of the blood. The liquid left after coagulation is a serum.

19.2.1 Red Cells

There are about five million red cells per micro-litre of blood, each about ten microns in diameter. The red cells are continuously being produced and destroyed in the body. The rate of destruction is about ten billion cells per hour in a normal healthy adult.

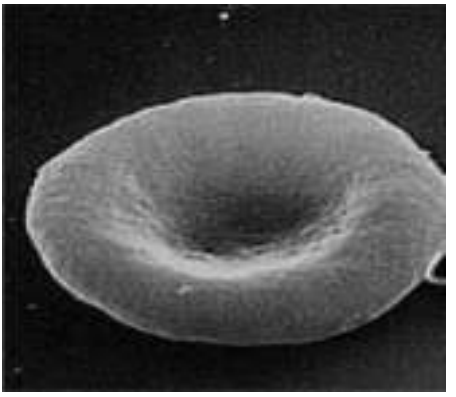

Fig. 19.2
Scanning Electron Microscope image of a red cell

19.2.2 Haemoglobin (Hb)

The colour of blood cells is due to haemoglobin. It is the iron-containing oxygen-transport metalloproteinase in the red blood cells of all vertebrates with the exception of some fish. The protein plays an important role in the functioning of the body. It transports oxygen to various body parts, where it combines with the food materials to provide energy to the body.

19.2.3 White cells

White cells, also called white blood corpuscles or leukocytes (or leucocytes) called leukocytes, are the **cells** of the immune system. They are produced by the bone marrow's multi-potent **cells, called** hematopoietic stem **cells**. They protect the body against both infectious disease and foreign invaders. The number of white cells is about four to eleven thousand cells per micro-litre. They resist and fight the attack of diseases germs.

Fig. 19.3
Scanning Electron Microscope image of white corpuscle

19.2.4 Platelets

Platelets are lens-shaped entities with a diameter of 2-3 um, roughly about one-fifth of the size of a red corpuscle. They are important constituents of the blood of mammals and are 5 to 10 % of the red corpuscles and about 5 times the number of white corpuscles. Their main function is Homeostasis, that is, to stop bleeding by clotting the blood at the injury site (at the oozing point)). They congregate around the wound to stop blood flow out of the tissue.

They come from bone marrow.

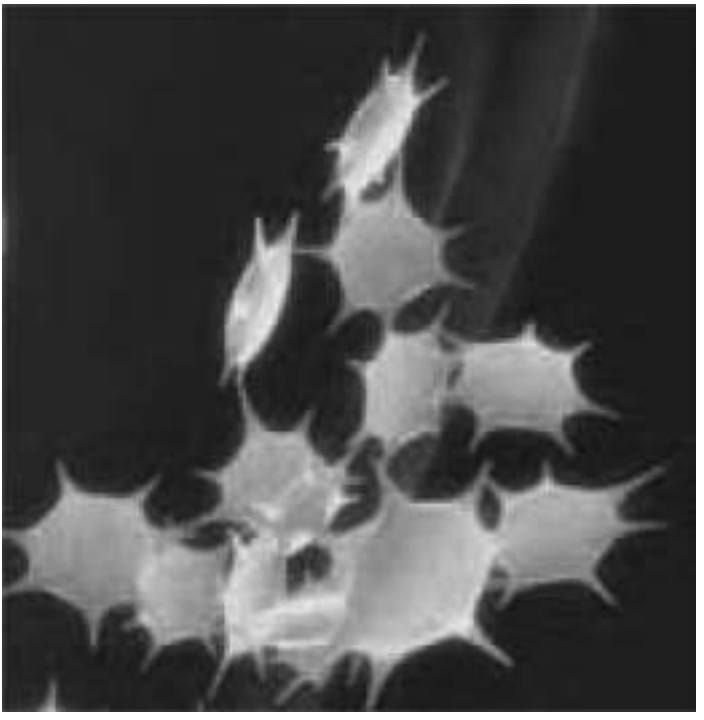

Fig. 19.4
Platelets in Human Blood

19.2.5 Blood Plasma and Serum

Blood plasma is the pale yellow liquid of blood. It keeps blood cells in suspension. It is about 55% of the body's total blood, by volume. It is mostly water (about 90 % by volume). It contains proteins, albumins, glucose, clotting factors and a host of electrolytes. Plasma is the main medium for transportation of the excretory products.

Blood serum is blood plasma without clotting factors.

Plasma and serum are complex mixtures of proteins, (enzymes, antigens, antibodies), minerals and organic compounds dissolved in water.

The amount of blood varies from individual to individual. It also varies in the same individual in different periods of his life, depending upon his age, diet and the work function Roughly an adult weighing sixty-five kilograms have about five kilograms of blood, *i.e.*, about one-thirteenth part of the body weight.

19.2.6 Drying

The blood evidence, in a criminal investigation, is in the form of dried stains most of the time. The following factors affect the drying of the stain:

1. Temperature
2. Humidity
3. Quantity of blood
4. Surface bearing the stain
5. Atmospheric conditions, including rain and wind.

As soon as bleeding starts, the drying process also starts and the changes in the drying process of the blood continue.

The first change in liquid blood, on exposure, is its clotting. The proteins lose some of their activities. Bacteria, fungi, heat and light may bring other changes. The process of change continues and with time, the blood may lose all its identifying characteristics. It is, therefore, advisable that blood is examined at the earliest.

The colour of the stain also undergoes successive changes with the passage of time. The colour changes in the blood/bloodstains can indicate time elapsed since the bleeding started... However, many variables affect the process, including the following:

1. Amount of blood
2. substrata
3. Environmental conditions; closed or open place
4. Atmospheric conditions (humidity, temperature, wind)

The above variables hinder proper estimation of age of stains from its colour. The estimation, at best, remains an intelligent guess in most of the cases.

19.2.7 Functions

Blood is the lifeline of a living being. It sustains life by providing food (and energy) to the body, it saves it from diseases and maintains proper temperature. The main blood functions are transportation, protection and protection. The three major functions in brief are:

Transportation; it transports many materials including the following:

- Gases; namely, oxygen/carbon dioxide between the lungs and rest of the body *inter se*
- Nutrients; it transports them(glucose, minerals etc.) from the digestive tract and storage sites to the rest of the body
- Drugs/Medicine; it transports injected/inhaled/ingested drugs/medicine to the relevant sites.
- Hormones; it takes them from the gland to body parts
- Metabolic waste**;** removes it from body parts to the disposal outlets

Protection

- It performs homeostasis; supply platelets to the injured site to control bleeding through blood clotting.

  It supplies white corpuscles to fight diseases.
- It maintains reserves of water, food and electrolytes

Regulation; It regulates many processes including the following**:**

- Regulates body temperature
- Controls acidity/alkalinity (pH) of the body
- Maintain water contents of cells

19.3 IMPORTANCE

Blood is one of the most important clue materials in crime investigation. It figures prominently in most of the serious crime. It is especially so in offences against persons.

> *Within a period of two weeks, 18 persons, while asleep at night, were killed in Mumbai. All of them had one fatal head injury caused by a blow from a heavy pointed weapon.*
>
> *A suspect was apprehended. His clothes carried small-sized bloodstains. They pointed the needle of suspicion towards the man.*
>
> *He carried other evidence also. His shoes had deposit of soil. He had a specially improvised iron bar with him, which carried bloodstains. Bloodstains on his clothes, weapon and on the clothes of the deceased in the last reported case were of group AB. The blood evidence served kingpin evidence against the accused. Soil on his shoes compared well with the control sample obtained from the crime scene. An unused piece of the iron bar left over with the blacksmith who improvised the weapon for the accused was recovered at his instance. Laboratory examination clearly revealed that the weapon used in this crime was made from the same iron bar as the piece found with the blacksmith.*
>
> *The suspect, Raman Raghav*[3]*, admitted all the 18 and other killings. (CH)*

The proper study of the evidence helps the investigation of a number of different types of offences against persons in the following ways:

1. It establishes *corpus delicti;* the occurrence of crime.
2. It links the crime, the criminal, the victim, the crime scene, the weapon of offence and the vehicle used in the crime, *inter se*.
3. It helps to discriminate between real and fake crime scenes.
4. It identifies the victim, the culprit and the animal if involved in the crime.
5. Its (blood) spatter helps in the reconstruction of the crime.
6. It permits determination of the sequence of occurrence of a crime, from the presence/spatter/distribution of blood at the scene/culprit/victim.
7. It is possible to guess the approximate time when the crime was committed from the study of the age of stains, rigor mortis and hypostasis (lividity).
8. It helps the investigation/identification of poaching, poachers and poached animals. In addition it provides linking evidence in maiming and worrying.
9. It helps to establish the paternity of a child in disputed cases and expose adultery.

3. ***Raman Raghav***, who terrorized ***Mumbai*** in the 1960s with a series of random murders, remains a psychological puzzle.

A 3-year-old victim succumbed to her injuries caused during her rape. Bloodstains on her clothes, on the clothes of the accused and on some articles at the crime scene were of 'O' group. On examination, it was found that the post-mortem blood of the deceased was of O group while that of the accused was of A group. (CH)

The detection and evaluation of blood evidence is a delicate process. The external factors: contamination, putrefaction, over-heating, bacterial growth and action of chemicals interfere in the evaluation of the evidence. The substratum (surface on which the blood evidence is found) also affects it. Likewise, the age deteriorates the bloodstains. Thus, to obtain the best results, blood evidence needs immediate expert handling.

19.4 PROBLEMS/POSSIBILITIES

A forensic biologist/serologist handles the blood evidence. In normal cases, he can answer most of the investigator's questions, including the following:

1. Are there bloodstains at the crime scene?
2. Is the quantity of blood at the scene consistent with the injuries on the deceased or injured?
3. Is there blood spatter at the crime scene? Does it help in the reconstruction of the crime? Does it indicate scuffle of defence effort?
4. Has the crime scene been washed/cleaned and the blood/bloodstains/blood traces removed? Are the blood traces recoverable/identifiable?
5. Is the blood, found at the crime scene, from the culprit, victim or both?
6. Does the weapon, recovered from the crime scene/culprit/his residence/office, carry blood from the victim?
7. Do the clothes of the culprit carry the blood of the victim, washed or otherwise?
8. Does the debris collected from the clothes/hair/nails/shoes contain blood from the victim?
9. Do the swabs/washings from the sexual organ and the pubic hair of the culprit carry blood from the victim?
10. Is the recovered blood/bloodstain/smear of human or animal blood?
11. What is the blood group of the human bloodstain?
12. What are the species of animal to which the blood belong?
13. How much blood has been shed at the scene?
14. What is the age of the stain?
15. Is the child biological issue of the alleged parent?
16. Did the person suffer from any disease like syphilis or leukaemia? If so, to what extent was the disease responsible for the death of the person? This is possible when liquid blood is available.
17. Are there any artefacts to show the body part from which the blood has come?
18. Does blood contain alcohol? If so, how much alcohol has the subject taken?
19. Does blood contain carbon monoxide, hydrogen cyanide or other poison?
20. Does the blood contain narcotic drug?

A forensic toxicologist answers the last three questions.

19.5 LOCATION

Fig. 19.5
The 'bloody scene' helps to envisage the sequence of events, and the extensive struggle that must have ensued between the victim and the culprit

The location of blood evidence is, ordinarily, not troublesome. However, in some cases where the search is started after a lapse of time it becomes a difficult task because the stain may change colour and become indistinguishable with the substrata. Or, wind/rain/heat/light may wholly or partially cover or wipe it off. Human beings, animals or traffic may also destroy the stains, wholly or partially. Washed blood is also not visible to the naked eye. Location of blood evidence involves the following:

19.5.1 Search

The search for the location of bloodstains and other blood evidence:

1. The IO examines the area, articles and clothing suspected to bear bloodstains with strong oblique light, even during daytime, and a magnifying lens. Most of the stains become visible.
2. If the invisible blood evidence is suspected to be on portable article or on garments, it is sent to the Forensic Science Laboratory. There the article/garment is spread on an examination table with white top. A shadow-less strong light lamp illuminates the exhibit for the examination. The table has also an arrangement for movable stereoscopic examination with a long flexible arm. The arrangement covers a large are a large of the table to cover the stereoscopic examination.
3. The examination table has arrangement for use of coloured lights. Red, green and yellow lights are used to create contrast. They sometimes reveal bloodstains. There are instruments which provide different coloured lights in addition to ordinary light and UV/IR radiations for the examination.
4. Ultraviolet rays are very useful to locate bloodstains on article suspected to carry bloodstains. The examination is done in a dark/semi-dark room. Even washed bloodstains become visible.

5. Infrared rays are useful to locate invisible bloodstains on coloured objects/garments. An infrared photograph reveals the bloodstains/spots.
6. The articles suspected to bear bloodstains is sprayed with luminol. It reacts with bloodstains to give fluorescence. Even decomposed blood reacts with the reagent. The reagent does not interfere with subsequent blood tests[4].

   The reagent is used to examine large areas, like washed floor, vehicles, etc. If the result is negative (no fluorescence); ordinarily, there will be no blood on the articles tested.

   The reaction is interfered by copper salts, which also give fluorescence with the reagent.

19.5.2 Location Sites

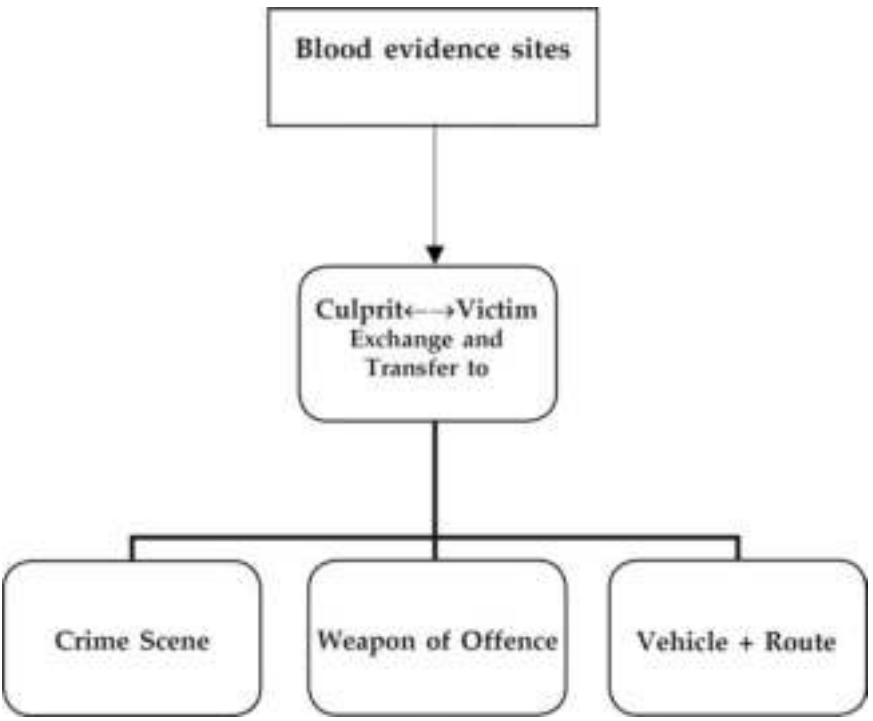

Fig. 19.6
Blood everywhere in offences against person

The important places for the location of blood are:

- The scene of occurrence,
- The culprit,

4. The reagent is prepared by taking water (100 ml), dissolving sodium perborate (0.7 g) 3-arninophthalhydrazide (0.l g) and sodium carbonate (5.0 g) in to make the reagent solution. It is sprayed upon the space/article suspected to carry bloodstains with glass sprayers in a darkroom. Strong luminescence indicates blood.

- The victim,
- The weapon of offence,
- The vehicle, and
- The route the culprit takes after the commission of the crime.

19.5.2.1 The Scene

The blood evidence found at the scene is in the form of stains, smears, streaks, splashes, spray, prints, clots, pools or liquid blood, on a variety of places and articles. It may be even clots trapped in washbasin trap. Or, it may be a water solution in the washbasin trap.

In indoor scenes, the floors, walls, doors, windows, furniture (chairs, tables, beds) and fans are the likely places. The position, size and the pattern of the stain, pools, etc., are carefully noted, sketched and photographed. They help in the reconstruction of the scene afterwards.

Clothing at the scene: wearing apparel (garments), bedding, curtains, upholstery, carpets, table covers and the like, may carry stains either due to spattering or due to wiping of the bloody hands.

The culprit may have used sundry items: paper, pieces of cloth, rags, articles of clothing, or other tissue material to wipe off the blood. He is likely to discard these items at or around the scene. They may be lying in dustbins, debris heaps, kitchen refuse or in water closets.

The blood from the scene is removed sometimes. The culprit may have washed his hands, face, clothes, the weapon of offence or even the stained area floor. The culprit thus succeeds in obscuring the blood evidence but it can be located. If floors, walls, doors, windows or furniture have been washed the evidence is available in cracks, crevices and joints. If clothes have been washed, blood may still be found under the seams or underneath the sleeves. If blood has been washed in a washbasin or in a closet, some clots are left in the traps attached to them.

The drawers and under surfaces of the furniture is also checked for wiped blood. If the culprit gets his hand and feet smeared with blood, he is likely to leave finger, palm, foot or footwear prints at the scene.

In outdoor scenes, the ground, the stones, the grass, the plant leaves, twigs and branches may carry blood. A rich growth of grass or dry or wet leaves may have been used to wipe off the blood. Or, earth, sand or dust may have been used for the purpose.

The wind may have blown dust, dirt, sand, grass or leaves over the scene covering the evidence. The scene is thoroughly searched for such hidden/covered evidence.

The culprit often discards paper, rags or other tissue material used to wipe off the blood and the blood-stained clothes. They may be lying scattered at the scene.

> *A housewife was found murdered in her home. The accused exchanged his bloodstained clothes with the clean ones from the house and escaped. Stains detected on the clothes left at the scene were both of A and B groups. The blood of the deceased and the bloodstains on her garments were of B group. On the suggestion from laboratory, blood sample of the accused was obtained and was found to be of A group. The matching of the blood group A of the bloodstain on the clothes left at the scene of crime with that of the accused provided strong corroboratory evidence. (CH)*

19.5.2.2 The Suspect

The culprit often carries blood on his hands, nails, hair, earlobes, feet, male organ (in sexual offences) and other exposed parts of his body.

> *A suspect was arrested a day after the murder. A small bloodstain found on his knee was of blood group B, which tallied with the blood group of the deceased. The accused had no other bloodstain on his person or clothes. His blood, however, was of group O. (CH)*

The culprit may carry blood on his clothing: trousers, shirt, coat, cap, tie, socks or shoes. The seams, joints and insteps of the shoes need special attention. These places are likely to retain blood for long periods. Even if the investigating officer has not been able to locate any blood, he takes the clothing into possession and sends them to the laboratory. The laboratory may locate some tiny stain or washed blood even on washed clothes.

A woman was found murdered in a first class compartment of a local train. Her ornaments/money was missing. Her blood group and that of the bloodstains found at the crime scene was B.

Later, snatched ornaments were recovered from one of the suspects. They had traces of blood of group B. A knife recovered at the instance of the second suspect. It carried blood group B stains. Bloodstains on the chapel (sleeper) and in the nail parings of the third suspect were also of group B. None of the suspects had B blood group. The presence of blood group B on the various entities strong corroboratory evidence against all the three murder accused. (CH)

19.5.2.3 The Victim

The victim, ordinarily, carries his own blood but in some cases, he/she may carry the blood of the culprit on his/her person and clothing especially if the victim had a scuffle with the culprit. If the blood is found of the same group as that of the suspect but different from the blood group of the victim, the findings provide a strong presumption of the suspect's guilt.

The victim is checked for blood/bloodstains of the culprit at the following sites:

1. **The nails**; the victim might have scratched the culprit
2. **The Teeth**; the victim might have bitten the culprit to extricate from the stranglehold of the culprit. The teeth may carry skin, flesh or blood of the culprit.
3. **Bleeding injuries;** If the culprit suffered bleeding injuries in the scuffle, the victim may carry culprit's bloodstains on clothes/body and it may also be found at the scene on the ground or on objects, in such cases.

19.5.2.4 The Weapon of Offence

If the culprit caused bleeding injuries to the victim, the weapon carries blood. In certain cases, most of the blood is wiped/washed off intentionally or otherwise. Even in such cases the joints, crevices and cracks of the weapon often retain sufficient blood to permit identification. The IO collects/sends the weapon invariably to the laboratory for blood tests.

If a firearm is discharged in contact or near-contact position, blood, skin and flesh pieces of the victim, get deposited on the firearms in some cases. They permit the identification of the blood group/DNA profile of the victim.

19.5.2.5 The Vehicle

If the culprit has used the vehicle in the commission of a crime or for the disposal of the body, the vehicle is likely to carry bloodstains from the injured/deceased where the body was placed. Even if the spot is cleaned, some traces of blood are likely to remain at the site.

If an injured or blood-soaked culprit has escaped from the scene in a vehicle, some blood is likely to get transferred to the vehicle. The amount is likely to be small. It is likely to escape notice on casual examination. The IO requisitions the laboratory experts to locate/collect the blood.

If the culprit has placed some blood-smeared objects like a weapon of offence, blood-covered valuables or clothes in the vehicle; they are likely to leave some traces on the vehicle.

If a blood-shedding occurrence has taken place in the vehicle itself, blood is found in the vehicle even if the culprit has tried to remove it.

19.5.2.6 The Route

The route followed by the culprit is checked for a blood trail or discarded blood smeared articles:

- If he is bleeding, he is likely to leave a blood trail.
- If he is carrying an injured person, he leaves a blood trail.
- If he is carrying a blood-dripping object, it leaves a blood trail.
- If the clothes of the culprit are extensively bloodstained, he discards them at the first opportunity, usually enroute.
- If he has other bloodstained objects, he gets rid of them at the earliest, usually return enroute.

19.5.2.7 Disposal Site

The culprit wants to get rid of incrimination objects. He may hide/bury the booty and their containers, the corpse or the incriminating evidence at a convenient secret place. The IO searches for the place. It is likely to carry blood, fragments of skin, flesh or bones at the site. It is possible to identify the victim definitely through DNA profiling.

19.6 COLLECTION

19.6.1 Basics/Preliminaries

When collecting blood evidence the investigating officer should:

1) Establish the location of the evidence and the position of the blood bearing article with respect to other fixed objects at the scene through videography, photographs, sketches and copious textual notes.
2) Record the direction, size and the number of stains.
3) Record the condition of the stains, whether they are dry, sticky, wet, contracting, puckering, crumbling or brittle.
4) Record whether the stains are contaminated or exposed to natural elements or heat. He records the conditions in his inspection notes. He informs the expert about these conditions in the forwarding letter.
5) Record the collection method of the stain: lifted, scraped, cut, dislodged or collected the object bearing the stain.
6) Pack bloodstains only after drying. Pack them separately from various sources in suitable vials or envelopes of appropriate sizes.
7) Preserve the purity of the stains by preventing mixing/rubbing of the stains with one another or with the container or with other parts of the article bearing the stain.
8) Preserve the relevancy/integrity/authenticity through proper packing, labelling, sealing and observing other legal formalities.
9) Maintain the continuity of the chain of possession from the time of recovery to the time of its production in the court in a custody log.

Sometimes there are a number of stains at the scene. It is difficult to make a proper selection of the stains for the collection. It is advisable to take the help of the laboratory staff in such eventuality, especially in important cases.

19.6.2 Techniques

Methods of collection of blood evidence vary with the nature of evidence and the place or article on which it is found. The following techniques cover most of the situations:

19.6.2.1 Liquid Blood

1) Liquid blood is sometimes found in blood pools at the scene. Two samples, each about five millilitres, are collected in clean vials. In one, sodium fluoride, oxalate or citrate is added and the other is kept without any preservative.
2) It is preferable to collect and send the liquid blood in sealed tubes without preservatives, keeping the tubes in crushed ice in a thermos bottle. A third sample is collected on a piece of white cotton cloth clean rag, about five cm^2. A part of the rag is left unstained which is used as control. The stain is dried and packed in a clean envelope or bottle.
3) If the blood in the pool has dried, about three grams of dried blood is collected.
4) If the blood in the pool is still sticky, some of it is picked up from the centre of the pool on a piece of cloth as stain. It is dried and packed as usual along with three grams of dried blood.

19.6.2.2 Wet Stains

The nature of the surface and quantity of the blood of the wet stain determine its collection mode. The experienced IO follows the drill:

1) Takes a clean piece of rag/filter paper and presses it against the stain. The stain is transferred to the rag. If the stain is partially dry, he moistens the piece, preferably with saline water before pressing. The piece picks up the stain. It is dried and dispatched.
2) If the stain is on a non-absorbent surface, he allows it to dry and collects the article.
3) If the stain contains sufficient liquid blood, he collects it in the same way as liquid blood, mentioned above.
4) If the blood is on an absorbent surface and has penetrated, the IO allows it to dry and collects the article.
5) If it is not possible to collect the article, for example, stains may be on earth or unpaved floor; the IO cuts the earth in a cone shape, puts the earth in a glass jar and sends it to the laboratory along with control sample of the unstained sub-strata.

19.6.2.3 Dry Stains

Dry stains are found in many situations. The IO collects them according to the situation:

1. **On clothes;** he takes possession of clothes bearing dry stains. He records the number, position and size of the stains on each. He keeps the stains separate whether they are on the same or different clothes so that they do not intermingle/contaminate one another during packing or transit.
2. **On the absorbent surface;** absorbent surfaces absorb the serum. Therefore, the IO collects stains as described in the preceding section.

3. **On non-absorbent surfaces;** the IO collect blood from non-absorbent surfaces in the following ways:
   - He collects the article; whenever possible.
   - Moistens a white clean piece of cotton rag (or filter paper) with saline water and press it against the stain. The piece picks up the stain. It is dried and dispatched with all the legal formalities
   - Moistens a piece of rag with inert gum and sticks it to the stain. The gummed rag piece picks up the stain. The piece is peeled off/dried/packs/dispatched, as usual.
4. He scrapes off the blood with a clean razor blade on to a paper and packs it in a clean envelope or vial. Ordinarily, scraping of bloodstain is not recommended, as some blood remains sticking. He collects it as in (2) or (3) above, if necessary.

On grass*;* when the blood is found on grass, the IO ties the grass with a thread. Cuts the tuft. Dries it and packs it in an envelope or glass jar. He takes care that the blood does not get dislodged in the process.

On body*;* bloodstains are sometimes found on the body of the culprit or of the victim. Their collection needs extra care to avoid contamination from the body:

- **Blood in the hair**; it is collected by combing the hair with a new fine comb. Alternatively, hair is clipped and collected.
- **Blood in the fingernails;** it is scraped out with a clean toothpick, along with a control sample from unstained fingers. The paring of nails is not done.
- Blood from other parts of the body is collected with a wet piece of clean rag or filter paper as discussed above. If the stain is adhering strongly the piece of cloth may be moistened with an inert gum solution.

There is an inherent danger of contamination in collecting bloodstain from the body. Body materials of the stain-bearing person can contaminate the collected stain. His blood sample, for control, is therefore, always collected/supplied.

19.6.2.4 Washed Blood

Laboratory staffs can locate/detect/collect traces of blood on washed clothes/surface. Their help, therefore, is requisitioned.

> *In a case of murder the scene of crime was a room with a pucca (hard) floor. The floor had been thoroughly cleaned. When the police examined the scene, no traces of blood was detected. Ultimately, the laboratory staff was requested to examine the scene. They found sufficient traces of human blood at the place where the water used for the washing of the room had collected (and dried). (CH)*

19.6.2.5 Blood Samples

Evaluation of the blood evidence requires blood samples from the victim(s) and the suspect (s). A medical officer collects them. However, investigating officer should ensure that the doctor uses unused syringes and clean containers to prevent any contamination. There should be no delay in the dispatch of the samples to the laboratory. They are properly identified, preserved (kept in a refrigerator) and dispatched. The chain of possession (custody) must remain intact (unbroken).

19.7 EVALUATION

Evaluation of blood evidence needs basic knowledge of biology and serology, proper training and ample experience. Above all the expert needs dedication, he must remain a man of science and keep up with the Joneses.

19.7.1 Basis

The evaluation of blood is based on its composition and behaviour under varying conditions. The evaluation studies relate to:

19.7.1.1 Cell structure

Blood, as already noted, is composed of red and white cells, platelets and plasma. The cells have definite shapes and sizes, which vary in different species. For example, human blood cells have characteristic non-nucleated discs (double concave) with a diameter of about 0.08 mm. Camel blood has oval blood cells. The birds, fish and reptiles have oval, nucleated and large corpuscles in their blood.

The identification of cell structure is possible in liquid blood; or, when the blood is fresh and moist, usually less than one day old. When the blood dries, the cell structure is usually damaged and it is not always possible to completely regenerate the blood cells.

A microscope is used to study the cell structure.

19.7.1.2 Haemoglobin

Haemoglobin on treatment with acids, alkalis, reducing agents or oxidizing agents gives a variety of products, which have characteristic absorption spectra of blood. They help to identify the blood.

The variations of haemoglobin used for the purpose are oxyhaemoglobin, acid and alkali haematins, methaemoglobin and cyanhaemochromogen. The absorption characteristics of these compounds identify blood.

A spectrophotometer is the instrument to study these spectra

19.7.1.3 Enzymatic activity

Blood contains *heme* in haemoglobin. It behaves like peroxidase. It catalyzes the liberation of oxygen from oxygen rich compounds like hydrogen peroxide or sodium perborate.

$$H_2O_2 \longrightarrow H_2O + \frac{1}{2}O_2$$

The liberated oxygen oxidizes certain colourless chemicals to give colour compounds. The common compounds used for colour reactions, for blood detection, are benzidine, phenolphthalein, leucomalachite green and luminol. The last gives fluorescence under UV light.

Other enzymes have been utilized to identify blood through electrophoresis' techniques. When blood is subjected to an electric field, these enzymes, due to some polarity thereon, move towards opposite charge poles. The rate of movement varies with their structure (stereochemistry), weight and electric charge of the enzyme. The pattern of separation is characteristic of blood. In fact, some blood types, based upon electrophoresis, have already been developed.

19.7.1.4 Antigens

The blood corpuscles have certain characteristic proteins called antigens. It is believed that the number of antigens is very large, over 160. They have complex stereochemical structures. If they are completely identified it may be possible to individualize the blood of a human being or of an animal through these antigens.

In addition, there are other proteins and cellular enzymes in the blood. Above 150 proteins and 250 enzymes have already been identified.

19.7.1.5 Antibodies

Corresponding to antigens, there are antibodies in the plasma (or serum). They are equally complex and large in number. They have a sort of negative relation with the antigens. For example, if a particular antigen is present in blood corpuscles, a particular type of antibody will be absent in the blood serum of that person. If the antibody is introduced in the blood, it coagulates (agglutinates) the blood cells.

Antigens and antibodies are also known as agglutinogens and agglutinins, respectively.

The study and identification of antigens and antibodies form the basis of classification of blood into various groups and their identifications by serological methods.

The most important antigens discovered so far are 'A' and 'B'. Likewise, corresponding antibodies are anti-A and anti-B, respectively. They divide the human blood into four major groups which are now internationally known as O, A, B, and AB.

Table 19.1
Presence of Antigen/antibodies in blood groups

S No	Blood group	Antigen A	Antigen B	Antibody A	Antibody B
1	**A**	**+**	**–**	**–**	**+**
2	**AB**	**+**	**+**	**–**	**–**
3	**B**	**–**	**+**	**+**	**–**
4	**O**	**–**	**–**	**+**	**+**

Note: **+** = Presence; **–** = Absence.

Further studies revealed that antigen A actually exists in a number of forms. Two of them: A_1 and A_2 can be used for further sub-classification of blood groups.

19.7.1.6 M and N antigens

Two more antigens in the blood corpuscles were discovered in the late twenties. It was found that they could be used independently of the previously known antigens. Thus, a person can have antigen M, N or both, M and N. The division of blood groups, thus, went up from, six to eighteen groups.

The scientists did not find the corresponding antibody to antigen N. Antibody to antigen M is also rare. Therefore, these antigens do not figure prominently in blood transfusions, but they are important in classification of blood.

19.7.1.7 P factor

Another antigen, named 'P', was found in the blood of certain persons, while that of others did not contain it.

Antibody relating to antigen P is sometimes found in normal human sera. Antigen P offers further sub-division of the blood groups, each of the eighteen groups is divisible into two groups, P-positive and P-negative, increasing the number of groups to thirty six.

19.7.1.8 Rhesus Groups

In the late thirties the immune sera was obtained from rabbits after injecting red blood cells from rhesus monkey. The anti-sera agglutinated about eighty five per cent of blood corpuscles of the white population irrespective of the fact whether or not they contain O, A, B or AB, M, N, MN or P antigens. The antigen responsible for this reaction was designated as Rhesus and assigned the symbol '**Rh'**. It doubled the number of existing groups.

Natural antibody to antigen Rh was not discovered in human blood. But antibodies were developed by Rh negative persons who were given Rh positive blood transfusions. The antibodies produced in human beings were of different kinds and permitted classification of blood into eight different Rh types. Thus, these antigens and antibodies brought the classification of blood to about three hundred groups.

All of these blood groups were being useful in settling the cases of disputed paternity. DNA has now taken over the task.

In addition to the above antigens and antibodies, the blood contains a host of other antigen and antibody populations. Some of the antigens are: Deigo, Duffy, Kell, Kidd, Lewis, Lutheran Xg and Yt. They are not used in the criminal justice system to any extent after the discovery of unique DNA profiles.

19.7.2 Evaluation Techniques

A number of techniques are used in the examination of blood. They involve physical, chemical and biological evaluations. The choice of techniques depends upon the nature of the evidence, *i.e.,* condition and size of the bloodstains, nature of the surface on which blood is found and the expert who may have a liking for certain techniques. The following evaluation techniques are common:

19.7.2.1 Visual Examination

Visual examination is useful to determine whether the given stain is of blood or not. Ordinarily, there is no difficulty in fresh stains but old stains may not be identifiable. The examination permits:

1. Determination of the number and size of stains
2. A rough estimate of the amount of bloodshed
3. The direction from which the blood has fallen is found from the tip of the elongated stain. The tip of the elongation points out the direction of movement of the person.
4. The shape of the stain indicates the height from which the blood has fallen.
    - Bloodstains from a height of up to 50 centimetres are round sharp edges.

- Bloodstains from a height of 50 to 150 cm have small spike like projections along the edges.
- Bloodstains fallen from a height over 150 centimetres have corrugated edges.

5. From the positions of the stains, the movement of the victim and the culprit can be determined. If bleeding culprit runs away, he can be tracked/followed through bloodstains.
6. The degree of fluidity, dryness and changes in colour permit rough estimation of the age of the stains.
7. Gross foreign matter like hair, flesh, bones in the blood may indicate the body part from which the blood has come.

   A magnifying glass improves the visual examination.

19.7.2.2 UV and IR Examination

Ultraviolet or infrared rays reveal washed or 'invisible' bloodstains from clothes, furniture, earth, floors, walls doors or windows. They also reveal stains on coloured garments or on painted surfaces. They help to reveal minute blood traces in various forms; streaks, spray, tiny fragments, etc.

19.7.2.3 Microscopy

Microscopic examination of bloodstains is important in many situations:

1. Species of origin of fresh bloodstains is established through microscopic studies and micro-measurements in some cases.
2. The part of the body from which the blood has come is found out from the nature of body matter associated with the blood. Thus, blood from nose, mouth, vagina or anus can be identified.
3. Diseases like leukaemia or syphilis can be detected microscopically.
4. Menstrual blood may be identified in some cases.
5. Blood from an infected site can be identified through the presence of puss.

Staining techniques, spectroscopic tests and some micro-chemical tests for blood evidence also use microscopy.

19.7.2.4 Spectroscopy

Spectroscopic examination of blood is convenient and useful. The test is usually carried out microscopically.

The blood haemoglobin is changed in two or three forms on the slide itself and characteristic absorptions are observed. Usually alkali haematein (obtained by treating the stains with ammonium sulphide) and cyanhaemochromogen (obtained by treating the above haematein with potassium cyanide) are studied for their characteristic spectra.

19.7.2.5 Spectrophotometry

Like some other methods, spectrophotometry can be used to identify blood. Absorption at certain wavelengths indicates the origin of the stain. Spectrophotometry is especially useful for disintegrated blood and when only small quantities of blood are available. Absorption in the

lower range (UV range) is more useful. Spectrophotometry has also been used to estimate the quantities of blood.

19.7.2.6 Chromatography

Ascending paper chromatography, using acetic acid, methanol and water solvent system has been employed to study the R_f values.

19.7.2.7 Electrophoresis

The electrophoresis techniques are of great importance. They are being used for the separation of various enzyme systems. They are used to study the body proteins. They are indispensable in DNA profiling to individualise humans and to identify animal species.

19.7.2.8 Colour Tests

Colour tests are the first series of tests employed after the location of the stain. If a questioned stain gives positive colour reactions in any two colour tests, the stain is possibly a bloodstain. If it fails to give colour reactions, in all probability it is not a bloodstain.

All these tests are highly sensitive and simple. Even an investigating officer can perform the test at the site himself. The tests are:

a. **Benzidine test**; The reagent is a solution of benzidine (0.1g.) and dry sodium perborate (0.2 g.) dissolved in glacial acetic acid (10 ml). It is sprayed over the stain. Appearance of deep blue colour indicates blood.

b. **Leucomalachite Green test** The reagent is a solution of leucomalachite green (0.1 g), sodium perborate (0.3 g) in 65% glacial acetic acid. When the reagent is applied to the stain, intense green colour if it is a bloodstain.

c. **Phenolphthalein test;** the reagent is reduced phenolphthalein (1 g) and sodium perborate dissolved in acetic acid (100 ml.). On application to the stain pink colour formation indicates blood.

19.7.2.9 Luminol Test

The preparation and application of luminol has already been described above.

All colour reactions, excluding luminol, are likely to make the bloodstains unfit for other confirmatory tests. Therefore, a small amount of bloodstain is taken up by pressing a wet filter paper to the stained area. The picked up stain is tested for blood. Alternatively, a small amount of stain is scraped on to a watch glass and tested.

Control tests, to check the substrata, are carried out simultaneously under identical conditions.

19.7.2.10 Crystal Tests

Two crystal tests are commonly employed. They are specific for blood but they are not sensitive. They often fail if the conditions are not rigidly controlled, or, if the blood is disintegrated or contaminated.

1. **Teichmann Test:** A dry crust or smear of blood is taken on a slide, treated with a drop of a solution of potassium iodide, bromide or chloride (0.1 g) in glacial acetic acid (100 ml). It is covered with a cover slip. On warming, it gives out bubbles if it is blood.

Typical haemin crystals are observed under the microscope. Heating may have to be repeated a number of times.

2. **Takayama Test:** The Takayama (Hemochromogen) test uses Takayama reagent which is a solution of the following:
   - One volume (say 10 ml) of glucose solution (10%),
   - One volume of potassium hydroxide solution (10%),
   - One volume of pyridine, and
   - Two volumes of deionised Water

   On warming, the dry blood-crust with the reagent gives characteristic crystals.

   Takayama test is specific for haemoglobin. The reagent forms insoluble, pink, needle-shaped crystals of hemochromogen. The main reactions involved are:
   - Sodium hydroxide releases the heme from the globin through alkaline hydrolysis.
   - Glucose reduces the heme iron, and
   - Pyridine combines with it to form the product, pyridine ferroprotoporphyrin.

19.7.2.11 The Precipitin Test

The test identifies the species of the bloodstains. It is a very delicate test and requires only small amounts of blood.

Antisera for human and common animals are prepared by injecting human or animal blood in rabbits (or other animals or birds) periodically, a number of times. When sufficient immunization has taken place, the animal is bled and its serum is collected. The serum contains antibodies relating to the blood injected.

When the anti-serum is brought in contact with corresponding blood, precipitate is formed at the point of junction. The white precipitate identifies the same species.

The reaction is performed using a sample, micro and capillary tubes, cavity slides or tiles having cavities. The precipitin reaction can also be carried out by electrophoresis. The most convenient mode is, however, the gel diffusion technique. Agar gel is spread over a microscope slide and seven wells are created in the gel, one in the centre and six in the six corners of a hexagon. The sample to be tested is placed in the central well. Antisera for different species are placed in the six wells. The antigen and antibodies are allowed to diffuse first in an incubator and then at room temperature. White precipitate is formed in the gel where the antigen sera meet the corresponding antiserum, which identifies the species of the questioned blood sample.

No precipitate is formed with other antisera. Control tests with blank and known blood are carried out under similar conditions.

A dilute blood solution is used for precipitin reaction. The antisera are not diluted. The blood solution and anti-sera should be free from turbidity and contamination.

The precipitin test is highly sensitive, specific and rapid. Bloodstains as old as fifteen years gave a positive reaction. Tests performed on Egyptian mummies (about 5000 years old) were also positive.

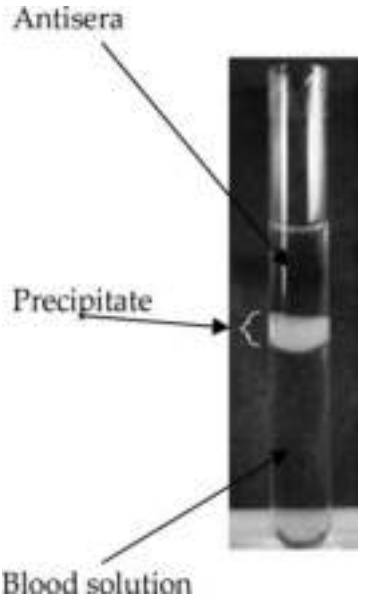

Fig. 19.7
Precipitin Reaction

19.7.2.12 Blood Grouping Techniques

Blood grouping techniques depend upon the existence of antigens and antibodies in human blood. There are two antigens and two antibodies which divide the blood into four groups. Their distribution is given in the table below:

The reactions of the antigen and antibodies permit the identification of the blood groups.

Table 19.2

Anti-body – Antigens Reactions

Antibody	**Antigen**			
	O	**A**	**B**	**AB**
Anti-A	–	+	–	+
Anti-B	–	–	+	+
Anti-A &Anti B	–	+	+	+
Anti-H (from Gorse)	+	–	–	–

Note: + =Agglutination; – = No agglutination.

A number of techniques are used to carry out the antigen-antibody reactions. In the past few decades very sensitive methods have been developed by which blood attached to even one millimetre long fibre of ordinary cotton cloth can be successfully grouped. The techniques vary and it is beyond the scope of this book to discuss them in detail. Besides the DNA profiling reduced the utility/use drastically

Direct methods involving mixed agglutination, or absorption-elution techniques are more popular. They are simple in principle and practice, but need experience. They may give unsatisfactory results with novices.

19.7.2.13 Mixed Agglutination

The antigen of the questioned sample is flooded with antisera. Excess is removed after some time by washing. Known indicator cells are then introduced. The indicator cells corresponding to the original antigen get attached.

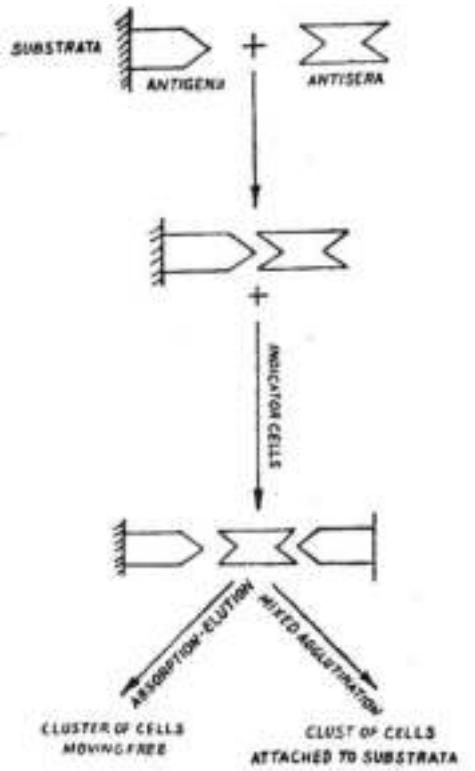

Fig. 19.8
Schematic representation of antigen-antibody reaction in absorption-elution and mixed-agglutination techniques

19.7.2.14 Absorption-elution Method

Absorption elution method involves the following steps:

1. Prepare Anti-A, Anti-B and Anti-H sera of 1: 256 to 1: 512 titre value.
2. Prepare 0.5% cell suspension of A, B and O cells.
3. Fix stain-bearing thread (2-3 mm) on a cellulose acetate sheet along with known blood stains and control cloth fibre, with an adhesive.
4. Add one drop of appropriate anti-serum on each thread.

5. Incubate in a moist chamber at 4° C for 12 hours.
6. Wash off the excess anti-sera with cold saline 6 times.
7. Blot dry the sheet with filter paper.
8. Add one drop of 0.5% indicator cells to each thread.
9. Incubate the sheet at 56° C for 15 minutes in moist chamber.
10. Rotate the sheet for 30 minutes and read the agglutination under a microscope. If cells of group 'A' are agglutinated, the original blood belongs to group 'A' if cell of 'B' group are agglutinated, the original sample is of group 'B' and so on.

Kind has suggested a slightly modified method for the same.

Absorption-elution technique is useful for the detection of A, B, H, M, N, and other antigens.

The following points are kept in view:

1. The original sample is properly fixed.
2. Absorption should take place at optimum conditions. High temperature may denature the antigen and prevent absorption.
3. The antisera should be of correct strength (avidity).
4. Proper washing is needed. Excessive washing causes elution while in-complete washing does not remove the antisera completely.
5. Indicator cells should have a low concentration (less than one per cent.)

In micro techniques, still lower concentrations are used.

19.7.2.15 Blood Grouping from Antibodies

Blood grouping is usually carried out with the antigens present in the bloodstain. But antibodies can also be used for the purpose.

Antibodies are labile and are destroyed comparatively more easily. When fresh blood is available in sufficient quantity, antibodies in the serum can be used similarly in antibody-antigen reactions.

19.7.2.16 Pitfalls

There are many pitfalls in blood grouping including the following:

1. **Imperfect Antisera:** Imperfect antisera will give misleading results.
2. **Auto-agglutination:** Auto-agglutination is clump formation in the blood extract without adding the antiserum. This can be due to many reasons.
3. **Pseudo-agglutination:** Pseudo-agglutination is the apparent clumping of cells when cell concentrations or serum strength is more than required. On dilution the clumps break up. The blood behaves normally.
4. **Bacteriogenic Agglutination:** Bacteria may cause bacteriogenic agglutination. If blood samples or their solutions are kept in a humid climate and at appreciable temperature the bacterial growth takes place which gives non-specific reactions.
5. **Atypical Antibodies:** Atypical antibodies are found only in a few blood sera. They interfere in the antigen-antibody reaction.

In view of the above, it is essential that blood grouping is carried out under optimum conditions and in addition to using duplicate samples, control and blank samples must also be used. The high sensitivity of the methods requires the highest degree of cleanliness and strict control of the reaction conditions.

19.8 SPECIAL PROBLEMS

19.8.1 Foetal Blood

Foeticide is a serious problem in India. Identification of the foetal blood assumes importance to fix the guilt of the culprit. Foetal blood has Y peptide, which is not present in venous blood of the grown up person. Its identification identifies the foetal blood. The y peptide is identified with anti-sera for foetal blood.

19.8.2 Menstrual Blood

Menstrual blood has the property that it does not coagulate to form clots because the fibrinogen in the blood gets degrades. The identification of the degradation products identifies the menstrual blood. Alternatively, it can be identified from the presence of proteins LDH 4 and LDH 5 which are not present in the venous blood.

19.8.3 Blood in Debris

Dust and debris may contaminate blood. It can be tested only after purification. The technique evolved for the purpose is:

The debris is placed in a beaker and covered with water. A filter paper strip is placed vertically with the lower end dipping in the water contained in the container. Blood solution moves up due to capillary action. It gets concentrated near the upper end of the paper strip. The blood, thus recovered, is examined and tested.

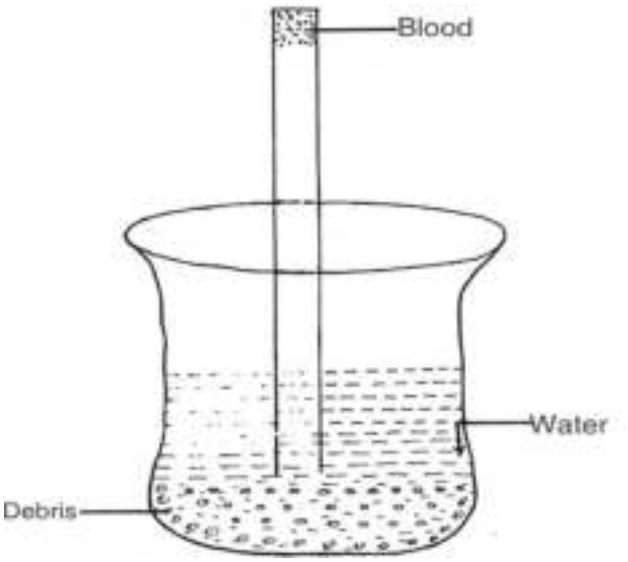

Fig. 19.9
Blood from Debris

19.8.4 Age of bloodstains

The colour and appearance of blood change with time. Also, blood diffuses in permeable surfaces. The extent of diffusion and the colour change can give some idea of the age of the stain.

19.8.5 Disputed Paternity

Cases relating to disputed paternity were not frequent in India due to social, cultural and religious customs and beliefs. Now the number of such cases is increasing.

Blood groups in children are inherited from their parents according to Mendelian hereditary law. Consequently, if blood groups of father and mother are known it is possible to ascertain what could or could not be the possible blood groups of the child in most of the cases. For example, if the father and mother belong to the group 'O', the child has to be of group 'O' only. He could not have A, B or AB blood group.

Table 19.3
Blood Group Inheritance[5]

S. No.	Parent 1	Parent 2	Child
1	A	A	A, O
2	A	B	A, B, AB, O
3	A	AB	A, B, AB
4	A	O	A, O
5	B	B	B, O
6	B	AB	A, B, AB
7	B	O	B, O
8	AB	AB	A, B, AB
9	AB	O	A, B
10	O	O	O

Antigens M and N are also inherited like antigens A and B.

M, N and MN type of a child can thus further help to include/exclude paternity.

Table 19.4
M-N Types and Heredity

S.No	Parent type	Children types
1	M and M	M
2	M and N	MN
3	M and MN	M, MN
4	N and N	N
5	N and MN	N, MN
6	MN and MN	MN, M, N

5. It is based on Mendelian law of inheritance. In some rare cases, the law is not obeyed.

Human Leukocytes Antigen (HLA) test has also been utilised for determining paternity. It involves certain antigens found in white cells. If the HLA test is positive, the chances of the person being father are 90%. A, B, O grouping increases the probabilities further. However, the use of DNA is more accurate in determining paternity. It is now being used universally. It is also more expensive than HLA typing.

We now know that they are determined by genes on chromosome 9, and they do not change as a result of environmental influences during life. An individual's ABO type results from the inheritance of 1 of 3 alleles (A, B, or O) from each parent.

Rhesus factors in blood have also been utilised in disputed paternity cases. However, the techniques especially the preparation of antisera is cumbersome, which has prevented the general use of these factors in paternity cases.

The paternity tests discussed above are now only of academic interest. DNA profiling offers better and infallible determinations. It is used all over the world almost invariably for the purpose, now.

19.8.6 Secretors

The discovery of blood group substances in other body fluids such as saliva, mucus, semen etc. has extended the field of serology. About eighty per cent of the human population secretes blood group substances in their secretions. Saliva and semen are especially rich in these substances. They contain about four times these substances as compared to the blood of the same volume. The substances are water-soluble and are interfered by cellular material present in the secretions. They are grouped by the mixed agglutination techniques.

A person, who secretes the blood group factors in his body fluids, is called a secretor, the one who does not, is called a non-secretor.

A lady passenger, found unconscious in a first class railway compartment, was removed to hospital where she was declared 'brought dead'. A few small bloodstains on her clothes were of, group A, while her own blood group was B. Only one of the four suspects had blood of group A. Saliva on the cigarette stubs found in the ashtray in the compartment was also of A group. (CH)

19.8.7 Miscellaneous

1. **Parts of the Body;** it is sometimes necessary to know from which part of the body the blood has come. It is possible only if the blood is found contaminated with particular secretions, hair or skin from the part of the body having identifying features. For example, nasal blood is identified through nasal mucus. Similarly, menstrual blood is identified from the presence of degradation products of fibrinogen.
2. **Quantity of blood shed;** it is estimated from the dried blood, which is found at the spot.
3. **Bloodstain spatter pattern;** it is useful to reconstruct the sequence of occurrence. The blood drops can lead to the place or places visited by the injured victim or the culprit.
4. **Presence of disease**; its determination may authenticate the claim for diminished responsibility for the death of the victim. The disease organisms are examined microscopically, by staining techniques and by biological methods.
5. **Presence of poison/intoxicants**; the presence of alcohol, carbon monoxide and other poisons in the blood are important clues in criminal investigations. They have already been discussed above.

19.9 PRESENTATION

The presentation of blood evidence does not offer any particular problems. Forensic Serologist presents it in the form of a report, which is admissible under section 293 of the Code of Criminal Procedure, 1973 of India. The court can, however call the Serologist for personal presentation; or for further elucidation, etc.

The presentation of blood evidence has the following important aspects:

1. The discovery and recovery of the evidentiary clues
2. The relevancy, authenticity, Integrity and intact chain of custody
3. The techniques of evaluations used in the analysis are standard and accepted by the serology fraternity.
4. Both positive and negative evidence considered
5. The report emanates from a qualified/dedicated/experienced and honest Serologist
6. Conclusions based upon generally accepted standards and adequate data
7. Adequately illustrated and convincing presentation

The investigating officer presents the discovery and recovery of the clue materials. He proves that the recovery of the evidence has been done with all the legal formalities, that the evidence is relevant, that its identity and integrity are beyond reasonable doubt and that its chain of possession is intact. He may support his proof with sketches and photographs wherever necessary. He produces seals, documents and identification marks to establish the true identity and intact chain of possession for the whole period.

The serologist uses and indicates that he has used the latest recognised tools and techniques and generated adequate and proves that the data produced is standard, recognised by the professionals in the field as sufficient to arrive at the conclusions he has arrived at.

The report he produces, has naturally to be concise. But it must be precise and intelligible. It contains details relating to the nature of the exhibits, their number, their description, etc. He describes briefly, the tests carried out, the observations made and the conclusions arrived at. He identifies the exhibits through his initials and marks, when required.

The presenting counsel organizes the presentation in an orderly way; the defence counsel brings out the lacunae, if any. The court ensures to get the whole truth and nothing but the truth. He maintains the decorum of the court.

19.10 CASE LAW

19.10.1 Taking Samples of Body Fluid[6]

Author's Summary

The defence took the plea that taking or examination of blood/semen is not covered under section 53 and it is against Article 20(3) of the constitution. The Court rejected the plea.

Highlights italicised

Relevant Extracts (Verbatim)

> The further objection of Sri Ayyapu Reddy was that taking samples of blood and semen does not come within the scope of examination of the person of the arrested person. The

6. *Ananth Kumar Naik v State of Andhra Pradesh*, 1977 Cr LJ 1797 : (1977) 2 Andh WR 437 : 1977 Mad LJ (Cri) 514.

said words take in only physical examination of the body. I cannot agree. Examination of a person by a medical practitioner must logically take in examination by testing his blood, sputum, semen, urine, etc. To a question put by me,

Sri Ayyapu Reddy has said that taking an x-ray photograph or electrocardiograph is not excluded from the examination of the person of the arrested person. When that much is conceded, I see no reason why the examination of blood and semen is outside the scope of section 53.

In B. Rami Reddy v State of Andhra Pradesh,[7] *Madhava Reddy, J. held that the signature of an arrested person can be taken for comparison and article 20(3) of the Constitution does not stand in its way.*

Justice Ramachandra Raju likewise held in M. Narayanaswami v V. Yangatanna,[8] *that taking thumb-impression of an arrested person is not precluded by a Article 20(3).*

For these reasons, I cannot agree that the impugned direction that the blood and semen samples of the petitioner should be taken comes within the mischief of testimonial compulsion.

The next argument was that taking samples of blood and semen inflicts torture and pain on an under trial prisoner and it was tantamount to an offence against the accused. It was further argued that there was no provision in the Code of Criminal Procedure to compel undertrial prisoner to give samples of blood and semen.

What I have stated above shows that under sections 53 and 54 of the new Code there is such a power. In fact section 53 provides that while making such an examination such force as is reasonably necessary for that purpose may be used. Therefore, whatever discomfort that may be caused when sample of blood and semen are taken from an arrested person it is justified by the provisions of sections 53 and 54, Code of Criminal Procedure.

19.10.2 Bloodstains[9]

Author's Summary

The identification of bloodstains was corroborated by a plethora of other evidence, bloodstained knife and bush shirt and extra-judicial confession.

Highlights italicised

Relevant Extracts (Verbatim)

Furthermore, their identifications are corroborated not only by the evidence of Takalya to whom the appellant had made an extra-judicial confession, but also by the evidence of the recovery of a blood stained knife and a blood-stained "bush shirt" at the pointing out of the appellant. The appellant had also some injuries on his person which had resulted from the scuffle. Their duration coincided with the time of the occurrence. He had also some bloodstains on his clothes which he could not explain.

The bloodstains on the objects mentioned were of the same group as either that of the deceased or of his wife. The accused's blood grouping is different. After examining the whole evidence, there is not a shadow of doubt left in our minds that the appellant had committed the dastardly attack.

19.10.3 Blood Group Identifies the culprit[10]

It will be recalled that head constable Gajanan Salokhe seized bloodstained shirt (article 1), handkerchief (article 2), "Banian' (article 3) and half pant (article 4) from the person of the appellant and also took clippings of his nails (article 5) as they were also suspected to be stained

7. (1971) 2 Andh WR 94 : (1971) 2 AP LJ 174 : 1971 Cr LJ 1591 (AP).
8. AIR 1975 AP 88 : (1974) 2 Andh WR 365 : ILR 1975 AP 578.
9. *Ramesh Ramdas Teli v State of Maharashtra*, AIR 1976 SC 345.
10. *Rau Chima Chougule v State of Maharashtra,* AIR 1977 SC 2407 : (1977) 4 SCC 518 : 1978 Cr LJ 14.

with human blood. As has been stated the chemical examination showed that while the appellant's blood was of "A" group, the blood of his son-in-law Shivaji was of "AB" group and the blood of his daughter Vijaya was of "A" group. The appellant's short and the clippings of his nails were found to be stained with human blood of "B" group, while his half pant (article 3) was found to be stained with human blood of "A" group. The High Court was therefore quite justified in reaching the conclusion that it was the appellant who had committed the two murders.

19.10.4 Presence of bloodstains on clothes corroboratory evidence[11]

Then there is also the evidence of recovery of bloodstained clothes from accused Nos. 1 and 3. The clothes were found stained with human blood and the explanation given by accused Nos. 1 and 3 for the presence of blood on the clothes can hardly be said to be convincing. Of course, this cannot be regarded as a conclusive piece of evidence for incriminating accused Nos. 1 and 3, but it is certainly a piece of evidence which goes to support the other evidence about the guilt of accused Nos. 1 and 3.

19.10.5 Recovery of Bloodstained Kassi[12]

For raising a presumption of guilt against the accused for offence of murder the ownership of the weapon of offence cannot be said to be of much importance. The matter of consequence is possession and its use by the accused. When accused failed to give an explanation for his possession of the bloodstained "Kassi" (spade) a weapon, which if used against the deceased could have caused the injuries found on her person, notwithstanding that the bloodstains found over it had not been established to be of human blood, yet

Its recovery construed a strong circumstance against the accused, 1972 Cr LJ 744 (SC); 1959 Cr LJ 90 (SC) and 1956 Cr LJ 790 (SC) relied on.

The evidence of identification of an article at the trial is the substantive evidence and the identification of the same article by the same witness, at the time of test identification, is only a corroborative piece of evidence.

19.10.6 Blood Trail[13]

Author's Summary

The defence version that the victim was injure somewhere far away from the house where blood trail was found. The finding of the doctor that the victim could not walk to reach the house negated the version. He carried to the place while still alive Dripping blood created the train

It was argued with great vehemence in the High Court as well as in the Court of Sessions that there was a trail of blood from the front door of the house of the vakil into the rooms marked H in the plan and that supported the defence theory that the deceased Kannan received the stab injuries not in or near the house in question but somewhere far away near the railway station. The High Court took the view that if Kannan had received the injuries somewhere outside the house it is impossible for him to have come into the room in view of the doctor's evidence.

11. *Namdeo Daulata Dhayagude v State of Maharashtra,* AIR 1977 SC 381 : (1976) 4 SCC 441.
12. *State of Rajasthan v Nanu Ram*, (1978) Cr LJ (NOC) 80.
13. *Marachalil Pakku v State of Madras,* AIR 1934 SC 648 : 1954 Mad WN 670 : 1954 Cr LJ 1668 (SC).

It was concluded on the material placed on the record that there could be no room for doubt that Kannan received injuries in the room itself and not outside, and that he was carried out of the room while life was still lingering and therefore there would be dripping of the blood from the body during the course of transit as the injuries were very serious and vital arteries had been cut.

19.10.7 Blood Pool[14]

Author's Summary

The facts that though the victim had 2 injuries, there was no blood at the site where body was found, nor on the cot which was used to carry the victim; nor there was any blood trail anywhere, indicated that the crime scene was fake.

Relevant Extracts

The evidence shows that although two injuries were caused and one of the questions which had been raised by the defence was that there was no blood at the spot, no attempt was made by the prosecution to show the reason why there was no blood at the spot. It is significant to notice that blood was not found at the spot. There was no blood on the cot on which the dead body of Chaggar Singh was carried, nor was there blood in the compound where the dead body was lying nor a trail of blood to the house.

The learned judge was not satisfied that the occurrence actually took place near the '*Haveli*' of Dial Singh.

19.10.8 Collection[15]

Author's Summary

The court rejected the evidence of the bloodstained article because they were not sealed and sent immediately to the laboratory. It created element of manipulation/padding.

Relevant Extracts

1. I would have attached great importance to the evidence of the imperial serologist in regard to the detection of blood-stains on the trousers and the shirt which the appellant was wearing at the time when he was arrested, but I feel impressed by the argument advanced by the learned counsel appearing as *amicus curiae* in this case that the delay in dispatching these articles to the chemical examiner and the absence of the evidence that these articles were sealed and despatched in the presence of the appellant and respectable witnesses is fatal to the prosecution so far as this point is concerned. As has been indicated in paras 2 and 4 above these articles were seized from the person of the appellant on evening of 17th Phagan 2006 at Thana and they were packed, sealed and despatched to the chemical examiner on 22nd Phagan, *i.e.*, six days after they had remained in the possession of the police. Where is the guarantee that these clothes were not tampered with during this long interval? In a similar case reported in [J&K LR 37 (A)] the learned Chief Justice, the late Mr. Justice Rachhpal Singh observed as follows at page 42.

In a case like this what happens generally is that the police immediately in the presence of witnesses takes possession of the articles containing bloodstains and at once seals them so that it is not open to the accused to come out with the defence that these bloodstains might have been

14. *State of Punjab v Behari Lal Pahu Lal*, AIR 1953 P&H 218 : 55 Punj LR 221 : 1953 Cri LJ 1427.
15. *Abdul Salam v State of Jammu and Kashmir,* 1953 Cr LJ 1865 : 10 J&K LR 94.

placed there by the police. In the present case the door leaves were for several days in the custody of the police and it is possible that somebody connected with the prosecution might have placed these stains on them.

The observation is fully applicable to this case. The learned counsel for the appellant has rightly drawn our attention to this glaring defect and I am afraid it would not be correct to exclude the possibility of the stains having been put subsequently on the clothes in this case. As it is, these stains cannot furnish any corroboration of the retracted confession. Apart from it, the appellant had more than 24 hours to wash his clothes and remove the stains. It is not the prosecution story that the idea did not occur to him. On the other hand the story for the prosecution is that the appellant had washed his *Loi*, Ex. P. 3, during the interval. It is therefore strange that he should not have washed his shirt and trousers and wandered about with these clothes on.

19.10.9 Relevancy[16]

Author's Summary

The chemical examiner, in a murder case, found bloodstains on the clothes recovered from the house of the suspect. However, the Serologist failed to identify the stains as human bloodstains. Stains provided no evidence!

Relevant Extracts (Verbatim)

The discovery of a blood-stained piece of cloth from the house of the appellant leads to no conclusion against him on the charge of murder. While the chemical examiner found blood on it, the imperial serologist could not say that it was human blood. The discovery of one or more dhotis with some stains of blood which are not ascertained to be human blood, five months after the alleged murder cannot be stated to be evidence of murder against the appellant. The Sessions Judge was quite right in observing that if some bloodstains are found on clothes of persons engaged in cutting roots and working in the jungle they cannot be put down as evidence of murder. The *dhoti* seized from the appellant's brother, Motiram was not even found in the possession of the appellant. Under the circumstances, the evidence classified under the fourth head is of no assistance to the prosecution.[1]

19.10.10 Blood Group establishes incident at the spot[17]

Author's Summary

The presence of the blood groups belonging to the injured and the deceased on the various exhibits lifted from the spot conclusively establishes that the incident had taken place at the spot from where the exhibits were lifted.

The FSL reports show that human blood of 'B' Group was detected on gauze cloth piece (lifted from the spot); human blood of 'AB' Group was detected on gauze cloth piece (lifted from the back tyre of motorcycle); human blood was detected on cemented piece (blood stained earth); blood was detected on control cemented piece (earth control); human blood was detected on shirt (shirt of accused); human blood of 'AB' Group was detected on Baniyan (Baniyan of injured); human blood of 'AB' Group was detected on shirt (shirt of injured); human blood

16. *Tulsiram Karu v State*, AIR 1954 SC 1 : 1953 SCJ 612 : 1954 Cr LJ 225 (SC). See also *In re Periyaswami Theven*, AIR 1950 Mad 714.
17. *Anil Kumar v State,* 2018 (4) ADR 168.

of 'AB' Group was detected on pants (pants of injured); human blood of 'AB' Group was detected on handkerchief (belonging to injured); human blood of 'B' Group was detected on Baniyan (belonging to deceased); human blood of 'B' Group was detected on pant (belonging to deceased; human blood was detected on shirt (belonging to deceased) and human blood of 'B' Group was detected on gauze cloth piece (blood sample belonging to deceased). It therefore stands established that the blood group of deceased was of 'B' Group and of the injured was of 'AB' Group. The presence of the blood groups belonging to the injured and the deceased on the various exhibits lifted from the spot conclusively establishes that the incident had taken place at the spot from where the exhibits were lifted.

19.10.11 Blood grouping not established — Significance of medical evidence[18]

Author's Summary

On a serological analysis of jeans, though human blood was detected, but the blood grouping could not be established. However, the forensic evidence cannot be examined in isolation. The medical evidence is also of great significance.

Relevant Extracts (Verbatim)

It has been argued on behalf of the appellants that the trial court failed to consider the fact that the FSL report is in favour of the appellant. It is a matter of record that on a serological analysis of the jeans of the appellant, though human blood was detected, but the blood grouping could not be established. In other words, due to "no reaction", the human blood of group 'B' found on the clothes of the deceased, could not match with the blood on the jeans of the appellant. Similarly, though human blood was found on the weapon of offence, i.e., knife, there was "no reaction" as to the blood group. However, the forensic evidence cannot be examined in isolation. The medical evidence is also of great significance. In the instant case, the doctor, who had proved the post-mortem report, has opined that the death was homicidal, caused by the severe injuries on the person of the deceased. The severe injuries on the body of the deceased as recorded in the medical evidence lends credence to the testimony of the eye witness, as to the ruthless manner in which the deceased was done to death by the accused persons.

19.10.12 Slovenly Reports[19]

Author's Summary

Courts found the reports of the chemical examiners slovenly/perfunctory. They gave guidelines to write proper reports; to avoid miscarriages of justice.

Relevant Extracts (Verbatim)

The chemical examiner's report about the bloodstains is slovenly and perfunctory and we have noticed with regret the same slovenliness in the reports of other chemical examiners in some other cases that have come before us. *The chemical examiner's duty is to indicate the number of bloodstains found by him on each exhibit and the extent of each stain unless they are too minute or too numerous to be described in detail.*

18. *Himmat Singh v State (Government of NCT),* 2019 (3) ADR 562.
19. *Prabhu Babaji Navle v State of Bombay*, AIR 1956 SC 51 : 1956 Cr LJ 147.
Also See: *Ramprashad v The State of Bhopal*, AIR 1953 Bho 17 : 1953 Cr LJ 702.

Merely to say that blood was detected on an exhibit, as this report states, is not enough. It may well lead to miscarriage of justice compelling judges to acquit when they would have convicted had the report been more revealing. We trust these observations will be brought to the notice of all chemical examiners in this country. Not that they all act like this. Many give full and detailed reports as they should.

19.10.13 Disputed Paternity[20]

Author's Summary

The case discussed in this judgment is old, somewhat redundant. The DNA technology provides definite answer, either way, in disputed paternity. Further, Case Law permits taking of blood samples for determination of paternity. ND Tewari's (a prominent politician of UP) case has cleared the law point.

Relevant Extracts (Verbatim)

The points for exposition in this revision are five in number *viz:* (a) technique of blood test; (b) the value of blood test; (c) the law on this subject in various countries; (d) how far such order could in criminal cases be held to be testimonial compulsion offending article 20(3) of the Constitution; and (e) how far this compulsory blood test can be extended to proceedings under section 488, Code of Criminal Procedure.

Point (a): The blood group of a person is determined by the characters which it contains. It must contain at least one character of each set and the characters are inherited according to fixed rules. A child cannot have a character which he does not inherit from one or other of his parents.

The technique of this blood grouping has been developing with the passage of years, and a vast literature on this subject has now sprung up. The gist of which can be studied in the authoritative treatises on medical jurisprudence and cannot be further dealt with here.

Point (b): The value of the test is however limited. Glaister has the following to say:

> *Its use for the determination of paternity is of value on account of the Mendelian inheritance of the individuality of the blood by the offspring of a given mating. Although the true father can never be definitely identified by the test, it can frequently be asserted that a certain man could not be the father of the child in question. A man who fails in repeated blood grouping tests can definitely, and without doubt be eliminated as the father. The test is also of importance when a child is claimed by two sets of parents.*

Gonzales, etc. states:

> *The tests, however, have their limitation; they may exclude a certain individual as the possible father of a child but they cannot possibly establish paternity. They can only indicate its possibilities. Another man with the same group as the father could be responsible for the child in question.*

Lyons had the following to say:

> *The negative finding is definite while positive finding indicates a possibility only. It can be stated definitely that Master Tom is not the son of Mr. Smith. It cannot be stated equally definitely that he is the son of Mr. Brown. That he can be the son of Mr. Brown is all that can be stated on the positive side. The remarks apply to Mrs. Smith and Mrs. Brown regarding motherhood.*

Wigmore on Evidence (3rd Edn.) in Vol. I, section 165A, (p. 610 and following) sums up blood groups as evidencing paternity, as follows:

> *In one specific biological trait, viz., blood-groups, scientific opinion is now in accord in accepting the fact that there is a causative relation between the trait of the progenitor and the trait of the progeny. In other words, the blood- composition of a child may be some evidence as to*

20. *Subayya Gounder v Bhoopala Subramanian*, AIR 1959 Mad 396 : (1957) Mad LJ (Cri) 822 : 1959 Cr LJ 1087 (Mad).

> *the child's paternity. But thus far this trait (in the present state of scientific discovery as generally accepted) can be used only negatively, i.e., to evidence that a particular man is not the father of a particular child C. The biological data that permit this inference are complex..... The progress of science will no doubt make it possible from time to time to increase the range of the cases that afford decisive proof, both negative and affirmative. Already, by judicial decision or by statute, the law has accepted the use of blood-group composition to evidence paternity negatively, – of course, only when testified to by a qualified expert.*

Point (c): The law on this subject in various countries can be studied from the valuable monograph published by Schatkin on '*Disputed Paternity Proceedings*'. 3rd Edn., Second Reprint 1956 (U.S.A.) (Mathew Bender and Co. 443, Fourth Avenue, New York, N.Y.) in Chapter VIII (p. 193 and following): In the United States of America, New York was the first state to authorise blood test in disputed paternity cases (Laws of 1935, Chapters 196, 197, 198, in effect March 22, 1935; as amended by laws of 1930, Ch. 439, section 1, in effect May 4, 1936). Nine other states have followed suit. All ten statutes are substantially the same. It runs as follows:

> *Whenever it shall be relevant to the prosecution or the defence in an illegitimacy action, the trial court, by order, may direct that the complainant, her child and the defendant submit to one or more blood tests to determine whether or not the defendant can be excluded as being the father of the child. The result of the test shall be receivable in evidence "but only in cases where definite exclusion is established. The test shall be made by a duly qualified person, or persons, not to exceed three, to be appointed by the court and to be paid by the country. Such experts shall be subject to cross-examination by both parties after the court has caused them to disclose their findings to the court or to the court and jury. Whenever the court order such blood tests to be taken and one of the parties, shall refuse to submit such test, such fact shall be disclosed upon the trial unless good cause is shown to the contrary.*

Brief as it is, the above statute covers the following important points:

a. The result is admissible in evidence only when the exclusion is established.
b. The expense of the test is made a county charge.
c. The test may be performed, not only by a physician, but also by any qualified pathologist.
d. The refusal of the mother (or defendant) to submit to the test may be drawn to the court's attention.

In Denmark, since 1937 the test has been compulsory by statute in affiliation cases, and it is today ordered as a routine matter in such cases. In Germany, prior to the Nazi regime, an average of 10 per cent of the children born each year were illegitimate, and under the aegis of National Socialism, this proportion no doubt increased. All children born out of wedlock are by operation of law automatically placed under State Guardianship. Under German law the defendant in an affiliation suit is presumed to be the father of the child if it is established that he cohabited with the mother during the statutory period of conception. This statutory period of conception lies between the 181st and the 302nd day (both inclusive), preceding the birth of the child. There are only two defences available to the accused (1) that conception by him was "obviously impossible under the circumstances (for example, if he can show that he was sterile); and (2) he may raise the legal defence of exception plurium that another man also cohabited with the mother during the legally critical period. In effect, therefore, the unwed mother in Germany is permitted to name two men successively as the father. If the defence is exception plurium, and the blood test excludes the other man, the defendant originally named will be adjudged the father. If the blood test excludes the defendant, suit may be brought against the other man. The courts of Soviet Russia have allowed blood tests since 1927, and today the positive result of the test there is regarded as absolutely conclusive proof of non-paternity. Incidentally, there is no longer any legal distinction drawn between legitimate and illegitimate children in Soviet Russia.

In Sweden, blood tests are compulsory and ordered as a routine matter in all affiliations.

As early as 1926, the Supreme Court of Austria accepted an exclusion as decisive of the issue of paternity, and acquitted the defendant.

In Canada, in *Morris v Gantous*, (1941) 47B de jur 150, the Quebec court held, in an opinion written in French, that it lacked the power to order the drawing of a blood specimen for the purpose of carrying out a blood test. (The Canadian Bar Review, May 1949, page 538).

In England, as pointed out in (1938) 185 LT 409 (A) or in other countries the courts have the power to order the tests to be done, but in this country they have not. English magistrates cannot take into account in any way an applicant's refusal to undergo a test. The test can only be done by consent. On July 6, 1938, Lord Merthyr introduced his Bastardy (Blood test) Bill in the British Houses of Lords, which, by its terms, was to have been effective on January 1, 1940. The Select Committee of that House reported favourably on the bill as follows:

> *The committee are unanimously of the opinion that the quantities of blood underlying blood grouping and the laws of inheritance governing the transmission of these qualities from parents to children are accepted by such a consensus of scientific opinion throughout the world as to render it desirable in the interests of justice for this knowledge to be applicable to affiliation cases.*

Due to the war all private members' bills were suspended and this bill was not enacted into law. Wherever courts in England have ordered blood tests it is only by consent.

In India, there is no special statute and there is no provision either in the Criminal Procedure Code nor in the Indian Evidence Act empowering courts to direct such a test to be made. Similarly as pointed out by Raghava Rao, J. in *Polavarapu Venkataswarlu v Polavarapu Subbayya*[21], there is no procedure either in the Civil Procedure Code or the Evidence Act which provides for a blood test being made of a minor and his mother when the father is disputing the legitimacy of the minor and held that if the parties are unwilling to submit to such a test the court has no power to direct them to submit themselves to such a test.

20.1 SEMEN

20.1.1 Importance

Semen, as evidence, is involved in heinous crimes like rapes, rape-murders, child abuse, incest, adultery, indecent assault, and unnatural offences, such as homosexual offences, bestialities, indecent exposures, infidelity allegations in divorce cases.

Semen, like other physical evidence in offences against the person, including sexual assaults helps to:

1. Establish *corpus delicti*.
2. Identify the culprit/victim.
3. Eliminate the innocent suspect/accused.
4. Reconstruct the crime/sequence of events.
5. Verify the victim's/defendant's/correct version.

The investigation of offences involving rape and child abuse cases needs delicate handling.

20.2 NATURE

Fresh semen is a gel-like fluid. It has a characteristic smell. It liquefies on standing in air for some time. The liquid, on further standing, dries up; leaving a solid opaque and crusty residue, reduced to about seven percent of the original weight. In the dry state, it has no smell.

A normal man ejaculates about 3.5 ml of semen, in one ejaculation. The number of sperms in a normal ejaculation is about 30 to 50 million. The number varies from man to man. Age/health/food/disease/medicine/stress affect.

The semen of some person does not contain sperm (spermatozoa). The complete absence of sperms in semen is called azoospermia. Complete absence of semen in ejaculation is aspermia. It is the cause of infertility. The semen of sterilised (Vasectomised) male does not contain sperms. Their semen, however, produce normal amounts of seminal secretions which are can permit detection of semen.

Human sperm has a definite shape and structure, which is distinguishable from sperms of other species. Identification of sperm in the stain is considered a conclusive identification of semen. It has a tadpole-like structure **(total length ~0.05 mm).** Sperm is seen through a microscope.

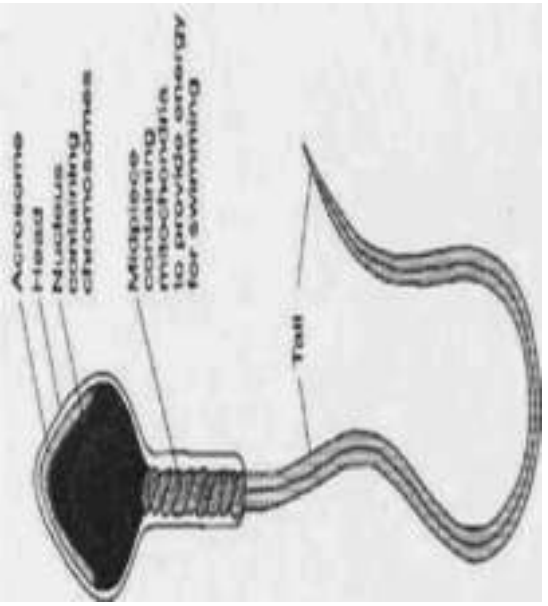

Fig. 20.2

Schematic (not to scale) Diagram of Sperm

Semen is a complex mixture of proteins, including blood group factors, choline, acid phosphatase, uric acid, and inorganic salts.

In comparatively recent years, vasectomy has become common in India. The semen of vasectomised persons does not contain sperms. Likewise, the ejaculation of aspermic persons does not contain semen/sperms.

Semen is easily destroyed. Exposure of the sample to factors, such as heat, humidity, oxidizing agents, and microorganisms (bacteria and mold) can affect semen. The evidence, therefore, needs prompt collection, preservation, and processing.

Sperm Detection/Collection Inhibitors

1. Delay in processing the evidence after assault
2. Destroying/secreting condom after use
3. Aspermic /azoospermic people
4. Victim's hygienic steps: (douching, bathing, gargling)
5. Chronic alcoholism depletes sperm stores
6. Degradation of seminal secretions
7. Physiologic activity (urinating, defecating, menses)
8. Trauma, congenital abnormalities, infections
9. Testicular irradiation, elevated scrotal temperature.
10. Drugs/toxins

20.3 EVIDENTIARY CLUES

Semen is the main piece of evidence in sexual assaults. Other biological and non-biological evidence (e.g., blood, fingerprints, track marks, and trace evidence) is ever present. It also helps to identify crime, criminal, victim, modus operandi. We discuss semen evidence only in this chapter. Other evidence has been discussed in other chapters.

20.3.1 Sources

The following are the usual clue material sources relating to semen:

1. The Victim

If a culprit has ejaculated in a sexual act, the victim carries semen on the following sites:

- In the vagina, anus, rectum or mouth (in case of oral intercourse) as the case may be.
- On pubic region, thighs, buttocks.
- On undergarments and other clothes.
- On hands, if they have not been washed.

2. The Culprit

- Sexual organs, pubic hair and thigh region
- Clothes especially undergarments, fly flaps of the trousers, the front flap of the shirt
- Handkerchief
- Materials used for wiping
- Hands, if not washed
- Nail scrapings may carry semen for a long time

3. The Scene of Occurrence

Semen is found at the crime scene at the following sites:

- As stains on beddings, floor, carpet, furniture, bathroom and lavatory, where the sexual act was committed.
- On discarded materials used for wiping i.e., clothes, paper or even leaves or grass which may have been used for the purpose.

- In outdoor scenes, it may be found on the ground, soil, grass or even on plants.
- If the scene of occurrence is a vehicle, semen may be found on the seats, on vehicle's floor, on the sides or on the curtains.
- Materials used for wiping, carrying semen, may be found inside the vehicle or at the spot where the vehicle was parked or thrown en route.

20.4 INVESTIGATOR'S ROLE

The IO has to locate, collect, preserve and process semen evidence, ensuring its identity, relevancy, integrity, authenticity and continuity of the chain of custody.

20.4.1 The Basic Steps

Investigating officer takes along a Magnifying lens, UV lamp or a polilight to locate semen stains. On reaching the scene performs the steps, mentioned in the text box below.

IO's Basic Steps at the Scene

1. Saves life: arranges medical aid at the earliest for the injured
2. Assesses risk factors in handling the scene. Biological evidence may contain infectious organisms (e.g. hepatitis virus). They are transmitted to any person on contact. He ensures protection for the investigators.
3. Walks through the scene to get an overall picture of the scene and to assess technical and work force needs of processing the scene
4. Plans the crime scene processing properly
5. Demarks/guards/protects the scene and the evidence thereon
6. Documents the scene: videography/photography/sketch/textual narration
7. Documents the location, collection, preservation, packing and sealing of the processing of the evidence, as per legal/departmental rules.
8. Fixes and ensures the identity, authenticity, integrity and unbroken chain of custody, until its possession is legally transferred to other authority (Laboratory, Court)
9. Gets the evidence examined/evaluate d from the concerned expert at the earliest
10. Ensures to:
    - Collect as much sample as possible from various sources separately.
    - Prevent inadvertent contamination of the evidence
    - keep silence while handling the evidence to prevent its contamination.
    - Prevent deterioration of the evidence the sample.
    - Air-dry the stains in an gentle air stream. No hot air blower.
    - Send the evidence on the original format whenever possible
    - Send control sample of the substrata
11. Stores the biological evidentiary clues in a refrigerator after air-drying.
12. Handles/packs the evidence from the culprit/victim/the scene, separately

Semen is delicate evidence. It is processed carefully. The IO takes care to:

1. Handle the evidence to the minimum extent. He sends the article bearing the stain to the laboratory, whenever possible. He ensures that there is no contamination/ destruction of the evidence during transport.
2. Cut out the stained area from a large non-transportable object with a porous surface and pack it in a paper, along with a substrata piece for control, packed separately.
3. Collect the sample by using a slightly moistened cotton swab if he is not able to collect the evidence by the above methods (1,2). Air-dry the swab and then despatch it along with a control substrata sample of an unstained area close to the biological evidence stain, in a separate packet.
4. Collect the stain on the smallest area of the swab or cotton gauze.
5. Air-dry all wet stains at the earliest without exposing them to heat/sunlight
6. Prevent contamination through inter-contact with other evidence, including specimen standards, minimal touching, separate storage of each stain, using clean gloves, tools.
7. Pack the evidence in paper containers. Do not use plastic receptacles!
8. Seal the package. All except the IO, the Analyst and the court, handle the evidence in sealed parcels only.
9. Put the identification data (case Number, PS and date) and his initial on the parcel.
10. Get the signatures of witnesses on the package.
11. Requisition the help of laboratory staff in refractory situations.
12. Use Rape Evidence Kit.

20.4.2 Location of Evidence

The investigating officer locates the semen evidence at various sites:

1. At the Scene

1) He searches the scene for a colourless or a pale yellow stain. If fresh, it gives a characteristic smell. Dry stains do not give the smell. Dry stains are rough to feel. It is stiff and brittle on complete drying.
2) He uses ultraviolet light to locate pale blue fluorescent stains. The fluorescence weakens with the passage of time. Polylight and laser give better results.
3) He gets the help of Forensic Scientist to locate the semen stain in important cases. The acid phosphatase method is the most convenient method to locate and can be used for large areas. It works even for weak stains.

2. With the Victim

The IO takes the victim to a hospital immediately. If the victim is a female, a female medical officer examines her; otherwise, a male doctor examines the victim. The IO requests the doctor to:

1) Describe all the injuries like bite marks and scratches on the body including those on the private parts and photograph them.
2) Collect swabs from all parts, likely to carry semen stains, (oral, vaginal, and/or anal) and to keep/pack/seal the swabs in separate packets after drying them in a gentle stream of air. The doctor must be able to identify the person and the site(s) from where he has collected the swabs. He must also put his signatures and the identification data on the package. Drying is essential. Wet stain deteriorate soon after

3) Collect the clothes worn by the victim at the time of the incident.
4) Collect a blood sample for DNA profiling and other tests.
5) Collect the following entities when collecting reference samples from a decomposed body. These are in addition to the blood sample:
   - a portion of deep muscle tissue,
   - certain organ tissue (e.g., heart or brain; not liver or kidney),
   - 2-4 intact molar teeth (if identification is an issue, ensure that mouth x-rays have been taken), and
   - A sample of compact bone (e.g., femur).

3. With the Culprit

The IO produces the suspect before a doctor and requests the doctor to:

1) Collect the clothes worn by the suspect at the time of committing the crime.
2) Collect semen, vaginal fluid and other stains (faecal matter in case of sodomy) from the suspect.
3) Take penile swabs (including that of glands, shaft, and base of the penis) if the case history and time-frame indicate the need.
4) Take Scrotal Swabs if assailant wore a condom. Focus on area closest in proximity to the penis.
5) Describe the injuries on the suspect, on his private parts including bite marks, scratches on his person. Get them photographed to scale.
6) Collect approximately about 5 ml of a blood sample for DNA profiling. Add anti-coagulant EDTA to the 10.
7) Collect fingernail scrapings using a toothpick, one toothpick per nail. Place all five toothpicks from the right hand into the appropriate container and label them. Repeat for the left hand.

4. In the Vehicle

The vehicle may have been used to kidnap the victim, to take him/her away after the rape or the rape may have been committed in the vehicle itself. Or, it may have been used merely as a transport for getting away from the scene. It is processed in the same way as a usual crime scene (supra). It usually yields useful evidence.

5. At the Residence of the Suspect

The culprit is likely to change clothes at his residence. He may also take steps to remove evidential traces of the crime. The investigating officer, therefore, must locate and collect:

1) The clothes worn by the suspect or culprit at the time of committing the crime
2) The evidence such as dust, weeds, seeds on the clothes or shoes from the scene
3) The fibres, saliva and other stains picked up from the garments of the victim or the scene of the incidence
4) The gag cloth used
5) Discarded cloth/clothe/paper pieces bearing seminal, vaginal, saliva stains, from the dustbin
6) The clothes kept for washing

20.5 COLLECTION

The IO collects all items at the scene having possible evidentiary value pertaining to the suspect/victim and helps to reconstruct the crime. He collects the evidentiary clues systemically ensuring their integrity/authenticity and intact chain of custody during collection/preservation/dispatch.

The kingpin of semen analysis is now DNA profiling. The following guidelines for the collection of semen for DNA analysis are useful. The IO should:

1. Collect as much sample as possible from a single source.
2. Collect at least a significant quantity of material to ensure sufficient DNA for testing purposes
3. The material collected should be as pure as possible. Some contaminants degrade DNA.
4. Air-dry (in a stream of cool air) the sample as fast as possible.
5. Do not expose the semen to heat and strong light
6. Refrigerate liquid semen sample; do not freeze it.
7. Ensure that the collection/packaging/storage of seminal evidence does not compromise the integrity/authenticity of the evidence.
8. Deliver the samples to the forensic laboratory post-haste.
9. Store the evidence in a cool and dry place to reduce deterioration.
10. Remember that blood/bloodstains are used for standard DNA profile used for comparison with the semen DNA profile.

20.5.1 Rape Investigation Kit

Many police organisations have evolved Rape Investigation Kits. They are convenient to handle rape cases. They improve efficiency. They should be part of the IO's arsenal.

Rape Investigation Kit

The kit consists of a box/bag containing small boxes/ microscope slides/plastic bags to collect/ store/preserve evidence (clothing fibers, hairs, body fluids) in an alleged sexual assault:. The essential items are:

1. Instructions pamphlet
2. Bags and sheets for evidence collection
3. Swabs for collecting fluids from the lips, cheeks, thighs, vagina, anus, and buttocks
4. Sterile urine collection containers
5. Sterile sample containers
6. Blood collection devices
7. Comb used to collect hair and fibre from the victim's body
8. Clear glass slides

9. Self-sealing envelopes for preserving the victim's clothes, head hair, pubic hair, and blood samples
10. Nail pick for scraping debris from the nail crevices
11. White sheets to catch physical evidence stripped from the body
12. Documentation forms and paraphernalia
13. Labels

While collecting semen evidence, the investigating officer, in addition to the usual steps and precautions, should:

1. Dry the semen stains completely, before packing. Otherwise, the semen putrefies.
2. Preserve the liquid semen either at low temperature (< 5^0 C) or with preservative (toluene or formalin). Mention the preservative in the noting, if used.
3. Obtain vaginal swabs and collect stains from the person and clothes of the female victim with the help of a female doctor.

In an interesting case, a doctor raped one of his patients, after injecting a strong sedative, to make her immobile. She complained to the police. DNA profiling of the blood from the doctor and the semen from her undergarments did not tally. The police let off the doctor. The case was reopened on the insistence of the victim. But DNA profiling again came to the rescue of the doctor.

In the meantime, another patient of the doctor complained of rape. The wife of the doctor became suspicious. She checked his medicine chest and was surprised to find a number of ampoules of the sedative injected into the two victims! She went to the police. Fresh DNA tests were carried out. But this time with cells taken from hair, saliva and blood. Semen DNA profiles corresponded, not only of the second victim but also with that of the first victim. The doctor confessed and he was convicted.

He hoodwinked the earlier DNA profiling tests by placing surgically a capsule containing blood obtained from a patient underneath his skin in the arm. He, unobtrusively, guided the needle of the syringe to the capsule when the technician was taking the blood sample for DNA profiling. ***(CH)***$_1$

20.6 POSSIBILITIES

The semen analyst can answer the following questions:

20.6.1 Is the questioned stain a semen stain?

Semen identification was formerly based upon the identification of the spermatozoon in the stain. Even now when an intact spermatozoon or its head is found, the nature of the stains is established. However, aspermic semen stains or the stains where the sperm are destroyed are identified through tests. There are two types of tests: presumptive tests and confirmatory tests.

20.6.1.1 Presumptive Tests

(a) **Smell;** if the semen stain is fresh it gives characteristic semen smell.

(b) **Dried stain**; they have Characteristic rough and brittle nature.

(c) **Fluorescence;** semen stains give characteristic fluorescence under UV rays.

(d) **Florence and Barberio's tests;** they are **a c**hemical test for choline and give characteristic crystals.

(e) **Acid phosphatase test:** This test is fairly characteristic and sensitive for the enzyme. The enzyme is found in other body fluids also. However, it is in significantly larger quantity in semen. The test is also used to locate semen on garments, bed sheets.

20.6.1.2 Confirmatory tests

(a) **Precipitin test with antihuman semen serum;** it gives unequivocal confirmation of the presence of semen.

In an interesting case, a woman alleged that Mr. X molested her in an attempt to rape her. She pointed semen like stain on her clothes. The stain, on examination in the laboratory was found to be white of an egg! **(CH)**$_1$

(b) **Conventional forensic serology methods** used in blood discrimination are also used in identifying semen in sexual assault cases. However, their use is diminishing at break-neck speed with the passage of time. Traditional serology utilised the following systems for semen discrimination:

- ABO (H) system
- Lewis antigens Enzyme typing system
- Phosphoglucomutase (PGM) system
- Peptidase A system
- p30 The glycoprotein: a prostate specific antigen

However, they are now becoming almost historical entities

DNA technology; it has revolutionized semen discrimination because of its highly polymorphic nature and extreme stability. It permits individualization with extraordinarily high sensitivity and specificity. It was not time/cost effective previously but not so now.

DNA profiling; in sexual assault investigations is becoming indispensable due to its ability to accurately individualize semen even in mixed stains from multiple donors (semen contributed by different individuals). Polymerase chain reaction and Restriction Fragment Length Polymorphism have improved the handling of the evidence. It is becoming the kingpin evidence in the investigation and prosecution of sexual assault cases.

20.6.2 Are the semen stains from the suspect?

Blood group factors are found in the semen of most of the persons. They, therefore permit the identification of the suspect on the pattern of blood evidence—high probability and no specific identity. Now DNA profiling of semen/semen stain provides a specific identity of the culprit. Not only the individual can be identified specifically, but in gang rape cases all those who raped the victim can be identified even from the mixture of the semen picked up on the vaginal swab or from the garments of the victim.

In a case, two girls were raped and one was murdered. A boy of 17 years was suspected to be the killer. Under interrogative pressure, he confessed to the crime. However, his DNA profile of the semen from the victim did not match with that of the culprit. The boy was let off. Mass screening of the youths of the town was carried out. However, to no avail. However, after sometime another youth became the prime suspect. His DNA profile matched with the DNA profile of the evidential semen. The youth was convicted for the murder. **(CH)**

20.6.3 How old are the stains?

Absolute age of a semen stain cannot be given because time alone does not affect the changes. Environmental conditions also affect. Semen undergoes the following changes.

1) Semen is gel-like when fresh.
2) It liquefies to a transparent liquid, on standing.
3) It is an opaque white substance on drying.
4) It gives characteristic odour until it is completely dry.
5) It loses its characteristics smell on drying.
6) The stain turns light yellow with age.
7) Whole sperms are seen in the stain up to about three weeks under ideal conditions. They disintegrate thereafter.

20.6.4 How long can Spermatozoa Survive?

Sperms remain mobile only for a few hours in the vagina. They may be alive in the vagina for about 24 to 72 hours. However, in frozen semen, the mobility and potency of the sperms remain over long periods.

In the vagina, sperm may be found up to about a week of coitus. The number of sperms, however, goes on decreasing. It is rare that sperm is detected after 3 days. Putrefaction of the body destroys the sperms. Climatic conditions and temperature are important factors to save/destroy sperms in cadavers.

20.6.5 Can gang rape culprits be individually identified from mixed semen vaginal swabs or stains?

DNA profiling can identify all the gang rapists. Semen from an individual can be identified from a mixture of semen; as in gang rapes.

> *In the Nirbhaya rape case, 6 rapists raped the victim in a bus in Delhi on 16th December 2012. DNA analysis and comparison of DNA profiles of the semen in the vaginal swab and DNA profiles developed from the blood of the accused matched. All the six rapists were identified, convicted and sentenced (4 to death, 1 committed suicide and the juvenile to 3 years reformatory confinement).* (CH)[3]

20.6.6 Can the semen of a Non-secretor be linked to him?

DNA profiling permits linkage of the semen of a non-secretor to the source person.

20.6.7 Can the aspermic semen be linked to the source person?

There is no difficulty in linking the aspermic semen with the source person.

20.7 SALIVA

Many body fluids, other than blood, semen, urine, which occasionally acquire importance in criminal investigations include saliva, urine, faeces, sweat, nasal secretion, tears and human milk. They link the criminal, the victim, the scene *inter se*. Saliva among them is the most important.

20.7.1 Importance

Saliva is an important evidentiary clue in a variety of cases including that of offences against the person, drug abuse, sex determination, identification/individualisation of the biter in bite marks via saliva, which is deposited in prints, bite marks, cigarette butts, on stamps and other objects. Analysis of saliva for serological testing and cellular content has proved to be of wide use in crime detection, drug and alcohol abuse, hormone identification, cases of poisoning and animal bites.

Saliva is assuming great importance as an evidentiary clue in forensic situations:

1) It is being used increasingly as a standard genetic material for DNA profiling because of its keeping quality, Ease of collection and importantly because of its more or less non-invasive collection.
2) Saliva also contains *mitochondrial* DNA (*mt*. DNA) in greater abundance. If the nuclear DNA analysis is not forthcoming mt DNA helps.
3) It does not need a doctor for collection. Even the IO can collect the sample at pinch.
4) It helps to identify the drug an addict has taken. Saliva offers one of the least non-intrusive methods for the detection of the abuse of prohibited narcotic drugs (amphetamines, barbiturates, benzodiazepines, phencyclidine, cocaine, opioids). Analytical techniques have crossed all physical barriers. The technology can analyse the smallest amount of most of the abused drugs.
5) Many drugs (such as phenobarbital, amphetamine and morphine) are detected in saliva and saliva stains by radioimmunoassay (RIA).
6) It helps in sex determination. The presence and detection of sex chromatin (Barr bodies in females and F bodies in males) indicate the sex of the biter. The ration of the sex hormones is also helpful for the purpose
7) It identifies whether the bite mark source is human or non-human. Salivary immunoglobulin in the bite of an animal/beast has been utilised to identify the species of the beast/animal through immunoassay techniques. The biter can be identified even after a long interval through monoclonal antibodies: ELISA with monoclonal antibodies helps to detect salivary immunoglobulin. Cross-over electrophoresis and double gel infusion are also used to identify non-human bites.
8) Saliva DNA profile is being used increasingly in bite marks. Saliva is deposited in/around the marks in many homicides, assault and other criminal cases. Its collection/analysis can identify the biter positively. The mode is superior to odontological identification as the teeth marks are not registered.

   Both[1] culprits/victims often bite one another for different reasons. It is found in cases of many homicides, sexual assault/molestations and other criminal cases. The biting process deposits saliva in the bite mark. It contains DNA molecules, which can identify the biter irrefutably.[2]

   External factors, like contaminants, heat, moisture, sunlight can degrade the sample. The Analysis, therefore, should be done at the earliest.

1. The flexibility and elasticity of the skin/flesh do not permit proper registration of the Topography of teeth marks. They may be identified from the bit structure in some cases not in all cases.
2. It cannot distinguish between identical twins.

20.7.2 Nature

Saliva is a fluid secreted by the salivary glands in the mouths of human beings and animals. In human beings quantity-wise, it is mostly water (> 95 %). It acts as a lubricant to help swallow food, provides digestive enzymes to break the food molecules to make them digestible and maintains proper pH and oral hygiene.

Saliva contains numerous prominent constituents including:

1) Blood cells, Epithelial cells which provide DNA
2) Enzymes (amylase, lipase). They help to digest the food. Amylase is used to detect the presence of saliva in a stain. Ptyalin when added to starch, hydrolyses it. Saliva extract, therefore, when added to starch, inhibits its colour reaction with iodine
3) Anti- microbial materials (for example, lysozymes)
4) Mucus
5) Electrolytes.

Saliva is deposited during biting, sucking, licking, spitting.

Saliva of secretors contains blood group substances and can be grouped. The saliva on cigarette stubs is often grouped in criminal investigation. DNA profiling of the saliva stains has enhanced the evidential value of the saliva stains and it is *at par* with blood and semen.

Food material mixed in saliva may interfere with blood grouping.

Saliva does not give specific precipitin test.

20.7.3 Location

Saliva stains are found, almost invariably, on bite marks, the surface licked or the entity sucked, on the utensils used for drinking water or any other beverage. They may also be found on spoons/forks used in eating.

Saliva stains are found at the scene, on a handkerchief, on discarded cigarette stubs, spittal, on cups, tumblers, bottles (used for drinking) on postage stamps or envelopes or even on toothpicks. If a person is gagged, the gag (a piece of cloth/tap used to silence the victim) will carry saliva stains.

Many people in India, especially the criminals, often are addicted to betel chewing. They spit the betel waste. It contains saliva.

20.7.4 Detection

Detection of saliva evidentiary clues is rather a difficult task because of it almost invisibility and the uncongenial substrata (human body many a time) on which they are found. The age and amount of saliva play an important part in the location of saliva stains. The following techniques are used to detect dry stains:

- Fluorescent spectroscopy: the suspected stain area is sprayed with tryptophan in α-salivary amylase. It gives a characteristic fluorescence. The technique is sensitive to detect dried saliva stains on the skin.
- UV rays: They give fluorescence.
- Lasers: argon ion laser give fluorescence.
- Alkaline phosphatase and salts like nitrate and thiocyanate are also used for the detection of dried saliva stains.

20.7.5 Collection

Traces of saliva from the stain are collected through swabs. A single wet cotton swab or wet filter paper (a part only) is kept upon the skin area suspected to bear the saliva stain for some time. It picks up the saliva material.

Some workers use a second dry swab after the wet one and combine the extracts from the two for evaluation.

20.7.6 Evaluation

1. **DNA profile** of each individual is unique except for identical siblings. It does not change over the lifetime of an individual. The polymorphic repair of STR in small fragments makes it possible to evaluate DNA even from degradation products.
2. ***mito*Chondrial DNA (*mt*DNA)** profile.; *mt*DNA is present in hair shafts and saliva samples. In the absence of nuclear DNA, *mt*DNA is used for maternal DNA profile
3. **Drug Analysis;** addict/addiction identification is usually done by drug analysis from the urine of the suspect. However, saliva is a better biological clue material because urine can be manipulated (substituted) and sometimes a question of privacy also comes up.

   Developments in analytical techniques have made it possible to analyze a large number of drugs (amphetamines, barbiturates, benzodiazepines, phencyclidine, cocaine and opioids are being analysed routinely) from saliva. The major advantage of saliva analysis is that the mode is easy, rapid and non-invasive.

   Radioimmunoassay is used to detect recent intake of marijuana from saliva.

The saliva, as an evidentiary clue, is assuming greater and greater importance due to continuously increasing sex crimes (and other offences against person), safe handling, easy processing and definite identification of the culprit (thanks to DNA profiling). The laboratories must gird up their loins and induct automation for saliva analysis.

20.8 URINE

20.8.1 Importance

Urine analysis is an important toxicological analysis in Forensics. It is routinely used for the detection of drugs like marijuana, cocaine, heroin, and amphetamines as well as their metabolites. The main purposes for which urine is analysed are:

1. Identification of drug addict
2. Identification of the drug abused
3. Determination of the dose of the drug taken
4. The nature of the poison and the dose administered in poisoning cases
5. Verification of the incident whether the drug/poison administered was a case of murdered/accident or suicide.
6. Determination if an overdose of prescription medicine has been administered
7. Monitoring drug dependency or to determine the presence of drugs in the body for medical and legal purposes.
8. Determination of drunkenness[3]

3. Details in the chapter on Alcohol Forensics.

In many organisations abroad, periodic drug screening is an important service condition for employment.

20.8.2 Nature

Urine is a complex mixture of both organic and inorganic compound in a matrix of biological materials. The materials being searched are in minute quantities; they need highly sensitive and specific techniques. In some cases, immediate results are needed. Their analysis, therefore, is a challenging task for the forensic science laboratories.

20.8.3 Evaluation

Urine is identified from the following characteristics:

1. Fresh stains give characteristic odour.
2. Stains fluoresce when exposed to UV rays. Fluorescence is weak and become weaker with time.
3. Urine contains large amount of urea. It gives characteristic smell on heating.
4. Urine contains creatinine. It gives red colour with picric acid solution in toluene.
5. Para-dimethylaminocinnamaldehyde (DMAC) is popular presumptive test. It is a simple, rapid and safe test. A concentration of 0.05% w/v is appropriate for the test. The test, however, is not specific for urine. Many other body fluids also give the test.
6. Urine usually contains body cells. DNA profiling individualises the stain
7. The tendency is to use instrumental techniques.[4] Mass spectrometry are separated from the molecules, ionised (electron ionization) them and then identify them. More recently, Direct Analysis in Real Time (DART) is used for ionization

The most important use of urine in Forensics is to identify/quantify the drugs of abuse. Mass Spectrometry is perhaps the best mode. It is the main discriminatory technique. It measures the precise molecular mass of ions as determined by their mass to charge ratio (m/z). SEM coupled with EDX is used to identify its elemental composition profile.

20.9 SWEAT

Sweat stains are involved in those cases where the culprits discard/leave some garments at the crime scene. Or, where the culprit/victim have perspired profusely and sweat fell at the spot or they wiped it and left the wipe at the scene.

Sweat is not a common evidentiary clue in forensics but it can provide definite evidence due to the presence of Body cells. They are extracted in some cases from sweat absorbed in hats/waist bands.

The composition of sweat is similar to urine. However, if the two substances are heated, the odour is characteristically different.

Relatively recently a sweat-specific protein was discovered. An antibody[5] (G-81) for the protein has been developed. It specifically identifies sweat antigen through the formation of a coloured complex, which shows different absorbance than other body fluids.

4. "An overview of forensic drug testing methods and their suitability for harm reduction point-of-care services," Harm Reduction J (July 31, 2017), available at https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5537996/(last accessed in November 2019).
5. It is not specific to other body fluids.

20.10 FAECES

Faeces are involved in cases of sodomy and bestiality. The stains are found on the active agent, his undergarments, on the flies of the trousers and on flaps of the shirt.

Faeces are identified microscopically. Bacterial studies of the faeces may also lead towards individualization but the same has not been exploited routinely, at present.

It is possible to identify the human or animal origin of the faeces.

20.11 CASE LAW

20.11.1 Nirbhaya Gang Rape-murder[6]

Author's Summary

It is a landmark judgment where the judges have utilised Forensics extensively for the dissemination of justice.

The facts of the case are that the victim Nirbhaya, along with her friend (PW- 1) boarded a bus going to Dwarka/Palam. They noticed that six persons were already inside the bus, four in the cabin of the driver and two behind the driver's cabin. The accused persons did not allow anyone else to board. The bus moved and the inside lights of the bus were put off. A few minutes later, three persons (identified as accused Ram Singh, Akshay and a juvenile) started to abuse. Pw-1 objected. It led to altercation. The two other joined the melee. PW-1 was beaten badly and became immobile. Nirbhaya was not only raped by all the six but treated her so brutally that she died a few days later, in spite of the best medical help.

The police did an excellent job of locating and using all the scientific evidence and presented an airtight case. The appreciation by the SC has been highlighted in italics.

All the courts (trial, high court and the Supreme Court) appreciated the evidence. And found it **'rarest rare of the cases'** and sentenced them to death, excluding the juvenile.

Relevant Extracts (Verbatim)

The prosecution case, as projected, is that on 16.12.2012, the deceased, 'Nirbhaya' (not her real name), had gone with her friend, the informant, PW- 1, to the PVR situated in Select City Walk Mall, Saket to watch a movie. After the show was over, about 8:30 p.m., they took an auto and reached Munirka bus stand wherefrom they boarded a white coloured chartered bus [DL- 1P-C-0149, Ext.P1] which was bound to Dwarka/Palam Road, as a boy in the bus was calling for commuters for the said destination. As per the version of the informant, PW-1, the friend of the prosecutrix, the bus had yellow and green lines/stripes and the word "Yadav" was written on it.

After both of them had entered the bus, they noticed that six persons were already inside the bus, four in the cabin of the driver and two behind the driver's cabin. The deceased and the informant sat on the left side in the row of two-seaters and paid the fare of twenty rupees as demanded. Before they could get the feeling of a safe journey (though not a time-consuming journey), a feeling of lonely suffocation and a sense of danger barged in, for the accused persons did not allow anyone else to board and the bus moved and the lights inside the bus were put off. With the lights being put off, the darkness and the fear of the unexpected darkness ruled.

6. *Mukesh v State for NCT Delhi,* Criminal Appeal Nos. 607-608 of 2017, SC, Decided on 5 May 2017. Bench: Dipak Misra, R Banumathi, Ashok Bhushan.
The Supreme Court has discussed the evidence relating to DNA, bite marks and fingerprint lucidly, with numerous case citations.

A few minutes later, three persons (who have been identified as accused Ram Singh, Akshay and a young boy, who has been treated as a juvenile in conflict with the law) came out of the driver's cabin and started to abuse PW- 1. The young companion of the deceased raised opposition to the abuse that led to an altercation which invited the other two who were sitting outside the driver's cabin to join.

The spirit to oppose and the duty to save the prosecutrix had to die down and perilously succumb to the assault by the accused persons with the iron rods that caused injuries to his head, both the legs and other parts of the body and the consequence was that he fell on the floor of the bus to hear the painful cries of the lady who, he knew, was being treated as an object, an article for experimentation and prey to the pervert proclivity of the six but could do nothing except to hear unbearable cries made in agony and pain. His spirit was dead, and bound to.

5. As the prosecution story further unfurls, the two accused persons, namely, Pawan and Vinay, pinned the young man down and robbed the victims of their mobiles besides robbing the informant of his purse carrying a Citi Bank credit card, ICICI Bank Debit Card, his identity card issued by his employer-company, metro card, a sum of rupees one thousand, his Titan Watch, a golden ring studded with jewels and a silver ring studded with pearl, black colour Hush Puppies shoes, black colour Numero Uno jeans, a grey colour pullover and a brown colour blazer. As per the version of the prosecution, PW-1 was carrying two mobiles and the prosecutrix was carrying only one, and the accused snatched away all the three mobiles.

6. The overpowering was not meant to satisfy the avarice. As the accusations proceed, after the informant was overpowered, as it could only have a singular result, the accused persons, namely, Ram Singh, Akshay and the Juvenile in Conflict with Law (JCL) took the prosecutrix to the rear side of the bus and she was raped by them, one after the other.

7. After committing rape, the accused Ram Singh (since deceased), accused Akshay and the JCL came towards the informant, PW-1, and nailed him down; then the accused Vinay and accused Pawan went to the rear side of the bus and committed rape on the prosecutrix, one by one. PW-1 noticed that earlier the bus was moving at fast speed but after sometime, he felt that the speed of the bus was reduced and he saw that the accused Mukesh, who was driving the bus, came near him and hit him with the rod and he also went to the rear side of the bus and raped the prosecutrix.

The prosecutrix was brutally gang raped by the accused one after the other and she was also subjected to unnatural sex. Her private parts and her internal organs were seriously injured by inserting an iron rod and hand in the rectal and vaginal region. As per PW-1, he had heard the cries of the prosecutrix like "chod do, bachao". PW-1 could hear the prosecutrix shouting in a loud oscillating voice. The prosecutrix was carrying a grey colour purse having an Axis Bank ATM card and other belongings.

The accused persons robbed her of her belongings and stripped her. They also took away the clothes of the informant while beating him with iron rods. The accused were exhorting that both the victims be not left alive. The accused then tried to throw both the informant and the prosecutrix out of the moving bus from its rear door but could not open it and so, they brought them to the front door and threw them out of the moving bus at National Highway No. 8, Hotel Delhi 37, Mahipalpur flyover by the side of the road.

8. As indicated earlier, the prosecutrix and PW-1 were noticed by PW-72, Raj Kumar, who heard the voice of 'bachao, bachao' from the left side of the road near a milestone opposite to Hotel Delhi 37. PW-72 saw PW-1 and the prosecutrix sitting naked having blood all around. Immediately thereafter, PW-72, Raj Kumar, informed PW-70, Ram Pal, who was in the Control Room, requesting him to call PCR. PW-70, Ram Pal, of EGIS Infra Management India (P) Limited, dialled 100 No. and even asked his other patrolling staff to reach the spot.

9. About 10:24 p.m., PW-73, H.C. Ram Chander, who was in charge of PCR van Zebra 54, received information about the incident and the lying of victims in a naked condition near the foot of Mahipalpur fly over towards Dhaula Kuan opposite GMR Gate. PW-73 reached the spot and found the victims. He got the crowd dispersed and brought a bottle of water and a bed sheet from the nearby hotel and tore the same into two parts and gave it to both the victims to cover themselves.

20.11.2 Collection of samples and identity of accused persons

32. The blood sample of the informant was collected by Dr. Kamran Faisal, PW-15, Safdarjung Hospital, on 25.12.2012 and was handed over to SI Pratibha Sharma, PW-80, vide seizure memo Ex.PW-15/A by Constable Suresh Kumar, PW-42. Similarly, as mentioned earlier, PW-49, Dr. Rashmi Ahuja, had collected certain samples from the person of the prosecutrix which are reflected in Ex.PW-49/A from point B to B. All the samples were collected by Inspector Raj Kumari, PW-59, vide seizure memo Ex.PW-59/A and were handed over to PW-80, SI Pratibha Sharma, at Safdarjung Hospital in the morning of 17.12.2012.

Also the samples of gangrenous bowels of the prosecutrix were taken on 24.12.2012 and were handed over to SI Gajender Singh, PW-55, who seized the same vide seizure memo Ex.PW-11/A. All the samples were deposited with the MHC(M) and were not tampered with in any manner. A specimen of scalp hair of the prosecutrix was also taken on 24.12.2012 by Dr. Ranju Gandhi, PW-29, and was handed over to PW- 80, SI Pratibha Sharma, vide seizure memo Ex.PW-29/A.

33. The accused were also subjected to medical examination and samples were taken from their person which were sent for DNA analysis.

34. ***DNA analysis*** was done at the behest of PW-45, Dr. B.K. Mohapatra, Sr. Scientific Officer, Biology, CFSL, CBI, and Biological Examination and DNA profiling reports were prepared which are exhibited as Ex. PW-45/A-C. The report, after analysing the DNA profiles generated from the known samples of the prosecutrix, the informant, and each of the accused, concluded that: "An analysis of the above shows that the samples were authentic and established the identities of the persons mentioned above beyond reasonable doubt."

35. On 17.12.2012 and 18.12.2012, a team of experts from the CFSL went to Thyagraj Stadium and ***lifted chance prints from the bus*** in question, Ex.P-1. On 28.12.2012, PW-78, Inspector Anil Sharma of P.S. Vasant Vihar, the then S.H.O. of Police Station Vasant Vihar, requested the Director, CFSL, for taking digital palm prints and foot prints of all the accused persons vide his letter Ex.PW-46/C. Pursuant to the said request made by PW-78, Inspector Anil Sharma, the CFSL, on 31.12.2012, took the finger/palm prints and foot prints of the accused persons at Tihar Jail. After comparing the chance prints lifted from the bus with the finger prints/palm prints and foot prints of all the accused persons, PW-46, Shri A.D. Shah, Senior Scientific Officer (Finger Prints), CFSL, CBI submitted his report Ex.PW- 46/D. In the report, the chance prints of accused Vinay Sharma were found to have matched with those on the bus in question.

> 36. ***Bite mark analysis*** *was also undertaken by the investigative team to establish the identity and involvement of the accused persons. PW-66, Asghar Hussain, on the instructions of the I.O., S.I. Pratibha Sharma, had taken 10 photographs of different parts of the body of the prosecutrix at SJ Hospital on 20.12.2012 between 4:30 p.m. and 5:00 p.m. which were marked as Ex.PW-66/B (Colly.) [10 photographs of 5" x 7" each] and Ex.PW-66/C (Colly.) [10 photographs of 8" x 12" each]. PW-66 also proved in Court the certificate provided by him in terms of Section 65-B of the Evidence Act in respect of the photographs, Ex. PW-66/A.*
>
> *Thereafter, PW-18, SI Vishal Choudhary, collected the photographs and the dental models from Safdarjung Hospital on 01.01.2013 and duly deposited the same in the malkhana after he, PW-18, had handed them over to the S.H.O. Anil Sharma, PW-78. The same were later entrusted to S.I. Vishal Choudhary, PW-18 on 02.01.2013, which is proved vide RC*

No.183/21/12 and exhibited as Ex.PW-77/V. PW-71, Dr. Ashith B. Acharya, submitted the final report in this regard which is exhibited as Ex. PW-71/C. In the said report, he has concluded that at least three bite marks were caused by accused Ram Singh whereas one bite mark has been identified to have been most likely caused by accused Akshay.

Thereafter, on 03.01.2013, the report of the CFSL was received. In fact, the trial court had assured itself of the correct identification of the bus by playing the said CCTV footage shown in the pen drive, Ex.PW-67/1, and the CD, Ex.PW-67/2, during the cross-examination of PW-67, Pramod Jha.

98. Learned counsel Mr. Singh has asserted that bus, Ex. P-1, has been falsely implicated in the present case as is evidenced from the recovery of the CCTV footage. In an attempt to discredit the CCTV footage, he pointed out that only the CCTV recording alleged to be of this bus was recorded and not of all other white buses that had 'Yadav' written on them. The learned counsel for the defence subsequently maintained that the CCTV footage cannot be relied upon as the same has been tampered with by the investigating officers.

99. PW-76, Gautam Roy, HOD, Computer Cell, Forensic Division, has testified that on 02.01.2013, he had received two sealed parcels sealed with the seal of PS and the seals tallied with the specimen seals provided. He marked the blue coloured pen drive found in parcel No.1 as Ex.1 and the Moser Baer CD found in the second parcel as Ex.2. He further testified that both the exhibits were played by him on the computer and the bus was seen twice, at 9:34 p.m. and 9:54 p.m.

He had photographed all these three by freezing the pen drive and the CD and these photographs were compared by him with the photographs taken by the photographer, PW-79, P.K. Gottam, which he had summoned. The witness testified that he had prepared the three comparison charts in this regard as Ex.PW-76/B, PW-76/C and PW-76/D, and his detailed report as Ex.PW-76/E.

The footage taken in a CD and pen drive was sealed in PW-67's presence and as the recording was automatic data being fed on regular basis into the hard disk, the question of tampering with the same could not arise. PW-79, P.K. Gottam, from CFSL, CBI, has stated in his examination that he took photographs of the bus bearing No.DL- 1P-C-0149 parked at Thyagraj Stadium, INA, New Delhi from different angles on 17.12.2012 and 18.12.2012 and handed over the same to PW-76. The said photographs were marked as B1 in Ex.PW-76/B; as C1 and C2 in Ex.PW-76/C; and as D1 in Ex.PW-76/D. He has deposed as to the genuineness of the photographs by deposing that the software used for developing the photographs was tamper proof.

100. Once it is proved before the court through the testimony of the experts that the photographs and the CCTV footage are not tampered with, there is no reason or justification to perceive the same with the lens of doubt. The opinion of the CFSL expert contained in the CFSL report marked as Ex.PW-76/E authenticates that there was no tampering or editing in both the exhibits, Ex.P-67/1 and Ex.P- 67/2, and that a bus having identical patterns as the one parked at Thyagraj Stadium is seen in the CCTV footage, which includes the word "Yadav" written on one side, "back side dent (left)" and absence of wheel cover on the front left side. The contents of the report is also admitted to be true by its author, PW-76, Gautam Roy. Quite apart from that, it is perceptible that the High Court, in order to satisfy itself, had got the CCTV footage played during the hearing and found the same to be creditworthy and acceptable. 157.

207. *Having dealt with the aspect pertaining to insertion of the rod, it is apposite to advert to the medical evidence and post mortem report. We have, while dealing with other aspects, referred to certain aspects including* ***DNA analysis*** *of medical evidence but the same requires to be critically dealt with as the prosecution has placed heavy reliance upon it.*

208. DNA is the abbreviation of Deoxyribose Nucleic Acid. It is the basic genetic material in all human body cells. It is not contained in red blood corpuscles. It is, however, present in white corpuscles. It carries the genetic code. DNA structure determines human character, behaviour and body characteristics. DNA profiles are encrypted sets of numbers that reflect a person's DNA makeup which, in forensics, is used to identify human beings. DNA is a complex molecule. It has a double helix structure which can be compared with a twisted rope 'ladder'.

209. The nature and characteristics of DNA had been succinctly explained by Lord Justice Phillips in Regina v Alan James Doheny & Gary Adams[83]. In the above case, the accused were convicted relying on results obtained by comparing DNA profiles obtained from a stain left at the scene of the crime with DNA profiles obtained from a sample of blood provided by the appellant.

In the above context, with regard to DNA, the following was stated by Lord Justice Phillips: "Deoxyribonucleic acid, or DNA, consists of long ribbon-like molecules, the chromosomes, 46 of which lie tightly coiled in nearly every cell of the body. These chromosomes - 23 provided from the mother and 23 from the father at conception, form the genetic blueprint of the body. Different sections of DNA have different identifiable and discrete characteristics.

When a criminal leaves a stain of blood or semen at the scene of the crime it may prove possible to extract from that crime stain sufficient sections of DNA to enable a comparison to be made with the same sections extracted from a sample of blood provided by the suspect. This process is complex and we could not hope to describe it more clearly or succinctly than did Lord Taylor C.J. in the case of Deen (transcript:December 21, 1993), so we shall gratefully adopt his description. "The process of DNA profiling starts with DNA being extracted from the crime stain and also from a sample taken from the suspect. In each case the DNA is cut into smaller lengths by specific enzymes. The fragments produced are sorted according to size by process of electrophoresis.

This involves placing the fragments in a gel and drawing them electromagnetically along a track through the gel. The fragments with smaller molecular weight travel further than the heavier ones. The pattern thus created is transferred from the gel onto a membrane. Radioactive DNA probes, taken from elsewhere, which bind with the sequences of most interest in the sample DNA are then applied. After the excess of the DNA probe is washed off, an X-ray film is placed over the membrane to record the band pattern. This produces an auto radiograph which can be photographed. When the crime stain DNA and the sample DNA from the suspect have been run in separate tracks through the gel, the resultant auto-radiographs can be compared. The two DNA profiles can then be said either to match or not.""

210. In the United States, in an early case Frye v United States[84], it was laid down that scientific evidence is admissible only if the principle on which it is based is substantially established to have general acceptance in the field to which it belonged. The US Supreme Court reversed the above formulation in Daubert v Merrell Dow Pharmaceuticals, Inc., 509 U.S. 579 [85] stating thus: "11. Although the Frye decision itself focused exclusively on "novel" scientific techniques, we do not read the requirements of Rule 702 to apply specially or exclusively to unconventional evidence. of course, well- established propositions are less likely to be challenged than those that are novel, and they are more handily defended. Indeed, theories that are so firmly established as to have attained the status of scientific law, such as the laws of thermodynamics, properly are subject to judicial notice under Fed.Rule Evid.201.

13. This is not to say that judicial interpretation, as opposed to adjudicative fact finding, does not share basic characteristics of the scientific endeavour: "The work of a judge is in one sense enduring and in another ephemeral... In the endless process of testing and retesting, there is a constant rejection of the dross and a constant retention of whatever is pure and sound and fine." B.Cardozo, The nature of the Judicial Process 178, 179 (1921)."

211. The principle was summarized by Blackmun, J., as follows: "To summarize: "general acceptance" is not a necessary precondition to the admissibility of scientific evidence under the Federal Rules of Evidence, but the Rules of Evidence-especially Rule 702-do assign to the trial judge the task of ensuring that an expert's testimony both rests on a reliable foundation and is relevant to the task at hand. Pertinent evidence based on scientifically valid principles will satisfy those demands. The inquiries of the District Court and the Court of Appeals focused almost exclusively on "general acceptance," as gauged by publication and the decisions of other courts. Accordingly, the judgment of the Court of Appeals is vacated and the case is remanded for further proceedings consistent with this opinion."

212. After the above judgment, the DNA Test has been frequently applied in the United States of America. In District Attorney's Office for the Third Judicial District et al. v William G. Osborne[86], Chief Justice Roberts of the Supreme Court of United States, while referring to the DNA Test, stated as follows: "DNA testing has an unparalleled ability both to exonerate the wrongly convicted and to identify the guilty. It has the potential to significantly improve both the criminal justice system and police investigative practices.

The Federal Government and the States have recognized this, and have developed special approaches to ensure that this evidentiary tool can be effectively incorporated into established criminal procedure-usually but not always through legislation. ... ... Modern DNA testing

can provide powerful new evidence unlike anything known before. Since its first use in criminal investigations in the mid- 1980s, there have been several major advances in DNA technology, culminating in STR technology. It is now often possible to determine whether a biological tissue matches a suspect with near certainty. While of course many criminal trials proceed without any forensic and scientific testing at all, there is no technology comparable to DNA testing for matching tissues when such evidence is at issue."

213. DNA technology as a part of Forensic Science and scientific discipline not only provides guidance to the investigation but also supplies the Court accrued information about the tending features of identification of criminals. The recent advancement in modern biological research has regularized Forensic Science resulting in radical help in the administration of justice. In our country also like several other developed and developing countries, DNA evidence is being increasingly relied upon by courts. After the amendment in the Criminal Procedure Code by the insertion of Section 53A by Act 25 of 2005, DNA profiling has now become a part of the statutory scheme. Section 53A relates to the examination of a person accused of rape by a medical practitioner.

214. Similarly, under Section 164A inserted by Act 25 of 2005, for medical examination of the victim of rape, the description of material taken from the person of the woman for DNA profiling is a must. Section 53A sub-section (2) as well as Section 164(A) sub-section (2) are to the following effect:

"Section 53A. Examination of person accused of rape by Medical Practitioner.-

(1) ... ...

(2) The registered medical practitioner conducting such examination shall, without delay, examine such person and prepare a report of his examination giving the following particulars, namely:- the name and address of the accused and of the person by whom he was brought, the age of the accused, marks of injury, if any, on the person of the accused, the description of material taken from the person of the accused for DNA profiling, and other material particulars in reasonable detail. Section 164A. Medical Examination of the victim of rape.-

(1) ... ...

(2) The registered medical practitioner, to whom such woman is sent, shall, without delay, examine her person and prepare a report of his examination giving the following particulars, namely:- the name and address of the woman and of the person by whom she was brought; the age of the woman; the description of material taken from the person of the woman for DNA profiling; marks of injury, if any, on the person of the woman; general mental condition of the woman; and other material particulars in reasonable detail."

215. This Court had the occasion to consider various aspects of DNA profiling and DNA reports. K.T. Thomas, J. in Kamti Devi (Smt.) and another v Poshi Ram[87], observed:

10. We may remember that Section 112 of the Evidence Act was enacted at a time when the modern scientific advancements with deoxyribonucleic acid (DNA) as well as ribonucleic acid (RNA) tests were not even in contemplation of the legislature. The result of a genuine DNA test is said to be scientifically accurate. ...

216. In Pantangi Balarama Venkata Ganesh v State of Andhra Pradesh[88], a two-Judge Bench had explained as to what is DNA in the following manner:

"41. Submission of Mr Sachar that the report of DNA should not be relied upon, cannot be accepted. What is DNA? It means: "Deoxyribonucleic acid, which is found in the chromosomes of the cells of living beings is the blueprint of an individual. DNA decides the characteristics of the person such as the colour of the skin, type of hair, nails and so on. Using this genetic fingerprinting, identification of an individual is done like in the traditional method of identifying fingerprints of offenders.

The identification is hundred per cent precise, experts opine." There cannot be any doubt whatsoever that there is a need for quality control. Precautions are required to be taken to ensure preparation of high molecular weight DNA, complete digestion of the samples with appropriate enzymes, and perfect transfer and hybridization of the blot to obtain distinct bands with appropriate control. (See article of Lalji Singh, Centre for Cellular and Molecular Biology, Hyderabad in DNA profiling and its applications.) But in this case there is nothing to show that such precautions were not taken.

42. Indisputably, the evidence of the experts is admissible in evidence in terms of Section 45 of the Evidence Act, 1872. In cross-examination, PW 46 had stated as under: "If the DNA fingerprint of a person matches with that of a sample, it means that the sample has come from that person only. The probability of two persons except identical twins having the same DNA fingerprint is around 1 in 30 billion world population.""

217. In Santosh Kumar Singh v State Through CBI[89], which was a case of a young girl who was raped and murdered, the DNA reports were relied upon by the High Court which were approved by this Court and it was held thus:

71. We feel that the trial court was not justified in rejecting the DNA report, as nothing adverse could be pointed out against the two experts who had submitted it. We must, therefore, accept the DNA report as being scientifically accurate and exact science as held by this Court in Kamti Devi v Poshi Ram (supra). In arriving at its conclusions the trial court was also influenced by the fact that the semen swabs and slides and the blood samples of the appellant had not been kept in proper custody and had been tampered with, as already indicated above. We are of the opinion that the trial court was in error on this score. We, accordingly, endorse the conclusions of the High Court on Circumstance 9.

218. In Inspector of Police, Tamil Nadu v John David[90], a young boy studying in MBBS Course was brutally murdered by his senior. The torso and head were recovered from different places which were identified by the father of the deceased. For confirming the said facts, the blood samples of the father and mother of the deceased were taken which were subject to DNA test. From the DNA, the identification of the deceased was proved. Paragraph 60 of the decision is reproduced below: "60. ... The said fact was also proved from the DNA test conducted by PW 77. PW 77 had compared the tissues taken from the severed head, torso and limbs and on the scientific analysis he has found that the same gene found in the blood of PW1 and Baby Ponnusamy was found in the recovered parts of the body and that therefore they should belong to the only missing son of PW 1."

219. In Krishan Kumar Malik v State of Haryana[91], Criminal Appeal No. 1252 of 2011, decided on 4 July 2011 (Supreme Court). in a gang rape case when the prosecution did not conduct DNA test or analysis and matching of semen of the appellant-accused with that found on the undergarments of the prosecutrix, this Court held that after the incorporation of Section 53- A in CrPC, it has become necessary for the prosecution to go in for DNA test in such type of cases. The relevant paragraph is reproduced below:

44. Now, after the incorporation of Section 53-A in the Cr.P.C w.e.f 23.06.2006, brought to our notice by the learned counsel for the respondent State, it has become necessary for the prosecution to go in for DNA test in such type of cases, facilitating the prosecution to prove its case against the accused. Prior to 2006, even without the aforesaid specific provision in CrPC the prosecution could have still restored to this procedure of getting the DNA test or analysis and matching of semen of the appellant with that found on the undergarments of the prosecutrix to make it a foolproof case, but they did not do so, thus they must face the consequences.

220. In Surendra Koli v State of Uttar Pradesh and others[92], the appellant, a serial killer, was awarded death sentence which was confirmed by the High Court. While confirming the death sentence, this Court relied on the result of the DNA test conducted on the part of the body of the deceased girl. Para 12 is reproduced below:- "12. The DNA test of Rimpa by CDFD, a pioneer institute in Hyderabad matched with that of blood of her parents and brother. The doctors at AIIMS have put the parts of the deceased girls which have been recovered by the doctors of AIIMS together. These bodies have been recovered in the presence of the doctors of AIIMS at the pointing out by the accused Surendra Koli. Thus, recovery is admissible under Section 27 of the Evidence Act."

221. In Mohammed Ajmal Mohammad Amir Kasab alias Abu Mujahid v State of Maharashtra[93], the accused was awarded death sentence on charges of killing a large number of innocent persons on 26th November, 2008 at Bombay. The accused with others had come from Pakistan using a boat 'Kuber' and several articles were recovered from 'Kuber'. The stains of sweat, saliva and other bodily secretions on those articles were subjected to DNA test and the DNA test matched with several accused. The Court observed:

222. In Sandeep v State of Uttar Pradesh[94], the facts related to the murder of pregnant paramour/girlfriend and unborn child of the accused. The DNA report confirmed that the

appellant was the father of the unborn child. The Court, relying on the DNA report, stated as follows: "67. In the light of the said expert evidence of the Junior Scientific Officer it is too late in the day for the appellant Sandeep to contend that improper preservation of the foetus would have resulted in a wrong report to the effect that the accused Sandeep was found to be the biological father of the foetus received from the deceased Jyoti.

As the said submission is not supported by any relevant material on record and as the appellant was not able to substantiate the said argument with any other supporting material, we do not find any substance in the said submission. The circumstance, namely, the report of DNA in having concluded that accused Sandeep was the biological father of the recovered foetus of Jyoti was one other relevant circumstance to prove the guilt of the said accused."

223. In Rajkumar v State of Madhya Pradesh[95], the Court was dealing with a case of rape and murder of a 14 year old girl. The DNA report established the presence of semen of the appellant in the vaginal swab of the prosecutrix. The conviction was recorded relying on the DNA report. In the said context, the following was stated:

8. The deceased was 14 years of age and a student in VIth standard which was proved from the school register and the statement of her father Iknis Jojo (PW1). Her age has also been mentioned in the FIR as 14 years. So far as medical evidence is concerned, it was mentioned that the deceased prosecutrix was about 16 years of age. So far as the analysis report of the material sent and the DNA report is concerned, it revealed that semen of the appellant was found on the vaginal swab of the deceased. The clothes of the deceased were also found having appellant's semen spots. The hair which were found near the place of occurrence were found to be that of the appellant.

224. In Nandlal Wasudeo Badwaik v Lata Nandlal Badwaik and another[96], the appellant, father of the child born to his wife, questioned the paternity of the child on the ground that she did not stay with him for the last two years. The Court directed for DNA test. The DNA result opined that the appellant was not the biological father of the child. The Court also had the occasion to consider Section 112 of the Evidence Act which raises a presumption that birth during marriage is conclusive proof of legitimacy. The Court relied on the DNA test holding the DNA test to be scientifically accurate. The pertinent observations are extracted below:

"19. The husband's plea that he had no access to the wife when the child was begotten stands proved by the DNA test report and in the face of it, we cannot compel the appellant to bear the fatherhood of a child, when the scientific reports prove to the contrary. We are conscious that an innocent child may not be bastardised as the marriage between her mother and father was subsisting at the time of her birth, but in view of the DNA test reports and what we have observed above, we cannot forestall the consequence. It is denying the truth. "Truth must triumph" is the hallmark of justice.

20. As regards the authority of this Court in Kamti Devi, this Court on appreciation of evidence came to the conclusion that the husband had no opportunity whatsoever to have liaison with the wife. There was no DNA test held in the case. In the said background i.e. non-access of the husband to the wife, this Court held that the result of DNA test "is not enough to escape from the conclusiveness of Section 112 of the Act."

The judgment has to be understood in the factual scenario of the said case. The said judgment has not held that DNA test is to be ignored. In fact, this Court has taken note of the fact that DNA test is scientifically accurate. We hasten to add that in none of the cases referred to above, this Court confronted with a situation in which a DNA test report, in fact, was available and was in conflict with the presumption of conclusive proof of the legitimacy of the child under Section 112 of the Evidence Act.

In view of what we have observed above, these judgments in no way advance the case of the respondents." From the aforesaid authorities, it is quite clear that DNA report deserves to be accepted unless it is absolutely dented and for non- acceptance of the same, it is to be established that there had been no quality control or quality assurance. If the sampling is proper and if there is no evidence as to tampering of samples, the DNA test report is to be accepted.

225. In order to establish a clear link between the accused persons and the incident at hand, the prosecution has also adduced scientific evidence in the form of DNA, fingerprint and bite mark analysis.

226. Various samples, for the purpose of DNA profiling, were lifted from the person of the prosecutrix; the informant; the accused, their clothes/articles; the dumping spot; the iron rods; the ashes of partly burnt clothes; as well as from the offending bus. PW-45, Dr. B.K. Mohapatra, analysed the said DNA profiles and submitted his report thereof. In his report, he concluded that the samples were authentic and capable of establishing the identities of the persons concerned beyond reasonable doubt.

guidelines and methodology documented in the Working Procedure Manuals of the laboratory which have been validated and recommended for use in the laboratory. He further added that once a DNA profile is generated, its accuracy is 100%. The trial court and the High Court have consistently noted that the counsel for the defence did not raise any substantial ground to challenge the DNA report during the cross-examination of PW-45. In such circumstances, there is no reason to declare the DNA report as inaccurate, especially when it clearly links the accused persons with the incident.

227. After establishing the identities of each of the accused persons, the informant and the prosecutrix through DNA analysis, ***the DNA profiles*** *generated from the remaining samples, where the identity of biological material found thereon needed to be ascertained, were matched with the DNA profiles of the prosecutrix, the informant and the accused, generated earlier from known samples. Such an analysis cogently linked each of the accused with the victims as also with the crime scene. A summary of the findings in the report submitted by PW-45, Dr. B.K. Mohapatra, is as under:*

"S.No.	*Accused*	*DNA EVIDENCE*
1	*Ram Singh*	*Rectal swab from the prosecutrix contained DNA of male origin, which was found consistent with the DNA developed from the blood sample of this accused.*
		DNA profile developed from the blood stains from the underwear, T-shirt and slippers of this accused was found consistent with the DNA of the prosecutrix.
2	*Mukesh*	*DNA profile developed from the blood stains from the pants, T-shirt and jacket of this accused was found consistent with the DNA of the prosecutrix.*
3	*Akshay*	*Breast swab of the prosecutrix contained DNA of male origin which was found consistent with the DNA of this accused.*
		DNA profile developed from the blood stains from the jeans of this accused was found consistent with the DNA of the prosecutrix.
4	*Vinay*	*DNA profile developed from the blood stains from the underwear, jacket and slippers of this accused was found consistent with the DNA of the prosecutrix.*
5	*Pawan*	*DNA profile developed from the blood stains from the sweater and shoes and slippers of this accused was found consistent with the DNA of the prosecutrix."*

228. Further, a summary of the DNA analysis of the biological samples lifted from the material objects such as the bus, the iron rods, and the ash and unburnt pieces of clothes is also worth producing here:

"Serial No.	*Identity of the victim*	*Findings of DNA Analysis*
	Informant	*The DNA profile developed from burnt clothes pieces were found to be of male origin and was consistent with the DNA profile of complainant.*
		The bunch of DNA profile developed from hair and blood stained pieces of paper recovered from the bus was found consistent with the DNA profile of complainant.
		The DNA profile developed from blood stained dried leaves collected from the place where both the victims were thrown matched with the DNA profile of complainant.
	Prosecutrix	*The DNA profile developed from blood stains from both the iron rods recovered at the instance of accused Ram Singh from bus was of female origin and was consistent with the DNA profile of prosecutrix.*
		The DNA profile developed from blood stains from curtains of the bus matched with the DNA profile of prosecutrix.

		The DNA profile developed from blood stains from seat covers was found consistent with the DNA profile of prosecutrix.
		DNA profile developed from blood stains from the bunch of the hair recovered from floor of the bus below sixth row seat, blood stains prepared from the roof of the bus near back gate, blood stains prepared from the floor of the bus near back gate, blood stains taken from side of back stairs of the bus, and blood stains taken from the inner side of the back door of the bus was found consistent with the DNA profile of prosecutrix.

230. Mr. Sharma, learned counsel appearing for appellants - Mukesh and Pawan Kumar Gupta, submitted that in the instant case, the DNA test cannot be treated to be accurate, for there was blood transfusion as the prosecutrix required blood and when there is mixing of blood, the DNA profiling is likely to differ. It is seemly to note, nothing had been put to the expert in his cross-examination in this regard. As the authorities relating to DNA would show, if the quality control is maintained, it is treated to be quite accurate and as the same has been established, we are compelled to repel the said submission of Mr. Sharma.

20.11.2.1 The evidence relating to finger print analysis:

231. Next aspect that is required to be adverted is the **evidence of fingerprint analysis** adduced by the prosecution to establish the identity of the accused persons. By virtue of the finger print analysis, the prosecution has tried mainly to establish the presence of the accused in the offending bus. On 17.12.2012 and 18.12.2012, a team of experts from the CFSL had lifted chance finger prints from the concerned bus, Ex.P-1, at Thyagraj Stadium. On 28.12.2012, PW-78, Inspector Anil Sharma of P.S. Vasant Vihar, the then S.H.O. of Police Station Vasant Vihar, requested the Director, CFSL for taking digital palm prints and foot prints of all the accused persons vide his letter Ex.PW-46/C. Pursuant to the said request made by PW-78, Inspector Anil Sharma, the CFSL on 31.12.2012 took the finger/palm prints and foot prints of the accused persons at Tihar Jail. After comparing the chance prints lifted from the bus with the finger prints/palm prints and foot prints of all the accused persons, PW-46, Shri A.D. Shah, Senior Scientific Officer (Finger Prints), CFSL, CBI, submitted his report, Ex.PW-46/D.

232. As per the report, Ex.PW-46/D, the result of the aforesaid examination of the Finger Print Division of the CFSL, CBI, New Delhi was that the chance prints of accused Vinay Sharma were found on the bus in question. The relevant portion of the report is as under:

Result of Examination

1. The chance print marked as Q.1 is identical with left palmprint specimen of Vinay Sharma S/o Sh.Hari Ram Sharma marked here as LPS-28 on the slip marked here as S.28 (Matching ridge characteristics have been found in their relative positions in the chance palmprint and specimen palm print. This forms the basis of the opinion that these prints are identical. Eight of them have been marked with projected red lines with their detailed description are placed at Annexure-1)

II. The chance print marked as Q.4 is identical with right thumb impression of Vinay Sharma S/o Sh.Hari Ram Sharma marked here as RTS-23 on the slip marked here as S.23 (Matching ridge characteristics have been found in their relative positions in the chance print and specimen finger print. This forms the basis of the opinion that these prints are identical. Eight of them have been marked with projected red lines with their detailed description are placed at Annexure-2)." The above report incontrovertibly proves that accused Vinay was present in the bus at the time of the incident. Be it noted, the other chance prints were found to be unfit for comparison or different from specimen print.

The comparison also shows that there is a concordance in terms of general alignment and angulation of the biting surfaces of the teeth of the lower jaw on the dental models of the accused person with the name Akshay and the corresponding bite marks visible on

Photograph No.5. In particular, the comparison revealed concordance between the biting surface of the teeth on the lower jaw of the dental models of the accused person with the name Akshay and the bite mark visible on Photograph No.5 in relation to the rotated left first incisor whose mesial surface pointed towards the tongue.

Overall, the bite mark shows some degree of specificity to the accused person's teeth by virtue of a number of concordant points, including one corresponding unconventional/ individual characteristic. There is an absence of any unexplainable discrepancies between the bite mark and the biting surfaces of this accused person's teeth. Therefore, the teeth on the dental models of the accused person with the name Akshay probably caused the bite marks visible on Photograph No.5."

239. Be it noted, the present is a case where the victim's body contained various white bite marks. Bite mark analysis play an important role in the criminal justice system. Advanced development of technology such as laser scanning, scanning electron microscopy or cone beam computed tomography in forensic odontology is utilized to identify more details in bite marks and in the individual teeth of the bite. Unlike fingerprints and DNA, bite marks lack the specificity and durability as the human teeth may change over time.

However, bite mark evidence has other advantages in the criminal justice system that links a specific individual to the crime or victim. For a bite mark analysis, it must contain abundant information and the tooth that made the mark must be quite distinctive.

240. Bite marks in skin are photographed in cases where the suspect is apprehended. A thorough dental combination is administered after dental examination of the suspect. Final comparison of the details of the original mark with the dentation of the suspect is done by experts.

241. The bite marks generally include only a limited number of teeth. The teeth and oral structure of the accused are examined by experts and, thereafter, bite marks are compared and reports are submitted. Forensic Odontology is a science and the most common application of Forensic Odontology is for the purpose of identification of persons from their tooth structure.

242. Forensic Odontology has established itself as an important and indispensable science in medico-legal matters and expert evidence through various reports which have been utilized by courts in the administration of justice. In the case at hand, the report is wholly credible because of matching of bite marks with the tooth structure of the accused persons and there is no reason to view the same with any suspicion. Learned counsel for the appellants would only contend that the whole thing has been stage- managed. We are not impressed by the said submission, for the evidence brought on record cogently establish the injuries sustained by the prosecutrix and there is consistency between the injuries and the report. We are not inclined to accept the hypothesis that bite marks have been managed. Acceptability of the plea of alibi

"**Aggravating circumstances**: A court may, however, in the following cases impose the penalty of death in its discretion:

(a) if the murder has been committed after previous planning and involves extreme brutality; or

(b) if the murder involves exceptional depravity; or

(c) if the murder is of a member of any of the armed forces of the Union or of a member of any police force or of any public servant and was committed-

(i) while such member or public servant was on duty; or

(ii) in consequence of anything done or attempted to be done by such member or public servant in the lawful discharge of his duty as such member or public servant whether at the time of murder he was such member or public servant, as the case may be, or had ceased to be such member or public servant; or

(d) if the murder is of a person who had acted in the lawful discharge of his duty under Section 43 of the Code of Criminal Procedure, 1973, or who had rendered assistance to a Magistrate or a police officer demanding his aid or requiring his assistance under Section 37 and Section 129 of the said Code." After reproducing the same, the Court opined: "Stated broadly, there can be no objection to the acceptance of these indicators but as we

have indicated already, we would prefer not to fetter judicial discretion by attempting to make an exhaustive enumeration one way or the other."

333. Thereafter, the Court referred to the suggestions pertaining to mitigating circumstances: "Mitigating circumstances.-In the exercise of its discretion in the above cases, the court shall take into account the following circumstances:

(1) That the offence was committed under the influence of extreme mental or emotional disturbance.

(2) The age of the accused. If the accused is young or old, he shall not be sentenced to death.

(3) The probability that the accused would not commit criminal acts of violence as would constitute a continuing threat to society.

(4) The probability that the accused can be reformed and rehabilitated. The State shall by evidence prove that the accused does not satisfy the conditions (3) and (4) above.

(5) That in the facts and circumstances of the case the accused believed that he was morally justified in committing the offence.

(6) That the accused acted under the duress or domination of another person.

(7) That the condition of the accused showed that he was mentally defective and that the said defect impaired his capacity to appreciate the criminality of his conduct." The Court then observed: "We will do no more than to say that these are undoubtedly relevant circumstances and must be given great weight in the determination of sentence."

337. the singular conclusion that the aggravating circumstances outweigh the mitigating circumstances now brought on record. Therefore, we conclude and hold that the High Court has correctly confirmed the death penalty and we see no reason to differ with the same.

357. ***When we cautiously, consciously and anxiously weigh the aggravating circumstances and the mitigating factors, we are compelled to arrive at the singular conclusion that the aggravating circumstances outweigh the mitigating circumstances now brought on record. Therefore, we conclude and hold that the High Court has correctly confirmed the death penalty and we see no reason to differ with the same.***

20.11.3 Corroboration not Necessary[7]

Author's Summary

Corroboration in rape cases is not a legal requirement (EA).
Quoted SC: "*The tender years of the child, coupled with other circumstances appearing in the case, such, for example, absence of motive to falsely implicate the accused, its demeanour, unlikelihood of tutoring and so forth, may render corroboration unnecessary*".

Relevant Extracts (Verbatim)[8]

The learned advocate asked us to look for corroboration of the evidence of the victim on the ground that rape has often been described as the easiest charge to make and the most difficult to refute: *Karichiappa Goundan (re:)*. The question of corroboration has been the subject-matter of a decision of the Supreme Court in *Rameshwar v State of Rajasthan*[9]. In that case the appellant was charged with committing rape on a young girl, eight years of age. The learned Sessions Judge held that the evidence was sufficient for moral conviction but fell short of legal proof because, in his opinion, the law requires corroboration of the story of the prosecutrix connecting the appellant with the crime. He was satisfied, however, that the girl had been raped by somebody.

7. Re *Anthony,* AIR 1960 Mad 308 : 1960 Cri LJ 927 (Mad).
8. AIR 1942 Mad 285 : 43 Cri L J 576.
9. AIR 1952 SC 54 : 1952 Cr LJ 547 : 1952 SCR 377.

Accordingly he acquitted the accused. In the appeal by the State against acquittal the High Court held that the law requires corroboration in such cases but held that the girl's statement made to her mother was sufficient corroboration and setting aside the acquittal convicted the appellant. On appeal to the Supreme Court it was held: The first question is whether the law requires corroboration in these cases. The Evidence Act nowhere says so. A woman who has been raped is not an accomplice. If she was ravished she is the victim of the outrage: In the case of a girl below the age of consent, her consent will not matter. The learned High Court Judges were wrong in thinking that they could not, as a matter of law, convict without corroboration. but that is a question of fact in every case.

In this case no corroboration beyond the statement of the child to her mother was necessary. The appeal was dismissed. How the principles laid down in the Supreme Court decision should be applied are set out in *Public Prosecutor Mohini Sankara Das*, 1956 Andh WR 572 and *State Govt. of Madhya Pradesh v Sheodayal Gurudayal*, AIR 1956 Nag 8 : 1956 Cr LJ 83 : ILR 1955 Nag 731; *Dulichand v State*, AIR 1952 Ajmer 54 : 1952 Cr LJ 1575; *See* also *Boya Chinnappa (re)*, AIR 1951 Mad 760 : (1951) 1 Mad LJ 110 : 1951 Cr LJ 718(2). How tell-tale smegma on the person of the accused will also corroborate the prosecutrix; see *Ramkala Prasad v Emperor*, AIR 1946 All 191 : 47 Cr LJ 611; *Harendra Prosad v Emperor*, ILR (1940) 2 Cal 180 : 44 Cal WN 830 : AIR 1940 Cal 461.[1]

20.11.4 Special Situation[10]

Author's Summary

A woman with 2" prolapsed was raped. There was no profuse bleeding. However there were semen stains of the rapist on the clothes of the victim. Unfortunately, the identification of semen was not linked to the culprit. The court acquitted the accused. It is a case of utter Unfortunate callousness on the part of all concerned!

Relevant Extracts (Verbatim)

The medical examination of the prosecutrix shows that she had a prolapse of the uterus about 2" outside her vulva. A forcible intercourse with such a woman would have certainly given a copious discharge of blood at the time. The report of the chemical examiner, on the other hand, goes to show that there was only one small patch of blood on the ghaghra of the prosecutrix. The presence of semen on the clothes of the appellant and the prosecutrix by itself, in my opinion, carries, no weight whatsoever for, admittedly, both of them are married persons and had been putting on the same clothes for a considerable time.

20.11.5 Delay in Despatch[11]

Author's Summary

Delay of in despatch of vaginal swab, after 4 months ,was declared worthless. It could have been tampered with.

Relevant Extracts (Verbatim)

Another very suspicious feature in this case is the evidence relating to taking a swab. That it is said was done on November 12, but for some reason, it was not sent to chemical examiner until March, 1951. Much can happen to a swab in the meantime and therefore the evidence of the chemical examiner as to the examination of the swab is really worthless.

10. *Har Nath v State of Rajasthan*, AIR 1952 Ajmer 49 : 1952 Cri LJ 1563 (Ajmer).
11. *Arabinda Dey v State of West Bengal,* AIR 1953 Cal 206 : 1953 Cr LJ 511 (Cal).

20.11.6 Life of Sperms[12]

Author's Summary

The advocate erroneously thought that the sperms in the vagina can be located for only a few hours. So, he made a wild charge that the sperms found after 2 days were introduce artificially. The wild charge was rejected and the rapist convicted.

Sperms have been identified from the vaginal swabs even up to a week.

Relevant Extracts (Verbatim)

Mr. Mitter therefore argued on the life of spermatozoa stating that beyond a few hours the spermatozoa could not live. Therefore, he argued that if any sexual intercourse had taken place on the 18th March, 1960, the spermatozoa could not be found on an examination on the 20th March, 1960, especially the girl had washed herself and answered call of nature during the period of time between the alleged crime and the medical examination. Therefore Mr. Mitter builds up the theory of artificial introduction of semen to *Hayatunnessa* by the police. He did not accuse the doctors. This suggestion of artificial insemination or artificial introduction was never made either to the investigating officer or to the doctors. To say the least, we consider this suggestion to be wild. Opinion and views expressed in medical text books that the life of spermatozoa is only a few hours after intercourse cannot help Mr. Mitter. Dead spermatozoa could still be found. It is not necessary to find live and active spermatozoa. Mr. Mitter tries to argue on the basis of medical authorities that the spermatozoa after death disintegrates, but he has not been able to show how long it takes spermatozoa to disintegrate so completely that even their presence cannot be detected. The fact remains that the chemical examiner definitely found spermatozoa in the vaginal smears and vaginal swabs of *Hayatunnessa*.

The swabs and smears were taken by responsible doctors, who, we believe, were true to their professional code. They were sent under sealed covers as exhibit 37 shows. Not the remotest suggestion was made in cross-examination that the seals were broken or tampered with by anybody.

We, therefore, hold that the medical opinion and the chemical examiner's report corroborate *Hayatunnessa's* evidence of rape.

20.11.7 Blood and Semen[13]

Author's Summary

The oral evidence, circumstantial evidence, the evidence on the persons on the victim/rapist and concurrent finding of three lower courts sealed the fate of the rapist.

Relevant Extracts (Verbatim)

1. We are satisfied and, indeed, Shri Mukherji fairly admitted, that the six-year-old Anjali had been the victim of rape on the date set out by the prosecution. The main point on which counsel laid stress was the identity of the criminal. The plea of the appellant was one of the total denial, which was consistently disbelieved at the forensic triple-decks through which it had passed. There is evidence of Anjali and her mother. The playmate Ashok (P.W. 2) has given corroborating testimony. The first information has been prompt and has implicated the accused. There was blood on the genitals of the appellant to explain which he invented the story of itches

12. *AW Khan v State of West Bengal*, AIR 1962 Cal 641 : 1963 All Cri R 11 : (1962) 2 Cr LJ 751 (Cal). See also *State of Orissa v Pichika Parvatisam*, AIR 1963 Ori 52 : (1963) 1 Cr LJ 310 : ILR 1962 Cut 781.
13. *RK Agarwal v State of Orissa*, AIR 1976 SC 1974 : (1976) 2 SCC 177 : 1976 Cr LJ 1376; See also *State of Bombay v Hiraman Punjab Vidhati,* (1965) 2 Cr LJ 349 (Bom); *Mushtaq v State of Uttar Pradesh*, AIR 1954 All 580 : 1954 All LJ 256 : 1954 Cr LJ 1288 (All).

and scratches thereof. It is true that while the evidence before the committal court has been consistent and total, implicating the accused, there has been some wobbling in the trial court on the part of the little girl and her mother, for reasons not far to seek. Even so, the evidence in the trial court is explicit enough to implicate the accused, even apart from the depositions in the committal court, which have been read as evidence under section 288, Code of Criminal Procedure. There are corroborating materials inescapably fixing the guilt on the accused, such as the bloodstain on his clothing. Even assuming that the evidence of little children requires general corroboration, we are satisfied that the proved circumstances that the girl was playing in broad day-light that she was carried away by the accused and brought back crying after a time, that there was a first information lodged before the police shortly thereafter, that the medical examination of the accused's genitals indicated the presence of spermatozoa, are sufficiently corroborative of the guilt of the appellant. Even otherwise, the grave injustice, manifest on the record, can induce this court to demolish the concurrent findings of guilt by the three courts below. There is little to be said for such a drastic step in the circumstances unfolded in this case.

20.11.8 Semen on wearing apparels[14]

Author's Summary

The victim was forcibly put into a car by the accused persons, took her to the place in a village and raped there. The wearing apparels of the victim as well as the accused persons were sent for analysis to the FSL where Human Semen was detected on Salwar, Lady's Shirt and Shameez. The report of the FSL corroborates the version put forward by the victim. The conviction of the accused is justified.

Relevant Extracts (Verbatim)

The High Court by reversing the order of acquittal of the learned trial Court, has convicted the accused appellants under Section 376 of the IPC is under challenge in the present appeal.

The victim, herself deposed in great detail as to how she was forcibly put into a car by the accused persons who took her to the place of occurrence in a village where the crime was committed. In the course of the investigation the wearing apparels of the victim as well as the accused persons were collected and sent for analysis to the Forensic Science Laboratory (FSL). The report of the FSL corroborates the version put forward by the victim. The report of the FSL in respect of the victim shows that Human Semen was detected on Salwar, Lady's Shirt and Shameez. However, semen could not be detected on Chunni, Vaginal swab, Pubic hairs and Blood stained piece of cloth. Thus the conviction of the accused appellants ordered by the High Court is perfectly justified.

In *Chhangu Passi v State of UP,* 2018 (6) ALJ 33, while examining Tai of the victim she had stated that on the date of incident at the time when she was collecting kandi then some children of the village informed her that the victim was lying in arhar field in unconscious position. Then she went there and saw that underwear of the victim was drenched with blood. Thereafter she took the victim to her house. After regaining consciousness, the victim had informed that the appellant had committed rape with her and thereafter FIR of the incident was promptly lodged on that very day. The evidence of witnesses which are corroborative evidence of fact subsequent to the incident are fully proved. Thus there is no illegality in the judgment of the Court below in convicting the appellant under Section 376, IPC.

However, the counsel for the appellant has submitted that statement given by the victim in examination-in chief is tutored statement and no reliance can be placed on it. Although she had stated in cross-examination that this statement was given by her as tutored by her father but in the end she had specifically denied that it was incorrect to say that appellant had not committed

14. *Ajay v State of Haryana*, Criminal Appeal Nos. 888 of 2015, decided on 8 August 2018 (SC).

rape with her. The victim was an eight years old girl at the time of incident and if some questions were answered in the manner on which the questions were put to her in cross-examination then on that basis her statement was not liable to be disbelieved. From the medical evidence it is also fully proved that victim was raped. From Forensic Laboratory report, it was also proved that sperm of human was present on the underwear of the victim. Thus suggestion of the counsel for the applicant that injury was received in any other manner and the victim was not raped, is not liable to be accepted inasmuch as if injury was received in any other manner then there was no occasion that sperm of human found on the underwear of the victim.

In *Shankar Singh S/o Nathu Singh vs State of Rajasthan,* 2019 Cr LJ 3088 (Raj HC, Jaipur Bench), the appellant on the next day of the occurrence suffered a disclosure statement wherein he stated that he can get the dead body of the deceased recovered. In pursuance of disclosure statement, vide Recovery Memo appellant got the dead body recovered from a drain behind the hill. The Recovery Memo was witnessed by the witnesses. One of them in the Court stated that the accused led the police party to the spot where the dead body was lying and also got recovered the same. This witness also witnessed the various recoveries effected from spot which included clothes and underwear of the victim-child. The frock of the deceased was sent to the Forensic Science Laboratory along with various other articles. The report submitted by the Forensic Science Laboratory proves that on the frock of the deceased semen of accused was found. Further the testimony of recovery witnesses is sufficient to complete the chain of circumstances to arrive at the conclusion that the offence has been committed by the appellant and by none else.

20.11.9 Venereal Disease Infection[15]

Author's Summary

Venereal disease was found on the person of the gang-rape victim. The examination of the rapists for the disease could identify/eliminate the rapist (s). However, all concerned with the investigation/examination/supervision failed to do their duty—unpardonable negligence!

Relevant Extracts (Verbatim)

It is a well-known rule (see *Modi's Medical Jurisprudence,* 10th Edn., p. 303 and p. 305) that in cases of rape the alleged victim and the accused persons should be specially inspected for venereal diseases. Dr. Jadunath Kar (P.W. 1) who medically examined the girl Bimali Devi took special care to collect some smear from the vagina of the girl and sent it to the chemical examiner from whose report it appears that the girl was infected with gonorrhea. Dr. Harekrushna Parija (P.W. 2), however, has not stated that he examined the accused persons with a view to ascertain if any of them was infected with venereal diseases. His evidence is entirely silent on this subject. Any medical officer with some knowledge of medical jurisprudence is expected to know that in cases of rape the accused ought to be specially examined for signs of venereal disease, if any.

Even if this medical officer overlooked this point, the investigating police officer or the superior police officers who supervised the case ought to have sent a special request to the medical officer to further examine the accused persons to find out if there were signs of venereal disease. Unfortunately, this was not done with the result that an important piece of evidence was lost. If any of the accused persons was found to suffer from gonorrhoea that would be the strongest piece of corroborative evidence of the girl's statement incriminating that accused. On the other

15. *Anam Swain v State of Orissa*, AIR 1954 Ori 33 : 1954 Cr LJ 132 : 19 Cut LT 14; See also *Rameswar v State of Rajasthan*, AIR 1952 SC 54 : 1952 SCR 377 : 1952 Cr LJ 547 (SC); (a) For faked rape: *Gangaram Nanhoosingh v Crown*, 1950 Cr LJ 244 (Nag); (b) Rape not proved: *Rajput Bhima Karasan v Kutch Government,* 1950 Cr LJ 396 (Kutch); (c) Unnatural Offence: *Lobana Vasantlal Devchand v State of Gujarat*, 1968 Cr LJ 1277.

hand, if none of the accused was found to suffer from gonorrhoea that circumstance itself would completely disprove the girl's allegation of rape by the accused persons because according to her evidence that was the first time when any person had sexual intercourse with her.

20.11.10 Spermatozoon Necessary[16]

Author's Summary

In the absence of DNA analysis, the identification of sperms was considered essential for the identification of semen. DNA has dispensed with the necessity! The present case appears to be a false accusation. Besides investigation were also lop-sided. Was it influence of the accused? Or, was it connivance of the females?

Relevant Extracts (Verbatim)

The wearing saris of both the women and underwears of Manik and Narayan were seized under the seizure list Ext. 1. The sari of Samiran (P.W. 10) was of light blue colour check-black bordered, which was marked as C and D by the chemical examiner. No spermatozoon could be detected in these exhibits. What is more striking is P.W. 10 was recalled to say that the green sari was worn by her that night. This was marked A by the Chemical Examiner and spermatozoon had been detected therein (Ext. 8) but the origin or groups of semen could not be detected. Be that as it may P.W. 10 was not a truthful witness at all and she had no hesitation to give apparent lies for securing a conviction.

It is also striking that the appellant though arrested on that very nights was not produced before Dr. Pal, (P.W. 11) who examined P.Ws. 1 and 10 on 10-5-70. No injury was found on the person of P.W. 10 suggesting resistance to violence.

20.11.11 Un-exhibited Report[17]

In the file of committal courts, there is an unexhibited report of Chemical Examiner. A reading of that report would show that no seminal stains and spermatozoa could be detected on article-A *i.e.,* Shantibai's Sari. It is further stated in the report that vaginal slides of the girl were not received by the Chemical Examiner although it was mentioned in the memo of the S.P. that those were also sent to Chemical Examiner for chemical examination. The story of Shantibai (P.W. 1) was that her Sari has got soiled by acts of discharges during the course of the incident by the appellants. She had gone to the length of producing the soiled Sari at the time of making her report. That Sari was seized by the police and sent for chemical examination. The report of the Chemical Examiner, already indicated, contra-indicates the story of any sexual intercourse having taken place with the prosecutrix. The law with respect to unproved prosecution documents appears to be that although the prosecution cannot be allowed to use them, the defence cannot be denied their use if those documents support the defence in any manner. In the case *Shivprasad v Emperor*, (1938) 39 Cr LJ 917 (Nag HC) : AIR 1938 Ngp 934, the FIR was not proved by the prosecution. It was held that the defence could not be shut out from using that document, merely because the prosecution had not formally proved it. If the prosecution wished to imply that FIR was a garbled document, it should have given evidence to that effect. In the absence of such evidence, the defence could legitimately make use of that document. Another case *Samedas v State of Madhya Pradesh*[18], also related to unproved FIR. It was not proved and hence could not be exhibited in the case. It was held that the prosecution could not be allowed to use it because it had remained unproved. But even so it was open to

16. *Narayan Dutta v State,* 1980 Cr LJ 264.
17. *Shatrughan v State of Madhya Pradesh*, 1993 Cri LJ 120 : 1992 (2) CLC 394 : 1992 (1) Crimes 889.
18. 1969 Jab LJ (SN) 54.

the defence to make use of it, if it supported the defence in any manner. In the present case the unexhibited report of the Chemical Examiner did not in fact require to be formally proved by any witness. It was a document which proved itself under section 293 of the Code of Criminal Procedure and should have been exhibited even if it was not referred to in the deposition of any witness. That report stood on an obviously better footing than an unproved FIR. The defence could be legitimately allowed to make use of it. When so considered, it militates against the prosecution story about any sexual intercourse having taken place with the prosecutrix.

20.11.12 Injuries[19]

Author's Summary

In a rape of 5 year old girl there were no injuries to the victim. Likewise, there were no injury to the penis of the rapist. However, there was no smegma in the penis. Absence of injuries is possible if there was no full penetration. Th rapist was convicted

Relevant Extracts (Verbatim)

1. It is true that Dr. H.S. Amwani found no injury on the genital region or anywhere in the appellant's body and no clotting of the hair. In the opinion of the doctor, there were no signs of struggle, but the absence of smegma around the corona suggested that there could have been sexual intercourse. There could possibly be no injury caused to the appellant at the hands of the raped girl because she was only five years old. As for the absence of injuries on the genital region of the appellant, Dr. H.S. Amwani was of the view that if there was no full penetration there would be no lacerations on the triennium of the penis. He further explained that if only the corona went inside the private parts of the girl, there would be no lacerations.

In *Modi's Medical Jurisprudence and Toxicology*, 14th Edn. at p. 339, it is mentioned that:

> *Modi had seen cases in which there was no injury to the penis of the accused although there were lacerations of the hymen, posterior perineum and even the vaginal walls of the victim.*

In *Taylor's Principles and Practice of Medical Jurisprudence*, 10th Edn. at p. 83, the case of *R. v Cowley* has been quoted in which the prisoner, aged twenty-four, was tried for a criminal assault on his own daughter Catherine, aged less than 4 years. The labia majora of the girl was swollen and bruised. The fourchette has been torn across as well as the posterior wall of the vagina, for a depth of over a quarter of an inch extending backwards; from this there was a laceration which came up to the anterior wall of the rectum. The anterior part of the external sphincter, *i.e.*, that part between the anal orifice and the central tendon of the perineum had been torn. There was bleeding on her private parts, and even on admission to hospital there was slight oozing of blood. The prisoner himself desired to be examined by a doctor. No marks of violence on his person nor any stains of blood or semen were found. The apron in which the child had been wrapped when she was taken to the hospital contained blood and spermatozoa on one spot and blood only on the other. Nothing was found elsewhere. The prisoner's pudenda was unusually clean for a man of his employment and cleaner than the rest of the body. The jury wishes to know why no marks of violence were found on the prisoner, and the medical witness had stated that the male organ, being pressed against the soft parts would not show marks of violence. The prisoner was on the evidence convicted and sentenced to 10 years' penal servitude.

This case and the medical evidence produced in that case supports what has been said in Modi's *Medical Jurisprudence and Toxicology* that there are cases in which in spite of all these injuries on the private parts of the victim, there may be no injury whatsoever on the penis of the accused. It would not be, therefore, correct to discard the prosecution evidence only on the basis that no injuries were found on the person of the appellant.

21.1 NATURE

DNA profiling is a process by which the unique profile of the DNA of a person is determined. 99.9% of the DNA of all human beings is the same. Only 0.1% DNA differs. It is this part of DNA, which is used for DNA profiling.

DNA is deoxyribonucleic acid. It is the basic genetic material in all human body cells and other living beings. It carries the genetic code. It is present in human white blood corpuscles. Red blood corpuscles do not have DNA. It is inherited from both the parents.

DNA is a complex molecule, called nucleotide. It has a double helix structure, which can be compared with a twisted rope "ladder". The side arms of the "ladder" are made of sugars and phosphates. The rungs of the "ladder" are made of two pairs of four bases:

1. Adenine (A)
2. Thymine (T)
3. Cytosine (C)
4. Guanine (G)

One pair is made of the first two bases, adenine and thymine and it forms one rung of the "ladder", each base emanating from either of the two arms and joining in-between. The last two, cytosine and guanine, form the other pair and the other rung of the "ladder". The bases of one pair do not interchange with the bases of the other pair.

The "ladder" thus formed, is twisted and each twist consists of ten pairs — ten rungs. One DNA molecule has more than one billion of these base pairs.

DNA structure, the order of these bases, determines human character, behaviour and body characteristics, even diseases.

These base pairs are further compacted into parts known as alleles/mini-satellites. They have several thousand such bases. Molecular biologists have been tinkering with DNA molecules to study the diseases and other inheritance aspects.

The structure of DNA (the arrangement of these base pairs) varies from individual to individual. Each individual, consequently, is unique — different from all others. In monozygotic twins, DNA structure is the same for the twins because the division of a same single fertilised egg creates them. Monozygotic twins are genetically identical.

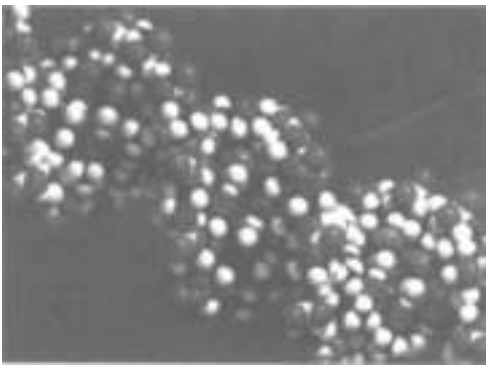

Fig. 21.2

DNA Molecule (Double Helix - 'the Twisted Rope Ladder')

DNA profiles are the structural pattern of the DNA molecule, the disposition of its constituents (base pairs). More than 99.9% of parts of the DNA are similar in several individuals, and only the remaining 0.1% determines the unique DNA profile of an individual. It is determined by comparison of two or more of the 13 STRs in the questioned and standard samples. They determine the individuality of a person and reflect his/her DNA makeup. The STR profiles are used mainly to identify human beings and other living entities, in forensics.

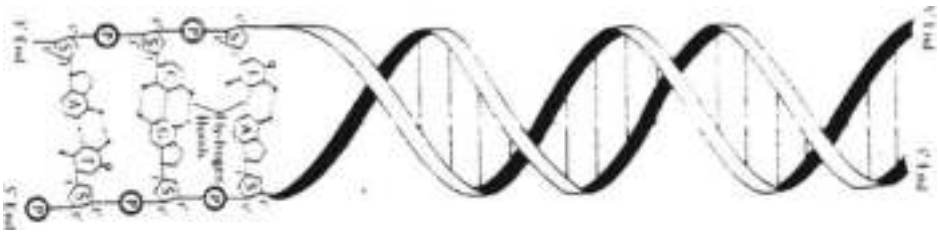

Fig. 21.3
The Watson-Crik Model of DNA

Intensive investigations of the DNA have revealed that:

1. The base pairs are compacted into units, which are repeated in the DNA molecule at a periodicity, which varies with the various individuals.
2. The length of these basic units, fragment lengths (FL) vary with different individuals.
3. If the purified DNA molecule is subject to the action of Restriction Enzymes (RE), under controlled conditions, the cleavage of the DNA double stranded-molecule takes place at sequence-specific points in the molecule, giving specific Restriction Fragment lengths (RFL).
4. The RFLs vary from one individual to another. This length variation phenomenon is called Restriction Fragment Length Polymorphism (RFLP). The variations in the fragment length can be due to a number of reasons:
   - There are several kinds of genome level differences in individuals.
   - The mutation alters the base sequence restriction enzyme recognition sites and thus creates new sites or eliminates original ones.
   - The mutation may insert or eliminate DNA building blocks between the boundaries defined by two cleavage sites.
   - RFLPs are present both in nucleic and mitochondrial DNA. Nucleic RFLPs are inherited in accordance with the Mendelian principles from both parents. Hence, they provide excellent information to determine a blood relationship.

21.1.1 Mitochondrial DNA

Mitochondria are body gene contained in eukaryotic cells, responsible for cellular respiration and for the generation of Adenosine Tri-Phosphate (ATP) — an important body constituent for the transfer of energy in living cells. Mitochondrial genes give mitochondrial DNA (*mt*DNA). It does not follow the Mendelian inheritance law. The mitochondrial genes are inherited from the mother only. The father is not involved in their inheritance. Hence, mitochondrial genes cannot be used to determine the fatherhood of a person or child. They, however, link the mother and other maternal females.

The basic composition of mitochondrial DNA and its shape vary from nucleic DNA. The functions also vary.

Human mitochondria contain 2 to 10 units of double-stranded circular DNA molecule. It has 16.5 kilobase length, and the molecular weight is of the order of 10.[7] The mitochondrial genome is highly variable. A segment, known as D-loop, provides high discrimination among

non-related individuals. Corresponding D-loop segments sequences are found in abundance in maternally related individuals. The D-loop segment is amendable to a polymerase chain reaction and, thus, minute quantities of the *mt*DNA can provide mitochondrial DNA profiling for determining maternal interrelationship or identity.

*mt*DNA profiling is coming up as an important tool to establish the identity or non-identity of an individual from hair (shaft), teeth and bones even when they are old. *Mt* DNA has thus widened the identification field tremendously.

In many situations, when nuclear DNA is not available, mitochondrial DNA is used. Many cases where Nuclear DNA was not available, mitochondrial DNA established the identity of the unknown deceased.

21.1.2 Y Chromosomes

Y-chromosomes are found in males. They pass from father to son. They are genetic markers. Their comparison can identify a familial relationship. They help to find familial lineage.

Y chromosomes are used to determine the sex from the body materials. A Y-chromosome-specific probe is used for the purpose.

21.2 IMPORTANCE

The correct identification of criminals/victims/mental patients/heirs/parentage of children and other individuals has always been one of the most important problems in criminal and civil investigations. The best and certain method had been the identification through fingerprints. This fingerprint identification mode was discovered at the fag end of the nineteenth century. It has been helping the criminal justice system tremendously since then; wherever it was adopted. Now, a similar but a more potent and versatile mode, with far wider ramifications, has been found. It has revolutionised the criminal investigation and trials. It is DNA profiling. There are two types of DNA: nuclear DNA (nDNA) and mitochondrial DNA (*mt* DNA). Both are used in the identifications of individuals. However, nuclear DNA is better, with wider applications and specific identifications. The DNA profile[1] of the clue material is compared with that of material from the suspected source to ascertain the identity or non-identity of the common source. If the standard sample s not available from the suspected source, body cells, from his close blood relation(s) can provide the DNA profile for comparison. Further, mitochondrial DNA from hair and bone, where nuclear DNA is not available, can be used for the identification.

The identification *via* DNA profiling is superior to other methods of identification in many respects:

1. It permits the identification of the individual not only from the comparison of his own body materials containing body cells *inter se,* but the identification of his body materials can also be made from the body cells of his blood relations: parents, sons, daughters, brothers, sisters and others.

1. A DNA profile is the intra-structural pattern of the DNA molecule, the disposition of its constituents (base pairs, etc.). It is determined usually by finding corresponding 5 or more of the 13 STRs in the DNA molecule.

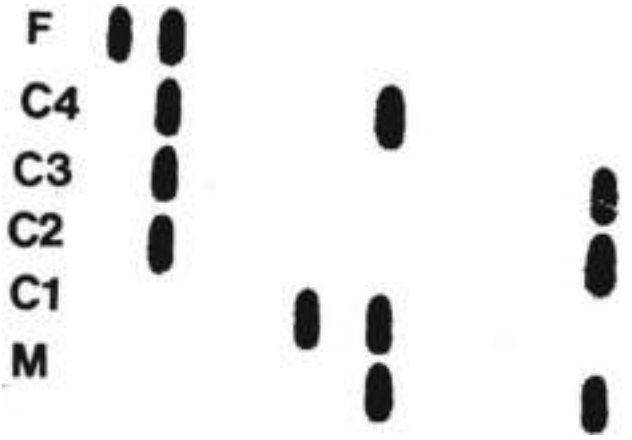

Fig. 21.4

Each of the four children in this family has one band from the mother (M). Likewise children C2, C3 and C4 have one band inherited from father (F). Child C1 has different paternal band, proving C1 had different father

2. The identification is possible from a variety of clue materials, which are available in different types of crimes: blood, semen, hair roots, hair shafts, body tissues, bones. They can definitely be linked to the source (the culprit or the victim) from which they emanated.

   In Naina Sahni's Tandoor Murder case the body of the victim, after the murder, was being burnt in an oven - Tandoor. Foul flesh-burning smell alerted the persons around. They suspected foul play and stopped the burning; a badly burnt body was taken out. The body material was too much charred to permit its use for the DNA test. Bone marrow was used to identify the victim. Its DNA profile was compared to those of her parents and identity established. (CH)

3. Whatever the nature of body material, they have the same DNA profile. The clues can be identified as *inter se*. Thus, a semen stain source is identified positively from a blood sample, a skin piece, a hair root, saliva, etc. taken from the culprit.
4. More importantly, in cases of mutilated non-identified bodies, the identity of the deceased is established by comparing his DNA profile with those from subject's parents, brothers, sisters, sons or daughters.
5. In all countries, thousands of dead bodies remain unidentified. DNA is helping to reduce the number of such unidentified bodies.
6. The quantities of the DNA required for analysis are extremely small, in nanograms and picograms. Polymerase Chain Reaction (PCR) obtains workable quantities through amplification of DNA.

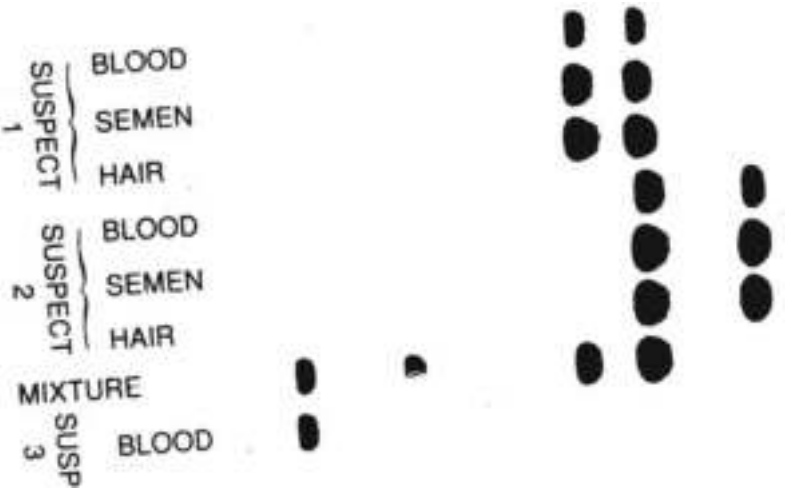

Fig. 21.5

In a case of gang rape, there were three suspects. However analysis of the mixed semen provided identity of only two suspects. Blood, semen and hair provided the same corresponding DNA profiles

7. An important advantage of DNA profiling is that the contamination of the evidentiary clues by similar biomaterial does not prevent the identification. In vaginal swabs, for example, the vaginal fluids are eliminated and they do not inhibit the identification of the source of semen. Likewise, in cases of gang rape, the semen of different rapists in the seminal stains or in the vaginal swabs can be identified as if the semen from other sources were not present.

   In the murder case of a Chief Minister of Punjab, Human Bomb was used. The person carrying the bomb was shattered to pieces. The identity of the person (human bomb) was established through DNA profiles comparison of the person and his parents. (CH)

8. Using Y chromosome specific probes, the sex of person from whom the body material has come is ascertained positively as that of a male. However, female sex has only to be inferred from the absence of male specific chromosomes.

9. DNA profiling is being used successfully in the identification of skeletal remains.

   A fifteen years old girl was murdered. Her skeletal remains were discovered after about eight years. The provisional identity of the deceased was done through skull superimposition technique and comparison of dental data, available with the dentist. Final definite identity was established through DNA profiling.

   A piece of the femur was taken. It was sand blasted to remove contaminants. DNA was extracted and purified from the bone. It was found highly degraded. The DNA, therefore, was typed through PCR amplification of 6 STRs and compared with those of her mother and father. The STRs were consistent inter se. *(CH)*

10. Old cases of disputed paternity, which often come up for inheritance, can be decided correctly through DNA profiling.

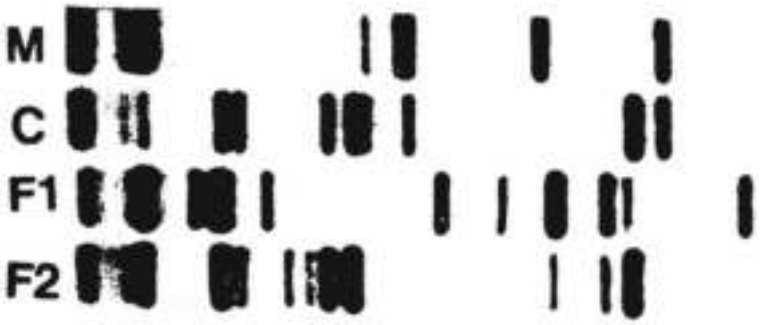

Fig. 21.6

Who is biological father of the child? dna profiles decide that f2 is the father when his 20 rflps matched with those of the child (c). F1 had also some common rflp s but few only. Above are only parts of the dna profiles

In an interesting case, decided in July 2002, by an USA court after 7 years, a 69 year-old person, Ben Erskine, claimed that he was the son of a Yoga Guru, Parmahansa Yogananda. The Guru had died in 1952. The Guru's organisation 'Self-Realisation Fellowship' has vast properties. Ben Erskine wanted a share in the properties. The organisation got a DNA profile of the claimant compared with the DNA profiles of three of the male relatives of the Guru, in India. The independent results from two separate laboratories showed, that there was no relationship between the Guru's clan and that of the claimant, Erskine.

The DNA profiling not only cleared the Guru from the sex scandal stigma, even after 50 years of his death but it also showed that the claimant was an impostor. (CH)

In the recent case of a high profile politician (Tiwari), DNA profiling of the blood of the illegitimate son and that of Tiwari established that the latter was the biological father of the former, though he denied the factum vehemently in the initial stage and accepted fatherhood only after DNA match. (CH)

The method of DNA identification of human beings is inferior to the fingerprint identification as a method only in one respect. The process involves sophisticated tools and techniques. It is, more costly and time-consuming.

The DNA profiling technology has improved tremendously in the past two decades. It has become more time and cost effective.

DNA profiling is, as seen earlier, possible from almost all body materials (Perspiration[2], for example, may or may not contain body cells). They are found in a variety of heinous crimes: murders, dacoities, encounters (fake or otherwise), hit and run cases, assaults, rape and other offences against the person. In addition, body materials are exchanged in many other offences like theft, trespass. The culprit may deposit body materials with the victim, at the scene, en route or on the vehicle used. Likewise, he or his weapon of offences or vehicle may pick up body materials from the victim. Hairs, for example, are shed continuously. The culprit is likely to leave them at the scene. Fallen hairs can provide DNA or *mit*o-DNA for profiling. If the victim has come in contact with the culprit, he is likely to transfer some hairs to the culprit. Thus, they exchange their visiting cards — cards, which cannot be forged or faked; cards, which on processing provide complete and irrefutable identities of their owners. Saliva on the victim, on cigarette stubs, on cups, tumblers, in the spittle can provide materials for DNA profiling. Nasal secretions and abraded skin are other clue materials that can provide DNA profiles.

2. In some cases, sweat may contain body cells. They provide the DNA profile.

There was never a doubt about the individuality of body materials even before the individuality of DNA molecule was discovered. Scientists had not been able to establish experimentally the individuality of materials from a particular source. The body materials were extensively utilised for blood group substances, enzyme and isoenzyme systems. In some cases, the possibility of a particular source of the material could be excluded but the positive identity of the individual source always remained elusive. DNA profiling has changed the scenario. It provides positive linkage with the possible source and equally positive de-linkage in the case of an innocent suspect. A case investigated in the UK, dramatically revealed the factum.

> *The case is known as the Leicester Murders. Two 15 years-old girls were raped and murdered. A seventeen-year-old boy was suspected and arrested. On interrogation (Third Degree?), he confessed to the crime. However, when the DNA profile of the semen from the victim was compared with the DNA profile of the self-confessed rapist-murderer, they were found different. Police let him off.*
>
> *A mass screening program was then organised. The prevalent methods for semen testing were employed first. DNA profiling was employed only in those cases where the usual methods could not eliminate 'a particular subject'. About 5500 were screened before the real culprit could be identified.*
>
> *A DNA profile from the incriminating samples was compared with DNA profiles of a number of samples, obtained from the public. Only one and one sample gave a perfect match. (CH)*

The other major application of DNA profiling is the determination of blood relationship. DNA molecule follows Mendelian law of inheritance. Out of 46 chromosomes, 23 are from the father side and 23 from the mother side. These chromosomes provide the DNA of the issues. The DNA of the offspring is, therefore, a combination of the structures of the DNA of his parents. The parents, brothers, sisters, sons, daughters, even uncles and aunts can be inter-linked. The findings have great importance, both in criminal and civil investigations.

21.3 POSSIBILITIES

DNA profiling has revolutionised the investigation of crime especially in offences against the person. It provides definite evidence of identity or of non-identity of the culprits or victims. Specifically, it helps immensely in the following types of forensic problems in criminal justice system:

1. Linkage of the criminal, the victim, the weapon of offence, vehicle used in the crime, scene of occurrence, routes, *inter se,* through body materials exchanged, dropped or deposited or sites or objectives.

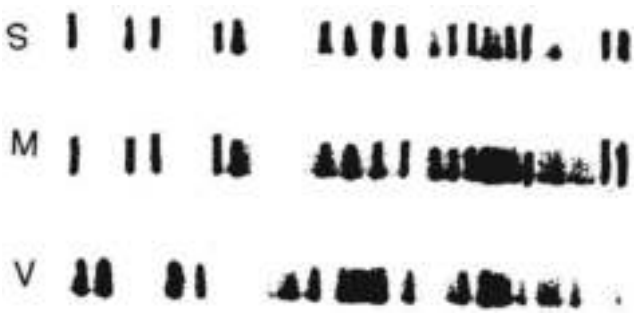

Fig. 21.7

Waterloo of a rapist-kurderer. DNA profile(s) of semen recovered from the pubic hairs of the victim matched with the corresponding dna profile (M) of the murderer's blood. The profile (V) for the victim's blood was completely different

2. Identifications of the culprits or the victim from biological materials
3. It is kingpin evidence in the identification of culprit (or culprits) in gang rape, from semen, semen stains or vaginal swabs in rape cases.
4. Identification of culprit (burglars, robbers, sex maniacs, hand to hand hits, scuffles) through saliva left on cups, glasses, cigarette stubs, spittle, and bitten skin.
5. Identification of persons through urine or faecal matter, left at the wrong places.
6. Identification of mutilated dead bodies through known and available body materials or from the DNA profile of his blood relation
7. Identification and inter-linkages of body parts *inter se* in the cases of scattered or dismembered body parts
8. Establishing correct parentage of a child in disputed paternity cases or adultery cases
9. Ascertaining incest

   A stepfather raped his minor stepdaughter. She conceived and gave birth to a child. The stepfather denied any responsibility. DNA profiles of the blood of the girl, the infant and the stepfather clearly indicated that the stepfather had fathered the child. There were 14 paternal-specific bands visible in the DNA profile of the infant. The entire fourteen bands had corresponding bands in the DNA profile of the stepfather. The expert gave a probability of the stepfather not being the father of the infant as less than one in 1014. (CH)
10. Identification of parents of an aborted foetus, murdered infant or abandoned child,
11. Determination of blood relationship of person(s) claiming the property in inheritance
12. Proof of adultery
13. Determination whether the twins are homozygote or heterozygote

Fig. 21.8

Twin problems? homologous? heterologous? DNA profiling decides.
Identical profiles for identical twins (homologous).
Non-identical profiles for heterologous twins.

14. Verification of false charges relating to rape, fatherhood, etc.
15. In paedophilia cases, DNA profiles developed from semen, saliva or faeces stains link the culprit with the victim/crime.
16. DNA profiles interlink serial rapes and murders or other serial crimes. The linkage provides collective data about the criminal and his *modus operandi.*

    In a case of robbery, DNA profile of the arrested robber was developed and sent to National Database. The Computer search brought in a rich harvest. Four other robbery cases, which had remained unsolved, were identified to be the handiwork of this robber. (CH)
17. In immigration disputes, sometimes illegal attempts is made to induct person of non-permitted relationship by declaring falsely that they are the permitted relatives. DNA identifies blood relation.

    A U.K. based person sponsored to induct brother's family into U.K. He declared that they were his wife and children. DNA profiles eliminated the chance of the children's entry into the country. They were not his biological kids. (CH)
18. Identification of poacher through DNA profiling of the bloodstains of the animal/beast poached on the poacher or on his paraphernalia. It has proved useful to protect wildlife. Bloodstains on poachers link him with the remains of the animal.
19. DNA profiling helps to identify fake encounters.

    On March 22, 2000, terrorists killed 35 Sikhs in a Kashmir village. On March 25, 2000, the security forces killed 5 persons, allegedly foreign terrorists, from across the border. The locals alleged that they were local persons. Blood samples were sent for their identification through DNA profiling. The laboratory found that the blood was unsuitable for the profiling. The blood of the terrorists was sent again to DNA profiling laboratory, along with the blood from the alleged relatives. The DNA profiling established that the terrorists were locals. (CH)

21.4 EVIDENTIARY CLUES

The basic material in DNA profiling is DNA. It is a stable compound. DNA of high molecular weight could be obtained from 5 years old semen stains and 4 years old bloodstains. Low-molecular weight DNA was recovered even from 2400 years old mummies.

Only a small amount, one to ten micrograms of DNA are sufficient for DNA profiling in RFLP technique. This amount is found in about 50 microlitres of blood; or, 10 microlitres of semen. Stains of equivalent amounts are adequate. Likewise, one hair root freshly pulled out, may carry sufficient amount of DNA for profiling.

Usually larger quantities are used for test purposes whenever they are available. For example, about ten hairs are processed if they are available.

The quantities mentioned above are the minimum for normal processing for identification of the individual through RFLP technique, which is on its way out for a number of reasons. Smaller amounts are no longer problematic. **P**olymerase **C**hain **R**eaction (popularly called **PCR**) increases the amount to the desired quantities from nano/picograms of DNA.

DNA is found in the living cell of our bodies and can, therefore, be extracted from different body-materials. A list is given below:

1. Blood and bloodstains
2. Semen and semen stains
3. Saliva, saliva stains
4. Urine, urine stains
5. Bone marrow

6. Canal root pulp
7. Faecal matter
8. Finger nail pairings
9. Body tissues and body organs
10. Foetal material
11. Hair and hair roots
12. Bones
13. Teeth
14. Post-mortem samples
15. Other Body materials/fluids containing body cells

DNA content of common evidentiary clues are given in the table below:

TABLE 1

DNA in Clue Materials

Evidentiary clue	DNA Amount
1. Blood	30 – 50 µg/ml
2. Stain, 1 cm^2	~ 200 – 500 ng
3. Semen	150 – 300 µg/ml
4. Vaginal Swab (after coitus)	0 – 3 ug
5. Plucked hair	1 – 750 ng
6. Shed Hair	0 – 12 ng
7. Saliva (Buccal cells)	~ 15 µg/ml
8. Urine (track cells)	1 to 20 ng/ml
9. Bone	3 – 10 ng/mg
10 Tissues	50 – 500 ng/mg

Notes:

1. The quantity of DNA varies from person to person, with state of health, age and food habit. Liquor, cannabis and drugs affect. The figures given in the table are therefore approximate
2. µ = micro;
3. n = nano
4. Buccal swabs are considered superior as sample for test. They are the least contaminated.

21.4.1 Blood

Blood is the most frequently used test material in DNA identifications. Both liquid blood and bloodstains are used.

21.4.1.1 Liquid Blood from the Scene

The IO collects liquid blood from the crime scene usually. He takes care to:

1. Use sterile (disposable) syringe.
2. Use clean and sterile receptacles.
3. Add EDTA to the collected blood and mix it thoroughly.
4. Transfer blood clots to the tube or to a cloth piece with a spatula
5. Soak a clean cotton cloth piece in blood at the scene, dry it and pack if the above materials are not available.
6. Collect as much water as possible in clean containers immediately to prevent further dilution and degradation, if the blood is in water and to send the collected sample to the laboratory at the earliest. He preserves the sample in a freezer if there has to be delay in sending the sample
7. Blood in water; collect.
8. Collect a control sample of the substrata from a nearby place.

21.4.1.2 Liquid Blood from suspects

A qualified doctor collects liquid blood samples from suspects, using a non-heparinised syringe and needle. Ideally, two samples of 5 ml of blood each are taken. The collected blood is stored in blood collection tubes that contain anti-coagulant EDTA. Such tubes are commercially available. The EDTA and blood are thoroughly mixed. The tubes containing the blood are stored at 4° C. If the blood is to be stored for a long period, it is stored in a freezer.

21.4.2 Bloodstains

Bloodstains are used quite frequently for DNA profiling. Even a small stain can provide a DNA profile. However, it is convenient to work with larger samples. The important factor for successful DNA analysis is that sample is contamination-free in collection and storage of the material. Bloodstains are air-dried at room temperature. The clothes bearing the stain are hanger in clean atmosphere and then stored in moisture-resistant containers. Stains on other substrata are, likewise, dried and sent to departmental laboratory at the earliest. They are packed in paper bags to prevent bacterial growth or disintegration.

21.4.2.1 Wet Bloodstains

Wet stains, on large objects, are picked up (soaked) on a clean cotton cloth and dried. Or, the blood is allowed to dry and then scraped and stored in sterile tubes.

21.4.2.2 Dried Bloodstains

The standard drill to collect dried bloodstains is to:

1. Fix the location of the stains (as in case of other evidence) through photographs or sketches.
2. Collect the object carrying the dry stain itself, whenever possible.
3. Scrape off the bloodstain from the big objects on to a clean paper. Fold the paper in a chemist fold or transfer the material to a sterile sample tube.

4. Collect the sample with a wet (with saline water) clean cotton cloth piece if the stain is small and the object is unwieldy.

   Process the picked up blood further, after drying.
5. Collect a control sample from the place close to the evidentiary clue.
6. Collects dried bloodstains on carpets, upholstery and on wooden objects by cutting the stain bearing area. Pack the stains separately. Also collects a control sample of the substrata from the close by area.
7. Collects blood spatter on adhesive tape by pressing it against the surface and leaving it pressed for some time. Suspend the tape in a container so that it does not meet the sides. He photographs the spatter (with scale) before taping it
8. Collect bloodstains from vehicles (outer surface, under surface) in such a way that other evidence is not mutilated/destroyed. Obtain control samples from the nearby substrata.

21.4.3 Semen

Semen is the second frequent-most material used for DNA analysis. It is the most important evidence in sexual crimes.

21.4.3.1 Azoospermic Semen[3]

Before semen is analysed for DNA profile, it is advisable to ascertain first whether the material is actually semen. Testing semen was almost useless with methods involving RFLP in azoospermic semen. However, the use of PCR/STR technology has changed the scenario. Researchers[4] have reported:

> *The examination of azoospermic semen poses a special problem for the forensic scientist. Both serologic and RFLP methods may result in inconclusive results. PCR analysis is known to have an advantage in the evaluation of variably degraded, small quantities of DNA. This investigation addresses the feasibility of detecting the DNA profiles of azoospermic males in cases of suspected rape by the use of PCR amplification of the VNTR locus DIS 80. DNA profiles were produced from aspermic semen samples from six vasectomized males. Two mixed post-coital vaginal samples containing azoospermic semen from two of the vasectomized males were also obtained and both revealed the combined profiles of the azoospermic semen donors and the vaginal epithelial donors. All cases resulted in an allelic banding pattern of the donor semen matching the respective blood/saliva standard.*

Ideally, a small portion of the stain is checked for the presence of sperms. If sperms are preset, the remaining stain is used for DNA extraction and profiling. If sperms are not found, the PCR technique is used.

21.4.3.2 Vaginal Swabs

In cases of sexual assaults, semen is often recovered on swabs from vagina, anus or from the mouth. The swabs are air-dried and stored under dry conditions.

21.4.3.3 Liquid semen

Liquid samples are collected as liquid blood samples. They are stored at low temperature or are frozen. Repeated freezing and thawing is avoided as it reduces the amount of recoverable DNA.

---

3. Semen without sperms.
4. Skinker DM, Warnecke SC, Morrow JK, Hunsaker JC. 3rd, "DNA typing of azoospermic semen at the D1S80 locus." J Forensic Sci. July 1997; 42(4): 718-20.

Semen samples in rape cases are contaminated with blood or vaginal secretions from the victim. The contaminants are removed by pelleting the sperm heads in a centrifuge. The pelleted DNA gives the DNA profile of the assailant.

As a precautionary measure, blood sample from the victim is taken for better interpretation of the analysis.

21.4.3.4 Proper collection

In the collection of the semen and semen stains the IO takes care to:

1. Collect the liquid semen with a sterile syringe in a sterile sample tube. Despatch the sample to the laboratory at the earliest. Or, store it in a refrigerator till it is sent.
2. Collect the liquid semen on a clean cotton cloth, if the amount of the semen is small.
3. Collect the object bearing the semen, if the object is amenable to the collection. The stain is air-dried before further processing.
4. Collect semen stains on bed, carpet, sofa-set by cutting off the piece of the substrata bearing the stain. Take a control sample of the substrata. Dry them before packing.
5. Collect semen stains from the floor (or from other impervious surface) by scraping or by lifting it on an inert adhesive tape. Take control sample from nearby areas also.
6. Request a doctor to collect the anus or oral swabs from the victim.
7. Request a lady doctor to collects vaginal fluids/swabs from the victim.
8. Use a rape evidence kit to collect the materials.

21.4.4 Hair

Hair samples are pulled from the head of the subject. Live roots material furnishes nucleic DNA in the live roots. Hair shaft provides *mt* DNA. Comb-collected and fallen hairs are also suitable for DNA profiling. Usually shed hairs are found at the crime scene. When there is a scuffle, one may find pulled out hair. The collected hairs are dried before packing.

Different types of hair contain different amount of DNA. In the same person even head hair may well have a different amount of DNA that that from moustache, beard, chest or pubic hair. Some hair may yield plenty of DNA for analysis, others may yield limited amount. PCR techniques however, have overcome the problems of small quantity of the DNA effectively in most of the situations.

Hair is dried before packing/sealing/storage.

Shaft of the hair yield plenty of *mito* DNA analysis.

Collection of hair follows the usual procedure mentioned for collection of hair in the chapter on hair (supra). The IO takes care to:

1. Use clean forceps and containers.
2. Pack only dry hair.
3. Store the hair in a refrigerator in case they are to be analysed for *n*DNA and if there is to be a delay in the dispatch of evidence.

21.4.5 Saliva Stains

Saliva is an important evidentiary clue in many criminal situations. As already seen,[5] saliva, as an evidential clue, often plays a crucial role in many offences against persons. The location/collection/packing are discussed in detail.[6]

Saliva *per se* does not contain body cells, but it does contain sufficient epithelial skin cells from the inside of the cheeks. In fact, saliva, because of these cells, provides about five times more DNA, volume for volume than blood. Saliva is in fact the preferred specimen source for comparison of DNA profiles. The process of taking saliva sample is also non-invasive.

21.4.6 Body Tissues and Organs

Body tissues, bone pieces, and certain organs often form important clue material. They are left/scattered at the scene, in the vehicles, with the weapon of offence, on the person of the culprit (in blast cases), at the sites of dismemberment or disposal. They are also important clues in dismembered/mutilated bodies. They can link the crime, the criminal, the victim, the scene, and the weapon of offence. They are located, collected, preserved, and dispatched in the same way as other biological evidence.

Common precautions relevant to all biological evidentiary clues, against contamination, putrefaction and degradation are observed with vehemence as their DNA analyses/comparisons provide definite/irrefutable linkage of the crime, the culprit and the victim *inter se*.

21.4.7 Post-mortem Samples

The post-mortem body materials, such as blood samples, spleen, flesh muscles, skin, bones, bone marrow, nails, hair all have been used for profiling, as they are good sources of DNA.

21.4.8 Foetal Material

Foetal material is a source of DNA. It helps to solve many crimes, including illegal abortions, undesired/illegitimate/rape conceptions, etc. Its DNA profile is compared with the suspected sources and the source of the foetus identified.

The collected foetal material is processed at the earliest to obtain a DNA profile. It could be preserved only by freezing it. These materials provide satisfactory DNA profiles to prove/disprove paternity.

21.4.9 Blood Samples in Paternity Cases

In disputed paternity cases, DNA profiles from the blood samples of the child and that of the parents are compared. In civil cases, usually, clients' family doctor takes blood samples if that is acceptable to both the parties (litigants). In some cases, the doctor is designated by the court. In criminal cases, the investigating officer collects blood samples through government doctor. The doctors collect the blood samples observing all the legal formalities and precautions against contaminations and spoilage. Blood sampling kits have come up. They are commercially available and are used.

The name and address of the doctor and the date and time of the taking blood sample is recorded.

For proper identifications, two passport size photographs of each concerned person are used. One copy of the photo, duly endorsed by the doctor, is pasted on the wrapper. The second copy is kept in the case record file. The completed identification documents are sent to the designated laboratory along with the blood samples.

5. See chapter 20 for a detailed discussion.
6. *Ibid.*

TABLE 2

Main Evidentiary Clues for DNA

S. no	Source	site	Evidentiary clue
1	victim	Vagina inside/outside	Semen, blood, Hair
2	Bite marks	Skin, clothing victim/ culprit	Saliva
3	Discarded Tissue paper	Surface area	Blood, semen. Mucus, sweat
4	Discarded used condom	Inside/outside surface	Semen, Vaginal fluid, blood, rectal material/cells
5	Finger nail of victim/ culprit	Nail crevices	Skin tissues, blood, vaginal fluids
6	Dirty Laundry	Surface area	Blood, semen, sweat
7	Head gear (cap, turban) mask	inner surface	Sweat, hair, dandruff
8	Smoked cigarettes	Cigarette stubs	Saliva
9	Ligature for strangling	Surface of ligature	Blood, skin, sweat
10	Bedding	Bed sheet, pillow blanket surface	Sweat, hair, semen, urine, saliva
11	Discarded used toothpick	Tip	Saliva
12	Tumblers, cup, bottles	Mouth touching site	Saliva
13	Stamps/envelopes	Licked area	saliva

21.5 EVALUATIONS

DNA profiling is needed in criminal and civil investigations. It gives definite identification. The tools and techniques are comparatively new and costly. However, all those who are concerned with the identifications, insist upon its use. Even the courts now insist upon the production of DNA evidence where it is required but not presented.

21.5.1 RFLP Analysis

RFLP Analysis is theoretically simple. When DNA is subjected to the action of single Restriction Enzyme, a large number of fragments (RFs) are created. These fragments are subjected to electrophoresis where they get separated into bands, depending upon their sizes and the residual charges thereon. Usually, the electrophoresis process conditions are so controlled that only fragments of 2-10 kilobase or other desired size are left on the Agarose gel. These fragments are picked up on a Nylon Membrane. This process is called Southern Blotting. Hybridisation probes are used to identify the fragments. These probes are pieces of DNA molecule, made radioactive with radioactive phosphorus isotopes (usually ^{32}P).

Hybridisation processing links the radioactive probes with the DNA fragments on the Nylon Membrane. The complementary base pairing takes place and the fragment becomes radioactive. The Nylon Membrane, after removing the excess of probes, is brought in contact with an X-ray film, which is affected at the radioactive sites to give visible bands on the X-ray plate on development. Comparison of the bands from the questioned DNA sample with the DNA profile from the suspected sources reveals the identity/non-identity of the given questioned source.

The following probability calculations for the number of common bands (indicating corresponding RFLPs) in paternity cases have been given:

Table 3

The Chance Occurrence of Band Matching

Number of bands	Odds against a chance match
4	250 to 1
6	4000 to 2
8	65000 to 1
10	1 million to 1
12	17 million to 1
14	268 million to 1
16	4300 million to 1
18	68000 million to 1
20	1 million million to 1

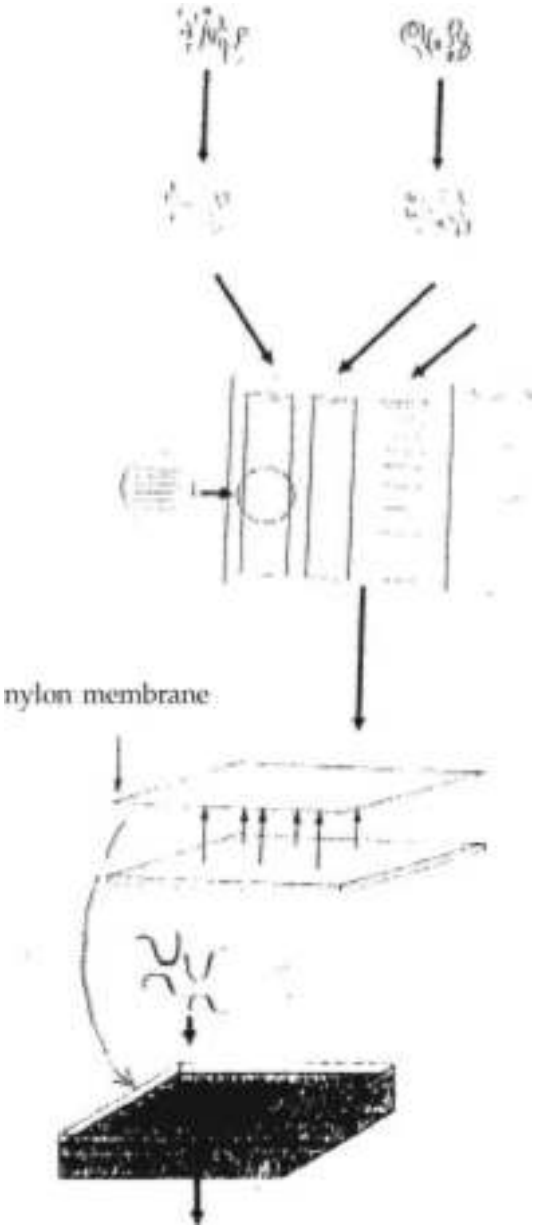
Fig. 21.9

Blood from the scene and from seven suspects dna profiled.
only two profiles match, which ones?

RFLP analysis of DNA involves the following steps:

1. Isolation of high molecular weight DNA from biological material
2. Fragmentation of DNA molecule through Restriction Enzymes (RE)
3. Separation of the Restriction Fragment Lengths (RFLs) through electrophoresis

4. Transference of RFLs to Nylon Membrane (Southern Blotting)
5. Preparation of radioactive probes
6. Hybridisation of the RFLs through radioactive probes
7. Visualisation of RFLs bands on X-ray film through autoradiography and its development to give visible patterns of the Restriction Fragment Length Polymorphs (RFLPs).



DNA is extracted from specimens

DNA is digested with restriction enzymes to produce fragments

Standard DNA size markers

large

Double stranded DNA fragments are separated by electrophoresis through an agarose gel

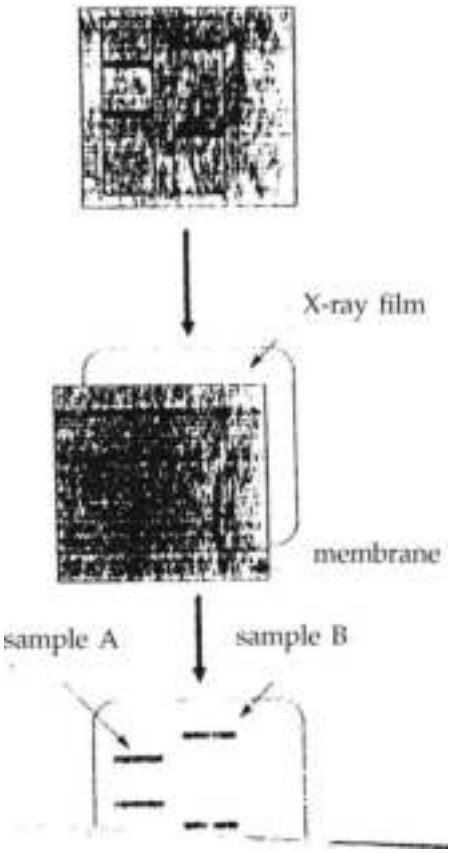
small

denture to produce single stranded DNA fragments

transfer of DNA fragments from gel to nylon membrane

radioactively labelled DNA probe in single stranded form

cover membrane with probe and incubate



the DNA probe binds to specific complementary DNA fragments but positions on membrane are invisible

wash membrane to remove excess probe

place X-ray film next to the membrane to detect banding pattern

develop X-ray film to visualise DNA Typing pattern.

Fig. 20.10

Schematic outline

RFLP Analysis was the first process used to identify human beings. The technique was laborious, time-consuming and costly. It also needed more quantity of samples, which was not available in some cases. It is more or less abandoned now.

The following facts have facilitated the acceptance of the evidence:

1. The RFLPs, which form the basis of identification, are:
   - Inherited
   - Stable throughout the lifetime of a person, like the ridge patterns of a fingerprint
   - Inherited from parents and have true genetic character.
2. There is adequate empirical data on the frequencies of various RFLPs to base identification on a statistical basis.
3. A nomenclature for RFLPs, based on molecular weights, has come up. In fact, the separation as well as identification of RFLPs is based mainly on their weight.
4. Forensic Science Laboratories and other institutions carrying out DNA profiling have needed expertise and tools and techniques for correct profiling.

5. The results are verifiable and can be crosschecked.
6. Appropriate test procedures, controls and standards have been laid down.
7. The quantum of proof: number, quality and positional variation data are specified.
8. Quality assurance is being practised in some DNA profiling laboratories.
9. Sensitivities of the test procedures have been improving with the passage of time. The amount of DNA required was 1 to 10 microgram. This quantity stands reduced to nanogram and picogram.
10. **P**olymerase **C**hain **R**eaction (PCR) replicates DNA fragments. It has ultimately overcome the deficiency of the sample's sufficiency.

21.5.2 STR Analysis

21.5.2.1 Definition

A Short Tandem Repeat (**STR**) is a microsatellite, consisting of a unit of two to thirteen nucleotides repeated hundreds of times in a row on the DNA strand. STRs surround the chromosomal centromere (the structural centre of the chromosomes). They are classified according to the length of the core repeat units, the number of contiguous repeat units, and/or the overall length of the repeat region. STR analysis has become indispensable in Forensics to discriminate/identify a common source of two or more biological evidentiary clue samples. STR analysis employs probes,[7] which get attached to the desired STRs. Polymerase Chain Reaction (PCR) amplifies the STR.

STRs are popular DNA markers because:

1. STRs have a high power of discrimination.
2. PCR amplify the various STRs many times, to get the desired amount.
3. Various STRs are multiplied to the same extent in the PCR.
4. The number of the STRs varies tremendously among persons *inter se*. It helps discrimination/individualization of the persons
5. The STRs of smaller sizes are chosen because they are easily separated, survive degradation of the sample and permit better statistical evaluation.
6. STRs have lower mutation rates, which gives predictable and stable data.

The above characteristics of STRs have made the STRs indispensable for human identification of all types.

21.5.2.2 Nature

There are 13 Short Tandem Repeat (STR) is a DNA molecule. They are analysed and compared to establish DNA profiles. They differ from person to person, except for identical twins that have similar DNA profiles.

The STRs are separated by electrophoresis. They are visualised with silver staining, which gives dark bands pattern. The patterns are characteristic for individuals.

Multiplication of STRs involves the following steps:

1. The desired strands are denatured and treated with primers and enzymes.
2. They are hybridised to get copies of the strands through PCR.

7. DNA markers, in a biological sample, are nucleotides that bind to DNA probes.

3. The polymerization takes place automatically. The desired fragments increase exponentially It is controlled to get the desired quantity of the STR. The operations are now automatic; performed through instruments. The process is so efficient that adequate quantity of the fragments is obtained in about two hours.

The DNA profiling is now done through PCR based STRs of repeat sequences of the high polymorphic region. This method uses highly polymorphic regions that have short repeated sequences of DNA (the most common is 4 bases repeated, but there are other lengths in use, including 3 and 5 bases). They are treated with sequence-specific primers and amplified. The fragments are then separated through electrophoresis. Two electrophoresis techniques: capillary and gel electrophoresis are commonly used. Capillary technique is more popular.

Other individuals share the STRs used also. Typically, each STR allele will be shared by around 5 – 20% of individuals. The power of STR analysis comes from looking at multiple STR loci simultaneously. The pattern of alleles can identify an individual quite accurately. Therefore, a number of STRs are located and compared simultaneously. The combined probabilities of the STRs give individuality of the DNA profile. Usually, 5 STRs are required for identifications. The probabilities generated this way are $\mathbf{1x10^{18}}$ or more. There are about 12 million monozygotic twins on earth; the theoretical probability is not accurate.

USA uses 13 STRs for identity in its CODIS (**C**ombined **D**NA **I**dentification **S**ystem) database; while UK uses 11 STRs in its NDNAD (**N**ational **DNA D**atabase) for identification of the individuals.

21.5.3 Polymerase Chain Reaction (PCR)

PCR is virtually a cloning process in which DNA or its fragments are replicated any number of times — even a million or more times. Equipment is now commercially available for automatic polymerase chain reactions.

The PCR technique has revolutionised the DNA analysis. Its advent has proved a boon for personal identification in forensics. It is used in both VNTR[8] and STR techniques. PCR is the modern approach for DNA analysis. It is used by most of the institutions carrying out DNA profiling work.

More recently, quantitative PCR estimation, through quantity based varying fluorescence intensities, has improved the PCR result interpretation.

21.5.3.1 Advantage PCR

The PCR amplifications offer many advantages:

1. PCR needs very small amounts of nascent evidentiary clues, considered insufficient previously, can be analysed for DNA. For example, a single hair, saliva on cigarette stubs or fine spray drop of blood can be used to provide the DNA profile of the individual. The possibility of DNA profiling with smaller amounts is a distinct advantage over RFLP technique.
2. PCR amplification is carried out in multiplex mode. In other words, a number of PCR of different STRs amplifications can be carried out simultaneously.
3. PCR amplification is possible with degraded DNA. This extends the application of DNA analysis to many cases in which the traditional method would fail.

8. **VNTR** is **V**ariable **N**umber **T**andem **R**epeat. It is a location in a genome where a short nucleotide sequence is found as a tandem repeat. These are found on many chromosomes. They show variations in length (number of repeats) among individuals.

4. PCR increases the amount of relevant DNA fragments (STRs). The increased amount increases the speed and thus, reduces the processing time and ensures better quality results of analysis.
5. PCR requires small amounts. The some quantities of the original clue material can be spared for independent testing by the defence, or repeat test at more than one place.
6. PCR produces increased amount of the disputed material. Thus related tests can be performed with the additional material.

These advantages of PCR technology have made the RFLPs techniques for DNA Profiling more or less redundant.

21.5.3.2 PCR Process

The Polymerase Chain Reaction process involves the following steps:

1. DNA is incubated at a suitable high temperature (~ 95° C). The double strand of DNA changes into a single strand. The strand acts as a template for replication.
2. The temperature is lowered. Oligonucleotides, re-application primers are added. They get attached (bound) to their complementary sequences on the template DNA strands in a specific way.
3. Nucleotide primers added stepwise, extend the primers strands and new DNA molecules are formed in the presence of DNA polymerase.
4. The thermo-stable polymerase TAQ is used for the purpose. It is heat stable. The DNA molecules have double strands. The molecules so formed acts as templates for subsequent replication cycles and the formation of new molecules increases exponentially.
5. In an automated reaction chain, the steps and the number of cycles are controlled by thermo-cycler. The extension steps are now carried out with greater speed at higher temperatures (up to 75° C) by the new generation of the thermo-stable polymerase.

An enzyme is used to make many copies of a small section of the DNA. This section cut into pieces by another enzyme and separated by electrophoresis. The fragments are then visualised with a silver stain, with the pattern of light and dark bands seen being characteristic for an individual.

21.5.3.3 Controlling Factors

The general representative factors, which control the quality, quantity and the speed of the replication of DNA or parts thereof, are:

1. The quality and quantity of the following materials:
   - DNA material
   - Oligonucleotide Primers
   - Polymerase
2. Ingredients of the reaction mix for the range 1 – 5000 copies are:

TABLE 5

1.	Primers	0.05 – 0.5 mM
2.	TAQ	1 – 4 units/100 ml.
3.	Buffer	5 – 8.4 pH
4.	Protein BEA/Gelatin	0 – 50 ml/ml
5.	KCl	50 mM
6.	Mg	1 – 6 mg
7.	d NTP	50 – 200 uM.

3. The reaction conditions:
   - The periodicity of the thermo-cycler
   - The frequency of the addition of the reaction mix
   - The number of cycles.

In principle each cycle, double the amount. Thus, the number of copies increases rapidly.

TABLE 6

PCR Replication

S. No	Number of Cycles	Number of copies
1	10	1024
2	20	10^6
3	30	10^8 (*i.e.*, up to maximum)

4. The presence, absence, addition or extraction of promoters or inhibitors
5. When the PCR product reaches about 10^{10}, the replication reaches its limit.

The main aim of the process is to achieve specificity of the reproduction of the DNA or of the target sequence(s). The following steps help to achieve this:

1. Starting material of very high purity is used because extremely small samples of DNA are involved sometimes. Contamination is scrupulously avoided when identifying, collecting, and preserving DNA evidence.

   In a case of forced oral sex, a single hair was found sticking in the mouth of the victim. Mitochondrial DNA analysis provided very strong evidence to get the culprit convicted. (CH)

The following precautions are essential:

- Wear gloves. Change them often.
- Use disposable instruments or clean them thoroughly before and after handling each sample.
- Avoid touching the area where you believe DNA may exist.
- Avoid talking, sneezing, and coughing over evidence.
- Avoid touching your face, nose, and mouth when collecting/packaging evidence.
- Air-dry evidence thoroughly before packaging.
- Put evidence into new paper bags or envelopes, not into plastic bags.
- Do not use staples.

2. Strict control of the reaction conditions is maintained.
3. High quality and the right quantity of the oligonucleotide primers is used .
4. Length of the target sequence is controlled. Shorter the target sequence, better the specificity.
5. The primers length is dependent upon the STRs.
6. Annealing temperature 60 – 65° C is used.
7. The number of cycles depends upon the number of copies of the material to be replicated. Less than fifty copies will hardly produce detectable material.
8. The minimal amount of the clue material, which should be available for amplification, is about 0.1 ng of amplifiable DNA. This amount contains about 40 total templates. This is the smallest amount recommended for each case.

21.5.3.4 Problems in PCR

The main problems in PCR amplification are:

1. Amplification inhibition

   It is due to problems with the starting DNA material. It is overcome by:

   - Reducing templates
   - Increasing polymerase
   - Changing reaction condition

2. Mis-incorporation

   The oligonucleotides get attached at wrong places. It has been estimated that this happens 1 or 2 times in 10^4 incorporations. The mis-incorporations are consequently negligible, unless, the starting material is too small.

3. Reliability of PCR products; the replication process is not perfect because:

   - Polymerase is not perfect; mis-incorporations do occur.
   - Sequence insertion or deletion may take place due to alignment errors in the template.
   - Tandem repeat sequences can cause misalignment on the template. Thus PCR products of different sizes are formed.
   - When the sample is small, the number of the template is small. Here in some cases some alleles amplify preferentially. The other alleles are masked and not seen.

Other problems, which need attention to get the correct results, are:

1. The sample has to be pure, contamination free.

   In an interesting case, sterile swabs were supplied in a rape examination kit. Wherever these swabs were used for DNA amplification they gave one same DNA profile. It was found that the swabs were contaminated by the same DNA material. (CH)

2. The sample should be authentic.

   It was an ingenious case of DNA fraud. A doctor in Canada raped his sedated patient(s), leaving semen on her underwear. She reported the case to the police which took a blood sample from the doctor. The DNA profiles of the semen and blood did not match. The process was repeated three times. Every time the profiles did not match. Yet the victim was

sure that the doctor has raped her. Fourth time three samples (buccal swab, hair and blood) were taken. The DNA profiles from buccal swab and hair matched with the semen profile but not with the blood profile. It was found that the doctor had surgically planted a Penrose drain filled with foreign blood. Every time the blood was being taken doctor guided the needle to the drain and thus fake sample of blood for DNA profile was given as sample. (CH)

3. DNA sample should not be degraded.
4. The Analyst should be aware of the existence of monozygotes (there are about 12 million of them in the world!), Chimeras [9], synthetic DNA, etc.
5. New workers may be over zealous and give results on insufficient data.
6. Some pseudo scientists follow conformation syndrome. They give wrong findings at times.
7. The system may fail at a time. Periodic check (calibration) of the system is essential.

It has, however, been seen that given the right conditions, undesirable side reactions are negligible.

21.5.4 Identification Techniques

There are three types of techniques for the identification of individuals in PCR amplification:

1. DNA Sequencing
2. Sequence Variations
3. Length Variations

21.5.4.1 DNA Sequencing:

DNA sequencing has become extremely important, in fact the most important tool for:

1. Individualisation of human beings
2. Understanding hereditary diseases and other problems
3. Clinical treatment and diagnosis of refractory diseases, and
4. Most importantly, for the evaluation of the genetic code

Mind boggling progress has been made in all aspects of DNA technology in recent years and the progress is continuing at an astounding rate. The major developments are coming in:

- Initial processing of DNA evidence
- Electrophoresis materials (gels) and experimental conditions
- Automation in separation of RFLs, determination of their molecular weight, use of fluorescent labels for their detection and evaluation

Today automatic processes are used for DNA sequencing. Thousands of nucleotides can be sequenced in a day. Automation has reduced human error to the minimum. However, considerable emphasis is being given on reproducible and reliable results. It is ensured by repeating the analysis, especially in criminal cases, where the lives/liberties of persons are concerned. Multiple sampling is adopted in important cases.

9. **Chimera**, in genetics, an organism or tissue that contains at least two different sets of DNA, most often originating from the fusion of as many different zygotes (fertilized eggs).

21.5.4.2 Sequence Variations:

Sequence variations are studied through **S**equence **S**pecific **O**ligonucleotides **(SSO)** which are of 15 to 30 Oligonucleotides corresponding to the target allele. The labelled probe is mixed with the PCR products on a dot-blot format. It will hybridise with the corresponding allele, not with others. A number of probes of different types are used in the same way. In one system the PCR products is fixed on a membrane in a dot-blot form. In another way the probes are fixed on the membrane in the form of blot and labelled PCR products are brought in contact. Corresponding allele gets attached. The attached positions are identified through the labels in both the techniques. The former is known as *dot-blot technique* and the latter as *reverse dot-blot technique*. The latter technique has proved its worth and is being used extensively.

> *In a rape case there were two suspects. The samples of the two suspects, of the victim (blood, epithelial cells and swab sperms) and blank were collected and analysed by reverse dot-blot technique. The test patterns were different for the two suspects and the victim identified the first suspect and eliminated the second. The sperm DNA from the vagina corresponded only with DNA of the first suspect. (CH)*

Other methods of DNA profiling through PCR amplification are:

- Direct sequence – A promising method
- Allele specific amplification – more useful in medicines
- Oligonucleotide – Ligation Assay
- Variations at restriction site – a useful technique
- Denaturing gradients Gel Electrophoresis

These methods are not extensively used in forensic work yet. The details of the methods are beyond the scope of the book.

21.5.4.3 Length Variation

The restriction fragment length polymorphism RFLP analysis of loci containing **V**ariable **N**umbers of **T**andem **R**epeats (VNTR) has been extensively used in identifying persons. Corresponding technique in PCR is *PCR–VNTR and PCR_STR* techniques. In the former the VNTR used are sufficiently large (15–70 bp.) In the latter, the STR is short, usually of 4 bases pairs and also of 3 or 5 base pairs. They allow separation of allele product by simple gel or capillary electrophoresis.

The PCR–VNTR technique uses automated DNA sequence, coupled to the fluorescence detection system. The fluorescent labels are introduced into the PCR primers. More than one fluorescent label can be used simultaneously.

21.5.5 Y-chromosome Analysis

The research has been extended to male specific chromosomes the **Y-chromosome**. Primes have come up which target Y-chromosomes and can thus separate Y-STRs. They are inherited paternally and thus can link an individual to his paternal male relatives.

Y-chromosome analysis helps to identify the sex of the biological sample. It is based upon the fact that the males alone have Y-chromosomes in addition to X-chromosomes. The females have X–chromosomes only. Primers have been discovered which target only polymorphic region of Y-chromosomes. A number of X and Y chromosome specific probes have been identified. They are used for discrimination.

Y-chromosome analysis permits direct identification of the male source of the clue material. The female source the clue material is inferred from the absence of Y-chromosome.

21.5.6 Amplified Fragment Length Polymorphism (Amp FLPs)

In **Amp FLPs** technique Variable Number Tandem Repeat polymorphism is utilized to identify different alleles. Separated on a polyacrylamide gel, the alleles are visualised by spraying the reagent. The technique has not been used extensively.

21.6 DNA PROFILE RECORDS

The importance of the DNA profile records has been fully realised in most of the well-off countries. They are using it in the following situations:

- **Recidivism**; the culprit leaves biological clues at the scene/with the victim. Similar DNA of clues from the record indicates recidivism.
- **Serial murder/rapes**; the culprit exchanges biological clues (especially blood semen) in such cases Their DNA interlink the crimes if his DNA profile(s) exists on the record.

Identity of Culprit; if we have DNA profile computerised indexed records of the known criminals, the criminal in a new case, is identified from the record. The DNA profile of the offender is developed from the specimen clue materials, which he leaves at the scene or with the victim.

Two well-known DNA profiles records (data bank or database) and indices are in USA and UK. They are being updated continuously. They have over five million profiles each on their systems. In the USA the system is called **Combined DNA Index System** (**CODIS**). In UK it is called **National DNA Database** (**NDNAD**).

21.6.1 Combined DNA Index System — CODIS

CODIS (Combined DNA Index System), an electronic database of DNA profiles that can identify suspects, are similar to the AFIS (Automated Fingerprint Identification System) database. It is maintaining the DNA index of individuals convicted of certain crimes, such as rape, murder, and child abuse. Upon conviction and sample analysis, perpetrators' DNA profiles are entered into the DNA database. DNA profiles from a crime scene can be entered into CODIS. Thus, an investigating officer will be able to know an 'unknown' criminal through the CODIS. In this system 13 STRs are utilized for the comparison and identification of DNA profiles.

21.6.2 National DNA Database (NDNAD)

The UK DNA database works on the same principles. The system however uses only 11 STRs for storage, comparison and identification of the profiles.

When a match is made from a National DNA Databank to link a criminal, with a prior DNA profile record in the National Data bank, involved in a fresh crime scene or case, the linkage is often called a *cold hit*. A cold hit is of immense help to the police in their investigation.

21.7 CASE STUDIES

21.7.1 Maternity Identification

A boy from Ghana, born in the UK, wanted to join his mother, brother and two sisters in UK. The authorities denied him entry because they were not satisfied that he was the son of the alleged mother. The usual blood tests were carried out. They indicated that the probability, of mother-son non-relationship was too meagre, less than 0.01%. However, they could not categorically fix mother-son relationship. She could be his aunt as well!

The case was referred to Prof. Jeffrey and his colleagues. They carried out DNA profiling of the blood of the mother and son and his brothers and sisters. Although the father was not available, most of his DNA fingerprints could be reconstructed from most of the DNA fragments, present in at least one of the 3 undisputed siblings, but absent from the mother. Of the 39 paternal fragments so identified, approximately half were present in the DNA fingerprints of the boy. Since unrelated individuals do not share DNA fragments, the examination of DNA profile suggested very strongly that the boy had the same father as the brother and two sisters.

But the main question was still unanswered. What was the relationship of the boy to the woman? Removing the paternal-specific fragments from the boy's DNA fingerprints, there remained 40 fragments in the boy's profile, all of which were present in the woman's DNA profile. This was strong evidence that the boy was the woman's son.

To cross-check their findings, the researchers examined the probability of their findings being still proved wrong. They found that of the 40 maternal-specific fragments in the boy, 25 were specifically inherited from the mother. All these 25 fragments were present in the woman.

The researchers argued that the probability of two unrelated people sharing 1 fragment is 0.26. So, the probability of being unrelated and yet sharing them all is, one in 20 thousand billion. Now, it was clear that the woman and the boy were so closely related, as to be mother and son.

Jeffreys and his colleagues also looked into the probability of the woman being the boy's aunt. They calculated that the probability of the siblings sharing a single DNA fragment is 0.62. Thus, the probability that the woman is in fact the boy's aunt, yet shares all 25 of the maternal fragments is 0.6225, i.e., *1 in 50,000 billion.*

It was, therefore, concluded, beyond any reasonable doubt, that the boy was indeed the woman's son. This evidence was conveyed to the immigration authorities, which dropped the case against the boy and allowed him to stay with his mother in Britain. (CH)

21.7.2 Abandoned Baby

This is a strange case where DNA profiling of a baby, found abandoned in a car, was connected to the owner of the car. There were, however, some facts, which cast doubts on the son-mother relationship of the abandoned baby and the lady owning the car. They are—

1. *The lady denied she gave any birth to the child or to any other child.*
2. *The medical doctor certified that the lady had not been pregnant recently.*
3. *The lady delivered a child just after eight months from the discovery of the child.*

The scientists performing the DNA profiling test were sure that son-mother relationship was correct. The residual samples were submitted to other scientists. They confirmed the findings.

There was no criminal case against the alleged mother as the doctor found that the child was stillborn. (CH)

21.7.3 DNA Analysis v Confession

It is a case of mass screening for a killer-rapist

On November 21, 1983, Lynda, a girl of 15 years was found murdered. The body was discovered a day after the killing. She had been raped and strangled with her own scarf. Police employed over 100 investigators and interrogated everybody in the locality, but the killer was not discovered. They had taken swabs from the vagina of the deceased and collected semen stains from her person and garments. The murderer continued untracked.

On July 31, 1986, another 15 years old girl Dawn disappeared. She was found raped and strangled to death in a nearby field. The nature of the injuries on the persons of Lynda and Dawn were similar. The police caught a seventeen-year-old boy who confessed to the crime. The police requested the services of Professor Jeffreys. He obtained the DNA profiles from the semen recovered from the two victims Lynda (in 1983) and Dawn (in 1986) and compared them with DNA pattern from the suspect. He found that whereas the semen from Lynda and Dawn were from the same source, they did not tally with the DNA pattern of the suspect. On their evidence, the suspect who had even confessed to the crime was let off.

The investigating police officer believed that the culprit belonged to the same area and that he should be between 15 and 30 years of age. He, therefore, decided that the eligible population of the area should be mass screened for the possible source of the semen.

The mass screening was started. Ninety per cent of the persons could be eliminated straightway, by conventional blood tests. The remaining ten percent persons were subjected to DNA profiling. Thus, about 5500 persons had been screened at a cost of about Rs. 1.5 crores, yet the killer still eluded them. Only 250 men who had left the area since the occurrence remained for screening.

Then, a sudden breakthrough occurred. A person bragged, in a pub, that he had personated for his friend in the mass screening for the killer. Police at once took up their cue, interrogated the imposter and reached the culprit, Colin Pitchfork, a 27 years old baker. The rest was easy. His blood test including DNA profile indicated that he was the rapist and murderer of the two girls, Lynda and Dawn. He was sentenced to two terms of life imprisonment for the crimes. (CH)

21.7.4 DNA Profile v Eyewitness

That DNA profiling is better than eyewitness accounts even, was proved beyond doubt in a rape case, which took place in New York. A rapist sexually assaulted three women. The police caught hold of one Victor Lopez. He was a light coloured person of Hispanic origin. However, all three victims insisted that a black person attacked them. The attorney for the culprit pleaded that it was a case of mistaken identity as his client was not black as alleged by the victims of rape. The jury, however, took the DNA profile as evidence and found Lopez guilty. (CH)

21.7.5 DNA Profile Induces Confession

The driver of a bus raped a 57 years old woman suffering from Alzheimer in the bus she was travelling. The woman when interrogated could not remember who had attacked her. However, police investigations revealed that only the bus staff could have committed rape. The driver of the bus became the prime suspect. His blood DNA profile matched with the DNA profile of the semen recovered from the victim. When the driver was confronted with the evidence, he confessed to the crime without much verbal persuasion. (CH)

21.7.6 DNA Fraud: Fake Blood Sample

It was an ingenious case of DNA fraud. A doctor in Canada raped his sedated patient(s), leaving semen on her underwear. She reported the case to the police, which took the blood sample from the doctor. The DNA profiles of the semen and blood did not match. The process was repeated three times. Every time the profiles did not match. Yet the victim was sure that the doctor has raped her. Fourth time three samples (buccal swab, hair and blood) were taken. The DNA profiles from buccal swab and hair matched with the semen profile but not with the blood profile. It was found that the doctor had surgically planted a Penrose drain filled with foreign blood. Every time the blood was being taken doctor guided the needle to the drain and thus fake sample of blood for DNA profile was given as sample.(CH)

21.8 SETTING STANDARDS

DNA profiling is a powerful tool for identification in forensics. Therefore, there is a need for DNA experts to fix clear guidelines for the procedures and standards needed to ensure reliable DNA profiling. They may also fix the quantum of data for identifications. Legislators may also consider whether licensing and proficiency testing should be required in DNA forensics for quality assurance, quality control and standardisation of tools and techniques to the viable extent.

(Supreme Court Cases (21st Century))

21.10.1 Nirbhaya (Jyoti Singh) Rape-murder[10]

Author's Summary

It is the most heinous crime in the Indian sex-crime history. A paramedic student, along with her friend boarded a bus in Delhi at about 12 o'clock at night. There were six men in the bus. Soon the six men attacked the pair. They bet her friend and incapacitated him. They beat the female brutally and all raped her in turn and then threw her from the bus in half-dead half naked condition, along with her friend. The wailing of the friend brought in help. They took them to hospital, where the best medical treatment could not save her. The six culprits were arrested and tried. Four were sentence to death, one committed suicide and one was juvenile, and punished according to law.

The judgment of the Supreme Court is a landmark judgment and should be read in its entirety. The extracts here relate to DNA evidence, the clinching evidence against all the accused.

Highlights italicised

Extract from Judgment (Verbatim)

83. **DNA Analysis**: In order to establish a clear link between the accused persons and the incident at hand, the prosecution has also adduced scientific evidence in the form of DNA analysis. For the purpose of DNA profiling, various samples were taken from the person of the prosecutrix; the complainant; the accused, their clothes/articles; the dumping spot; the iron rods; the ashes of burnt clothes; as well as from the offending bus.

PW-45 Dr. B.K. Mohapatra analysed the said DNA profiles and submitted his report thereof. In his report, he concluded that the samples were authentic and capable of establishing the identities of the persons concerned beyond reasonable doubt.

Prosecution relies upon the biological examination of various articles including the samples collected from the accused and the DNA profiles generated from the bloodstained clothes of the accused. The DNA profile generated from the samples collected, when compared with the DNA profile generated from the blood samples of the victim and PW-1 Awninder Pratab Pandey, were found consistent.

84. For easy reference and for completion of narration of events, I choose to refer to the articles recovered from the accused pursuant to their disclosure statements and other articles like bloodstained clothes; samples of personal fluids like blood, saliva with control swab; other samples like nail clippings, penile swab, stray hair etc. Details of the DNA analysis is contained in the reports of biological examination and DNA profiling (Ex.PW-45/A to Ex.PW-45/C), furnished by PW-45 Dr. B.K. Mohapatra.

85. Before considering the above findings of DNA analysis contained in tabular form, let me first refer to what is DNA, the infallibility of identification by DNA profiling and its accuracy with certainty. DNA – De- oxy-ribonucleic acid, which is found in the chromosomes of the cells of living beings, is the blueprint of an individual. DNA is the genetic blue print

10. *Mukesh v State for Nct of Delhi*, Criminal Appeal Nos. 607–08 of 2017, SC, Decided on 5 May 2017. Bench: Dipak Misra, R Banumathi, and Ashok Bhushan.
Also see another land mark judgment on another brutal rape-murder case: *Shankar Kisanrao Khade v State of Maharashtra,* (2013) 5 SCC 546.

for life and is virtually contained in every cell. No two persons, except identical twins have ever had identical DNA. DNA profiling is an extremely accurate way to compare a suspect's DNA with crime scene specimens, victim's DNA on the bloodstained clothes of the accused or other articles recovered, DNA testing can make a virtually positive identification when the two samples match. A DNA fingerprint is identical for every part of the body, whether it is the blood, saliva, brain, kidney or foot on any part of the body. It cannot be changed; it will be identical no matter what is done to a body. Even relatively minute quantities of blood, saliva or semen at a crime scene or on clothes can yield sufficient material for analysis. The Experts opine that the identification is almost hundred per cent precise. Using this i.e. chemical structure of genetic information by generating DNA profile of the individual, identification of an individual is done like in the traditional method of identifying fingerprints of offenders. Fingerprints are only on the fingers and at times may be altered.

Burning or cutting a finger can change the mark of the fingerprint. But DNA cannot be changed for an individual no matter whatever happens to a body.

86. We may usefully refer to Advanced Law Lexicon, 3rd Edition Reprint 2009 by P. Ramanatha Aiyar which explains DNA as under:-

DNA.- De-oxy-ribonucleic acid, the nucleoprotein of chromosomes. The double-helix structure in cell nuclei that carries the genetic information of most living organisms.

The material in a cell that makes up the genes and controls the cell. (Biological Term) DNA finger printing. A method of identification especially for evidentiary purposes by analyzing and comparing the DNA from tissue samples. (Merriam Webster)" In the same Law Lexicon, the learned author refers to DNA identification as under:

DNA identification. A method of comparing a person's deoxyribonucleic acid (DNA) – a patterned chemical structure of genetic information – with the DNA in a biological specimen (such as blood, tissue, or hair) to determine if the person is the source of the specimen. – Also termed DNA fingerprinting; genetic fingerprinting (Black, 7th Edition, 1999)

87. DNA evidence is now a predominant forensic technique for identifying criminals when biological tissues are left at the scene of crime or for identifying the source of blood found on any articles or clothes etc. recovered from the accused or from witnesses. DNA testing on samples such as saliva, skin, blood, hair or semen not only helps to convict the accused but also serves to exonerate. The sophisticated technology of DNA fingerprinting makes it possible to obtain conclusive results. Section 53A Cr.P.C. is added by the Code of Criminal Procedure (Amendment) Act, 2005. It provides for a detailed medical examination of accused for an offence of rape or attempt to commit rape by the registered medical practitioners employed in a hospital run by the Government or by a local authority or in the absence of such a practitioner within the radius of 16 km from the place where the offence has been committed by any other registered medical practitioner.

88. Observing that DNA is scientifically accurate and exact science and that the trial court was not justified in rejecting DNA report, in *Santosh Kumar Singh v State* through CBI (2010) 9 SCC 747, the Court held as under:-

65. We now come to the circumstance with regard to the comparison of the semen stains with the blood taken from the appellant. The trial court had found against the prosecution on this aspect. In this connection, we must emphasise that the court cannot substitute its own opinion for that of an expert, more particularly in a science such as DNA profiling which is a recent development.

66. Dr. Lalji Singh in his examination-in-chief deposed that he had been involved with the DNA technology ever since the year 1974 and he had returned to India from the UK in 1987 and joined CCMB, Hyderabad and had developed indigenous methods and techniques for DNA fingerprinting which were now being used in this country. We also see that the expertise and experience of Dr. Lalji Singh in his field has been recognised by this Court in *Kamalanantha v State of T.N.* (2005) 5 SCC 194 We further notice that CW

1 Dr. G.V. Rao was a scientist of equal repute and he had in fact conducted the tests under the supervision of Dr. Lalji Singh. It was not even disputed before us during the course of arguments that these two scientists were persons of eminence and that the laboratory in question was also held in the highest esteem in India.

67. The statements of Dr. Lalji Singh and Dr. G.V. Rao reveal that the samples had been tested as per the procedure developed by the laboratory, that the samples were sufficient for the purposes of comparison and that there was no possibility of the samples having been contaminated or tampered with. The two scientists gave very comprehensive statements supported by documents that DNA of the semen stains on the swabs and slides and the underwear of the deceased and the blood samples of the appellant was from a single source and that source was the appellant.

68. It is significant that not a single question was put to PW Dr. Lalji Singh as to the accuracy of the methodology or the procedure followed for DNA profiling. The trial court has referred to a large number of textbooks and has given adverse findings on the accuracy of the tests carried out in the present case. We are unable to accept these conclusions as the court has substituted its own opinion ignoring the complexity of the issue on a highly technical subject, more particularly as the questions raised by the court had not been put to the expert witnesses. In *Bhagwan Das v State of Rajasthan,* AIR 1957 SC 589 it has been held that it would be a dangerous doctrine to lay down that the report of an expert witness could be brushed aside by making reference to some text on that subject without such text being put to the expert.

71. We feel that the trial court was not justified in rejecting the DNA report, as nothing adverse could be pointed out against the two experts who had submitted it. We must, therefore, accept the DNA report as being scientifically accurate and exact science as held by this Court in *Kamti Devi v Poshi Ram,* (2001) 5 SCC 311. In arriving at its conclusions the trial court was also influenced by the fact that the semen swabs and slides and the blood samples of the appellant had not been kept in proper custody and had been tampered with, as already indicated above. We are of the opinion that the trial court was in error on this score. We, accordingly, endorse the conclusions of the High Court on Circumstance 9." [emphasis added].

89. From the evidence of PW-45 and the details given in the above tabular form, it is seen that the DNA profile generated from bloodstained clothes of the accused namely, A-1 Ram Singh (dead); A-2 Mukesh; A-3 Akshay; A-4 Vinay; and A-5 Pawan Gupta @ Kalu are found consistent with the DNA profile of the prosecutrix. Also as noted above, two sets of DNA profile were generated from the black colour sweater of the accused Pawan. One set of DNA profile found to be female in origin, consistent with the DNA profile of the prosecutrix; other set found to be male in origin, consistent with the DNA profile of PW-1. Likewise, two sets of DNA profile were generated from the black colour sports jacket of accused Vinay, one of which matched the DNA profile of the prosecutrix and another one matched the DNA profile of PW-1. Likewise, two sets of DNA profile were generated from the jeans pant of accused Akshay, one of which matched the DNA profile of the prosecutrix and another one matched the DNA profile of PW-1. The result of DNA analysis and that of the DNA profile generated from bloodstained clothes of the accused found consistent with that of the victim is a strong piece of evidence incriminating the accused in the offence.

90. DNA profile generated from the blood samples of accused Ram Singh matched with the DNA profile generated from the rectal swab of the victim. Blood as well as human spermatozoa was detected in the underwear of the accused Ram Singh (dead) and DNA profile generated therefrom was found to be female in origin, consistent with that of the victim. Likewise, the DNA profile generated from the breast swab of the victim was found consistent with the DNA profile of the accused Akshay.

91. As discussed earlier, identification by DNA genetic fingerprint is almost hundred percent precise and accurate. The DNA profile generated from the bloodstained clothes of the accused and other articles are found consistent with the DNA profile of the victim and DNA profile of PW-1; this is a strong piece of evidence against the accused. In his evidence, PW-45 Dr. B.K. Mohapatra has

stated that once DNA profile is generated and found consistent with another DNA profile, the accuracy is hundred percent and we find no reason to doubt his evidence. As pointed out by the Courts below, the counsel for the defence did not raise any substantive ground to rebut the findings of DNA analysis and the findings through the examination of PW-45. The DNA report and the findings thereon, being scientifically accurate clearly establish the link involving the accused persons in the incident.

227. After establishing the identities of each of the accused persons, the informant and the prosecutrix through DNA analysis, the DNA profiles generated from the remaining samples, where the identity of biological material found thereon needed to be ascertained, were matched with the DNA profiles of the prosecutrix, the informant and the accused, generated earlier from known samples. Such an analysis cogently linked each of the accused with the victims as also with the crime scene. A summary of the findings in the report submitted by PW-45, Dr. B.K. Mohapatra, is as under:

"S.No.	Accused	DNA EVIDENCE
1	Ram Singh	Rectal swab from the prosecutrix contained DNA of male origin, which was found consistent with the DNA developed from the blood sample of this accused.
		DNA profile developed from the blood stains from the underwear, T-shirt and slippers of this accused was found consistent with the DNA of the prosecutrix.
2	Mukesh	DNA profile developed from the blood stains from the pants, T-shirt and jacket of this accused was found consistent with the DNA of the prosecutrix.
3	Akshay	Breast swab of the prosecutrix contained DNA of male origin which was found consistent with the DNA of this accused.
		DNA profile developed from the blood stains from the jeans of this accused was found consistent with the DNA of the prosecutrix.
4	Vinay	DNA profile developed from the blood stains from the underwear, jacket and slippers of this accused was found consistent with the DNA of the prosecutrix.
5	Pawan	DNA profile developed from the blood stains from the sweater and shoes and slippers of this accused was found consistent with the DNA of the prosecutrix."

228. Further, a summary of the DNA analysis of the biological samples lifted from the material objects such as the bus, the iron rods, and the ash and unburnt pieces of clothes is also worth producing here:

"Serial No.	Identity of the victim	Findings of DNA Analysis
	Informant	The DNA profile developed from burnt clothes pieces was found to be of male origin and was consistent with the DNA profile of complainant.
		The bunch of DNA profile developed from hair and blood stained pieces of paper recovered from the bus was found consistent with the DNA profile of complainant.
		The DNA profile developed from blood stained dried leaves collected from the place where both the victims were thrown matched with the DNA profile of complainant.

"Serial No.	Identity of the victim	Findings of DNA Analysis
	Prosecutrix	The DNA profile developed from blood stains from both the iron rods recovered at the instance of accused Ram Singh from the bus was of female origin and was consistent with the DNA profile of prosecutrix.
		The DNA profile developed from blood stains from curtains of the bus matched with the DNA profile of prosecutrix.
		The DNA profile developed from blood stains from seat covers was found consistent with the DNA profile of prosecutrix.
		DNA profile developed from blood stains from the bunch of the hair recovered from floor of the bus below sixth row seat, blood stains prepared from the roof of the bus near back gate, blood stains prepared from the floor of the bus near back gate, blood stains taken from side of back stairs of the bus, and blood stains taken from the inner side of the back door of the bus was found consistent with the DNA profile of prosecutrix.

21.10.2 DNA Fixes Rape-Rapist-Murderer[11]

Author's Summary

This is an unfortunate case where the culprit, a misguided youth, misusing the power/pelf of his father (a senior police officer), committed brutal rape-cum murder of a young lady when she did not succumb to his overtures. There were no eyewitnesses. Forensics un-ravelled the crime. DNA analysis provided the clinching evidence, supported by medical examination. It is unfortunate that the Supreme Court found it right to reduce the sentence in such a brutal heinous murder in extremely aggravating circumstances.

Highlights italicised

Relevant Extracts (verbatim)

As per the prosecution story, the appellant harassed and intimidated the deceased and despite her requests and then her remonstrations, did not desist from doing so. The deceased thereupon made several complaints against the appellant in different Police Stations during the year 1995 on which he was summoned to the Police Station and was advised to behave properly and a Personal Security Officer, Head Constable Rajinder Singh PW-32, was also deputed for the security of the deceased. It appears that as a consequence of the complaints against him, the appellant too retaliated and made a report to the University on 30th October, 1995 alleging that the deceased was pursuing two courses simultaneously which was in violation of the University Rules and when no action was taken he sent two reminders dated 4th December, 1995 and 20th December, 1995 to the University as well. A show cause notice was issued to the deceased and in response thereto she submitted her reply dated 1st December, 1995 and during the pendency of these proceedings, the result of her LL.B. 5th Semester examination was withheld. On 23rd January, 1996 PW Head Constable Rajinder Singh, the PSO, did not turn up at the residence of the deceased at the stipulated time on which she left for the university in her car along with her parents PW-1 Mr. C.L. Mattoo and PW-44 Mrs. Rageshwari Mattoo who had

11. *Santosh Kumar Singh v State Through CBI*, 2011 AIR SCW 3647 : (2010) 9 SCC 747.

to visit the Tis Hazari Courts to attend to some civil proceedings. The parents were dropped off at Tis Hazari at 10.15 a.m. Head Constable Rajinder Singh, however, reached the Faculty of Law directly and saw the appellant present there. The deceased attended the class from 11.15 a.m. to noon and thereafter accompanied by the Head Constable left the faculty for Tis Hazari but finding that her parents had already left the court, she returned to her residence at about 1.45 p.m. and directed Head Constable Rajinder Singh to report again at 5.30 p.m. The deceased then had her lunch whereafter Virender Prasad, the domestic help, left the house at about 2.30 p.m. to meet his friend Vishnu Prasad @ Bishamber at the residence of PW-6 Lt. Col S.K. Dhar at Safdarjung Enclave and returned to Vasant Kunj at 4.55 p.m. He then took the dog for a walk in the colony. The appellant came to the residence of the deceased at about 4.50 p.m. carrying his helmet in his hand and was seen by PW-2 Kuppuswami. PW-3 Jaideep Singh Ahluwalia, Security Supervisor in the colony also saw the appellant at 5.30 p.m. near the residence of the deceased, PW-43 and O.P. Singh Advocate also noticed the appellant riding out of the park area of B-10, Vasant Kunj at the same time. Head Constable Rajinder Singh PW reached the residence of the deceased at about 5.30 p.m., as directed, along with Constable Dev Kumar. The Head Constable pressed the call bell but eliciting no response from inside, he went to another door which opened onto the courtyard and knocked but again to no effect. As the door was slightly ajar the two entered the bedroom of the deceased and found her dead body lying under the double bed. The Head Constable immediately informed Police Station, Vasant Kunj about the incident on which SHO Inspector Surinder Sharma arrived at the site and a daily diary report (*rojnamcha*) to the above facts Ex. PW-18/A was also recorded at 5.45 p.m. Inspector Lalit Mohan, Additional SHO, Vasant Kunj was entrusted with the investigation on which he along with Sub-Inspector Sushil Kumar, Sub-Inspector Padam Singh, Head Constable Satish Chand and several other police officers too reached the residence of the deceased and found her dead body lying under the double bed with the cord of the electric heat convector tied around her neck. He also noticed blood stains around the body. A case under section 302 of the IPC was thereafter registered at Police Station, Vasant Kunj, on the complaint of the father of the deceased, in which the day's happenings were spelt out. It was further noted that after completing their work in the Tis Hazari Courts he and his wife had visited Safdarjung Enclave and from there he had gone on to attend an official meeting at Vikas Kuteer, ITO whereas his wife had visited the All India Institute of Medical Sciences and it was on returning to his residence at 7.30 p.m. that he found that his daughter had been murdered.

> ***The dead body was also subjected to a post-mortem on 25th January, 1995 at the Safdarjung Hospital by a Board of Doctors consisting of Dr. Chander Kant, Dr. Arvind Thergaonkar and PW-33 Dr. A.K Sharma who in their report Ex. PW 33/B found 19 injuries on the dead body and also observed that the private parts showed black, curly non-matted pubic hair, the hymen intact with no tearing present and admitting only one finger. The Doctors also took two vaginal swabs and slides were duly sealed, the swabs and slides in a glass bottle as well as samples of the blood and hair. The clothes of the deceased were also taken into possession and sealed. The Board also opined that the death was a result of strangulation by ligature and that the injuries on the dead body were sufficient to cause death in the ordinary course of nature.***

Inspector Lalit Mohan thereupon produced the appellant before PW-50 DSP Shri A.K. Ohri of the CBI and the subsequent investigation was made by the DSP with the assistance of several other officers from the CBI. The underwear of the appellant was also seized by the CBI as he represented that he had been wearing the same underwear for the last couple of days. DSP Ohri also visited the crime scene on the 26th January, 1996 but did not find Mr. C.L. Mattoo, the father of the deceased, present. On the next day, he recorded the statement of Virender Parshad, the domestic servant and also directed Shri D.P. Singh, DSP to conduct the house search of the appellant. On the 28th January, 1996, a request Ex. PW 34/A was made by Mr. S.K. Bhatnagar, Additional Director of the CBI to Dr. A.K. Gupta, Medical Superintendent, Dr. R.M.L. Hospital for procuring the blood samples of the appellant. DSP

Ohri along with the other staff took the appellant to the hospital and met PW-34 Dr. N.S. Kalra, Head of the Biochemistry Department and two blood samples of 10 ml. each were taken by Ms. Godavari Mangai, Lab Assistant and were handed over to Dr. Kalra. These samples as well as the other case property collected by DSP Ohri or entrusted to him by Inspector Lalit Mohan were deposited with the Moharrir Malkhana on the 29th January, 1996 and preparations were made to refer the matter for a DNA test. Specimen hand writings Ex.PW24/A1 to A21 of the appellant were also obtained once again this time by the CBI. On 30th January, 1996 Shri M.L. Sharma, Joint Director, CBI addressed a letter to the Director, CCMB, Hyderabad requesting for DNA profiling. Several articles were accordingly entrusted to PW-39 Sub-Inspector R.S. Shekhawat on 31st January, 1996, they being:

1. One sealed parcel containing clothes of the deceased such as T-shirt, brassiere, jeans and underwear;
2. One sealed packet containing underwear of the accused Santosh Kumar Singh;
3. One sealed jar containing vaginal swabs/vaginal slides of the deceased; and
4. The blood samples of the appellant taken in the Dr. R.M.L. Hospital.

The Sub-Inspector thereafter flew to Hyderabad on 31st January, 1996 and deposited the aforementioned articles in the Office of Dr. Lalji Singh, Officer on special duty at the CCMB, Hyderabad on the next morning and an acknowledgement Ex. PW-49/A relating to the following articles was obtained:

1. One sealed parcel containing clothes supposed to be of the deceased, namely, T-shirt, brassiere, jeans and underwear.
2. Vaginal swabs/vaginal slides supposed to be of the deceased.
3. One thermocole box containing 4 vials marked as S-l, S-2, S-3 and S-4 supposed to be blood of the accused.

The underwear of the appellant was, however, returned by Dr. Lalji Singh as it was not relevant for the DNA fingerprinting test.

* * *

In the course of a rather verbose judgment, the trial court noted that there were 13 circumstances against the appellant. We quote herein below from the judgment:

1. *The accused had been continuously harassing the deceased right from the end of 1994 to January 1996, a few days before her death.*
2. *The accused had more than once given an undertaking that the accused would not harass the deceased in future while admitting that the accused had been doing so earlier.*
3. *The motive of the accused was to have the deceased or to break her.*
4. *On the day of occurrence, the accused was seen in the premises of Faculty of Law, University of Delhi in the forenoon, where the deceased had gone to attend LL.B. class, while the accused was no more a student of Faculty of Law at that time.*
5. *At the crucial time before murder, i.e., about 5 p.m. on 23-1-1996, the accused was seen outside the door of the flat of the deceased, i.e., B-10/7098 with helmet in his hand which had a visor.*
6. *On the day of occurrence after murder, the accused had reached late to attend class at Indian Law Institute, Bhagwan Dass Road, where the accused was a student too.*
7. *Immediately after the murder, the mother of the deceased had raised suspicion that the accused had a hand in the murder of her daughter.*
8. *When the accused joined investigation on the night between 23/24-1-1996, the accused had an injury on his right hand. There was swelling and fracture on 5th*

metacarpal of right hand. There was no plaster or bandage on his hand. That injury was fresh, having been caused 24 to 38 hours. The blood pressure of the accused at that time was high which showed anxiety.

9. *DNA Fingerprinting Test conclusively establishes the guilt of the accused.*
10. *On 25-1-1996, the helmet Ex. P.3 of the accused which was taken into possession had broken visor. On 23-1-1996 before the murder, it was found by PW-2 Shri Kuppuswami, PW Personal Security Officer Rajinder Singh that the helmet of the accused had a visor. Violence was detected on both sides of visor. Helmet was besmeared with a spree of blood. At the spot, pieces of visor were found near the body of the deceased besmeared with her blood.*
11. *The deceased had 19 injuries on her person besides three broken ribs. These injuries were suggestive of force used for rape. A tear mark over the area of the left breast region on the T-shirt of the deceased suggested that the force was used for molestation.*
12. *The accused took a false defence that fracture on the hand of the accused was sustained by the accused on 14-1-96 and it was not a fresh injury. The accused also gave false replies against proved facts.*
13. *The influence of the father of the accused resulting in deliberate spoiling of the case.*

The trial court then went on to circumstance No. 9 and evolved its own theories and after a huge discussion, rejected the DNA report given by the CCMB, Hyderabad as also the evidence of Dr. Lalji Singh and Dr. G.V. Rao.

This finding has also been reversed by the High Court by observing that though there appeared to be no physical evidence of rape on the body but the DNA test conducted on the vaginal swabs and slides and the underwear of the deceased and the blood sample of the appellant, it was clear that rape had been committed, and that too by him. The High Court held that it would be a dangerous doctrine for the court to discard the evidence of an expert witness by referring to certain texts and books without putting those texts to the expert and taking his opinion thereon. The High Court also reversed the finding of the trial court that the vaginal swabs and slides and the blood samples of the appellant had been tampered with. The trial court and the High Court both held circumstance No. 11 in favour of the prosecution and it was observed that the deceased was alone at the time of incident and that she had been brutally attacked with the helmet which had been used with great force to cause as many as 19 injuries, including three broken ribs.

17. Mr. Sushil Kumar has then argued with emphasis, that the case rested primarily on the factum of rape and if it was found that there was no evidence of rape, the case of murder would also fall through. He has, accordingly, taken us to circumstance No. 9, which the trial court noted as under:

DNA fingerprinting test conclusively established the guilt of the accused.

He has first pointed out that the post-mortem did not reveal any evidence of rape. Reference has been made to the statement of PW-33 Dr. A.K. Sharma, who along with a Board of two other Doctors had performed the post-mortem on the dead body on the 25th January, 1996 at the Safdarjung Hospital and it was observed that the deceased was wearing a full sleeved high neck pinkish T-shirt with a small tear on the breast, blue coloured jeans, one brassiere and underwear and woollen socks and though there were a large number of injuries on the dead body and the local examination of the private parts showed black, curly non matted pubic hair, and an intact hymen, with no tearing. The Doctor was also questioned as to whether the hymen would always be torn and ruptured during the first sexual encounter and he explained that though this would be the normal case but it was not always so and that the hymen could remain un-ruptured even after repeated sexual intercourse for certain reasons which he then spelt out. It has, accordingly, been submitted that there was absolutely no evidence of rape detected during the course of the examination. He has also pointed out that as there were no semen stains on the dead body of the deceased or her clothes and as the underwear of the appellant sent to the CCMB, Hyderabad had been returned without examination and had been examined thereafter

in the Central Forensic Science Laboratory, Delhi and the semen's stains found were of group A which was not the blood group of the appellant, there were no evidence suggesting rape.

18. It has, finally, been submitted that the observation of the High Court that the DNA test conclusively proved the involvement of the appellant in the rape was not tenable as it appeared that the vaginal swabs and slides which were allegedly taken from the dead body at the time of the post-mortem examination and the blood samples of the appellant taken under the supervision of PW Dr. N.S. Kalra had been tampered with. It has been argued that as per the findings of the trial court the record of the Malkhana with respect to the vaginal swabs and slides had been fudged and though these items had been handed over to the CBI officers on the 25 January 1996 they had been deposited in the Malkhana on the 29 January 1996 and no explanation was forthcoming as to how and why this delay had happened, it has also been submitted that as per the evidence of Dr. N.S. Kalra a request had been made to him by the CBI to take 2 samples of blood of 10 ml. each from the appellant but 2 samples of 10 ml. had been taken and transferred to 4 vials and when the vials had been opened at the CCMB, only 12 ml. of blood had been found, and this too cast a doubt on the prosecution case. It has finally been submitted that the tests conducted by the CCMB, Hyderabad were faulty and could not be relied upon.

19. The learned Additional Solicitor-General has, however, controverted the above submissions and has pleaded that they were based on the supposition of a bias against the appellant and that all those involved including the officials of the CBI, the Doctors who had conducted the post-mortem examination, those who had taken the blood samples and the Scientists of the CCMB were in league to implicate him in a false case. He has further argued that there was no evidence of tampering with the vaginal swabs and slides which had been sealed by the Doctors and handed over to the police and had been collected from the Malkhana by PW-39 Inspector Shekhawat and taken to the CCMB, whereas the blood samples, on the contrary, had been retained in the office of Dr. N.S. Kalra in the RML Hospital and that Inspector Shekhawat had taken them from there and gone straight on to Hyderabad and delivered them to the CCMB with seals intact.

It is the primary submission of Mr. Sushil Kumar that the vaginal swabs and slides taken from the dead body at the time of the post-mortem examination had been tampered with and as there was some suspicion with regard to the blood samples taken by Dr. N.S. Kalra on the 25 January, the DNA report too could not be relied upon. This is a rather far-fetched plea as it would mean that not only the investigating agency, that is the senior officers of the CBI and DSP Ohri in particular, the doctors who had taken the vaginal swabs and slides, the doctors and other staff who had drawn the blood samples, and the scientists in Hyderabad had all been in a conspiracy to harm the appellant. To our mind, this premise is unacceptable. We see from the post-mortem report Ex. PW 33/B dated 25 January 1996 and the endorsement thereon that one bundle containing a full sleeved high neck pinkish violet colour T-shirt having a cut mark over the area of the left breast region, one blue coloured jeans, one pair of woollen socks, one white coloured brassiere and one blue coloured underwear had been sealed and handed over to the investigating officer, Inspector Lalit Mohan. It also finds mention that these items along with two vaginal swabs and two slides had also been handed over to the I.O. It has been submitted by Mr. Sushil Kumar that these items had been retained by Inspector Lalit Mohan till the 25th of January, 1996 and then handed over to PW-38 Inspector Sunit Kumar of the CBI. Inspector Sunit Kumar, however, deposed that on the 29 January 1996, and on the direction of DSP Ohri, he had gone to the Department of Forensic Medicine, Safdarjung Hospital, and taken the bundle of clothes and one jar containing vaginal swabs and slides duly sealed and several other items as well and that a specimen of the seal had also been obtained by him. It is, therefore, obvious that till 29th of January, 1996 the aforesaid articles remained in the custody of the Safdarjung Hospital and that they were deposited in the malkhana on the 29 January 1996.

* * *

There ***are extremely aggravating circumstances as well. In particular, we notice the tendency of parents to be over indulgent to their progeny often resulting in the most horrendous of situations. These situations are exacerbated when an accused belongs to a category with unlimited power or pelf or even more dangerously, a volatile and heady cocktail of the two. The reality that such a class does exist is for all to see and is evidenced by regular and alarming incidents such as the present one. Nevertheless, to our mind, the balance sheet tilts marginally in favour of the appellant, and the ends of justice would be met if the sentence awarded to him is commuted from death to life imprisonment under section 302 of the Indian Penal Code; the other part of the sentence being retained as it is. With this modification in the sentence, the appeal is dismissed.***

21.10.3 DNA Connects Mohamad Ajmal Kasab, Terrorist with Terror[12]

Author's Summary

Ajmal Amir Kasab was a terrorist, who along with other terrorists from Pakistan committed terrorist activity in Mumbai killing many persons and destroyed property in 2008. All other terrorists were killed except Kasab during encounter. His association with the terrorist group was established through DNA, extracted from the beddings of the group.

Relevant Extracts (verbatim)

The appellant, Mohammed Ajmal Mohammad Amir Kasab @ Abu Mujahid (hereinafter referred to as 'the appellant' or as 'Kasab'), who is a Pakistani National, has earned for himself five death penalties and an equal number of life terms in prison for committing multiple crimes of a horrendous kind in this country. Some of the major charges against him were: conspiracy to wage war against the Government of India; collecting arms with the intention of waging war against the Government of India; abetting the waging of war against the Government of India; commission of terrorist acts; criminal conspiracy to commit murder; criminal conspiracy, common intention and abetment to commit murder; committing murder of a number of persons; attempt to murder with common intention; criminal conspiracy and abetment; abduction for murder; robbery/dacoity with an attempt to cause death or grievous hurt; and causing explosions punishable under the Explosive Substance Act, 1908. He was found guilty of all these charges besides many others and was awarded the death sentence on five counts, life-sentence on five other counts, as well as a number of relatively lighter sentences of imprisonment for the other offences.

21.10.4 DNA Fixes Foetus' Father-Murderer[13]

Author's Summary

A girl from Delhi was inveigled by a rapist for repeated sex on the promise of marrying her. She got pregnant. The rapist wanted her to abort, which she resisted. He ultimately took her in his mother's car, on the pretext of marrying her at Haridwar, to a secluded place and tried to kill her by beating with jack and pana, cut her with blades and throwing acid on her person. Police. passing by, hearing the shrieks, reached the spot; caught hold of the culprits. There were no eyewitness. However, she was alive when the police reached the scene. She could give the details of the brutalities she suffered. Thereafter she died. The DNA connect of the culprit with the foetus in the womb of the victim, clinched the case against the culprit.

Highlights italicised

Relevant Extracts (verbatim)

Shorn of unnecessary facts, the case of the prosecution as projected before the trial court was that on 17-11-2004 Inspector D.N. Verma (PW-1) along with Sub-Inspector Chander Pal Singh (PW-2), Constable Rambir Singh, Constable Sukhram, Constable Ashok Kumar and Driver Yashvir Singh were on patrolling duty; that when they reached ahead of Badsu on Khatoli Road leading towards Falut, they met Constable Rajesh Kumar and another Constable Ramavtar who informed PW-1 and other persons accompanying him that one Indica car took a turn for going towards Falut road and that they heard some screaming noise from that vehicle. PW-1, accompanied by the other personnel referred to above, proceeded towards Falut road and after a distance saw an Indica car. They stated to have seen through the focus light of the police jeep two young men trying to pull out a girl in an injured condition by opening the rear door of the car. It is stated that it was around 21.30 hours. The police jeep in which PW-1 and others were proceeding stopped ahead of the Indica car and caught hold of the two young men and also noticed a girl, with injuries all over, on whom acid was also sprinkled. The girl had also sustained injuries on the head as well as on her right cheek. On noticing the above, according to PW-1, when he questioned her, she responded by stating that her name was Jyoti and she is the daughter of one Baljeet Singh, R/o Lane No. 16, House No. 56, Jagatpuri, P.S. Preet Vihar, New Delhi and that her mother's name was Varsha whose cell number was 9871020368. Inspector D.N. Verma (PW-1) stated to have gathered information from her that she developed a friendship with the appellant Sandeep while she was working in a mobile shop. She also stated to have revealed that she was pregnant. According to the information gathered from Jyoti, accused Sandeep had called her on that evening and asked her to come to Laxmi Nagar Market, Delhi, around 6 p.m. promising her that he will marry her at Haridwar. Believing his words, she went to Laxmi Nagar Market from where she was taken in a car and that while they were moving in the vehicle, accused Sandeep asked Jyoti to get the foetus aborted at Meerut, to which she disagreed. On this, he started beating her inside the vehicle right from the point of Modi Nagar. She stated to have further informed PW-1 and others that she told accused Sandeep that she would reveal all facts to his family members as well as to the police and that when the vehicle in which they were travelling turned towards an isolated place near Khatoli, they tried to throw her into the sugarcane field at which point of time PW-1 and other police members

13. *Sandeep v State of Uttar Pradesh*, (2012) 6 SCC 107 (with other criminal appeals). [Judgment : Fakkir Mohamed Ibrahim Kalifulla, J.].

reached the spot. According to her information to PW-1, accused Sandeep and Shashi Bhushan caused the injuries on her with the aid of a jack and pana (spanner) apart from cutting her with a blade and also by pouring acid on her head. PW-1 stated that on noticing the condition of the girl, he arranged for shifting her to Muzaffarnagar Government Hospital in the police jeep along with Constable Rambir Singh and the driver of the jeep. It was further stated that accused Sandeep and Shashi Bhushan, on being apprehended, also revealed their names and informed that accused Sandeep used to visit deceased Jyoti while she was working in a mobile shop in Mayur Vihar Phase-1 for the last six months prior to the date of occurrence and developed friendship with her, and that in course of time, deceased Jyoti pressurized him to marry her. On the date of occurrence, around 6 p.m. he stated to have called her over phone to meet him at Laxmi Nagar red-light, that she responded to his call and came to Laxmi Nagar red-light where accused Sandeep was waiting along with his friend Shashi Bhushan who drove the vehicle Indica car bearing registration No. DL 3CR 6666 which belonged to his mother.

> ***Accused Sandeep stated to have extended a promise to marry her at Haridwar. While the vehicle started moving, accused Sandeep asked Jyoti to get the foetus aborted to which she did not agree instead threatened him by saying that she will reveal all facts to his parents as well as to the police and that as they reached Modinagar, he started beating her.***
>
> ***According to the version of accused Sandeep, as told to PW-1, at Modinagar he purchased, two bottles of acid and four shaving blades, that when they reached Khatoli, on seeing an isolated place, they tried to pull out the injured Jyoti from the vehicle and that at that point of time they were apprehended by the police. It is the case of the prosecution that while both the accused were taken into custody, the vehicle in which they were travelling was also seized along with the jack and pana, four blades and two acid bottles. The articles, namely, blood stained floor mat, empty bottles of acid, one pair of ladies footwear were stated to have been seized after preparing a seizure memo.***

A copy of the seizure memo was stated to have been handed over to the accused. It is the specific case of the prosecution that since it was late in the night and it was a lonely place, there were no independent witnesses other than the police personnel. The seizure memo was marked as Exhibit K-1.

* * *

Keeping the (above respective) submissions in mind, when we analyze the case in hand the following facts are indisputable:—

(a) The relationship of Sandeep with deceased, prior to the date of occurrence, namely, 7-11-2004 as his girlfriend;

(b) The deceased was carrying the foetus of six months old in her womb;

(c) The Indica car in which the deceased was found on the date and time of occurrence belonged to the mother of accused Sandeep;

(d) At the time when the deceased was secured by the police on 17-11-2004 at 21.30 hours she was seriously injured but was alive;

(e) The death of the deceased was ascertained by the Dr. B.S. Chaudhary (PW-6) at 10.55 p.m.

(f) As per the post-mortem certificate, there were as many as 17 injuries which were caused by blunt weapons like jack and pana (spanner), shaving blades and also chemical acid.

(g) Police witnesses were all on patrol duty on the date of occurrence.

(h) The DNA test disclosed that accused Sandeep was the biological father of the foetus found in the womb of the deceased.

(i) The theory propounded by the accused i.e., the car was stolen on 17-11-2004 was not established before the trial court in the manner known to law.

(j) The statement of the accused as stated to have been made to PW-1 contained various facts unconnected to the crime and also the self-incriminating facts which could be distinguished.

(k) The absence of any independent witness at the place of occurrence.

21. Having regard to the above factors, we are convinced that the case of the prosecution that the deceased made a statement about the sequence of the occurrence was really made as spelt out by the witnesses PW Nos. 1 to 5.

Another submission made on behalf of the appellant was that there were serious infirmities in preserving and testing of the sample of the foetus and the consequent DNA report implicating the accused Sandeep to the destruction of the foetus whose biological father was found to be the accused himself. The infirmity pointed out was that the sample of the foetus of the child was taken as early as on 17-11-2004 while it was sent for forensic lab only on 25-1-2005 and that since there was a long gap in between, the prosecution ought to have disclosed as to how the samples were properly preserved in order to proper test to be conducted for ascertaining the correctness of its outcome. Though such submission was made with some emphasis, it was not pointed out as to what was the nature of procedure to be followed in regard to the preservation of the samples taken apart from what was followed in taking the samples by the prosecution. It is not in dispute that at the time of post-mortem, when the foetus was discovered, the same was preserved by taking two samples one in the Formalin solution and the other one by ice preservation. It is borne out by record that there was an FSL report dated 5-1-2005 as per which the SSP of Muzaffarnagar was informed that the foetus which was preserved in Formalin solution was not accepted since laboratory had no standard protocol for extracting the amplifiable DNA of Formalin preserved tissues.

> **34.** ***Therefore, in the evidence of PW-10 Junior Scientific Officer of Central Forensic Laboratory, Chandigarh, it was brought out that the blood samples of accused Sandeep and the foetus received by him on 27-1-2005 and that necessary test was conducted based on which a report on 13B/1, 13A/2 and 13C/3 were forwarded which confirmed that the accused Sandeep was the biological father of the foetus. He also confirmed in the cross-examination that the earlier sample of foetus preserved in Formalin solution received on 5-1-2005 was returned back without opening the seal as the same was kept in Formalin solution and standard protocol analysis was not available in the laboratory. He further confirmed that when the sample on second time was received along with the letter dated 25-1-2005, the same was preserved in ice separately which they were able to test in their laboratory for finding out the result. It has also come in his evidence that the collection of samples, preservation of samples and transportation of samples if not carefully done, it may affect the result, but in the case on hand the result reported by him was not based on wrong facts. In the light of the said expert evidence of the Junior Scientific Officer it is too late in the day for the appellant-Sandeep to contend that improper preservation of the foetus would have resulted in a wrong report to the effect that the accused Sandeep was found to be the biological father of the foetus received from the deceased Jyoti. As the said submission is not supported by any relevant material on record and as the appellant was not able to substantiate the said argument with any other supporting material, we do not find any substance in the said submission. The circumstance, namely, the report of the DNA in having concluded that accused Sandeep was the biological father of the recovered foetus of Jyoti was one other relevant circumstance to prove the guilt of the said accused.***

* * *

Case of the prosecution based on the evidence displayed, confirmed the commission of offence by the appellant, without any *iota* of doubt, we are of the considered opinion, that still the case

does not fall within the four corners of the principle of the 'rarest of the rare case'. However, considering the plight of the hapless young lady, who fell a victim to the avaricious conduct and lust of the appellant Sandeep, the manner in which the life of the deceased was snatched away by causing multiple injuries all over the body with all kinds of weapons, no leniency can be shown to the said appellant.

Taking note of the above decision and also taking into account the facts and circumstances of the case on hand, while holding that the imposition of death sentence to the accused Sandeep was not warranted and while awarding life imprisonment we hold that accused Sandeep must serve a minimum of 30 years in jail without remissions before consideration of his case for premature release.

21.10.5 Identity of Mutilated Human Body Parts[14]

(DNA, Odontology, Superimposition)

Author's Summary

It is a shocking inhuman brutal murder of a medical student by a senior medical student. The culprit dismembered the body and disposed off the parts at various places. Parts were recovered at the instance of the culprit. Forensics established that the various body parts belong to the same person. DNA of the parents and body parts established the identity of the deceased as that of their son.

Relevant Extracts

In the academic year of 1995-96 the respondent-accused was studying in the senior first year course of MBBS and the deceased-Navarasu, son of Dr. P.K. Ponnusamy [PW-1], a retired Vice-Chancellor of Madras University, was studying in the junior first year course of MBBS in Raja Muthiah Medical College, Annamalai University, Annamalai Nagar. The respondent was staying in room No. 319 of KRM Hostel and the deceased was staying in room No. 95 in E.1 Malligai Hostel belonging to the same medical college campus. PW-1 returned from his foreign trip on 7-11-1996 and was waiting for the arrival of his son-Navarasu from college to celebrate Diwali which in that relevant year fell on 10-11-1996. When Navarasu did not return home till 9-11-1996, PW-1 started enquiring from the friends of his son, available at Madras but no information of his whereabouts could be gathered by the father. PW-1 then on 9-11-1996 rang up the university authorities to find out and ascertain the whereabouts of his son. When he was informed that the college authority found his hostel room locked and when it was broken upon, it was found that his belongings along with a small box were lying in the room but he was not available in the room. The college authorities and the father were of the opinion that Navarasu had not left for Diwali to Madras. PW-1 thereafter rushed to the University on 10-11-96 and made a complaint of missing of his son at about 11.30 p.m. on 10-11-96 which was registered as Crime No. 509 of 1996 [Exhibit-P1].

While this process was going on and without the knowledge of Annamalai Nagar Police, a torso was recovered at about 8.30 a.m. on 7-11-1996 by G. Boopahty, Inspector of Police, E.5 Pattinapakkam [PW-55], from the PTC Bus Depot at Mandaiveli, Madras based on the information given by Prakash 3[PW-53], conductor of

14. *Inspector of Police, Tamil Nadu v John David,* 2011 AIR SCW 2764.

the bus route No. 21G. The said recovered torso was sent for post-mortem after inquest. The Annamalai Nagar Police after registering the missing report started investigation and during the course of such investigation gathered materials and also received information from various persons including students of the college pointing the guilt towards the accused, who was also found absconding from the college premises from 12-14-11-1996. On 14-11-1996 the accused surrendered himself before the Judicial Magistrate, Mannargudi. The message of his surrender was conveyed to the Annamalai Nagar PS, which got the police custody for five days of the accused from 18.11.1996.

On 19-11-1996 at about 1.30 a.m. the accused gave a confessional statement stating that he has put the severed head of the deceased in the boat-canal within the University campus. Pursuant to the said confession, the head was also recovered. Annamalai Nagar PS on 20-11-1996 asked E5. Pattinapakkam PS for sending the records connected with the torso recovered at Madras on the suspicion that it may belong to the severed head of the deceased-Navarasu, which was recovered at the instance of the accused. Dr. K. Ravindran [PW-66] conducted autopsy/post-mortem of the head at 10.00 a.m. on 21-11-1996. On 22-11-1996 a message was received from Villupuram Control Room which was forwarded to Annamalai Nagar PS which mentioned that three human bones femur, tibia and fibula have been recovered at 1.30 a.m. on 21-11-1996 from the seashore of Konimedu of Merkanam based on the information given by the concerned Village Administrative Officer-Nagarajan [PW-43]. Post-mortem of the limbs were conducted by Dr. Srinivasan [PW-45] and later limbs were sent to PW-66. PW-66, after examining the severed head, the torso and three human bones above mentioned, found that there are scientific materials to hold that they belong to a single individual and also the fact that they belong to deceased-Navasaru.

The father of the deceased PW-1 and Thandeeswaran [PW-60], nephew of PW-1, also identified and confirmed that the head and torso are of the deceased.

For confirming the said fact, the sample blood of PW-1 and his wife Baby Ponnusamy [mother of Navasaru] was examined by Dr. G.V. Rao [PW-77] at Hyderabad by DNA test. PW-77 compared the tissues taken from the severed head, torso and limbs and on scientific analysis he found that the same gene found in the blood of PW-1 and Baby Ponnusamy were found in the recovered parts of the body and that therefore they should belong to the only missing son of PW-1.

21.11 ADDITIONAL CASE LAW

21.11.1 DNA Analysis: Court's Directions[15]

Author's Summary

The Definite nature of DNA identification has prompted the court to prove guidelines in the location/collection/preservation/evaluation/comparison of the evidence so as to maintain relevancy/integrity/Authenticity/intact chain of possession and verified evaluation of the evidentiary clues. The court rejected the desire of the defence to supervision or independent second examination.

Highlights italicised

15. *Chandan Panalal Jaiswal v State of Gujarat*, 2004 Cr LJ 2992 : 2005 (1) Guj L H 225 : 2004 (3) Guj L R 2726.

Relevant Extracts (verbatim)

The apprehension expressed before the Court is *qua* the DNA evidence collection of the attempts by highly prejudicial investigating agency. A sample, if not properly collected and/or analysed with, (*i.e.,* of general sample and the crime exhibits), then the same could not be called into question, and the accused shall have to face trial and, therefore, when the petitioners have consistently taken the plea of *alibi*, they should be at least permitted to observe the process of drawing of sample from the body of the person of the accused and the process of examination which was to take place in Forensic Science Laboratory (FSL for short), at least from outside of a window glass.

It is true that the high profile test is considered irrefutable proof of identification and therefore, it is necessary to establish standard of analysis and accuracy in the level of statistical calculations. The laboratory performing such tests should be submitted to Double Blind Test in which neither the Lab nor the Technicians know what the samples are to ensure that they are working with acceptable quality control. In the present case, it is now the say of the petitioners that they may not be subjected to wrong test or a wrong method (*i.e.* outdated method) or that the test is being performed against their will and wish.

On the contrary Mr. Shah submitted that the accused persons are ready to give general samples from their respective body so that they can strengthen their case and the findings may give strength to their plea of *alibi*. But the question raised before the Court is whether the investigating agency can be conferred with the authority to resort to DNA test in absence of any special law enacted by the legislature for the said test. The answer would be that under the Cr. P.C. wide powers of investigation are conferred on the investigating agency and when the present accused are not under police remand/custody, necessary permission can be sought from the Court. The Court can permit, on merit of each case, the investigating agency to take the accused for necessary test such as Narco analysis, lie detection test or finger printing etc. of the accused and to draw general sample from the body of an accused person. But obviously, when an accused is asked to undergo DNA analysis while granting such permission to the said authority/agency (when it comes to DNA finger printing analysis/test) appropriate directions can be issued to safeguard the interest of the accused and other relevant aspects as the test has been believed to be conclusive even though the same is sensitive from all biotechnological and sociological point of view. There should not be permission for an invasion on individual privacy and, therefore, the 3 (three) factors determining the seriousness of invasion of privacy pointed out by Mr. Shah should be taken care of. These three factors are:

a. whether the person has a reasonable expectation that the information is private and will be accessible by others only with the person's consent;

b. how sensitive the information is *i.e.*, what impact on them might be from non-consensual disclosure and;

c. how invasive the method of obtaining the information is? And under such circumstances special safeguards are required to be enacted to protect the information pertaining to Individual DNA analysis/test.

At this juncture, I would like to quote some part from the book published by Person Education having heading "Understanding Biotechnology" from Chapter 10 titled as "Forensic DNA" wherein the author has stated that.

> *Considering the DNA analysis a powerful identification technique, it should be used carefully. The sensitivity level of many DNA test is so high that cells from a Technician's hands or from its sneeze could contaminate the sample. Therefore, care in the collection, custody and manipulation by the biological sample is of great importance for the validity of this analysis. Finally, human being can make mistakes. Technicians can mislabel a flask, change codes, change names and so on. Due to many possible errors, many laboratories use double reading in each step of the, analysis. They also save part of the sample for possible re-analysis.*

It would be also proper to quote a very relevant portion from a book titled as "Foundation for DNA Finger Printing Evidence" by Jeffrey Lee Ashton dealing with The Evidentiary Matter" and the same is about 'chain of custody':

> *Proof of the chain of the custody of sample used in DNA identity testing present no unusual problems. Procedures already used for collection, storage and transportations of sample used in the standard serology will suffice well for samples used in DNA testing. Care should be taken to seal and label samples properly to ensure the future integrity and the identification of the samples…*

Irrespective of the request made by the accused, the Courts are supposed to ensure the laboratory accuracy and should also focus while granting such permission and asking the present accused to undergo DNA finger printing test/analysis on the aspect of 'laboratory error.'

Expressing apprehension of vanishing of the entire crime exhibits, it is argued that where there is no scope of duplicate tests of a particular crime exhibit, the prayer of the petitioner being innocuous, should be accepted and the petitioners may be permitted to keep their DNA Forensic examiner (expert) present right from the stage of collection of blood samples till the test analysis are performed.

Mr. Oza, learned PP, has strongly resisted the submission and has pointed out that there is no scope of errors as pointed out by Mr. Shah and the apprehension expressed by him is in reference to the methods earlier adopted by the FSL in performing DNA Finger Printing Test because in early years the Restriction Fragment Length Polymorphism (RFLP) based technology was used. Of course the new technology known as PCR base technology was also adopted during some of these years *i.e.*, between 1987 and 1998. In the year 1997 PCR and sequence based technology was used (which is useful) in determining the material used and/or parental relatedness. At present the latest technology-analysis technique was is STR technology which has some relation with PCR and the sequence based technology. This STR *i.e.*, Short Tandem Repeat is the latest one. So the apprehension expressed by Mr. Shah is only relevant, if any earlier or outdated technology is sought to be adopted for analysis/test, in the present case.

A statement has been made by the learned PP on instructions from Dr. Mehta JT. Director, who was present in the Court at the instance of the Court, that in the present case considering the routine procedure of collection of reference blood sample in DNA identification, a format is being prepared and the same is required to be signed and submitted by the person who gives reference blood from his body and he is required to ensure the authenticity of the blood sample collected for DNA analysis. There is DNA division in the State Laboratory and the format prescribed is to be signed by the responsible medical officer of the hospital and is also supposed to put his seal giving the details providing details in the format prescribed over and above. Such a format carries a recent passport size photograph and the source with a declaration by him as a donor. If the donor is a minor or lunatic or otherwise disabled, such declaration has to be signed by his guardian.

In response to a query raised by the Court, Mr. Shah submitted that the petitioners have no objection if the blood sample is drawn from the source by a responsible medical officer and the petitioners shall be co-operative in preparing and signing the format.

It is relevant to note that DNA Laboratory of FSL, Gujarat State; Ahmedabad has entered into a Mou with Central Forensic science laboratory, Kolkata and Centre for DNA Finger Printing and Diagnostic, Hyderabad. The laboratory facilities, instruments and the techniques followed by all the three laboratories are the same. All the methods/Kits (instruments etc.) used are well-validated for Forensic Identification purpose and in the present case the analysis which is the latest one *i.e.* STR is to be applied. The STR technique is the latest one and its human specific, fast and easy to standardise. The technique is automated which ensure better accuracy and *reproducibility* (emphasis). It is submitted by Mr. Oza that the interpretation of the results is also quite simple and all activities are being done and observed mainly by computers. Therefore, the possible chances of errors are eliminated.

The demand for appointment of an observer is not found acceptable as it may demoralize the Forensic Scientist of FSL who is an independent authority and not working either under police or under the guidance or supervision of police authorities. The Role of FSLs can very well be appreciated in the light of the scheme of section 293, Cr. P.C. and other relevant provisions under which these Laboratories are functioning. It is also relevant to note that appointment of an observer may also lead to contamination including leakage of the confidential report and even some information and aspects which would otherwise are required to be kept secret. The potential defence witnesses whether ever could be permitted to enter the laboratory is also a question and this proposed invasion whether can create any hurdle or embargo in performing the analysis also would be a crucial aspect, if such private experts starts non-co-operation. If the accused persons have any question or doubt as to the method adopted by the FSL experts, then while examining such expert during the trial the accused positively can bring their own expert who can assist the counsel.

The Court can reject the request made of such a nature but, I am afraid, if the relief as prayed for is granted, it would amount to interference by Court in the investigation. The Courts have no role to play during the investigation nor to regulate the same, which is an accepted proposition of law. The learned Magistrate while passing the order under challenge seems to have followed this proposition of law. The ratio of the decision in the case of *UOI v Prakash P. Hinduja*, JT 2003 (5) SC 300 : 2003 Cr LJ 3117 : AIR 2003 SC 2612, could be attracted wherein the Apex Court by referring a case reported in *State of Bihar v J.A.C. Saldanna,* (1980) 1 SCC 554 : 1980 Cr LJ 98 : AIR 1980 SC 326, in the case of has observed that power of the police to investigate into the cognizable offence is ordinarily not to be interfered with by the judiciary. The legal position is absolutely clear and also settled that the Court would not interfere with the investigation. Such an attempt would mean from the time of lodging of FIR till the submission of the report by the Officer-in-Charge of investigation, in the Court under section 173(2), Cr. P.C. this field being exclusively reserved for the investigating agency.

In view of the submissions made by Mr. Oza before the Court and the statement made by him that present analysis technique followed by the FSL, Gujarat State shall be STR which is the latest one, this Court would not interfere in the process to be adopted by the said authorities by granting the relief as prayed. But considering the various aspects brought to the notice of the Court and the other aspects emerging from the record and the materials supplied to the Court while dealing with this revision application, it would be appropriate to give the following directions:

(i) that the authorities should see that blood samples are collected by a responsible medical officer preferably in the jail ward itself and by obtaining a declaration with the photograph in the format shown to the Court during the course of hearing of this petition.

(ii) if required, the petitioner-accused should be taken to the civil hospital and the blood samples should be drawn by a responsible doctor under a police Japta but the same shall not be treated as handing over the accused to Investigating Officer and the accused shall remain in the custody of the jail authorities.

(iii) The FSL, Gujarat State, Ahmedabad should see/ensure that splitting/ division of crime exhibit remains possible. Of course, this would depend upon the size or sufficiency of crime exhibit so that in the event of challenge, duplicate test if required, can be performed as independently as possible and the risk or error can be reduced enormously. If splitting/ division of crime exhibit is not possible, then, in such eventuality, the FSL shall inform the Court about the vanishing of crime exhibit, (totally used) during process.

It is clarified that merely because no specific Act having been enacted by the Legislature in our country, the investigating agency can resort to call upon the suspect/accused to undergo DNA analysis/test. It may be virtually under the powers conferred on the investigator by Cr. P.C. Thus, even if there is a vacuum of legislation, the Court is supposed to see that no authority suffers from any type of prejudice. Maximum care 'if required' should be taken and it would be wrong to presume any inaction or negligence on the part of the said authorities and especially the doctor who is to draw the sample or FSL experts who have to draw the analysis. Committing some laboratory error would result into wrong finding, especially when the State has assured that latest technique *i.e.* STR is to be performed in the present case.

I have gone through the relevant part of the booklet given by Mr. Oza throwing light on STR Typing by Automated DNA Sequencer. This deals with STR Makers in Human Identification. The booklet is prepared for the workshop organized by Central Forensic Science Laboratory, Kolkata and sponsored by Applied Biosystems, USA between 27-9-2003 and 1-10-2003. This Court has no reason to ignore the facts and other details emerging from the work done by the Scholars and gathered in research in recent past.

For short, the apprehension expressed by Mr. Shah is not accepted as well founded. Of course, Mr. Shah and Mr. Oza have assisted this Court immensely by putting their good efforts. Though this is a case where the petitioners-accused have accepted that they would undergo DNA Finger Printing Test to see that their plea of *alibi* can be strengthened from the finding, which may be recorded. But in all other cases also the ratio would remain the same wherein the FSL is asked to play some role in the investigation of a crime because the accused cannot be permitted and should not be permitted to put his own expert either to participate in such investigation or to watch the investigation. Ultimately, it may otherwise, prejudice either the defence or prosecution because it would amount to interference in the process of investigation.

In view of the above observations and directions made in para 20 of the judgment, the revision application deserves to be dismissed. Accordingly, the revision application is dismissed. Rule discharged.

21.11.2 Perfect Identity; DNA Test admissible[16]

Author's Summary

In a scuffle, the victim was injured. His clothes, found in the car of the accused, had bloodstains. The DNA of the stains tallied with the DNA of victim's blood. The culprit stood identified.

Highlights italicised

Relevant Extracts (Verbatim)

The said shirt, which was seized from the said car, was sent to DNA Expert to find out whether the shirt had bloodstains of A-1. The said shirt was marked by DNA Expert as 5(a) and was marked by them as Ex. K. which is M.O. 10 and which is a pink coloured shirt. P.W. 46 DNA Expert was examined in the Court. He holds M.Sc. degree in Criminology and Forensic Science. He also holds Ph.D. degree in Forensic Aspects of DNA and Finger Printing. He further holds a Post-Doctoral qualification in Development of DNA Probes for Forensics. According to his evidence,

16. *Pantangi Balarama Venkata Ganesh v State of Andhra Pradesh*, 2003 Cr LJ 4508 (AP) : 2003 (1) Andh LD (Crl) 789 : 2003 (2) Andh LT (Cri) 9 (AP).

DNA Finger Printing technique is an absolute method for identification, as on today for individualization of biological sample to the probability value of 99.9998 per cent. The theory of technique lies in the fact that each individual inherits DNA from its parents in the proportion of 50:50. DNA present in any person does not match with other person in the world.

According to his evidence, on 17 February 1996 their office received requisition from the Court of the II Additional Munsif Magistrate, Ongole dated 16-2-1996 in which the request was made that four samples of blood of the accused and the injured in Cr. No. 140/95 of Ongole I Town Police Station may be compared by the DNA Finger Printing technique with bloodstained clothing and swabs collected at the scene of offence. Accordingly he carried out the test. We have already stated that the blood samples were already taken with the identity card. They were marked, as KLM being identical DNA finger printing to that of A-1. Thus, the shirt, which was marked as Ex. K and which was marked as M.O. 10 was that of A-1 according to DNA test. Hence, on this evidence, the learned counsel Mr. Kannabhiraman pointed out that the Expert deposed that the blood of A-1 is identical to the blood which has been found on Ex. K.M.O. 10 is identical and it is not the same and therefore the learned counsel has submitted that the mistakes are likely to be there in identifying the blood since the samples were collected two months after the incident. He takes the support of an article written by one Lalji Singh, Centre for Cellular and Molecular Biology, Hyderabad in DNA Profiling and its applications in which the learned Author has observed as under:

> ***Precautions:—DNA profiling is technically demanding. There are cases on record in the US where mistakes seem to have been prompted by human errors. There is a need for quality control. Every precaution should be taken to ensure preparation of high – molecular weight DNA, complete digestion of the samples with appropriate enzymes, and perfect transfer and hybridization of the blot to obtain distinct bands with appropriate control. If necessary the analysis should be repeated. The DNA fingerprinting test, if performed property is infallible. However, there is a need to interpret DNA typing with a thorough understanding of the populations involved.***

We have no hesitation in accepting the proposition. But it cannot be said that in this particular case, human error has crept in unless it is shown by cross-examination. DNA confirms the identity of victims. Then what is DNA? DNA means:

> (Deoxyribonucleic Acid), which is found in the chromosomes of the cells of living beings, is the blueprint of an individual. DNA decides the characteristics of the person such as the colour of the skin, type of hair, nails and so on. Using this genetic fingerprinting identification of an individual is done like in the traditional method of identifying fingerprints of offenders. The identification is hundred per cent precise, experts opine.

The key feature of this technique is that no matter what biological sample is obtained – hair, a bit of skin, blood – the results are not going to be different. This is because all the cells in the body contain the same set of DNA, something unique for each individual.

The test was conducted in *Beena's* murder case.

In the present case, the CFSL and the CCMB conducted tests on the bones recovered by the police and on blood samples of Beena's blood relatives: her mother Rathi Devaiah, brother Nanjappa and sister Gangamma. The results were astounding: the DNA extracted from the bones found to be belonging to a female aged around 20-25 years. The DNA of the bones also tallied with the DNA in the blood samples of Beena's mother, sister and brother and was comparatively of the same genetical order.

The test according to police, had taken much time as the Hyderabad institutions had to seek expert opinion from institutions abroad.

Thus, the evidence of DNA Expert is admissible in evidence as it is a perfect science. In the cross-examination P.W. 46 has deposed as under:

"If the DNA fingerprint of a person matches with that of a sample, it means that the sample has come from that person only. The probability of two persons except identical twins having the same DNA fingerprint is around 1 in 30 billion world population." It means that DNA test gives the perfect identity. It is a very advanced science.

21.11.3 DNA from blood sample of accused[17]

Author's Summary

The DNA obtained from the hair of suspected, vaginal smear slide of the deceased, paizami of deceased and underwear of deceased are matching with the DNA obtained from the blood sample of deceased and blood sample of accused. The testimony of independent witnesses is duly corroborated by the medical evidence and forensic reports. Thus the conviction of accused person is proper.

Relevant Extracts (Verbatim)

The accused allegedly enticing away the victim-girl of 8 years from religious function and thereafter raping her, resulting in her death. The independent witnesses have seen the accused leaving with the deceased after the function was over around midnight. the doctor has categorically deposed that the victim died due to asphyxia as a result of commission of rape. The doctor has further opined that as a result of commission of rape, the victim has undergone acute pain and shock and due to exertion of pressure, she was suffocated. The internal organs of the victim i.e. brain, liver, spleen and kidneys were congested. He has noticed the injuries on the body of the victim, as noticed hereinabove. The doctor has proved the post mortem report. According to the Forensic Science Laboratory report, the soil sticking with the clothes of the deceased matched with the soil lifted from the spot. The Police also sent the samples for DNA. The DNA test performed on the exhibits provided is sufficient to conclude that, (1) The DNA obtained from T-shirt of accused is form a single female human source and matching with the DNA obtained from the blood sample of deceased; (2) The DNA obtained from the hair of suspected, vaginal smear slide of the deceased, paizami of deceased and underwear of deceased are matching with the DNA obtained from the blood sample of deceased and blood sample of accused. Thus the conviction of accused person for rape and murder of minor girl is proper because the testimony of independent witnesses is duly corroborated by the medical evidence and forensic reports.

21.11.4 Taking blood sample for DNA Test is not violative of Article 20(3) of the Constitution[18]

Author's Summary

There was dispute of property between father and son. Father alleged that son was an imposter, not his son. Father wanted DNA test for the proof. The imposter opposed it on the ground that it was against Article 20(3) of the constitution. The superior court found it erroneous and allowed the test.

Relevant Extracts (Verbatim)

The petitioner is the father of the respondent. The respondent herein is the plaintiff in Q.S. No. 26/92. He has instituted the said suit against his father for partition and separate possession of his share in the coparcenary properties. The defendant has resisted the said suit on the ground that the plaintiff is not entitled to claim partition in the joint family properties since he was not born to him. Therefore, he filed I.A. No. 8 under Order 26, rule 10A read with section 151, Code of Civil Procedure for the appointment of a Commissioner for purpose of blood test and genetic finger printing test of the plaintiff to find out whether he is his son. The said application was resisted by the plaintiff on the ground that he could not be compelled to undergo the test as it was violative of article 20(3) of the Constitution of India. The learned Munsiff having upheld the said objection rejected the said I.A.

In my view,the impugned order is erroneous and is liable to be set aside for the following reasons: Clause (3) of Article 20 of the Constitution of India deals with accused's immunity from being compelled to be a witness against himself. This clause gives protection to (i) to a person 'accused of an offence'; (ii) against compulsion 'to be witness', (iii) against himself. Therefore, it is clear from clause (3) of Article 20 that the protection under this clause is confined to criminal proceedings or proceedings of criminal nature before a court of law or other Tribunal before whom a person may be accused of an 'offence' as defined in section 3(38) of the General Clauses Act. It would not, therefore, extend to parties and witnesses in civil proceedings or proceedings other than criminal. In *Mallela Suryanarayana v Vijaya Commercial Bank Ltd.*, AIR 1958 AP 756 : (1958) 2 Andh WR 331 : ILR (1958) AP 651 and *R.P. Ulaganambi v K.C. Loganayaki*, 1986 Cr LJ 1522 : 1986 (2) DMC 79 : 1986 Mad LW (Cri) 122, the High Court of Andhra Pradesh and the High Court of Madras respectively have taken the view that the immunity granted by article 20(3) of the Constitution of India does not extend to civil proceedings and the intendment of this article is to afford some protection to a person involved in a crime, having regard to the predicament in which he would be placed and to interpret it as applying to all proceedings – civil or criminal which might at a subsequent period expose the person concerned to prosecution on the basis of answers given by him, is to enlarge the scope of this article and to defeat justice. Therefore, in my view, the learned Munsiff was not at all right in dismissing I.A. No. 8 on the ground that the prayer made therein amounted to testimonial compulsion violative of Article 20(3).

Under Hindu Law illegitimate sons living together with their putative father do not constitute coparcenary and father has no power to admit them as his coparceners. In my considered view, the trial court in order to enable the defendant to prove that the plaintiff was not born to him and he is not entitled to claim partition in the suit properties ought not to have rejected I.A.S.

For the foregoing reasons, this Revision Petition is allowed. The impugned order on I.A. No. 8 is hereby set aside. I.A. No. 8 is allowed and the trial court shall appoint a Commissioner for the purpose mentioned therein at the cost of the defendant. There shall be no order as to costs.[1]

21.11.5 Choice of Laboratory for Second DNA Test[19]

Author's Summary

It is a simple case of disputed paternity. The complainant wanted the test to be done at Hyderabad. The other party opposed it. The superior court allowed 2nd test but did not accept the choice of the complainant for the laboratory.

Highlights italicised

19. *Vishal Motising Vasava v State of Gujarat,* 2004 Cr LJ 3086 : 2005 (1) Cur Cri R 345 : 2004 (4) Rec Cri R 182.

Relevant Extracts (Verbatim)

Having considered the order dated 25-11-2003 passed by the learned Sessions Judge, it appears that the order passed by the learned Sessions Judge for allowing second DNA test to be conducted of the petitioner cannot be said without jurisdiction or illegal, which would cause any great injustice to the party. As such, the order can be said to be discretionary order which would not call for interference by this Court. I find it proper not to observe further and leave it at that stage, more particularly, in view of the fair stand taken by the learned advocate for the petitioner that the petitioner has also no objection for second DNA test to be conducted at any hospital in Gujarat State.

So far as the insistence of the original complainant for getting the DNA test to be conducted at Hyderabad only and not at any other place and acceptance of such request by the learned Sessions Judge in the impugned order, deserves interference. The complainant may be justified at the most in insistence for second DNA test to be conducted. However, such insistence cannot be stretched to the extent of getting the test conducted at a particular laboratory of the choice of the complainant. If such contentions at the instance of the complainant are accepted, it may leave room to large number of other manipulations and complications. It will be for the State to modulate and regulate such procedure to be undertaken since it will be the duty of the State to ensure that the criminal justice is properly administered in the State. The State for various reasons may decide to get such test to be conducted at the nearest laboratory or in an appropriate case the Court may direct the State to get such test conducted at a particular laboratory, but certainly the complainant cannot be said to have any vested right to get such test conducted at a particular laboratory only. Further, no extraordinary circumstances are recorded by the learned Sessions Judge for accepting the contention of the original complainant to get DNA test conducted at Hyderabad only. It has not come on record that the laboratories for conducting DNA test situated in Gujarat are either not useful or the report may create a doubtful situation. In absence of such material on record, in my view, the learned Sessions Judge has committed error in accepting the contention of the original complainant that the DNA test shall and must be conducted at a laboratory situated at Hyderabad only.[2]

> ***In view of the aforesaid discussion, the order dated 25-11-2003 passed by the learned Sessions Judge below application – Exh. 94 in Sessions Case No. 36/02 shall operate to the extent of ordering the second DNA test of the petitioner by comparing the blood of the child – Piyush. However, the order will stand modified to the extent that such DNA test shall be conducted at any laboratory situated in Gujarat State. It will be for the learned Sessions Judge to decide after hearing both sides for the place of the laboratory anywhere in Gujarat. As and when such test will be conducted for the purpose of blood sample or otherwise, the State shall make arrangements for ensuring that the petitioner is kept present personally for such purpose and the petitioner shall be at liberty to keep his advocate present at the time when blood samples are to be collected. The original complainant shall also be at liberty to remain present either with her parents or advocate of her choice.***

CHAPTER 22

FORENSICS BIOMETRICS

SYNOPSIS

22.1 General 1301
22.2 Nature 1301
22.2.1 Physiological biometrics 1301

Automated Facial Recognition

22.1 GENERAL

Biometric Forensics is the science of identification of the unique identity of a person through study/measurements of unique characteristics of behaviour/body part. The main advantage of this identifying mode is that the biometric body parts/traits used are personal traits of the individual. They are not lost/stolen/forgotten/misplaced/imitated/destroyed as long as the person lives because the body traits are inseparable parts of the physiology or psychology (behaviour) of the individual.

Biometric traits are being used extensively and increasingly for definite and quick identification of persons, at entry points to some institutions and installations and identification of important paper/electronic documents. They are becoming indispensable for security in many working places. Biometric identification is unique, personal and always available, is being preferred to passwords, pin codes, identity cards, and other identifying modes as the latter can be lost, forgotten, stolen or forged. It is not so with biometric identifying elements.

Modern technology has simplified the processes. Automation, in processing biometric data for the identification of a person is available in a database template, stored in a computer.

The biometric entities being used for the identification of the individuals are many. The nature and frequency of the use, the cost of the technology, the speed and personal preferences are the factors, which decide the selection of the biometric element for a particular need. The automated comparison to ascertain match/non-match is proving to be high cost and time effective.

22.2 NATURE

Forensic Biometrics is of two types:

1. Physiological biometrics
2. Natural behavioural biometrics

Both types of biometrics are individualistic and unique to the individual. They identify him. Those body/behaviour traits of the individual, singly or severally, establish his identity beyond a reasonable doubt.

22.2.1 Physiological biometrics

Physiological biometrics involves the measurements of body parts. Almost any part of the body can be used, however, commonly used body parts are:

1. Fingerprints/palm prints
2. Iris
3. Facial features
4. Retina
5. DNA

There are many other physiology elements that are being investigated for use in biometric identifications, including:

1. Ear prints
2. Footprints
3. Lip prints

4. Body odours/scents
5. Brain profiling[1]
6. Heart functioning[2]
7. Face Images
8. Facial physiology
9. Hand thermograms
10. Veins: e.g., hand veins
11. Hand geometry

22.2.2 Behavioural Biometrics
